SMYRIS et **SMERILLUS**, Offic. *Smiris*, *Mer.* Pin. *Boet.* 591. *Worm.* 65. *Aldrov. Mus. Metall.* 653. *Charlt. Foss.* 27. **EMERY.**

Smyris, *Smyrillus*, or *Emery* of the Shops, *σμύρις* of the Greeks, *Smergium* of *Serapion*, *Sumbagedi* of the *Arabians*, is a ferruginous, heavy, metallic Substance, of a Colour inclining to black, and so hard that Lapidaries use it in cutting and polishing their Diamonds, and Smiths to polish their Iron and Steel.

Emery is of three Kinds; the common, which is blackish, and very much used, is found in many Parts of *Europe*, especially in an Island on the Coast of *Tuscany*, and in *Guernsey* in the *British Channel*. The second is a hard uneven Sort of a

reddish Colour, like Bloodstone or Oker, but does not stain the Hands. This is, by some, reckoned among the Bloodstones. The third is of a blackish red Colour, streaked with gold-coloured Veins. It is found in the Gold-Mines of *Peru*, and really contains Gold. This Kind is thought by Chymists to be a Gold-Ore, or rather a Sort of immature or imperfect Gold; and therefore they esteem it very much, and extract a Tincture from it with Spirit of Sea-Salt, with which they fix Mercury in an Instant, and give this Substance the Name of the miraculous Precipitate, because they fancy they shall at length attain the true Art of making Gold by Means thereof.

Emery is recommended by *Dioscorides* and *Galen* as a Dentifrice; but it corrodes the Teeth too much, and insensibly wears them away. It is not now of any other Use in Physick. *Geoffroy*.

SMYRNA. *σμύρνα*. Myrrh.

SMYRNIUM.

The Characters are;

The Leaves are large, various, and sometimes perfoliated, or perforated by the Stalk; the Seeds are thick, hemispherical, lunated, gibbous; channelled and black.

Boerhaave mentions three Sorts of *Smyrniun*, which are;

1. *Smyrniun*: *Raii Synop.* 3. 208. *Tourn. Inst.* 316. *Boerb. Ind. A.* 54. *Hippofelinum* & *Smyrniun*, Offic. *Hippofelinum*, *Ger.* 866. *quoad descript.* *Emac.* 1019. *Raii Hist.* 1. 437. *Hippofelinum*, *frve Smyrniun vulgare*, *Park. Theat.* 930. *Hippofelinum Theophrasti*, *vel Smyrniun Dioscoridis*, *C. B. P.* 154. *Macerone quibusdam Smyrniun*, *semine magno*, *nigro*, *J. B.* 3. 126. *Olusatrum quibusdam*. **ALEXANDERS.**

Alexanders has many large winged Leaves, of a yellowish green Colour, much larger than Smallage, or else pretty much resembling it. The Stalks grow to be three or four Foot high, channel'd or furrowed, having the like; but smaller; Leaves growing on them, and on their Tops pretty large Umbels of small five-leaved white Flowers, succeeded by large oblong corner'd black Seed. The Root is large and branched; blackish on the Outside, and white within. The whole Plant has a strong warm Taste. It grows upon the Rocks by the Seaside, and flowers in June. It is usually kept in Gardens for Use.

This is an Herb more used in the Kitchen than in Apothecaries Shops, being eat now as a Salad among other Herbs; or else boiled and eaten with Salt Meat. It is accounted to be of the Nature of Parsley or Smallage; but stronger, and therefore may be serviceable in opening Obstructions of the Liver and Spleen, to provoke Urine and the Catamenia, and to help the Dropsy and Jaundice. *Miller's Bot. Off.*

It is aperient, diuretic, and sudorific; excites the menstrual Discharge, and promotes a difficult Birth; it is good for the Colic, Asthma, and Ischiadic Pains. *Hist. Plant. Boerhaavio ascript.*

2. *Smyrniun*; *peregrinum*; *rotundo folio*. *C. C. P.* 154.

3. *Smyrniun*; *peregrinum*; *folio oblongo*. *C. B. P.* 154. *Boerb. Ind. Alt. Plant.*

SODA. An Head-ach. Sometimes, according to *Blancard*, it imports a Heat of the Stomach. *Soda Subethica*, is a soporiferous Pain of the Head. *Castellus* from *Bonetus*.

SODA, is, also, the lixivial Salt of **KALI**.

SOIA. See **PHASEOLUS**.

SOL. The Sun, in Chemistry; is the Character for Gold. See **AURUM**.

In the *Collectanea Chymica Leidensia*, there are several Preparations of Gold described, which are not used in the present Pharmacy.

SOLANIFOLIA. A Name for the *Circæa*; *Lutetiana*; and for the *Circæa*; *minima*.

SOLANO-CONGENER. See **BELLADONNA**.

SOLANOIDES. Bastard Nightshade.

The Characters are;

It hath a rose-shaped Flower, consisting of five Leaves, whose Pointal afterwards becomes a roundish Fruit, having one hard Seed, which is covered with a thin Pulp, so as to have the Appearance of a Berry.

Miller mentions two Sorts of *Solanoides*, which are;

1. *Solanoides Americana*; *Circæa foliis canescentibus*. *Tourn.*

2. *Solanoides Americana Circæa*; *foliis glabris*. *Tourn.*

These Plants are Natives of the warmer Parts of *America*; from whence their Seeds have been brought into *Europe*; and the Plants are now become pretty common in the Gardens of the Curious.

The Fruit of these Plants afford a fine red Colour, when bruised; but it soon fades on Paper, which renders it worth little. If a Quantity of these Fruit is squeezed into a

Glass

Glass of fair Water; so as to colour the Water; of a deep red, and a Stem of Flowers of the Tuberosa put into the Glass, it will in one Night imbibe so much of the Liquor as to variegate the Flowers with a Rose Colour. *Miller's Dictionary*.

SOLANUM.

The Characters are;

It has the Flower of the Alkekengi; the Calyx is monophyllous, quinquefid, stellated, and not vesicary. The Fruit is soft, succulent, of an oval or globular Figure, and full of Seeds, which are generally flat.

Boerhaave mentions four and twenty Sorts of *Solanum*; which are,

1. *Solanum*; scandens; vel *Dulcamara*. See AMARA-DULCIS.

2. *Solanum*; scandens; vel *Dulcamara*; flore albo. *C. B. P.* 167.

3. *Solanum*; scandens; vel *Dulcamara*; foliis ex albo variegatis. *M. H. B.* 194.

4. *Solanum*; officinarum; acinis nigricantibus. *C. B. P.* 166. *Tourn. Inst.* 148. *Boerb. Ind. A.* 2. 67. *Solanum vulgare*, *Park. Theat.* 346. *Raii Hist.* 1. 672. *Synop.* 3. 265. *Solanum hortense*, *Ger.* 268. *Emac.* 339. *Solanum hortense*, *five vulgare*, *J. B.* 3. 608. *Nilentsunda*, *Hort. Mal. Part.* 10. p. 145. *T.* 73. *Aguara-quiyà*, *Pison.* 224. NIGHT-SHADE.

Cordus and *J. Baubine* have taken the Flower of this Plant to be pentapetalous; whereas it is certainly monopetalous. It is commonly believed that the Seed of the Nightshade, with black Fruit, produces those which have a red and yellow Fruit. But besides that Experience shews the contrary, these Species are distinguished by other more particular Circumstances, as will appear by their Descriptions.

The Nightshade, with black Fruit, has a Root half a Foot long, three or four Lines thick at the Neck, waving, whitish, fibrous and hairy; the Stalk, which is full of Pith, rises about a Foot and a half high, three Lines thick, greenish, rough, and angular, divided commonly at the Distance of nine or ten Inches, into several Branches, stretching out upon the Sides, and often bending downward; garnished with Leaves growing alternately, which beginning with a Tail half an Inch long, increase to an Inch and a half in Breadth, and two Inches long; they are pointed, waved rather than notched, dark, green, smooth, and shining; the Pedicle lengthens itself into a Rib; the Waves of which bend themselves about till they are lost in the Extremities of the Leaves. Those which grow upon the Divisions of the Branches, are smaller, rounder, and more pointed at the Top, where the Sprigs are set with two or three little Threads.

The Flowers do not usually grow out of the Bosoms of the Leaves, as in most other Plants, but out of the Branches themselves, a little below the Leaves. These Flowers grow together from five to eight, upon a Stalk an Inch and a half long, divided into slender Pedicles, four or five Lines long. Each Flower is white, monopetalous, of the Shape of a Balloon, three Lines or three and a half in Diameter, perforated at the Bottom, where it is yellowish, and, as it were, terminated in a Ring; divided from the middle into five Segments, long, pointed and disposed in Form of a Star. From the Sides of the Bottom of the Flower arise short Chives, charged each with a yellow Summit, dusky, narrow, a Line and a half long. All these Summits join together, and hide the Bottom of the Pointal, the Basis whereof is almost round, pale green; jointed in the Hole of the Flower, and fixed in the Bottom of the Empalement; this Empalement is a little greenish Funnel, cut into five obtuse Points. When the Flower is gone, the Pointal becomes a spherical Fruit, pretty hard, at first of an Olive-green, afterwards black, about four Lines Diameter, full of a limpid Juice, and several whitish Seeds, a Line long, flat, rounded, bordered with a small greenish Skin, easily separated from it, disposed in a Ring about the Placenta, which is in the middle of the Fruit, and distributes the Nourishment to all the Seeds.

The Root is in a manner insipid; the Leaves have an herby Taste, a little saltish; the Fruit is something sharp and winy; the whole Plant has a narcotic Odour, but not so strong as in the other Species.

It flowers in *July*, *August*, and *September*; the Fruit is ripe in *September* and *October*.

The Leaves give but a faint Tincture of red to the blue Paper; but the ripe Fruit gives it a very deep one; which gives us Reason to conjecture, that the Sal Ammoniac in this Plant, is tempered in the Leaves by a considerable Quantity of fetid Oil and Earth; but that the acid Part of this Salt is very much disengaged in the ripe Fruit; so that we must make choice of the Parts of this Plant, as different Occasions may require. The Berries, for Example, are more

cooling, but yet more repellent than the Leaves, which lenify by resolving, cleansing, and absorbing.

By the Chymical Analysis they yield a great deal of volatile concrete Salt.

Nightshade is used to allay Inflammations, to soften and relax the Fibres which undergo too violent a Tension. They apply the bruised Herb to the Piles, or bath the Parts, with the Juice a little warmed. They work this Juice for some time in a leaden Mortar, to anoint the Cancer with. The same Juice quickened with a sixth Part of Spirit of Wine, well deslegmated, is very good for the St. Anthony's Fire, Tetters, Pustules, Pimples, and all the Diseases of the Skin. The Nightshade is used in the Ointment of Poplar, and all anodyne Cataplasms. *Casalspinus* affirms, that they give the Water, or the Juice, to drink in the Inflammation of the Ventricle, and Heat of Urine; he says, that three Ounces of the same Water, taken with an equal Quantity of Wormwood Water, evacuates by Sweat. Nevertheless, the internal Use of this Plant is very much suspected. *Tragus* says, that it kills Hogs, and advises not to use the Water of it internally, till it has been distilled two or three Years. *Martyn's Tournefort*.

5. *Solanum*; officinarum; acinis Puniceis. *C. B. P.* 166.

6. *Solanum*; officinarum; acinis ex luteo virescentibus.

7. *Solanum*; officinarum; folio laciniato Stramonii, flore parvo; albo; acinis nigris.

8. *Solanum*; lanuginosum; hortensi simile. *Raii H.* 672.

9. *Solanum*; tuberosum; esculentum. See BATTATA VIRGINIANA.

10. *Solanum*; pomiferum; frutescens; Africanum; spinosum; flore Borriginis; foliis profundè laciniatis.

11. *Solanum*; pomiferum; frutescens; Africanum; spinosum, flore Borriginis; folio pallidius virescente, subtus tomentoso.

12. *Solanum*; pomiferum; frutescens; flore Borriginis; folio tomentoso; incano; solo caule spinoso.

13. *Solanum*; incanum; Chinense; minus spinosum; floribus parvis, umbellatis. *Pluk. Almag.* 351.

14. *Solanum*; fruticosum; bacciferum. See AMOMUM PLINII.

15. *Solanum*; lignosum; Africanum; sempervirens; Laurinis foliis. *H. A.* 2. 191.

16. *Solanum*; Africanum; lignosum; folio; atroviridi; angustis; oblongo, obtuso.

17. *Solanum*; Guineense; fructu magno instar Cerasi, nigerrimo, umbellato.

18. *Solanum*; Americanum; caule & pedunculo nigro; & folio Acanthi, spinosis.

19. *Solanum*; Americanum; caule pedunculo; folio Malvæ, tomentosis, & spinis albis donatis; fructu luteo.

20. *Solanum*; spinosum; fructu rotundo. *C. B. P.* 167. *Pomum Hierachuntanum*. *Imperat.* 665. *Mala insana*, nigra. *Rauwolf. Lugd. Append.*

21. *Solanum*; fruticosum; Indicum; fructu rubro. *T.* 149. *Cherubunda*. *H. Mal.* 2. 67. *Scheruschunda*. *1c. Tab.* 36.

22. *Solanum*; Africanum; spinosum; fructu canescente, undulato. *Triumfett. Prælus.* 49.

23. *Solanum*; pomiferum; non spinosum; fructu duro. *Vaill.*

24. *Solanum*; spinosum; incanum; foliis sinuatis; flore Borriginis; fructu luteo; ovuli Gallinacei magnitudine & formâ. *Triumf. Boerb. Ind. Alt. Plant.*

The first and second Species are called *Dulcisamara*, or *Dulcamara*, (*Bitter-sweet*) because if you chew a Bit of them newly crompt, it diffuses a Bitterness over all the Mouth, and soon after a Honey-like Sweetness. The Juice of this Plant is very penetrating, saponaceous and detergent; whence it is proper in Wounds where Blood is extravasated and grumous. It is, also, diuretic, expelling Gravel from the Kidneys; and sudorific, for which Reason Physicians advise a very strong Decoction of the tender Branches to be drank in a Phthisis, where Attenuants and Cleansers are required; but where there is an excessive Thinness of Blood, which manifests itself by natural Sweats, it is prejudicial. It is a very serviceable Plant in Inflammations, and too great a Tenseness of the Fibres, and the bruised Leaves are good in the Hæmorrhoids: The Juice is very good in a Cancer, to wash the same; and with rectify'd Spirit of Wine, is proper in an Erysipelas, and all cutaneous Diseases. It has the Virtues of Liquorice, and the Decoction of it is highly serviceable in all Disorders from Obstructions, for it is detergent and aperient, and is commended in all pectoral Distempers, Ulcers, external or internal, the Scurvy, and Lues Venera. It is very diuretic, and no Plant is more proper for a Camp, where the Soldiers have received any internal or external Hurt. Outwardly, it is useful in the Gout to ease the Pains. Physicians

ficians highly extol the outward Use of this Plant, and, I think, with good Reason: They take the bruised Leaves, and expressing the Juice, mix it with Ointment of Roses, and apply it to the Head in a Phrensy, as a Refrigerent and Anodyne, whence the Juice is said to be an Antiphlogistic. The Leaves bruised with Salt, or Nitre, are proper in Inflammations, Gangrenes, and Suppurations. The Plant taken inwardly, is said to mitigate unnatural Heat, to refrigerate, and comfort the internal Parts. But as many Children in the Country are seiz'd with Convulsions, and destroy'd by the Use of it, which, also, proves mortal to Poultry, as we are assur'd by the Peasants, this Plant is to be suspected, as well as its Berries. The Leaves bruised are fit to be externally applied in Inflammations of the Hemorrhoids. The seventh and eighth are not so soon to be trusted. The ninth has Tubera for Roots, and was first discovered in America, where it is commended as excellent Aliment; but if too freely eaten, they are suffocating. The Tubera roasted under the Ashes, are very wholesome Aliment, and are said to be provocative. The fourteenth is thought to be the *Solanum* of the Antients, and the Apples are said to be of a refrigerating Quality; but I can say nothing of their Virtue, for want of Experience. The seventeenth is very poisonous, for its Berries cause Death, almost without any visible Symptoms. *Hist. Plant. ascript. Boerhaave.*

Solani Species, Fockii Fockii dicta javanensisbus Bontii.

By the Leaves, Flowers and Fruit, it is certain, that this Plant is a Species of *Solanum*, only the Fruit is much larger than that of our *Solanum*, as exceeding sometimes the Length of a Cubit, as thick as a Man's Arm, and of so smooth and polish'd a Rind, as to represent a Man's Face like a Mirror. It is full of minute Seeds, like that of the common *Solanum*. The Fruits in these Countries (*Java*, and the neighbouring Islands) are not only esculent, but of a very delicious Savour, if boiled with Wine and Pepper, and have the same Taste as the Stool of an Artichoke. They are of good Nutrimnt, and of a diuretic Quality, for which Reason they are very serviceable in the Stone of the Bladder, and Affections of the Kidneys.

There is a wild Species of this Plant, which bears a perfectly spherical Fruit, and of a yellow Colour when ripe (the Garden Sort being purple or white like Hail) and of a bitter Taste, so as none but the wild Boars and Rhinoceroses will eat it. *Raii Hist. Plant.*

Solanum vesicarium Indicum. C. B. Solanum sive Halicacabum Indicum. J. B. Halicacabum Indicum rectum. Park. Camaru Basilienibus. Marggr.

This Plant has a pretty thick, and, according to *Parkinson*, a firm, erect, angulous and nodous Stalk, of the Height of a Cubit, or two, spreading into many Branches, adorn'd with Leaves somewhat larger than those of the common *Halicacabum*, jagged, and of a smutty green Colour. The Flowers grow single from the Divarications of the Branches, and the Bosom of the Leaves, and are of a pale yellow Colour, like those of the common *Solanum*. The Bladders, or Fruit, are equal to those of the *Halicacabum*, with a Stone so large, as sometimes to burst the Bladder into four Parts. The whole Plant is insipid, but exudes a mucilaginous Juice at the Joints, of the strong Smell of the *Lycopersicon*. *Raii Hist. Plant. ex Parkinson.* I find no Virtue ascribed to it.

SOLANUM is also a Name for several Sorts of *Alkekengi*, *Jalapa*, *Lycopersicon*, and *Stramonium*.

SOLANUM BARBADENSE. A Name for the *Phytolacca*; *Americana*; *fructu minori*.

SOLANUM MELANOCERASOS. See **BELLA DONNA**.

SOLANUM POMIFERUM. A Name for the *Melangea*, *fructu oblongo violaceo*; and for the *Melangea*, *fructu oblongo albo*.

SOLANUM QUADRIFOLIUM. A Name for the *Herba Paris*.

SOLANUM RACEMOSUM & Virginianum. Names for the *Phytolacca Americana*; *fructu majori*.

SOLARIS HERBA, is the **HELIOTROPIUM**.

SOLATER, or **SOLATUR.** Quicksilver. *Rulandus*.

SOLDANELLA.

The Characters are;

The Root is perennial; the Leaves are stiff, and less than those of *Asarabacca*. The Flower is Bell-shaped, and frimbriated; and the Fruit is cylindrical, and gaping at the Top.

Boerhaave mentions but one Sort of *Soldanella*, which is, 1. *Soldanella*; *Alpina*; *rotundifolia*. *C. B. P. 295. Tourn. Inst. 82. Boerb. Ind. A. 202. Soldanella Alpina*, *Ger. 690. Soldanella Alpina rotundifolia*, *C. B. P. 295. Tourn. Inst. 82. Soldanella montana quibusdam*, *J. B. 3. 817. MOUNTAIN BINDWEED.*

It grows on the Alps, flowers in *July*, and the Herb is reckon'd by *Monti* among *Vulneraries*.

SOLDURA. The Faces of alkaline Salts. *Libavius*.

SOLEA. The Sole-Fish.

There are but few Fishes which have so excellent a Taste, and are at the same Time so wholesome as the Sole. This Fish is of different Bignesses and Kinds.

It is tender, short, firm, having but little viscus, and gross Juices, and contains a just Proportion of oily and volatile saline Particles, which makes it have so agreeable a Taste, and render it nourishing, productive of good Juice, and easy of Digestion. The Head of this Fish being dried and reduced to Powder, is reckoned good for the Stone, Gravel, and Scurvy. It produces no ill Effects, if it be not immoderately used.

Buglossus is another Latin Name for it from *Βούγλωσσος*, from *Bēs*, an Ox, and *γλίσσα*, a Tongue, because in Form it resembles a Near's Tongue. *Lemery on Foods.*

SOLELASAR. An alkaline Salt.

SOLEN. *σολήν.* A hollow chirurgical Instrument, in which fractur'd Limbs were plac'd. It is, also, the Name of an oblong Sea Shell-Fish, of which Naturalists take Notice of two Species.

SOLENARIUM. *σολενάριον.* A channell'd chirurgical Instrument, in which the Penis was laid, as a fractur'd Limb in the *Solen*.

SOLEUS.

This is a large, fleshy, flat Muscle, nearly of an oval Figure, and thicker in the Middle than at the Edges. It has its Name from its supposed Likeness to a Sole. It is situated on the Backside of the Leg, lower down than the *Gastrocnemii*, by which it is covered; and these three Muscles form the Calf of the Leg.

It is fixed above, partly to the Tibia, and partly to the Fibula. It is fixed to above one Third of the upper Part of the Backside of the Fibula, and a little to the articular Ligament of the Head of this Bone. It is, also, fixed to the Backside of the Tibia, from the oblique Line or Impression which terminates the Insertion of the *Popliteus*, down to the Middle of the internal Angle of the Bone; afterwards, leaving these two Bones, it ends in a broad, strong Tendon, which, together with that of the *Gastrocnemii*, forms what is call'd *Tendo Achillis*. This strong Tendon contracts a little in its Passage to the *Os Calcis*, and then expanding a little, it is inserted obliquely in the Backside of the Bone, all the Way to the Tuberosity. The outer, or posterior Fibres of this large Tendon, are the longest; the inner, or anterior Fibres, shortest; and the rest are longer or shorter, in Proportion to their Nearness to these two Portions.

The fleshy Body of the *Soleus* seems to consist of two Planes of Fibres at least, that on the Backside of the Muscle being the most simple; and the other, or that next the Bone, being penniform.

This Muscle, and the two *Gastrocnemii*, form what Anatomists call a true Triceps.

The *Gastrocnemii* and *Soleus* make a Kind of Triceps, and by their common Tendon extend the Foot, and keep it extended against the strongest Resistance. It is by their Means that we raise the whole Body, even with an additional Burthen, when we stand a Tip-toes, and that we walk, run, and jump. The Length of the posterior Portion of the *Os Calcis* gives them a great Advantage in acting, by removing the Line of their Direction from the Axis of Motion.

The Motions of the Foot perform'd by these Muscles, may be referred to the first two Kinds of Levers. When we stand a Tip-toes, the Foot represents a Lever of the second Kind, the Fulcrum being then at one End, the Power at the other, and the Weight between them: And we have a Lever of the first Kind, when the Leg being fixed, we endeavour to overcome any moveable Resistance with the Toes, or whenever we move the Foot held off the Ground.

These Muscles not only extend the Foot on the Leg, but, also, the Leg on the Foot, as appears evidently when after a moderate Genuflexion, we raise our Bodies; for then the Foot remains fix'd, while these Muscles extend the Leg; and it is here to be observed, that this Genuflexion is not made by the Action of any Flexors, but only by the Relaxation of the proper Extensors.

The *Gastrocnemii*, by their Insertion in the *Os Femoris*, may in great Efforts move the Leg on the Thigh, and the Thigh on the Leg, as Assistants to the *Biceps*, *Semi-Membranosus*, *Semi-Tendinosus*, *Gracilis Internus*, and *Sartorius*. In these Motions the superior Extremities of the *Gastrocnemii* cross under the lower Extremities of the Muscles last named. The fleshy Fibres of the *Gastrocnemii* are very long, and there is a great Distance between their two Insertions; and,

on this Account, these Muscles are better fitted for large Degrees of Motion than for Strength.

The *Soleus*, by the Multitude of its fleshy Fibres, and its penniform Structure, is more proper for strong than large Motions, and seems principally to sustain the *Gastrocnemii* in the Motions begun by them. The tendinous Portions of this Muscle, and of the *Gastrocnemii*, though they form a strong Tendon altogether, seem nevertheless to slide a little upon each other in the different Flexions and Extensions of the Foot. *Winslow's Anatomy.*

SOLIDAGO. A Name for the *Doria*; *quæ Jacobæa*; *Alpina*; *foliis longioribus*; *ferratis.*

SOLIUM. The Bathing Vessel in the ancient Baths.

SOLIUM is, also, a Name for one Species of flat Worm, for there are two Sorts of *Tenias*; one properly so call'd, that neither moves, nor has any form'd Head; the other call'd *Solium*, from its being the only one of its Species in the Body, which moves, and has a very regular round Head, resembling a Wart.

SOLOMA. Silver; that is, Silver of the Chymists. *Rulandus.*

SOLSEQUIUM. Sulphur.

SOLVAS. An obscure Word in *Paracelsus*, importing something which dissolves Bole, but does not explain what.

SOLUTIO. Solution. This imports the Termination of a Disease; an Inflammation, for Example, by Resolution.

Chymical Solution is explain'd under the Article **MENSTRUUM**. Solution of the Belly, is rendering it laxative.

It has been a constant and received Opinion among the Professors of the Art of Chymistry, and still prevails among them, that the Solution of Bodies, which is of excellent Use in Chymistry, is effected principally by Means of the Pores of those Bodies. Solid Bodies, they say, on account of the different Structure and Connexion of the Parts of which they consist, are furnished with Variety of Pores and Passages, through which the smallest Particles of the Menstruum find an Entrance, and, by insinuating themselves into the Interstices, dissolve the Connexion. These Pores, they imagine to be of different Magnitude and Figure, and to belong to fluid as well as solid Bodies, and to admit none but congruous Particles, like to those of which the Dissolvent is composed; whence they conclude, that different Bodies require different Menstruums.

But, however subtle and ingenious that Opinion may appear, in point of Invention, or how specious soever in the Eye of Reason, we doubt not, upon a thorough Examination and deeper Insight into the Matter, to shew, that it is built upon a very weak and slippery Foundation, which we demonstrate in the following Manner.

First, then, we freely grant, that in all hard and compact Bodies there are some Pores or Cavities, not of the same, but different Figures, Part of which admit the Aereo-ethereal Fluid, while into others, from whom that Fluid is expelled or excluded, some other convenient aqueous or spirituous Liquid may find an Entrance. This Difference of Pores in Bodies is, also, the Cause of their specific Gravity, or that some are heavier or lighter than others. But, however, we ought to understand, that if the Pores or Interstices between the Parts of solid Bodies are possessed by Fluids, we are not so much to regard the Figure of those Pores, as their Diameter, whether it be larger or narrower; for it is known from Mechanics, that a Fluid enters Pores, of whatever Figure they are, if it be so qualified as to meet with no Obstruction on account of their Diameter. And, therefore, though we do not absolutely deny, that there are such Pores in solid Bodies, yet no Reason obliges us to grant the same in Fluids. For, though in solid Bodies the Parts more firmly cohere, and are at Rest among themselves; yet it is otherwise in Fluids whose Parts are agitated by the Interfluent Ether with a constant and continual Motion, and are perpetually changing their Situation. Since, therefore, it is impossible so much as to conceive any constant Disposition of Pores in a Fluid, it is evident, that the different Arrangement of their Parts has nothing to do in Solutions; for when a Liquid occupies the Pores of a Solid, it leaves it in a more light and subtile fluid State than when it enter'd. But the Case is otherwise in Fluids, for these, when the Ether is expelled, which impels Fluids to continual Motion, are deprived of all Motion, and necessarily concrete into a Solid. Thus Water, when the subtile ethereal Matter is expressed by the incumbent very cold Air, congeals into a hard and compact Substance. To this it must be added, that Fluids, when they admit a large Quantity of Ether, affect a large Space, as it happens when they are heated, whereas Solids are not affected in the same Manner.

Besides, since Fire liquifies Metals and Stones, Mercury softens and amalgamates Metal, one Ounce of Acid dis-

solves the like Quantity of alkaline Salt, and one Ounce of highly rectify'd Spirit of Wine receives one Ounce of pure distill'd Oil, for instance, Oil of Cloves, of Lavender, or Camphire, I see not how this Reception of Solids into the Pores of a Fluid can any way take Place; for the Pores of the dissolvent Menstruum cannot be greater than, or equal to, the whole Body.

Nor can we by any Means comprehend how Copper put into a Solution of Silver, or Iron into a Solution of Copper, can cause a Precipitation in these Solutions, because these solid Bodies can by no Means enter the Pores of the Menstruum: Nor can it be explain'd from this Hypothesis why highly rectify'd Spirit of Wine pour'd on saturated Spirit of Sal Ammoniac should precipitate its volatile Salt, or why Water should precipitate a Solution of Camphire in Spirit of Wine.

Some there are who press'd with these Difficulties, take another Method of Explication, and alledge the Similitude of Parts between the Dissolvent and the Body to be dissolved. But neither will this Hypothesis put the Matter beyond all Doubt, since we observe that heterogeneous, or quite dissimilar Bodies easily unite with one another, and dissolve one another more readily than homogeneous Bodies use to do; for every one knows, that all Acids very readily dissolve Salt, or alkaline Bodies; that Water admits Earth, as we see, for Instance, in a Decoction of Quick-lime; that insipid Water receives all Kinds of Salts, and that alkaline Menstruums are well fitted for dissolving Sulphurs.

Nothing, then, remains but to search after some other, and these true and genuine, Causes of Solutions, which are affected by Menstruums. And the most probable Account which can be given of the Matter and the most easy to be conceived seems to us to be, that we should suppose the Fluid, in putting the Parts of the Dissolvent in Motion, to hurry them along with itself in the same Motion of Fluidity, and by this Means unite itself with them. Thus we see that Water puts all Kinds of Salts into a like Motion of Fluidity, and so unites itself.

Moreover, all distilled Oils, all resinous Balsamics, are dissolved by a sulphureous, highly rectify'd Spirit of Wine, and by that Means are incorporated together. And Solutions are generally made when the active Principle, especially the saline, intimately unites itself with the Dissolvent in such a Manner, that both together constitute a third, that is, a neutral Salt; which done, this very neutral Salt, by an easy Compliance with the Motion of the Water, is itself readily dissolved. Thus menstuous Acids, which are nothing but a Solution of an acid Salt into a Phlegm, while they dissolve alkaline Substances, whether earthy or saline, pass into a neutral Salt, which, after the Manner of all Salts, liquifies into a Phlegm. In the same Manner Metals, when dissolved by menstuous Acids, as Aqua-Fortis, or Aqua-Regis, while these acid Salts associate with the metalline Particles, pass into a third Kind of Salt, which appears after an Evaporation of the Menstruum, and is readily dissolved in the Water contained in the Menstruum.

From all these Experiments it appears, that a Menstruum which cannot be united with the Dissolvent, can effect no Solution. Thus highly rectify'd Spirit of Wine cannot be united with common Salt, because the inflammable Sulphur refuses a Conjunction with this Kind of Salt; and hence it is that common Salt, as well as other Salts, cannot be dissolv'd by this highly rectify'd Spirit. For a like Reason, oleous and alkaline Menstruums dissolve not Metals, because neither the Sal Alkali, nor the Oil, can insinuate themselves into an intimate Union of the Parts which constitute the Metals, and not at all because they are contrary to one another in their Pores and the Figure of their Parts; on the contrary, highly rectify'd Spirit of Wine very readily unites with distilled Oils and Resins, which are only a more subtile Kind of Oil, coagulated by an Acid, because they meet together in a friendly Manner, and thus Water with Water, and Water with Ice, readily mix together.

As, therefore, a Solution is effected by an Union of the Dissolvent and the Thing to be dissolved, so when this Union is again destroyed, and the Dissolvent forsakes the Thing dissolved, or one of them is separated from another, the Fluidity itself ceases, and the dissolved Substance is separated from the Menstruum, which Action the Chymists call *Precipitation*. It is a great Error, therefore, to imagine that Precipitation happens because the Pores of the Menstruum, which contained the Thing dissolved, are occupy'd by some other Matter, whence there must of necessity be an Expulsion of the Parts of the dissolved Body from the Pores of the Menstruum. It might be more truly said, that Precipitation is no other than a new Solution, or a new Union of the Menstruum with another Body, I mean while the precipi-

tating Matter unites more closely with that Menstruum with which the Body was before united.

The Reason why the Menstruum, with which the Body was before united, applies itself to a new and even precipitating Body, and unites itself with it, seems to be, that the Menstruum, more readily and freely incorporates with the Precipitant, than with the former Body, on Account of the greater Agreement of Parts, which is a Point that deserves Confirmation by Experiments. Thus Copper put in a Solution of Silver made by Aqua-fortis, causes it to subside; and Iron in a Solution of Copper, made in the like Manner by Aqua-fortis, soon precipitates the Copper; and Zinc, whenever added to a Solution of Iron by Aqua-fortis, immediately causes the Iron to subside to the Bottom; and if you have a Mind again to precipitate the Zinc, it may very well be done by throwing in some Salt of Tartar.

The Reason to be given for these different Precipitations is as follows: Because the acid Salt of the Nitre, which is in the Aqua-fortis, is better qualified to associate with the Salt of Tartar than with the Zinc, hence it lets the Zinc subside; and because the acid Salt of the Nitre will much more easily incorporate with Zinc than with Iron, hence the Iron is precipitated; and again, because the same acid Salt more readily unites with Iron than Copper, therefore Iron put into a Solution of Copper, causes it to sink to the Bottom; and thus it is in other Instances. And it is besides worth our Observation, that an Acid more violently precipitates such Bodies, which have been dissolved in a more subtle Acid. Thus Spirit of Vitriol, poured on Solutions of alkaline, earthy Bodies, such as Mother of Pearl, Corals, Crabs Eyes, and Egg-shells, dissolved in Vinegar, suddenly precipitates them to the Bottom. The Reason is obvious, and is because a stronger Acid more intimately unites with terrestrial alkaline Particles, than does a milder one, whence this latter being left to itself, very speedily sinks and subsides. And therefore, whenever Spirit of Vitriol is poured on Sugar of Lead, which is a Salt prepared with Lead and distilled Vinegar, there happens in like Manner a Precipitation of the Lead; but when these are distilled, then the Spirit of the distilled Vinegar, and not the Spirit of Vitriol, ascends and is distilled, the Spirit of Vitriol being left in the Bottom, united with the saturnine Body; and the same Thing happens in those other Solutions of alkaline Substances made with Vinegar, which have been already mentioned.

Moreover, Water precipitates Solutions of resinous Bodies made with highly rectified Spirit of Wine, not because this Spirit enters the Pores of the Water, but because it more easily and freely unites with Water than with Resins. The same highly rectified Spirit of Wine precipitates the volatile Salt from the Spirit of Sal-ammoniac, which is prepared with Water. In short, a Solution of Salt of Tartar precipitates a Solution of Pearls, or of Crabs Eyes made with Vinegar, because the Salt of Tartar more easily and readily unites with these Acids than with these earthy Bodies; whence also an Addition of Crabs Eyes to the Solution of Salt of Tartar will not destroy the Union. It is a known Experiment also, that common Salt cast into a Solution of Silver by Aqua-fortis, precipitates it into a white Magistery, for scarce any other Reason, than that the highly penetrating Acid of the Nitre incorporates with the Earth of the common Salt, which is of an alkaline Nature, abandoning the Silver with which it was united.

From all these Experiments which have been produced, it abundantly appears that *Syncretism* and *Diacrisis*, or *Union* and *Separation*, are the greatest Instruments and most simple Operations of Nature, for the performing so many and so great Effects, since neither Nutrition, Generation, Virtue, Accretion, Mutation of Form or Texture, Solution nor Coagulation, can be understood or explained without them. And hence we may be convinced, also, that the Doctrines of Pores and Particles of various Figures to which the Chymists and Naturalists betake themselves for Refuge, when pressed with Difficulties, is of no Service, as having no good Foundation in the Nature of the Thing itself; and that many and great Phenomena of Nature may far more easily, and with much less Perplexity, be explained and illustrated by the two fundamental Points of *Union* and *Separation*. F. Hoffman, *Observ. Physico-Chym.*

SOLUTIVA. Laxatives.

SOMNAMBULO. A Person who walks in his Sleep.

SOMNIFERA. Medicines which induce Sleep.

SOMNIUM. A Dream or Vision. See **INSOMNIUM**.

Pythagoras taught that the Air was inhabited by the Souls of Demons or Heroes, and that these Beings send to Mankind Dreams, Signs and Diseases, and also to Beasts.

The Ancients were strongly possessed with an Opinion,

that their Gods communicated to the Sick in Dreams, Remedies for their Distempers.

Galen says, that once, when he had a fixed Pain in the Part where the Diaphragm is attach'd to the Liver, he dreamed that *Æsculapius* advised him to open the Artery betwixt the Thumb and the second Finger of the Right Hand; which he did, and found himself immediately cured.

Plutarch Synop. 9. 10. examines into the Reasons why autumnal Dreams are more uncertain than others.

Phayllus, General of the *Phocians*, in the War betwixt them and the *Thebans*, dreamed that he was like the Statue of a consumptive Person, dedicated by *Hippocrates* at *Delphi*, and soon after died consumptive.

SOMNOLENTIA. Sleepiness. See **LETHARGUS**.

SOMNUS. Sleep. See **OPIMUM**; and **LETHARGUS**.

All Bodies, by their Actions upon one another, and by the Action of the circumambient Bodies, are liable to be impaired and wasted; and all animal Bodies, from an active and Self-moving Principle within them, as well as from the Rubs of Bodies without them, are constantly throwing off some of their superfluous and decayed Parts; so that animal Bodies are in a perpetual Flux. To restore this Decay and Wasting of animal Bodies, Nature has wisely made alternate Periods of Labour and Rest, Sleeping and Watching, necessary to our Being; the one for the active Employments of Life, to provide for and take in the Materials of our Nourishment; the other to apply those Materials to the proper wasted Parts, and to supply the Expences of Living. And it seems as improper, in the Order of Nature, to disturb the animal Functions in the Time of Sleep, by any other Employment, than that of the secondary Concoctions (as they are called) that is, the applying the Nourishment to the decayed Parts, to recruit the Blood, perfect the Secretions, and to lay up plenty of Spirits, or (to speak more philosophically) to restore the weakened Tone of nervous Fibres; that is, in short, to restore the Decays of Watching and Action: This, I say, is as improper, as it would be (were it possible) to eat or drink, or make Provision for the Necessities of Life, in the Time of Sleeping. Hence is evident, the Absurdity of heavy, various and luxurious Suppers, or of going to Rest till many Hours after such a Meal, which must otherwise break in upon the Order of Nature, and the due and appointed Times of Sleeping and Watching. Wherefore, I advise the *Valétudinary*, the *Studious*, and the *Contemplative*, either to make no Suppers, or only of vegetable Food; and to take a due Time for Watching after them.

There is nothing more certain, than that (abstracting from acute Cases) our Sleep is sound, sweet and refreshing, according as the alimentary Organs are easy, quiet, and clean. If any one, not suffering under any Disease, is disturbed in his Sleep, 'tis certain his Stomach is filled with Food or Crudities; or his Guts filled with Wind, Choler, or superfluous Chyle: And those restless Nights, and the Difficulty of going to sleep, which are generally ascribed to the Vapours, are entirely owing to these Causes, tho' they be not so strong as to become sensible; for then Pain is added to Watching, and they are felt. And upon Complaints of such restless Nights, I never once failed, upon Enquiry, of finding the true Cause in the Diet of the preceding Day, or of some few Days before; and constantly have discovered, that some Error in Eating and Drinking, either in Quantity or Quality, has produced them. I have been astonished to see hypochondriacal and hysterical People, restless all Night, tossing and tumbling till towards the Morning, then dropping asleep till late Hours, awake heavy, oppressed and unrefreshed, complain of being hag-ridden, tired and wearied, as if they had been whipp'd, spurred, lashed, and beaten, through all the Watches of the Night; rise with foul Mouths and white Tongues, Belchings, Yawnings, Coughing, Spitting, or Reaching and Heaving, without Appetite, Spirits or Life, all the Day-time, begin to live and breathe, become chearful and hungry, about ten, eleven, or twelve o'Clock at Night, eat a hearty, various, and luxurious Supper, drink a Cheeruping Cup of the best, become as merry as Crickets, and long to sit up later, at last, tumble to bed, and repeat the same Farce over again. The Reason of all this Complaint is the Load on the Stomach, that will not suffer them to rest till it is got off. The sharp and crude Humours twitching and twinging the nervous Fibres, and Coats of the Bowels, become like so many Needles and Pins constantly running through them, tho' not always with sensible Pain; the unconcocted Chyle stopping or circulating slowly, first in the Bowels, then in the smallest Vessels, begets these Convulsions, Flatus, Night-mares, and Oppressions of Spirits. So that the secondary Digestions are not over till next Evening, (hence their Want of Appetite :) And when these are finished, their Stomachs come, and their Spirits

Spirits flow; and thus the perpetual Round is carried on. Did they but follow the Dictates of Nature, go to Bed for some Days with a light Vegetable, or no Supper at all, and bear the Inconveniencies thence arising, their Appetites would come in due Season, and they would quickly find the Truth of the Aphorism of the *Schola Salernitana*.

Somnus ut fit levis, fit tibi cæna brevis.

The Seasons for Sleeping and Watchings, which Nature seems to point out to us, at least in these our Climates near the Tropics, are the Vicissitudes of Day and Night. Those Damps, Vapours and Exhalations, that are drawn up into the higher Regions, and are so rarefied by the Heat and Action of the Sun, as to become innocent, or very weak in the Day-time, are condensed, sink low, near the Surface of the Earth, and are perpetually dropping down in the Night-season, and consequently must be injurious to these tender Persons, that unnaturally watch in that Season, and must necessarily obstruct the Perspiration, which the Activity of Watching, and the Motion of Labour promotes. Our Bodies suck and draw into them the good and bad Qualities of the circumambient Air, through the Mouths of all the perspiratory Ducts of the Skin. And were we to view an animal Body with a proper Glass, it would appear with an Atmosphere quite round it, like the Steam of a Boiling Pot. Now we may easily conceive what Injury a Constitution may receive, not only by stopping such a perpetual Discharge of Superfluities, but also by forcing into the Habit, by the Air's Weight and Pressure, those noxious Fumes and Vapours, that are perpetually falling near the Surface of the Earth in the Night-time. Your true Topers are so sensible of this, that, by Observation, they have gathered it to be more safe for their Health, and better for prolonging their Lives, to get drunk betimes and go to Bed, than to sit up and be sober.

On the contrary, the Heat of the Sun in the Day-time, by its Action on human Bodies, the very Light, and free Air, and the Motions of Things about us, disturbing the Quiet of the Air, must necessarily disorder the equable Course of the Perspiration, the Tenor of the secondary Concoctions, and the Tranquillity of the Spirits, so necessary to Rest and Quiet. So that nothing seems more directly pointed out to us by Nature, than the Day for Labour, and the Night for Rest: And this without taking in the Consideration of the Necessity of the Sun's Light for the Ends of Labour, and providing the Necessaries of Life. Some Animals that are exceeding tender, are directed by Nature to alternate Periods of Watching and Rest, not twice in twenty four Hours, but twice in the Year, as Summer and Winter; such as Swallows, Bats, and many Sorts of Insects, who sleep all the Winter, and watch all the Summer. So consistent is Nature, in appointing the brightest and most enlightened Parts of our Lives for Action, and the darkest and most inclement for Rest. Not but that robust Constitutions (as well as Animals fitted by Nature for different Ways of Living) may, by Custom, get the better of these natural Appointments: But I write for the Valetudinary, the Studious and the Contemplative.

I advise all such, if they would preserve their Health, and lengthen out their Days, to avoid, as much as is possible, Evening Dews, Nocturnal Studies, and unseasonable Watching; in Summer to go to Bed with the Sun, and in Winter to rise, at least, by Break of Day. Those who live temperately, will necessarily sleep but little: But to recompense that, their Sleep will be much more found, refreshing, and fruitful of Cheerfulness and free Spirits, than that of those who live more freely. For, as I have before said, the Quantity of Sleep will always be in Proportion to the Quantity of Eating and Drinking. Valetudinary, Studious, and Contemplative People, ought to go to Bed by eight, nine, or ten, at farthest; and rise by four, five, or six, by which they will have eight Hours a-bed, and that is sufficient for any Person, not under an acute, or the sharp Fits of a chronical Distemper.

Nothing can be more prejudicial to tender Constitutions, studious and contemplative Persons, than lying long a-bed, or lolling and soaking in Sheets, any Time after one is distinctly awake, or has slept a due and reasonable Time. It necessarily thickens the Juices, enervates the Solids, and weakens the Constitution. A free open Air is a Kind of a cold Bath, especially after rising out of a warm Bed; and consequently, makes the Circulation brisker and more complete, and braces up the Solids, which lying a-bed dissolves and soaks in Moisture. The erect Posture, and the Activity of Watching, make the Perspiration more plentiful, and the gross Evacuations more readily thrown off. This is evident from the Appetite and Hunger those that rise early feel

beyond that which they get by lying long a-bed. Add to all these the Influence of the fresh, benign, Morning Air, the retreating of all the noxious Damps and Vapours of the Night, together with the Clouds and Heaviness that are thrown upon the Brain from Sleep; and lastly, that Cheerfulness and Alacrity which is felt by the Approach or Presence of that glorious Luminary the Sun, which adds a new Force to the Heart, and a Spur to the Spirits.

All Nations and Ages have agreed, that the Morning Season is the proper Time for speculative Studies, and those Employments that most require the Faculties of the Mind. For then the Stock of the Spirits is undiminished, and in its greatest Plenty, the Head is clear and serene, the Passions are quieted and forgot, the Anxiety and Inquietude that the Digestions beget in the nervous System, in the most tender Constitutions, and the Hurry the Spirits are under after the great Meal, are settled and wrought off. I should advise, therefore, those who are of a weak relaxed State of Nerves, who are subject to hypochondriacal or hysterical Disorders, whose Professions lead them to much Use of their intellectual Faculties, or who would indulge speculative Studies, to go early to Bed, and to rise betimes, to employ their Morning Hours in these Exercises till eleven o'Clock, then to take some agreeable Breakfast of vegetable Food; to go on with their Studies and Professions till three, four, or five, as their Spirits will hold out, and then to take their great Meal of Animal Food; all the rest of the Day to throw off all Study and Thought, divert themselves agreeably in some innocent Amusement, with some gentle bodily Exercise; and as soon as the Digestion is over, to require and provide for going to Bed, without any further Supplies, except it be a Glass of fair Water, or warm Sack-Whey. But the Aged and Sickly must go sooner to Bed and lie longer, because Age and Sickness break Rest, and the stiffened and hardened Limbs of the Ancient become more pliant and relaxed by much Sleep, a supine Posture, and the Warmth of the Bed.

RULES FOR HEALTH AND LONG LIFE, DRAWN FROM SLEEP AND WATCHING.

1. The Valetudinary, the Sedentary, and the Studious, should eat very light, or no Suppers; if any it ought to be vegetable Food; neither ought they to go soon to Bed, after any Supper whatsoever.
2. Going to Bed on a full Stomach, and Wind and Crudities somewhere in the alimentary Passages, is the Cause of the want of due Rest, which is found and refreshing always in Proportion to the Emptiness and Cleanness of these Passages; and their Vacation from their proper Office of Digestion; and this is the Cause of the Want of kindly and refreshing Rest, in hypochondriacal and hysterical People.
3. Watching by Night, and Sleeping by Day, is of the most pernicious Consequence to Health and long Life, and plainly contrary to the Indications of Nature and the Constitutions of our Bodies.
4. The Valetudinary, Sedentary, and Studious, ought carefully to avoid Evening Dews, Nocturnal Studies, and uneasy Watching, go to Bed by eight, nine, or ten, and rise proportionally by four, five, or six, unless actually under a Fit of Sickness.
5. Nothing is more prejudicial to tender Constitutions, than lying long a-bed, indulging a lethargic and drowsy Sleep, or lolling or loitering awake, as appears by their Heaviness, and Want of Appetite upon doing so; and their good Stomachs, Cheerfulness, and Freedom of Spirits, when they rise early.

Chryse on Health.
In another Treatise the above-quoted Author thus speaks with respect to Sleep.

Sleep I conceive to be caused by the Disability and Incapacity of the bodily Organs to continue and perpetuate the active, rational and voluntary Functions. Without Repair, Nutrition, and Winding up, they grow languid and unelastic. When by Labour, or the common Expence of Living, the Organs are relaxed and debilitated, there must be an alternate Cessation to repair and refit them, which is called Sleep; and accordingly we find the animal Body shortened and compressed by its own Weight, by Action, and by the Loss of its Spring against Night, and lengthened and extended again in the Morning. What hinders Sleep is the continual Action of an internal Fluid, Wind or Flammence, acting on the internal Membranes (of which the Bowels principally consist) pricking and stimulating them, and forcing them into Action; and by the Recoil or elastic Sharpness of this internal *Aura* or *Flatus*, producing wild Cogitation, or irregular intellectual Operations. Hence it is that the Body is restless; and often there is an Endeavour to gulp, expel and throw up this Wind;

Wind; that Medicines that force the Perspiration, as Opates, Eastern Gums, animal Salts and Spirits, Aromatics, Cordials, and Diaphoretics, procure Sleep; and a Dose of the Gum Pills, with an Aloetic, will give a good Night, as it drives out the perspirable Matter every Way; and Cyder, and any flatulent Food (as green Pease) will hinder it. Dreaming is but partial sleeping, for Sleep admits of all the Degrees of Quantity there are between sound undreaming Sleep and perfect healthy Waking, all the Degrees and Terms that are between a given Quantity and nothing; and accordingly Labour, Fatigue, light Food, gentle Evacuations of all Kinds, will procure, in some Degree, undreaming Sleep; and the more rank, high, and poignant the Aliment, the more painful and terrifying will be our Dreams; as, on the other hand, the more mild, soft and light our Food is, the more pleasant and gentle will be our Dreams, if otherwise healthy. And old Persons, weak and sickly Constitutions, and People under acute and chronical Distempers, especially those that are called nervous and cephalic, have the wildest, most inconsistent and painful Dreams, and the most imperfect Sleep, and sometimes no Sleep at all, which is one of their greatest Miseries. I should philosophically define Sleep, a Disability or Incapacity of the material Organs, from Exinanition, Use and Expence, to continue easily much longer the intellectual Functions and voluntary Motions, without a new Repair and Winding up, in the same Manner as Hunger is caused; and Dreaming to be only partial and imperfect Waking, by a perpetual Irritation from Flatulence and obstructed Perspiration, on the internal Nerves and Membranes, or from Pain; and Waking to be the perfect and pleasant Pliancy of the intellectual and animal Organs, to obey the Impulse of the self-motive, self-active Spirit; and that in this immaterial Agent there is a lower, and more ordinary and weaker Effect and Energy (or a contractile and expansive Energy) by which the animal Functions are perpetuated without Interruption; and a higher and more intense and voluntary Degree of Agency, by which Waking, and the intellectual Operations are performed; and it is this, that in a sound Sleep, and in a Deliquium, is suspended, and in Death both, without a new Vehicle.

OF PROGNOSTICS FROM SLEEP IN DISEASES.

All Sleep from which the Patient awakes not at all, or not without Difficulty, but labours under an extraordinary Drowsiness, or Propension to Sleep, is of a lethargic Kind, of which Nature is a *Coma* or *Cataphora*, a *Carus*, a *Catoche* or *Catalepsis*, and *Veternus* or *Lethargy*. For our Instruction in forming Prognostics from these disorderly Kinds of Sleep, as well as from what is natural, we are to premise some Things which may be of Use to us in acquiring a just Knowledge of those soporiferous Affections. And here, first, we shall divide Sleep into natural and unnatural. Natural Sleep, according to the *Definitiones Medicæ* ascribed to *Galen*, is a Retreat, or Recourse of the Soul from its Boundaries to its Original, according to the Course of Nature; or it is a Rest and Cessation from animal Actions. In this Sleep, the natural Heat, which was fatigued and exhausted with Labour and Watching, retires into the Viscera, and there receiving fresh Recruits from the copious Humid residing in those Parts, breaks forth with renewed Force, and rouses the Subject from Sleep. In Conformity to this Sentiment, we are told by *Hippocrates*, 6 *Epid. Sect. 4. Aph. 12.* "That in Watching the external Parts are evidently hotter, and the internal colder; but that the Reverse happens in Sleep." And *Sect. 5. Aph. 28.* he observes, "That in Sleep the Blood retires more to the inward Parts." *Galen* makes the same Observation in his Comment, when he says, "That a Person, while awake, has his exterior Parts hottest, and the interior coldest, and that the Reverse happens to him in Sleep." And a little after, in Confirmation of the Judgment of *Hippocrates*, he adds, that in Sleep the Blood, and with it the natural Heat, retires to the inward Parts; and, in Waking, is diffused on the Parts towards the Superficies. By this inward Recession of the natural Heat, and the consequent Refrigeration of the exterior Parts, all the Actions and Operations of the Senses are suppressed and lie dormant, the Passages of the Nerves through which the Heat is diffused outwardly, and the animal Faculties exert themselves, being obstructed by the Cold, whence, as *Galen* observes, there follows a Cessation of all the Actions of the Soul. This, then, is natural Sleep, which, as we said, is occasioned by a Retirement of the natural Heat, exhausted by Watching, to the Viscera, in order to be recruited. Hence it is that Sleep becomes customary after Meals, and, what is, also, a particular Cause of Sleep, that at such a Time a Mul-

titude of gross and humid Vapours ascending to the Head, obstruct the Passages of the Brain, by which Means the Heat is repressed and inclosed within, and rendered incapable of diffusing itself, in order to awaken the Subject, before it has accomplished an Extenuation and Excussion of those Vapours. We conclude, then, that natural Sleep is occasioned either by a Retirement of the natural Heat, dried up and exhausted by Watching, and standing in Want of the Humid to the Viscera, in order to be recruited, or from Vapours arising from the Food, and obstructing the Passages of the Brain. This last Sleep, indeed, is by some esteemed a Kind of unnatural Sleep, and it is plainly so, and so much the more, when those Vapours are more copious, as we may observe in drunken Persons, who sleep long and profoundly, from an Oppletion of the Brain with Vapours, generated by an excessive Quantity of Wine. With Relation to this Subject, we are told by *Hippocrates*, 5 *Aph. 5.* "That if a drunken Person loses his Voice on a sudden, he dies in Convulsions, unless he be seized with a Fever, or recovers his Voice at the Time when a Crapula generally terminates;" for, in such a Case, if the Wine and its Vapours be not digested and diffused by the Heat, they induce a Suffocation. Hence he had Reason to intimate, that Persons in such a Condition are relieved by the Accession of a Fever, because the febrile Heat, which is far more efficacious than the natural, digests the Vapours of the Wine.

This, then, is one of the unnatural Kinds of Sleep which Physicians call by various Names, according to the Diversity of their Causes, tho' they all come under the general Appellation of *Lethargic*. This Affection is incapable of exerting itself outwardly, but remains latent and confined within, either on Account of the Multitude of Humidities which oppress the Brain, or the Cold alone, or on both Accounts, or from mere Weakness.

That Kind of unnatural Sleep which affects the Patient in a Lethargy, is properly called *veternus*; another Kind is what the *Greeks* call *καρὺς*, a *Carus*, and the *Arabians* *Subeth*. Besides, there are other Kinds, which take the Names of *Catoche* or *Catalepsis*, or, as it is generally termed *Congelatio*, "a Congelation," and a *Coma* or *Cataphora*; all these are Species of unnatural Sleep, whose nature is to be examined, in order to enable us to form Predictions from them.

First, then, we will suppose that all who are affected with an unnatural Sleep, are said to be *comatous*, or *veternus* (*Lethargic*). *Galen* in 3 *Epid. Com. 1. T. 7.* calls them *comatous*, who have a strong Inclination or a Propension to Sleep. He calls it a *Propension to Sleep*, when the Patients are unable to watch, or remain with their Eyes open, but keep them winking or twinkling. And in his Comment on 2 *Aph. 3.* he calls a *Coma* a long Sleep, from which it is difficult to awake; and this Difficulty of Awakening, is what distinguishes this Affection from a long natural Sleep, as the same Author observes, *Com. in 2. Aph. 1.* where he says, "That many are deceived, who persuade themselves that *comatous* Affections begin with a long Sleep; for we have said enough to convince them, that they cannot be called a *Coma*, before they come in Conjunction with a Difficulty of Awakening, and that a Sleep, which exceeds the natural Bounds in respect of Time, but is not attended with a Difficulty of Awakening, is rightly called, a long Sleep." We bestow therefore the Epithet of *comatous* or *lethargic* on a Sleep from which it is difficult to rouse the Patient, or such a Propension to Sleep, as keeps him with his Eyes not indeed open, but winking, and desiring to shut his Eye-lids in Hopes of Sleeping. [See the Article *COMA*.]

The Species of a *lethargic* or *veternus* Sleep, are distinguished, in that some imply no more than a *Propension to Sleep*, of which Nature are what we call a *Coma*, *Cataphora*, and a *Marcor* (preternatural Drowsiness); others include in their Notion not only a *Propension to Sleep*, but a violent Drowsiness, and an almost invincible Necessity of sleeping, as is observed in a *Lethargy*. Others again import besides, a *Congelatio* or *Deprehensio*, affecting all the Parts of the Body, which Disorder is called by the *Greeks* *Catoche* and *Catalepsis*. And, in the last Place, there are others which, together with a Difficulty of awaking, and an almost invincible Necessity of sleeping, include a Deprivation of all Sense and Motion, as well as Reason, as in that lethargic Affection which the *Greeks* call *Καρος*, and the *Arabians* *Subeth*.

These lethargic Sleeps admit, also, of another Distinction, for some of them are simple and exquisitely such; others mixed with Watchings. In this respect a *Coma* is distinguish'd into what is simply so called, and into what the *Greeks* call *καὶμα ἀγρυπνίας*, "A wakeful *Coma*;" as they, also, call the former, *καὶμα ὕπνου*, "A sleepy *Coma*." Thus we call an Affection compounded of a Lethargy and a Frenzy, by the Name

Name of *Typhmania*, in which the Patients sleep, wake, and are delirious; of such a Disorder are we to understand *Hippocrates*, 3 *Epid. Sect. 3.* where he says, "That of those who laboured under Phrenesies, none was outrageous, as it generally happens in such Cases, but sunk away under the Weight and Oppression of a malignant kind of *Torpor* and *Cataphora*."

Having premised these Things concerning the Differences of a *lethargic Sleep*, we proceed to enquire into the Causes. *Galen*, in 3 *Epid. Com. 1. T. 7.* assigns four Causes of a *Coma* or *Cataphora*. The first is an extraordinary Humectation of the Part which is the Fountain of Sensation, (and in which *Aristotle* has rightly demonstrated that *Sleep* is produced) as it sometimes happens in Drunkenness. The second is only cold, as when it is occasioned from the Use of Narcotics. But this Cold either affects the first Original, or results from a Consumption of the natural Heat by an immoderate flameous Heat; the Consequence of which is mortal. The third Cause consists of a Complication of Heat and Moisture, from whose Concurrence, also, proceed what we call a *Comatous Sleep*. The fourth and last is a Decay of Strength; and this is the Cause of that kind of *Coma* which is observed in dying Persons, who, on account of Weakness, are not able to keep their Eye-lids open; and it is peculiar to Persons in this Circumstance, that after they have shut their Eyes, they take little or no Sleep, but lie waking, and yet have not the Power to lift up their Eye-lids. *Galen*, in 2 *Aph. 3. et de Lec. Affect. Lib. 3. Cap. 3. et de Prasag. ex Pulsibus, Lib. 4. Cap. 8.* and in many other Places, teaches that the proper Sign of Dryness is Wakefulness, of Humidity profound Sleep, and of Coldness Dotage, accompanied, also, with a profound Sleep, as appears from the Use of Narcotics. From a Humidity of the Brain, attended with a Refrigeration, proceeds a *lethargic Sleep*, and the Consequence of a Coldness and Dryness of that Part is a *Catalepsis*, that is, a *Deprehensio* [See that Article] or *Congelatio*, under which Disorder the Patients are not comatous, but keep their Eyes fixed and staring, without ever closing them.

These, then, are all the Causes which *Galen* assigns of simple or exquisite soporiferous Affections; but when these Disorders are of a complicated Nature, as for instance, when a Person under a *Coma* continues waking, and even appears delirious, there must, of Necessity, be a complicated Cause. We have observed, that there is a sleepy and a wakeful *Coma*; the Cause of the first we have already assigned, the other happens, according to *Galen*, on 2 *Aph. 1.* and *Lib. 4. de Prasag. ex Puls. Cap. 8.* when the Brain is oppressed with Heat as well as Humidities, in the same manner as when from a Mixture of hot and pituitous Humours in the Brain, there arises that Affection compounded of a Phrenzy and Lethargy, which the Greeks call *τυφμανια*, *Typhmania*, of which we have spoken before; and supposed to be the Case of those described by *Hippocrates*, 3 *Epid. Sect. 3.* who died under a violent *Cataphora*, after labouring for a long time under a continual *Coma* of the wakeful kind. *Galen*, in his Comment, tells us, that a wakeful *Coma* proceeds from a Putrefaction of cold Humours in the Brain; for a *Coma* proceeds from Humidity; and a Delirium from an Acrimony excited by Putrefaction.

We proceed from the Causes of the various kinds of *Sleep* to the *Prognostics* which may be drawn from them, beginning with the Natural. Now as all unnatural *Sleep* is bad, so, on the other hand, all natural *Sleep* is good and beneficial; since, as *Galen* says, *Com. in 6 Epid. Sect. 4. T. 12.* it concocts the Humours, by virtue of the Heat retiring to the inward Parts; and, as he tells us, *de Caus. Puls. Lib. 3. Cap. 9.* by the Increase of the internal Heat, the Concoctions in the Veins and Arteries, and in the whole Animal, are highly promoted. For this Reason *Sleep* is to be avoided in the Beginning of internal Inflammations, as attracting the Matter to the inward Parts and Viscera; unless, as the same Author observes, *Com. in 4 Aph. 67.* it may be thought to prove more beneficial by concocting the Humours, than pernicious on that other Account. *Sleep* is beneficial in the Decline of a Disease, otherwise it proves mortal, as may be inferred from *Galen*, *Com. in 2 Aph. 2.* *Sleep* is known to be good and salutary, by its mitigating the Inflammation, Fever, Pain, or Delirium, which it effects whenever it concocts the morbid Matter. To this Purpose is that of *Hippocrates*, 2 *Aph.* "Sleep which increases the Pain and Uneasiness in a Disease, is mortal; but Sleep which gives some Relief is not mortal;" Nay, is rather good and serviceable in the Decline of Inflammations, Pains and Fevers; and, in short, is always salutary, as indicating a Concoction and Digestion of the Humours by the Heat, agreeably to that of *Hippocrates* in the second Aphorism of the same Book, where he says, "When *Sleep* composes a Delirium, it is a good Sign." And *Galen*, in his Comment, approves that *Sleep* which mitigates an Inflammation, Fever, Pain and

Delirium. *Sleep* is known to be good, when it appears to be profound and not turbulent; for such *Sleep*, as you read *Coac. 152.* indicates a firm Crisis. But the best kind of *Sleep* is what succeeds long Watching, and which appears to be sweet to the Patient, tho' it be of long Continuance. *Galen*, in 1 *Prorrhetic.* speaks of some who after three or four Days waking, slept a whole Day and Night, and found great Relief from it; such long *Sleep* usually proves of great Benefit to Children, and is commended in them.

We have said enough with respect to the Indications and Prognostics to be drawn from natural *Sleep*, and proceed to treat of the unnatural kinds of *Sleep*. And first we read, *Coac. 178. τὸ κατὰ φύσιν πρὸς τὴν κακίαν*, "A carous Disposition is on all accounts bad." For tho' in drunken Persons, as some say, *Sleep* is neither to be absolutely commended nor condemned, yet several have been known, who after a Day and Nights profound Sleep under a Debauch, have never awaked. Very justly, therefore, was it pronounced by *Hippocrates*, of such Persons, 5 *Aph. 5.* that if they be suddenly seized with an Aphony, they die in Convulsions, unless relieved by a Fever, or recover their Voice at the usual Time when a *Crapula* is solved.

But can there be any good Indication produced from comatous Sleeps? Most certainly, since they are frequently Fore-runners of such Crises as are form'd by Hæmorrhages at the Nose, or from the Parotides, the Blood ascending to the Head. But then this favourable Judgment must be confirm'd by Signs of Concoction in the Excrements, and by other critical Signs; with relation to which it is said, 1 *Prorrhetic. 168.* "That a *Coma* and Deafness attending a Cephalalgia, end in an Eruption of an Abscess behind the Ears." And *T. 169.* "A Tension of the Hypochondrium, with a *Coma*, Restlessness, and a Cephalalgia, terminate in the Parotides."

With relation to bad kinds of *Sleep*, all which exceed the Bounds of Nature are supposed to be such, according to *Hippocrates*, 2 *Aph. 3.* where he says, "That both *Sleep* and Watching, if they exceed the Bounds of Nature, are bad." But with respect to *Sleep*, we are to have a special Regard to Custom, which is a second Nature. Bad, also, is all *Sleep* from which the Patient receives no Benefit, and much more that *Sleep* which leaves him in a worse State than before, for such, 2 *Aph. 1.* is pronounced mortal; and *Galen*, in his Comment thereon, tells us, "That as *Sleep* in the Decline of a Disease is of great Service, if it relieves the sick; so if it renders his State rather worse, it proves mortal." In the same Place he teaches, that *Sleep* is hurtful in Fevers, when neither the Fever nor its Symptoms are diminished, but increased or exasperated by it; or new Symptoms, as Pains and a Delirium, are excited; or when the Patient, who was delirious before his *Sleep*, perseveres in his Delirium after it; or if the *Sleep* degenerates into a *Coma*, from which it is impossible, or, at least, difficult, to rouse him. All these Aggravations proceed from the Malignity of the Humours, which being left unconcocted by the natural Heat, recur upon the Viscera, and oppress those Parts, as the above-said Author there shews.

A *Coma* in the Beginning of Diseases, as it is usually occasioned by a Redundance of Humidity oppressing and moistening the Brain, can be an Indication of no other than a severe and dangerous Distemper, since it is a manifest Sign; that the Brain begins to be injured by so great a Multitude of Humours, and if attended with some other pernicious Symptoms, proves mortal. Thus it happened in the Case of the Wife of *Olympiades*, 7 *Epid. T. 49.* who on the fifth Day being seized with a *Coma*, was insensible to Endeavours used to rouse her, and recovered not the Use of her Speech, which she had lost, nor was any way relieved, but drew her Breath in a sublime Way, [See PNEUMO.] through her Nostrils; all which concomitant Symptoms portended a fatal Event to the *Coma*. A *Coma*, also, appearing not in the Beginning, but at the Height of a very hot and severe Distemper, is no less fatal than if it were excited by a Decay of Strength. An Instance of this Nature we have in *Hermocrates*, 3 *Epid. Sect. 1. Aeg. 2.* on whom *Galen* thus comments: "The *Coma* which seized *Hermocrates* on the eleventh Day, was induced either by an extraordinary Refrigeration of the Brain, or an Imbecility of the Faculty; but from which soever of them it proceeds, it is extremely pernicious: For we have demonstrated, that Coldnesses consequent on hot and dry Disorders are incurable; but what is occasioned by Weakness, signifies that Death is very near at hand." We have already observed, that this kind of *Coma* may be known by *Galen's* Description of it, *Com. 1. in 3 Epid. T. 7.* "The Patients, he says, after they have shut their Eyes, have little or no Sleep, but lie waking, tho' unable to raise their Eye-lids." Again that *Coma* is no less mortal, as *Galen*, *Com. 1. in Prognost.* in which the Patients lie with

their Eyes staring, and never shut them, a Symptom common to those who are affected with a *Congelatio*, or *Deprehensio*. Of this Sort of *Coma*, *Galen* discourses in the Place above-quoted, in the following manner: "We ought to regard," he says, the Suspicion, as *Galen* says, of the Eyes in Sleep; "for if any Part of the White of the Eye appears when the Eyelids are shut, and the same is not occasioned by a Flux of the Belly, or taking a Medicine, or the usual Custom of the Patient in sleeping, it is a pernicious Sign, and highly destructive, as indicating an Extinction of the Faculty which moves the Eye-lids." An instance to this Purpose we have in the Wife of *Theodorus*, 7 *Epid. T.* 27. of whom *Hippocrates* observes, that "Her Eyes were sunk down, and rested mostly on the lower Eye-lid, with a fixed and stupid Look, and the Whites appearing pale and discoloured, and like those of dead Persons." Such is the Aspect of those who are affected with a *Congelatio*, which Disorder is by the Greeks called *Catache* or *Catochus*, and *Catalepsis*; and the Patients by *Galen* on the *Prorrhetica*, those under a *Catochus*. Of those the Author of the *Prorrhet.* 96. speaks, where he says, that "A *Catochus* and an *Aphony*, attended with an *Eclipsis* (or "an universal Faintness and Feebleness) are pernicious."

But we may be instructed to pass our Judgment upon a *Coma*, not only from the Variety of its Causes, but from other Symptoms which precede, attend, or are consequent upon it. In the first Place, from preceding Signs, as, for instance, when a *Coma* succeeds long Watching, proceeding from a very hot and dry Cause; in this Case it is deadly, as we observed in another Place, where we shewed that a Coldness consequent upon hot and dry Diseases, is mortal. For this reason, all Physicians regard a Lethargy, which succeeds a Phrensy, as a most fatal Disorder. A *Coma*, therefore, which comes upon the Patient after long Watching, except it be critical, is pernicious. In the same manner is a *Coma* to be esteemed good or bad, from the good or bad Signs which accompany it; for with other bad Symptoms it must necessarily be bad and dangerous: But when the Patient lies under a *Coma*, and at the same time continues waking, which indicates no small Degree of Malignity in the Distemper, it forebodes a difficult or dubious Crisis: And thus it is, also, when the *Coma* is attended with a Delirium. According to the Observation of *Hippocrates*, 3 *Epid. Sect. 3. Stat. Pest.* and in particular Instances, whose Cases are related in the same Book, severe and dangerous Symptoms attending a *Coma*, render it a very dangerous Disorder. Thus the Author of 1 *Prorrhet.* 89. "A *Coma* with a Distortion of the Eye is bad." And *Coac.* 180. "They who, in the Beginning of a Disease are comatously affected, and sweat a thin Matter, and discharge a concocted Urine; who labour under a burning Heat, succeeded by Refrigerations without a Crisis, the Heat returning after short Intervals, and who become torpid, comatous and convulsive, are in a dangerous State." And no wonder, since there is a Complication of so many formidable and deadly Symptoms. And in the following Text we read, "that comatous Sleep and extraordinary Refrigerations of the Body are mortal." But this is to be understood of a burning Fever, in which the Patients burn inwardly, and shiver with Cold outwardly; and in such Disorders a *Coma* is always destructive. In the last Place, it may very well be known what a *Coma* portends, from the Signs which appear after it; for it appears to be critical when followed by some good Excretion or Evacuation. But it seems proper to a *Coma* to portend the critical Appearance of the Parotides. Thus we read, *Coac.* 185. "That they who are oppressed with a *Coma*, Nausea, and Pain of the Hypochondria, and spit little and frequently, may expect Abscesses behind the Ears; or perhaps the *Coma* may be attended with a convulsive Disposition." Sometimes a *Coma* is the Forerunner of a Flux of the Belly. Thus we read in the same Treatise, *T.* 182. "That they who labour under a *Coma*, attended with a Lassitude and Deafness, are relieved by a critical Flux of the Belly, discharging itself in red Stools." But the Author of 1 *Prorrhet.* 1. 1. which is repeated, *Coac.* 179. tells us, "That a Diffillation of Blood from the Nose, under a *Coma*, is a mortal Sign." Of the same Signification, also, are all bad Evacuations and bad Symptoms appearing after a *Coma*, as portending a hard and dangerous Crisis. Thus for Instance, if a *Coma* be succeeded by Convulsions, a Delirium, Aphony, Anxiety, violent Pains of the Viscera, or other bad Symptoms, they are so far from being good Prognostics, that they portend a fatal Event. *Prosper Alpinus de Praesag. Vit. & Mort. Egrot.*

SONATH. The Name of a Remedy extolled by *Paracelsus*, as excellent in Apoplexies.

SONCHITES. A Name for the *Hieracium*. Hawk-Weed.

SONCHUS.

The Characters are;

The Stalks are tender and fistulous; the Heads are large; the Calyx is contracted into a Cone, when the Flowers fall off; the Seeds are either small, long and narrow; or larger and sulcated, or rough as if granulated.

Boerhaave mentions fifteen Sorts of *Sonchus*, which are;

1. *Sonchus*; asper; arborecens. *C. B. P.* 124. *Edit.* 2. *Hieracium*; arborecens; palustre. *C. B. P.* 127. *Edit.* 1.
2. *Sonchus*; repens; multis *Hieracium majus*. *J. B.* 2. 1017. *Raii Hist.* 1. 226. *Synop.* 71. *Tourn. Inst.* 474. *Boerhaave, Ind. A.* 84. *Hieracium*, Offic. *Hieracium majus folio Sonchi, vel Hieracium Sonchites*, *C. B. P.* 126. *Sonchus arborecens*, *Ger.* 231. *Emac.* 294. *Hieracium majus Dioscoridis*, *Ger. Emac.* 296. *Hieracium majus Sonchites*, *Park.* 788.

THE GREATER HAWK-WEED.

It is found in the Fields, and flowers in July. The Leaves are said to be cooling, and moderately astringent, and to be good in Inflammations. The Herb, together with the Root, is said to be a good Topic for the Sting of a Scorpion. *Dale. Dioscorides.*

3. *Sonchus*; Niliacus; gigas; *Lippii*.
4. *Sonchus*; asper; non laciniatus. *C. B. P.* 123. *M. H.* 3. 360.
5. *Sonchus*; asper; laciniatus & non laciniatus. *Park.* 804. *C. B. P.* 124. *Boerb. Ind. A.* 85. *Raii Hist.* 1. 223. *Synop.* 70. *Sonchus asper*, Offic. *Ger.* 229. *Sonchus asperior*, *Ger. Emac.* 291. *Sonchus asper laciniatus folio dentis Leonis*, *Tourn. Inst.* 474. *Sonchus laciniatus spinosus*, *J. B.* 2. 1016.

PRICKLY SOW-THISTLE.

This Sow-Thistle has a hollow, angular, channel'd Stalk, about two Foot high, having the lower Leaves long, stiff, and pretty much cut in, or indented about the Edge, every indenting ending in a Prickle; those which grow on the Stalks, do, as it were, encompass it with two roundish Auricles, and are less jagged than those below. The Flowers grow several together on the Tops of the Stalk, in Shape like Dandelion, but much less, and of a paler yellow Colour, the under Part of the Petala being tinged with Purple; they are set in longish scaly Calyces, and turn into Down, enclosing long thin flattish Seeds; the Root is thick, long and whitish; and the whole Plant, upon breaking, yields a milky bitter Juice. It grows every where upon Banks, and by Way-sides, and flowers in May and June. The Leaves are used. *Miller's Bot. Off.*

6. *Sonchus*; laevis; laciniatus; latifolius. *C. B. P.* 124. *Tourn. Inst.* 474. *Boerb. Ind. A.* 85. *Sonchus laevis*, Offic. *Ger.* 229. *Emac.* 292. *Park.* 805. *Raii Hist.* 1. 222. *Synop.* 70. *Sonchus laciniatus non spinosus*, *J. B.* 1015.

SMOOTH SOW-THISTLE.

The smooth Sow-Thistle has hollow-channel'd Stalks, like the rough, and grows as tall; the Leaves are smooth, and free from Prickles. Those next the Stalk are cut like Dandelion into several Segments, that at the End being largest; those which grow on the Stalk seem to encompass it, and have fewer Incisions, being somewhat triangular and pointed at the End. The Flowers, Seed and Root, are much alike. This grows in the same Places with the former, and is no less frequent.

The Leaves of both the last Sorts are of the same Nature with Dandelion, being aperitive and diuretic; and good for the Gravel and Stoppage of Urine, some People boil the Leaves in Posset-Drink, and give it in Fevers. The young Shoots are eaten by some People among Sallads like Lettice. They are but seldom used in the Shops. *Miller's Bot. Off.*

It has a herby saltish Taste, a little bitter, and gives a pretty deep Tincture of Red to the blue Paper. It contains a Salt, in some measure like that called *Oxyfal Diaphoreticum* by *Angelus Sala*; but in the Sow-Thistle this Salt is dissolved in a great deal of Phlegm, and united with a great deal of Sulphur. The Sal Ammoniac is found there in a very small Quantity; for,

By chymical Analysis, it yields but a little urinous Spirit, and no volatile concrete Salt; thus the Sow-Thistle is a Dissolver a little moderated; the Decoction is given to drink, to allay the Heat of the lower Belly; it facilitates the Circulation of the Humors in this Part, and removes the Obstructions, by which they stagnate. *Martyn's Tournesfort.*

7. *Sonchus*; laevis; laciniatus; latifolius; flore niveo. *C. B. P.* 124.
8. *Sonchus*; muralis; cymis hirsutis. *H. C. Suppl.*
9. *Sonchus*; angustifolius; maritimus. *C. B. Prodr.* 61.
10. *Sonchus*; asper; laciniatus; Creticus. *C. B. P.* 124. *Prodr.* 60. *Hieracium majus, folio Sonchi, semine incurvo*. *C. B. P.* 127. *Chondrilla Cretica, nomine missa, semine crispo*. *J. B.* 1022.

11. Sonchus; Turgitanus; Papaveris hortensis folio. *Flor.*
2. 27. *Chandrilla Turgitana, floribus luteis, papaveris hortensis folio.* H. L. 657.

12. Sonchus; lævis; angustifolius. C. B. P. 124. *Sonchis affinis, Terracrepola.* J. B. 2. 1018. *Chandrillis quadam affinis, lacinolata, an Trinciata,* J. B. 2. 1021. *Hieracium annuum, foliis imis angustioribus, lacinatis, caulescentibus, glaucis & integris.* M. H. 3. 67.

13. Sonchus; chondrilloides; altissimus; folio oblongo, nitido, flore luteo magno, radice repente.

14. Sonchus; lævis in plurimas, tenuissimas lacinias divisus. C. B. P. 124. *Prodr.* 61. *Chondrilla lutea,* J. B. 1029.

15. Sonchus; lævis, in plurimas, tenuissimas, angustissimasque lacinias divisus. *Cimel. Reg. Vaill. Boerh. Ind. Alt. Plant.*

SONDARI. H. M. The Name of an East Indian Shrub, called *Frutex Indicus Baccifer, floribus umbellatis, fructu tetracocco.* It is of no Use in Medicine. *Raii Hist. Plant.*

SOPHERA. A Name for the Senna; *orientalis; fruticosa; Sophera dicta.*

SOPHIA CHIRURGURUM. A Name for the *Sisymbrium; annuum; Absinthii minoris folio.*

SOPHISTÆ, *οπισθεντες ιεροι.* These are described by Hippocrates, as Physicians guilty of Arrogance and Insolence to others, on a Presumption of their superior Knowledge; whereas in fact they are guilty of the most notorious Errors, and excessively ignorant.

SOPHISTICATIO. Adulteration.

SOPHRONESTERES. The *Dentes Sapientiæ.* See DENS.

SOPIENTIA. Medicines productive of Sleep, or Ease from Pain. See ANODYNA, NARCOTICA, and OPIUM.

SOPIO. An old Name for Opium. *Rhodii Lexicon Scribonianum.*

SOPOR. The same as CAROS, or COMA.

SOPORARIÆ ARTERIÆ. The Carotid Arteries.

SOPORIFERA. Medicines inducing Sleep.

SORA. The same as ESSERE.

SORBET. The same as SERBET.

SORBTIO. Sorbile Aliment.

SORBUS.

The Characters are;

It resembles the Pear and Cratægus in all Respects, except that the Leaves are pinnated as in the *Fraxinus.*

Boerhaave mentions two Sorts of *Sorbus*, which are;

1. *Sorbus; sativa.* C. B. P. 415. *Boerh. Ind. A. 2. 248. Tourn. Inst. 633. Sorbus, Offic. Ger. 1287. Emac. 1471. Raii Hist. 1. 1456. Synop. 3. 452. J. B. 57. Sorbus legitima, Park. Theat. 1420. THE SERVICE-TREE.*

This grows to be a pretty large Tree, whose Branches are clothed with winged Leaves, something like those of the Ash-tree, consisting of seven or nine serrated Pinnæ, each Leaf terminating in an odd one. It has several Clusters of five leaved white Flowers, which are followed by Fruit of the Shape and Bigness of a small Pear, growing several together on Foot-Stalks, an Inch long; they are of a greenish Colour, with a Mixture of Red, as it has been more or less exposed to the Sun; of a rough, austere, choaky Taste; but when ripe or mellow, sweet and pleasant. It is found wild in some Parts of England, as in *Staffordshire* and *Cornwall*, flowering in May, but the Fruit is not ripe till November. The Fruit is used.

It is reckoned to be very restraining and useful for all Kinds of Fluxes; but when ripe, not altogether so binding. The Fruit is seldom or never to be met with in our Markets; and therefore, for a Succedaneum, we use the *Sorbus Tormalis.* *Miller's Bot. Off.*

2. *Sorbus; aucuparia.* J. B. 1. 62. *Tourn. Inst. 634. Boerh. Ind. A. 2. 248. Ornus, Offic. Ornus sive Fraxinus sylvestris, Park. Theat. 1419. Sorbus sylvestris, sive Fraxinus Bubula, Ger. 1290. Emac. 1473. Sorbus sylvestris, foliis domesticæ similis, C. B. P. 415. Raii Hist. 2. 1457. Synop. 3. 452. THE QUICKEN-TREE.*

This Tree grows in mountainous and moist Places; it flowers in May, and produces ripe Fruit in September. The Fruit is said to be a very good Hydragogue, and excellent for the Scurvy. The Liquor which distils from a Wound made in this Tree, is recommended as an excellent Antiscorbutic, and as a good Remedy for Disorders of the Spleen.

SORDES AURIUM. Ear-Wax.

SORDES ULCECUM. The sordid Matter in foul and ill-digested Ulcers.

SOREX. See MUS MAJOR.

SORGHUM. A Name for the *Milium; arundinaceum; suberosundo semine; Sorgho nominata.*

SORNI. Mars; that is, Iron. *Turba Philosophorum.*

SORY, *σῶρι, or σῶρι.* See CHALCITIS.

SOSTRATI VINCULUM. A Species of Bandage described by *Galen*, in his Treatise of Bandages.

SOTEIRA, *σῶτειρα.* The Name of an Antidote described by *Paulus Ægineta.*

SOTIRELLA. The Name of a Medicine in the Form of 2 hard Mass, consisting of Opium and some other Narcotics, with Nutmeg, Saffron, Camphire, and Soot. It is described in the *Augustan Dispensatory*, and is directed to be put into hollow Teeth.

SOTIRELLA PARVA, is another medicinal Mass, composed of much the same Ingredients; of the same Use; and described in the same Dispensatory.

SOTSITSOU. A Name in *Boerhaave's Index Alter. Plantarum*, for the *Palma; Japonica; spinosis pediculis; Polypodii folio.*

SPADAM. The Name for a Species of Sword-Fish, neither used in Food or Physic. *Lemery des Drogues.*

SPADON, *σπάδων.* A Spasm.

SPAGIRIA, or SPAGIRICA ARS. Chymistry, or Alchymy.

SPALAX, *σπαλάξ.* The Animal called a Mole.

SPALT, according to *Lemery*, is a stinty heavy Stone, which is used by the Founders in fusing their Metals. It is esteemed deterfive and desiccative, externally applied.

SPANNA, for Hispana, Spanish. In *Scribonius Largus*, No. 256. the *Pix Spana*, Spanish Pitch, is an Ingredient in a *Malagma*, there directed. The same Epithet is applied to Wine, Oil, Pitch, Alum and Opium, by various Authors.

SPANACHIA, according to *Blancard*, is the same as *Spinachia*, Spinnage.

SPANDARAPUM. The same as SPARADRAPUM. *Castellus*, from *Schenckius*.

SPANOPOGONES, *σπανοπόγωνες*, from *σπανος*, thin, and *πόγων*, the Beard. Persons whose Beards are thin, or whose Hairs fall off from their Chins, are thus called.

SPARA. A whimsical Term in *Paracelsus*, to which it is not easy to affix any Meaning. It is thus defined, *Spara Vis Mineralis ex Illech. primæ Substantiæ ex primo ente, est pars prima ex quatuor elementatis. Elementata ista sunt Mineralia majora. Paracelsus.*

SPARADRAPUM. A Sort of Cerecloth, called, also, *Tela Gualteri.*

Take of the *Diapalma* Plaister, and Diachylon with the Gums, each one Pound; Cerufs, half a Pound; Root of Orris, finely powder'd, an Ounce and half: Melt these together, and whilst they are in Fusion, dip therein soft worn-out Linen-Rags, so that they may be covered with the Plaister on each side; then take them out, spread them, and let them dry, and render the Surfaces smooth with a Knife or *Spatula*. The principal Uses of these are for Issues. *Lemery Pharmacop. Univerf.*

There are two other Forms of Sparadraps in the old College Dispensatory; as the *Sparadrap* for Issues.

Take of Wax, half a Pound, Red Lead and Turpentine, each four Ounces; Cinnabar, and the Roots of Florentine Orris powder'd, each one Ounce; Musc, four Grains: Mix, and use as above.

Take Oil of Roses, half a Pound; Sheeps Suet, four Ounces; Wax, ten Ounces; Litharge, Refin of the Pine, Frankincense, and Mastich, each two Ounces; Armenian Bole, and volatile Meal, each an Ounce: Make a Plaister to be used as the preceding.

The last is, in the Old College Dispensatory, called *Tela Gualteri.*

SPARAGMOS, *σπαράγμις.* A Convulsion.

SPARAGUS. The same as ASPARAGUS.

SPARALLIUM. An uterine Clyster. *Rulandus.*

SPAREDIA. In *Paracelsus*, is a Ligature anointed over with the White of an Egg.

SPARGANIUM.

The Characters are;

The Flowers are male, polypetalous, herbaceous, furnished with a vast Number of Stamina, and are closely connected to the Stalk in the Form of a Globe. The Ovaries grow on the same Stalk below the above-mentioned masculine Flowers, and are crooked small Tubes like Pods, which, when ripe, become osseous, unilocular, or bilocular *Capsula*, filled with a farinaceous Nucleus. These Ovaries are, also, collated into Globes like Knots.

Boerhaave mentions two Sorts of *Sparganium*, which are;

1. *Sparganium; ramosum, Ger. Emac. 45. C. B. P. 15. Theat. 28. Park. Theat. 1205. Raii Hist. 2. 1311. Synop. 3. 437. Tourn. Inst. 531. Boerh. Ind. A. 2. 168. Sparganium, Offic.*

Offic. Sparganium quibusdam, J. B. 2. 541. **BRANCHED BUR-REED.**

It grows on the Banks of Rivers, and in marshy Places, flowering in July. The Root is recommended by *Diocorides* as excellent against the Poison of Serpents, taken in Wine.

2. *Sparganium*; non ramosum. C. B. P. 15. *Theat.* 231. *Platanaria altera*, Dod. p. 60r. *Boerb. Ind. Alt. Plant.*

SPARGANOSIS, *σπαργάνωσις*. A Milk Tumor in the Breasts. *Galen.*

SPARSI MORBI. Scatter'd Diseases. The same as Sporadic Diseases.

SPARTIUM. The Broom-Tree.

The Characters are;

It hath a pupillaceous Flower, whose Pointal, which rises from the Flower cup, afterwards becomes a short, roundish, swelling Pod, containing, for the most part, one Kidney-shaped Seed in each.

Boerhaave mentions three Sorts of *Spartium*, which are;

1. *Spartium*; alterum; monospermum; semine Rani simili. C. B. P. 396. *Genista Hispanica, floribus luteis parvis, monospermas, semine Rani simili.*

2. *Spartium*; tertium; flore albo. C. B. P. 396. *Genista Hispanica, floribus candidis.*

3. *Spartium*; orientale; siliqua compressa, glabra & annulata. T. Cor. 44. *Boerb. Ind. Alt. Plant.*

SPARTIUM is, also, a Name for several Sorts of **GENISTA** and **SECALE**.

SPARUS, *σπαργος*. The Name of a Fish found near the Sea-shore, somewhat like a Guilt-Head.

SPASMA, *σπασμα*, from *σπένω*, to draw. A Divulsion or Distension of the nervous Fibres of a Muscle without Laceration, or a Wound. See **CONTUSA**.

SPASMODES, *σπασμῶδης*. Spasmodic, or convulsive; from *σπασμῶς*, a Convulsion.

SPASMODICUS. The same as **SPASMODES**.

SPASMOLOGIA. A Treatise or Dissertation on Spasms or Convulsions.

SPASMOTICUS. The same as **SPASMODICUS** and **SPASMODES**.

SPASMUS. A Convulsion, or Spasm.

No Disorder is more terrible to human Nature, or complicated with more dreadful Symptoms, than Convulsions, which are preternatural and violent Contractions of the nervous, membranous and muscular Parts, especially of the Trunk and Limbs, arising from a spasmodic Stricture of the Membranes surrounding the spinal Marrow, and the Nerves distributed from it, and an impetuous Influx of the nervous Fluid into the Organs of Motion.

Hence appears the Difference between Convulsions and an Epilepsy; for as the primary Cause of the latter is situated in the *Pia* and *Dura Mater*, those nervous Membranes which cover the Brain and the other Parts of the Head; so, on the contrary, the Cause of Convulsions is principally to be sought for in those Membranes which surround the spinal Marrow, and the Nerves distributed from it. The Symptoms, also, of those two Disorders are different, though most of them, on account of the intimate Consent of these nervous Membranes, are found to have a great Affinity with each other: For in an Epilepsy the Patient is afflicted with an Alienation of Mind; a Depravation of the internal as well as the external Senses; a foaming of the Mouth; a clenching of the Thumbs in the Fingers; and a Forgetfulness of every Thing that happens during the Fit. But these are Symptoms different from those of Convulsions, in which there is neither an Alienation of Mind, a foaming at the Mouth, nor a clenching of the Thumbs; and if these Symptoms happen during Convulsions, they constitute the Disorder of the convulsive epileptic kind.

Convulsions, like other spasmodic Disorders, principally exert their Tyranny upon the nervous, fibrous, and membranous Parts; and as these are copiously interwoven with other muscular, glandular, cartilaginous and bony Parts, they, also, draw them into Consent, and excite violent Commotions in them. And though these violent Commotions principally affect the external Parts and Limbs, yet they sometimes penetrate to the internal Viscera, and excite terrible Disorders in them.

Convulsions attack the miserable Patients in various manners; for in some they happen suddenly, without any Signs of the approaching Disorder; whilst in others they may be foreseen by some Signs: The most considerable of which are, a Refrigeration of the Extremities, especially of the Feet; or a Sense of Formication, which, also, seizes the Os Coxygis, and like a cold Vapour ascends through the Spine of the Back. The left Hypochondrium is affected with tensive and flatulent Pains, and the Patient is so obstinately costive, that neither the Flatulences nor Excrements can be discharged, whilst the

smallest Clyster-Pipe cannot be introduced into the Anus; or if it is otherwise, the Clysters and Suppositories are, by the Force of the Spasms, thrown up by Vomit along with the Excrements: The Bladder is so strongly constricted, that either none, or a very limpid and white Urine is discharged: In other Patients Convulsions are preceded by Oscitations, Pandiculations, Tremors of the whole Body; Anxieties of the Præcordia; an unequal, hard, and contracted Pulse; Cardialgias; Nauseas; Vomittings; Palpitations of the Heart; a Difficulty of Deglutition; Pains of the Head and Teeth; a Ringing of the Ears, and a Vertigo.

During the convulsive Paroxysm, the Limbs are surprisingly agitated, drawn in different Directions, distended, tossed, contorted and incurvated. Sometimes the Arms are so retorted towards the Back, that the Patient seems to sit upon them: At other times they in vain beat the passive Air: At other Times the Legs are drawn into various Directions: Sometimes they stamp and strike the Earth hard: Sometimes the Spine of the Back is incurvated, so as to form an Arch, whilst the Breast is raised: And at other times the whole Body is stiff and immoveable, as a Stone. These Agitations seize many in the very Posture in which they are, without throwing them on the Ground; whilst others, like epileptic Patients, fall suddenly down; weep, laugh, grind their Teeth, gape, hang out their Tongues, and are vertiginous. As the Gestures and Motions of convulsive Patients are very various, as we find in *M. N. C. An.* 6. *Obs.* 23. *Dec. an.* 9. *Obs.* 64. *Dec.* 2. *an.* 3. *Obs.* 77. *an.* 7. *Obs.* 135. and *Horstii Epistol.* 'tis still far more surprising, that such Patients should frequently speak Languages they never learn'd, and like Prophets predict future Events; for which Reason they were by the Ancients accounted Demoniacs, as we are informed by *Forestus*, in *Obs. Med. Lib.* 10. *Obs.* 56. *Schol.*

After the Paroxysm many Patients retain an incredible Languor of the whole Body and Feet; many fall into Deliriums, and a profound Sleep; and in others the Disorder is terminated by Eructations, an Explosion of Flatulences, Vomiting, and a copious Discharge of Lymph. Convulsions are frequently succeeded by an Evacuation of Mucus or Blood from the Nostrils, Uterus, or hæmorrhoidal Veins. In some, also, the Paroxysm is terminated by crying, and in numberless different manners. The Sleep of convulsive Patients is generally turbulent, and full of Dread and Terror; their Appetite unstable, and their Bodies costive; they sweat with Difficulty, and are subject to the Influence of various Passions of the Mind. The Paroxysms are sometimes longer, and sometimes shorter; and happen sometimes at longer and at other times shorter Intervals, tho' for the most Part they strictly observe the Variations of the Moon. I have known Patients in whom they have duly happened at a particular Time of the Year for a few Months, and have afterwards entirely ceased. In Women they either precede or accompany the Eruption of the Menstrues; and are more frequent and violent after high Feeding. They are, also, easily excited by the slightest Causes, especially by the Passions of the Mind.

Those are most subject to Convulsions whose nervous Systems are either naturally, or by any other Cause, weak; especially if their Juices are impure. Hence Convulsions are not only hereditary, but, also, sometimes handed to very remote Generations; especially if the Parents have been hypochondriac, hysteric, arthritic, subject to the Hemorrhoids, or if the Mother, when pregnant, has been inclined to violent Passions: For this Reason, Children and young Persons are more subject to Convulsions than Adults, and Women than Men. Persons of a delicate Turn of Mind, an acute Genius, and those of choleric Temperaments, are, also, more liable to them than others.

Having given the History of Convulsions, we now come to consider their Pathology. The proximate Cause, therefore, of Convulsions, is a strong and violent Stricture of the Membranes surrounding the spinal Marrow, and of the nervous Parts distributed thence. Hence 'tis obvious, that in Convulsions those Parts are only agitated, which receive their Nerves from the spinal Marrow. But since these Membranes have an intimate Communion with the Meninges of the Brain, of which they are Productions, it is easy to conceive why convulsive Motions are frequently complicated with those of the epileptic Kind, into which they, also, often degenerate.

That these Things may be the more clearly perceived, 'tis to be observed, that the spinal Marrow, like the Brain, is composed of a white, medullary, and cineritious Substance, and is continuous to the Brain. See *Hippocrates, L. de Carnibus Sect.* 3. *Galen, L. 12. de usu Partium, Cap.* 15. and *Veslingius, in Anat. Cap.* 14. This spinal Marrow is covered with one common membranous Covering, which adheres to the Spondyls of the Vertebrae; and with three proper Membranes, the innermost and second of which are Productions

from the Pia Mater, and the third from the Dura Mater. This spinal Marrow is lodg'd in the Cavities of the Vertebrae, and, according to *Vieussens*, in *Neurograph. Lib. 2. Cap. 1.* is furnished both with arterial and venous Blood-Vessels distributed through its Substance; for it receives arterial Ramifications from the vertebral Arteries, and the Trunk of the Aorta Descendens, from which the returning Blood is discharg'd through the small Veins, first into the venous Sinuses of the Vertebrae, the Veins of the Vertebrae, the *Vena Sine Pari*, other small Veins, and at last into the Vena Cava Ascendens. See *Vieussens* in the Work above quoted, *Tab. 18. Fig. 1. 2. and 3.* The principal Function of the spinal Marrow seems to be, to distribute from it various Nerves, of which there are thirty Pairs, and two spinal Nerves, by *Willis* call'd the accessory Nerves, which are distributed to the *Par Vagum*. See the same Author, *Tab. 19. Fig. 11.* These Nerves are first distributed to the Muscles of the fore and back Parts of the Neck, of the Back, Breast, superior and inferior Limbs, to the Motion of which they are subservient; then they are distributed through the internal Viscera of the Breast and Abdomen, constitute the Membranes in them, and lastly send off various considerable Ramifications to the external Muscles of the Face and Head, and contribute greatly to the Motion of these Parts.

Whoever duly compares what has been said with all the Symptoms of the Disorder, will easily discover a rational Connexion between them, and be able to assign the mechanical Cause of Convulsions. But 'tis to be observ'd, that this convulsive Irritation of the Parts may happen in a double Manner; for either the Membranes of the spinal Marrow are primarily irritated, convuls'd, and draw other Parts with which they are connected into consent; or some of these Parts are first spasmodically affected, and communicate the Convulsion to the spinal Marrow, from which it is propagated to other Parts. Hence we shall call the former of these Convulsions Idiopathic, and the latter Sympathetic.

Among the mediate Causes which dispose to this Constriction of the spinal Marrow, the most considerable are violent Passions, than which nothing is more effectual both for inducing and supporting Convulsions, especially if the Patient is expos'd to external Cold, or commits any Error in Regimen. *Henricus ab Heer*, in *Obs. 24.* gives us a memorable Instance of violent Convulsions produced by a sudden Consternation of Mind, occasioned by a Reflexion upon Fornication before committed. And nothing is more frequent than for Persons, especially such as are young, to be seized with Convulsions by Frights, or excessive Passion. Immoderate or premature Venery are, also, of great Efficacy in exciting Convulsions; for which Reason Cotion is call'd by Physicians, a slight Epilepsy.

Among the material Causes of Convulsions, we may justly reckon a peccant State of the Juices, and especially a certain, acrid, saline, and scorbutic Dyscrasy of them. Hence Convulsions are frequently produced by a Retropulsion of the Gout, arthritic Disorders, the Itch and Purples; and the Convulsions are again mitigated upon the Erruption of the peccant Matter. But as nothing more contributes to the Impurity of the Humours, than the Redundance or Spissitude of them, especially if the natural Excretions by Sweat or Stool, or the Hemorrhoids, or Meneses, are diminished or suppressed. Hence 'tis obvious, why hysteric and hypochondriac Patients, and those afflicted with an Obstruction of the Meneses or Hemorrhoids, are most subject to Convulsions. Hence 'tis frequently observed, that Girls before the Erruption of their Meneses, are often afflicted with Convulsions, which often cease upon the Appearance of that Evacuation.

If we enquire into those nervous Parts from which the convulsive Strictures are generally propagated to the Membranes of the spinal Marrow, the most considerable of them are found to be the Stomach and Intestines, the Vellications of which prove the Cause of Convulsions through the whole nervous System; for these Parts, by Means of their nerveo-membranous Structure, are very susceptible of irregular Motions, and are greatly affected by the slightest Cause. But since the Stomach receives its Nerves first from the right and left external Ramifications of the eighth Pair, and likewise from the Nerves arising from the first and second Vertebrae of the Back, and running off to the costal Ramification; and since the Intestines receive their nervous Branches from the internal Ramification of the eighth Pair, which concurs with the Intercoastal, and forms the mesenteric Plexus, the Reason is obvious, why the Strictures of these Parts are easily propagated to the Membranes of the spinal Marrow, and the whole nervous System.

Hence no Species of Convulsions are more frequent than those which have their primary Seat in the Duodenum, in which acid and viscid Crudities mixing with the Bile and pancreatic Juice, quickly acquire an acrid and almost cau-

sic Nature. Thus in *M. N. C. Dec. 3. an. 3. Obs. 138.* we have a memorable Account of a Catalepsis, accompanied with violent Symptoms, the Cause of which was lodg'd in the *Prima Via*. Hence, also, acrid, caustic, and poisonous Substances, by corroding the Membranes, excite universal Convulsions. Thus in *M. N. C. Dec. 3. an. 4. Obs. 30.* there is an Instance in which universal Convulsions were produced by drinking Wineedulcorated with Litharge. And 'tis sufficiently known, that acrid Purgatives have often produc'd the same Effect. All these will the more easily and infallibly happen, if a scorbutic Disposition of the Patient concurs. Hence in *M. N. C. Obs. 77. Dec. 2. An. 3.* we have an Account of violent epileptic Convulsions arising from the imprudent Injection of an acrid Clyster in scorbutic Pains of the Belly.

This is, also, confirmed by various Observations of impartial Authors, in which 'tis evinced, that Worms in the Intestines have produced surprizing ambulatory and rotatory Convulsions, especially in Children. Memorable Instances of this Kind are found in *Georgius Horstius Epist. Medicin. Sect. 3. M. N. C. Dec. 1. An. 6. Obs. 187.* and *Dec. 3. An. 3. Obs. 99.* and *Ferrius in Obs. Med. L. 10. Obs. 117.* If we enquire into the Causes of these Convulsions, we shall find, that they not only consist in Corrosions and Vellications of the Intestines, which happen to Children, but that they are, also, produc'd in Adults, by dead Worms in the Intestines, which diffuse a putredinous Vapour, which insinuates itself into the nervous System. Hence, in Cases of this Kind, the Breath is often fetid and cadaverous.

But since the urinary Bladder and Uterus receive their nervous Ramifications from the lowest Branches of the internal eighth Pair, and from some Ramifications arising from the Os Sacrum, 'tis easy to conceive why Vellications, Spasms, and Wounds of these Parts terminate in Convulsions. Thus, according to *Ettmüller*, in *Coll. Praet. p. 2. Tom. 1.* there are numberless Instances of Convulsions produced by a Suppression of Urine. 'Tis, also, frequently observ'd, that Women in Labour are seiz'd with peculiar convulsive Motions of the Limbs, when the Spasms of the Uterus ascend and affect the Nerves of the spinal Marrow. Hence the Hands and Neck are often agitated from one Side to another, the Breast is elevated, the Members and whole Body tremble; and unless those Spasms are allay'd and again deriv'd downwards, in order to expel the Foetus, they often prove prejudicial, and even mortal, both to the Mother and Infant; for though 'tis certain, that there can be no Delivery without spasmodic and convulsive Motions, yet 'tis to be observ'd, that their Seat ought to be principally in the Uterus, Os Sacrum, and adjacent Muscles. But when from various Causes they are propagated to the superior Parts, and invade the superior Part of the spinal Marrow, they excite various and terrible Symptoms.

External Wounds of the spinal Marrow, and other remote nervous Parts, also, produce violent Convulsions. Every Surgeon knows, that Fractures and Luxations of the Vertebrae, where bony Splints prick the spinal Marrow, excite Convulsions: And every one knows, that Wounds of the nervous Parts, or of a single Nerve, by Venesection, for Instance, or any Puncture, Vellication, or any Cause whatever, produce violent Convulsions. *Rhodus* in *Obs. Cent. 1. Obs. 32.* and *50.* gives us Instances of Convulsions produced by a Puncture of a Nerve in the Hand. *Forestus* in *Obs. Lib. 10. Obs. 118. 119.* informs us, that Convulsions were produced by the pricking of a Nerve in Venesection. And in *Obs. 120.* he informs us, that the like Effects was produced by a Wound. And *Rhodus*, in the Part above quoted, informs us, that violent Convulsions have sometimes been produc'd by an incautious Pairing of the Nails. Hence Punctures, Wounds, and Injuries of some of the external Parts of the Head and Muscles, are found to terminate in Convulsions, which I have seen excited by a Wound of the temporal Muscle. Nor is this to be wonder'd at, since, according to *Vieussens* in *Neurograph. Tab. 24.* from the second vertebral Nerve, some Ramifications distributed upwards through the external Ear enter various Muscles of the Face.

The same is, also, the Reason of the Convulsions produced by the Stings of various Animals. In *M. N. C. Dec. 1. An. 9. Obs. 65.* we have an Account of a surprizing Species of Convulsions produced by the Bite of a large Fly. Many skilful Physicians have given us Instances of intense Pains of the Limbs, Agitations, and Incurvations of the Back, and Tossings, accompanied with a disordered Fancy, produc'd by the Bites and Stings of enraged Animals. Hence 'tis obvious, that the Matter is very small and pernicious, which excites such Tumults and irregular Motions in the whole nervous System.

Though

Though Convulsions are very terrible, yet they are not suddenly mortal. When they are recent, the Patient young, and the Constitution sound, an easy and short Cure is to be hop'd for: But if they arise from a Suppression of the Menfes or Hemorrhoids, they are removed by recalling these Evacuations. But when the Humours are thick and impure, the Excretions suppress'd, the Constitution delicate, the Patient advanced in Years, and the Disease hereditary, and of long standing, the Cure is very difficult; for then the Fluids are not only peccant, but, also, the solid nervous Parts, in which the acrid exhal'd Matter is impacted and radicated. Besides, the Nerves when greatly distended with violent Convulsions, instead of the subtile, ethereal, nervous Fluid, are fill'd with a gross Vapour, and for that Reason not without great Difficulty reduc'd to their natural State. Hence, also, we are to account for the surprizing Strength of Persons under convulsive Paroxysms. Convulsions, also, frequently degenerate into a true Epilepsy, or a hypochondriac Melancholy, especially when a bad Regimen, or a preposterous Cure concur. Lastly, those who die of Convulsions are taken off by an Apoplexy. Hence on dissecting the Carcasses of these who have died of Convulsions, the Vessels of the Brain have been found infarcted and distended with stagnant Blood; or Extravasations of Blood have been found here and there in the Ventricles of the Brain, and in the spinal Marrow.

In the Cure of convulsive Motions, three Intensions are to be principally pursued; the first of which is, to correct the material Causes which support the Disorder, prepare them for an Elimination, and commodiously evacuate them. The second is, to sooth and allay the violent and irregular Commotions of the nervous Parts. And, thirdly, to corroborate the nervous System, in order to prevent a Relapse, which frequently happens. But the Patient, especially if the Disorder is inveterate, is above all things to be exhorted to Patience under the Cure for some Time; nor is the Cure to be obtain'd by a great Variety of drastic Remedies, but rather by mild Medicines, and such as are friendly to Nature; these, with the Assistance of Patience and a sufficient Time, will accomplish the Cure.

With respect to the Cure in general, 'tis to be observ'd, that if the Disorder, according to *Hippocrates*, arises from a Redundance of Humours; or if the Quantity of Blood is too great; or if it is thick, and the Pulse large, and especially if the Habit is sanguineous, we are to begin the Cure with Venesection either in the Foot or Arm; and these Venesections are to be repeated twice, thrice, or oftener, according to the Degree of the Plethora; or Scarifications may be interpos'd; but Venesection is more expedient after, than during the Paroxysm; for by bleeding in the Paroxysm, I have frequently observ'd violent and long protracted Symptoms produced.

I have, also, very rarely observ'd convulsive Motions remov'd without the Observation of a proper Regimen. Hence in inveterate Convulsions it is expedient to change the Air and Soil, especially if dank and moist, and to reside in a serene and mild Air; to travel and use frequent Exercise; proper Aliments, of a soft Texture and easy Digestion, are to be chosen; but all hot, spirituous, vinous, and Malt Liquors are to be carefully avoided. The Patient is, for ordinary Drink, to use Decoctions of the Root of Viper's Grass and Shavings of Hartshorn, or Whey, or the *Selteran* cold Springs. Baths for the Feet, prepared of River-water, Bran, and Chamomile Flowers are, also, to be us'd; and the Patient is to immerse his Legs pretty far into them when they are considerably tepid, before going to Bed, after which he is to procure a gentle Sweat; for these Measures have a singular Efficacy in promoting the Circulation of the Humours, and allaying the spasmodic Strictures.

But no Attempts towards a Cure are to be made, unless the Body is soluble; for which Reason, if the Patient is costive, we may exhibit a proper Dose of the *Pilula Balsamica*, or Infusions and Potions prepared with Manna, or Manna us'd instead of Sugar in some warm Infusion; or if the Patient is entirely costive, emollient and oleous Clysters are to be injected till the Body is duly soluble. But when 'tis certain that the Fomes of the Disorder is lodg'd in the *Primæ Viæ*, 'tis expedient, especially about the Changes of the Moon, to exhibit an Emetic in Conjunction with a Laxative, for which Purpose two or three Grains of emetic Tartar may be mixed with a Decoction prepared of one Ounce of Manna, that thus there may be a sufficient Evacuation of the peccant Humours both by Vomit and Stool.

Among the most simple and dietetic Medicines which are generally of great Service in convulsive Disorders, we may justly reckon large Draughts of cold and simple Water, by which Means I have seen the most violent Convulsions remov'd; for common Water, in consequence of its Levity and Fluidity, enters the capillary Vessels of the human Body,

renders the Blood more fluid, corroborates the Parts, involves the acrid and sulphureous Humours and Vapours, and by exciting a gentle Sweat, eliminates them from the Body. Hence the proper and moderate Use of temperate, cold, and hot Springs, seems to be of singular Efficacy in convulsive Disorders.

But if Convulsions, especially about the State of Puberty or Youth, arise from excessive Venery, Anger, or any other Commotions of Mind, the Patient is carefully to abstain from every thing capable of producing a Commotion and Orgasm in the Fluids, or exciting the Solids to preternatural Motions and violent Strictures, such as Aromatics, acrid Purgatives, Emetics, all hot and spirituous Substances, violent Exercises of Body and Mind. On the contrary, greater Confidence is to be repos'd in Diuretics, emollient, demulcent, and nutritive Substances. Hence Cows Milk, that of Asses, or Whey, as, also, Baths of sweet Water mix'd with Milk, are of singular Service. Gelatinous, nutritive Broths, are, also, of great Service; and for ordinary Drink, the Patient is to use weak Chocolate, or Decoctions prepared of the Roots of Vipers-Grass, Barley, the Shavings of Hartshorn and Ivory, and the Flesh of Vipers. To these we are to add such Remedies as allay spasmodic Motions, together with Anodynes and Specifics, which are hereafter mentioned.

When Convulsions arise from Worms, these are to be kill'd and expell'd from the Body: But 'tis to be observ'd, that in this Case all Anthelmintics and Specifics are not equally proper; since the Preparations of Garlick, Vitriol, Copper, Aloes, drastic Purgatives, and Mercurials destroy Worms, they are nevertheless unfriendly to the nervous Parts when rashly exhibited. It is more expedient to attempt the Cure by external Remedies, such as Clysters of Milk, those prepared of sweet and oleous Substances, and Liniments of a purgative Quality, such as the Ointment of Sow-Bread, externally applied to the Navel and Abdomen. The Anthelmintics given internally ought to possess a corroborative and nervous Quality, such as Worm-seed, either reduc'd to Powder or an aqueous Essence, or Mercurius Dulcis mix'd with two Parts of medicinal Cinnabar, and reduc'd to the Form of Pills, with Extract of Tansy, Rhubarb, and the lesser Centaury. Other peccant, bilious, viscid, and acrid Sordes of the *Primæ Viæ*, are to be treated with inciding, resolvent, absorbent, digestive Medicines, such as correct Acrimony, and gentle Evacuants, either of the emetic or laxative Kind. If acrid Purgatives, or Things of a caustic or poisonous Quality have excited the Convulsions, the *Spicula* of these Substances are to be sheath'd up by pinguous, oleous, mucilaginous Substances, and Preparations of Milk.

If Convulsions are supported by a Suppression of the Menfes, we are by no Means to recal that Evacuation by Emmenagogues, and other hot Medicines generally exhibited for that Purpose. In such a Case, 'tis more expedient to restore the free Circulation of the Humours by the Use of Baths of natural and medicinal Waters, by prudent Venesection, by bathing the Feet with tepid Liquors, by balsamic Pills, by warm Infusions of the Leaves of Baum and the Lime-Tree, and by correcting Powders. Then the irregular Motions of the solid Parts are to be allay'd by Antispasmodics and Anodynes, such as the anodyne Liquor mix'd with Essence of Castor, which is an excellent Medicine; then the weaken'd Parts are to be corroborated. When Convulsions arise from a Suppression or Diminution of the *Menfes*, besides the above specified Remedies and Venesection, the Application of Leeches to the *Anus* is of singular Service.

It frequently happens, that the Retropulsion of Sweats, of ulcerous Excretions, of the Itch, Purples or Gout, induces Convulsions. In this Case, the acrimonious Sordes of the *Primæ Viæ* are to be corrected, and the spasmodic Strictures allay'd by absorbent Powders prepar'd of Crabs Eyes, the *Pulvis Marchionis*, prepar'd Amber, Cinnabar, Nitre, diaphoretic Antimony, and the Extracts of Saffron and Castor. In the Evening the Patient may take the anodyne Liquor, with a small Dose of *Bussins's* bezoardic Spirit, and the Spirit of Castor, or antispasmodic Pills prepar'd thus:

Take of the Extracts of Yarrow, and of the Flowers of Chamomile, and the Herb Carduus Benedictus, each one Dram; of *Venice* Treacle, Amber, and Cinnabar, each half a Dram; of Saffron, twelve Grains; and Oil of Chamomile, eight Drops; form them into Pills, with which Laxatives are to be frequently interpos'd.

Then Asses Milk mixed with the *Selteran* cold Springs are to be drank, or Whey, both of which are to be persisted in for some Weeks, interposing, at proper Intervals, Manna in conjunction with Cream of Tartar.

If, when by these Means, the material and especially the grosser Causes are removed, convulsive Motions should still remain, they are to be treated with such Medicines as allay exorbitant Motions, and with Specifics opposite to the subtle sulphureous Vapour which is impacted in the Nerves, and is the principal Support of the Disorder. To this Class principally belong antispasmodic and antiepileptic Specifics, taken from the animal Kingdom; for these, by their Fragrance immediately perceived by the Smell, are opposite to the fetid Vapours which support the Convulsions, and by a specific Virtue subdue them. The most considerable of this Kind, are the Shavings of the Sea-horse's Teeth, of Ivory, of the Bone found in the Head of the Sea-cow, of the Elk's Hoof, and of the human Cranium, as also human Blood and Secundines dried, the Viscera of Vipers and Serpents, together with their Hearts, Galls, and Liver; the Ankle Bones of Hares dried and pulverized, the Water of Swallows with Castor, but especially the Powder of Earth-worms. No less efficacious are some Medicines drawn from the vegetable and mineral Kingdoms, among which are the Coals of the Lime-tree pounded, the Extract of Saffron, the Flowers and Roots of Piony and wild Poppies, as also Medicinal Cinnabar. This Intention is, also, answered by Sedatives and Anodynes, such as the anodyne Liquor mixed with Essence of Castor, the Pilula de Cynoglossio mixed with *Aurum Fulminans* and Cinnabar, and the *Pilula Wildegansii*, which, when the grosser Matter is removed, excellently check habitual convulsive Motions. And lastly, Corroboratives are to be used, in order to answer the third Intention of Cure.

Nor are we to neglect external Remedies, among which we may reckon Ointments and Liniments applied to the Nape of the Neck, and Spine of the Back. The Ingredients of these may be that of human Fat, Badgers, Bears, the Mountain Mouse, the Beaver, and Vipers. With these Fats we are to mix the distilled Oils of Rue, Lavander, Marjoram, Rosemary, Nutmeg, and, in order to render them more penetrating, a few Drops of the Spirit of volatile Sal ammoniac. But 'tis to be observed, that the distilled Oils are to be omitted in Patients who cannot bear them, and only the Fats and mucilaginous Substances used. No Medicine is preferable to Baths of fresh Water used about the Time of the Invasion. By these let a gentle Sweat be provoked, Nature being either spontaneously inclined to it, or, if not, by an Infusion of the Flowers of the Lime-tree, which are of singular Efficacy, of Cowslips, St. John's-wort, and Valerian Root, by which means, violent Paroxysms are frequently prevented.

When in Convulsions arising from Worms, Mercurius Dulcis is exhibited with a purgative, 'tis to be observed, that before the Use of this Medicine, or other Anthelmintics, mucilaginous Demulcents, such as a few Spoonfuls of the Oil of Sweet-almonds, are to be exhibited; or let Milk be drank immediately before or after, in order to allay the Strictures of the Intestines.

Tho' Venesection is often beneficial in convulsive Disorders, especially where there is a Plethora, a Spissitude or Dyterasy of the Humours, a Suppression of the Menes or Hemorrhoids, or when the Head is violently affected, yet we are not to take away a large Quantity of Blood at one Time, nor to use Venesection promiscuously; for as the Disorder, when often recurring, more frequently proceeds from a Defect than a Redundance of laudable Blood, it easily happens, that by immoderate Venesection the Strength is impaired, the Stomach weakened, Perspiration retarded, and in Patients not manifestly plethoric, more Harm than Good done. Nor is Venesection to be performed on the Side affected, nor during the Equinoxes, but about fourteen Days before or after them; because at these Times the Paroxysms, during which nothing is to be attempted, are generally more violent than at other Seasons.

When a Suppression of the Hemorrhoids supports Convulsions, and a gentle Tumor and Obstruction of the Vessels are already formed, after other proper Measures, I know no more efficacious Medicine than Chalybeats. Hence the following vinous Infusion is of singular Service.

Take of the Roots of Zedoary and Succory, each half an Ounce; of the Tops of the Lesser Centaury, and the Flowers of Clary, each four Pugils; of recent Citron Peel, half an Ounce; of Currans, two Ounces; and of Rhenish Wine one Quart; mix all together, digest over a gentle Fire, and keep for Use.

In convulsive Disorders no Medicines are more prejudicial than such as throw the Humours into violent Commotions, to which they are at these Times too much subject. Hence we are carefully to abstain from all hot spirituous volatile Substances, hot Tinctures and Essences, crude Astringents and

Narcotics, which not only recal the Paroxysms, but also render the Disorder worse and more obstinate.

We are not rashly and immediately to have Recourse to Baths, which are not to be used, so long as the Patient is plethoric, or the *Duodenum* full of Sordes; for in such Cases, 'tis to be feared that the malignant Matter, being put in Agitation by the Baths, should be diffused thro' the whole Body. The same Caution is to be observed with respect to a Milk-Diet, instead of which bilious Patients ought to use Whey; nor is a Milk-Diet to be used at all, unless the *Prima Via* and Viscera are found and free from Sordes. A Course of Milk is most safely begun about the Middle or End of the Spring.

The Body in convulsive Disorders ought always to be kept soluble, since we observe them to be most violent when the Patient is costive. This Intention is best answered by mild laxative Preparations of Rhubarb, Raisins and Manna, Clysters, and an emollient Diet. Tho' Liniments are of singular Efficacy in soothing and relaxing Spasms, yet they are more properly used when the Paroxysm begins to remit, than at its Height, especially if the Patient has previously used the Bath.

Antiepileptic Specifics and spirituous Corroboratives are by no Means to be exhibited in the Beginning of the Disorder, and not till after the material and gross Cause is removed; for when this Cause is removed, convulsive Motions frequently cease; without the Assistance of Specifics, whose Efficacy is found to be greatest in Convulsions arising from Commotions of Mind, especially if the Viscera are found. Thus I knew a young Man, who for sixteen Years had laboured under violent epileptic Fits, happily cured by my antiepileptic Powder, after having previously taken a Vomit.

The Return of Convulsions is best prevented by a due Use of the Non-naturals. Let the Patient, for Instance, live in a pure, serene and temperate Air. And as *Hippocrates*, in *Secl. 2. Aph. 45.* affirms, that in young Persons, Convulsions are cured by Change of Air, so the Patient is to be persuaded to remove from marshy, cold, and moist Places, infected with a thick and coarse Air, to higher, dryer and more healthy Parts. The Patient must not lie on the moist Ground, nor walk long in a bad Air, in the Night-time, or when the Sun shines excessively hot. Let his Food be of easy Digestion, and for ordinary Drink, let him use cold or medicated Water, or warm Infusions. He ought to preserve a serene Mind, abstain from immoderate Venery, use Exercise, take a good deal of Sleep, preserve his Body soluble, and, lest a Redundance of Blood should happen, use proper Venesections or Scarifications. *Frederic Hoffman.*

SPASNIA. A violent lancinating Pain in the Muscles of the Thorax during Coughing. *Castellus* from *Mercurialis*.

SPATHA. *σπάθα*. This sometimes imports a Rib, or a Scapula; but it is generally used to express a *Spatula*, an Instrument well known in Apothecaries Shops. *Spatha*, in *Celsus*, *L. 7. C. 10.* is a Sort of Incision Knife, the Shape of which *Heister* thinks is not known. *Celsus*, speaking of a *Polypus* in the Nose, says it must be loosened from the Bone by a sharp Iron Instrument, *in modum Spathæ factis*, shap'd lik'd a Sword; for *Spatha*, *σπάθα*, signifies, properly, a Sort of Sword; whence all the other Things which are thus called, borrow the Name on account of their Similitude. *Spatha*, *σπάθα*, is, also, the external Covering of the Fruit of the Palm.

SPATHESTER. *σπάθιστρον*. from *σπάω*, to draw. A Chirurgical Instrument, contrived for drawing the Prepuce over the Glans, when too short to cover it.

SPATHOMELE. *σπαθομήλη*. A *Spatula*.

SPATILE. *σπάσιλον*. A liquid Stool.

SPATULA. An Instrument for mixing and spreading Plaisters, and for many other Uses.

SPATULA FÆTIDA. See **XYRIS**.

SPAUL. Blood. *Rulandus*.

SPECARIUM. The same as **LAPIS SPECULARIS**.

SPECIES, in Pharmacy, is a Powder.

The Species usually prepared are the following.

Species Diambra cum & sine Odoratis. See **DIAMERÆ SPECIES**.

Species DIANTHUS. See **DIANTHON**.

Species DIATRAGACANTHI FRIGIDI. See **DIATRAGACANTHI FRIGIDÆ SPECIES**.

Species DIATRILOŃN PIPEREOŃN. See **DIATRION PIPEREOŃN SPECIES**.

Species HIERÆ PICRÆ. See **HIERA**.

Besides the foregoing Species, *Schroder* mentions the following:

Species Dianifu.

contra Apoplexiam.

Aromaticæ Caryophyllatæ cum & sine ambra & Moscho.

Aromaticæ Rosatæ cum & sine Ambra & Moscho.

Species

Species *Diacalaminthæ*.
Cephalicæ.
Diacinnamomi.
Diacorallii.
Confectionis Cordialis.
Cordiales cum & sine Ambra & Moscho.
Diacubebæ.
Diacurcuma five Diacrocæ.
Diagalanga.
de Gemmis calidæ, cum & sine Ambra & Moscho.
de Gemmis frigidæ.
Ducis five Electuarii Ducis.
de Hyacintho.
Diahyssopi.
Imperatoris.
Diaireos Salom.
Simplex.
Usitatæ.
Justini five Electuarii Justini.
Dialacca.
Lætificantes Galen. cum & sine Ambra & Moscho.
Lætificantes Rhafis.
Liberantes, confectionis liberant.
Lithontribon.
Diamargariton calidæ Avicen.
Diamargariton frigidæ Nicolai.
Diamoschu Amaræ.
dulcis cum & sine Ambra & Moscho.
Diapenidion.

Diatrogacanthæ calidæ.
ad Vermes, Confectio ad Vermes.
Dia-Xyloaloes, cum & sine Ambra & Moscho.
Dia Zingiberis.

SPECIFICA. Specifics.

Since 'tis certain from Experience, that some Medicines have a Kind of peculiar and specific Efficacy in the Cure of particular Disorders, and are for that Reason preferable to others, I shall consider some of those Medicines, which, from long Experience, I have found in a singular Manner beneficial in the Cure of certain Diseases. But by *Specifics* I do not, with the common Herd of Physicians, mean such Medicines as infallibly and in all Patients produce salutary Effects, and never frustrate the Hopes of him who prescribed them. For such Medicines are no where to be found, because the Operations and Effects of Remedies are not formally inherent in them, but depend upon the mutual Action and Re-action of the Medicine upon the Body, and of the Body upon the Medicine; for all Medicines act not only according to their own Sphere of Activity, but also according to the Constitution of the Patient, so that the same Medicine, exhibited to ten different Persons labouring under the same Disorder, produces different Effects in each.

The high Pretences, therefore, to Panaceas, Arcanums and Specifics, against particular Disorders, are false and ill-grounded, since by Specifics we ought to mean no more than such Medicines as are more efficacious and infallible than others in the Cure of particular Disorders; for some Medicines contain Elements or Principles every one of which contributes to remove the Cause of the Disorder; so that the Compound, or Medicine itself, answers various Intentions of Cure at once. Thus Rhubarb is preferable to all other Laxatives in the Cure of Diarrhæas, because it not only evacuates, but also by its balsamic Bitterness, blunts and corrects the acid and caustic Humours, and when the Purging is over, corroborates the relaxed Tone of the Viscera by its earthy, subastringent Particles. Thus, also, in Diseases of the Breast, and Coughs proceeding from Disorders of the Stomach, in order to cleanse the Primæ Viæ, Manna is preferable to all other Laxatives on account of its Sweetness, which obtunds and corrects the corrosive, acid, and acrid Humours. Other Remedies are, also, called Specifics, because their Virtues and Power of producing certain Effects in particular Diseases, have been discovered and confirmed by

long Experience. Hence the *Peruvian Bark* is a Specific for stopping the Paroxysms of Intermittents, Opium for alleviating Pain, and Mercurials for curing the Lues Venerea. Some Remedies are called Specifics, because they are more friendly than others to the Parts affected, and by their Virtue have a particular Influence upon them. Thus the Nerves, together with the nervous and membranous Parts, are happily affected by Medicines abounding with a subtle, aromatic and fragrant Oil, whereas bad Effects are produced in them by Narcotics, Opiates and Astringents. The Stomach is delighted with Acids, by Means of which Appetite and Digestion are promoted, but the Bronchia of the Lungs are injured and stimulated to Spasms by them. Cantharides, and Insects abounding with a volatile caustic Salt, neither affect the Stomach nor Intestines, but the urinary Ducts of the Kidneys, the Ureters, Bladder and Urethra, are vellicated and agitated with spasmodic Strictures by them.

Thus we are to form our Judgments of the Virtues of Specifics, which ought to be frequently used and greatly esteemed by Physicians. But we shall now consider what Specifics are appropriated and adapted to particular Disorders. With regard then to intermittent Fevers, and especially, in order to check their Paroxysms, the *Peruvian Bark* is greatly celebrated, because, besides its astringent Quality, and that by which it stops febrile Motions, which it has in common with many other Medicines, such as Preparations of Vitriol and Allum, the Roots of Tormentil and Bistort, it is, also, in Consequence of its bitter, balsamic Principle, possessed of a singular Efficacy for correcting the morbid Matter, and corroborating the languid Solids. This Bark may be exhibited in Substance, reduced to an Electuary or Essence, or, which is best of all, infused and gently boiled in *Rhenish Wine*. Among the Specifics, also, for Intermittents are generally reckoned the Flowers of common Chamomile, so much extolled by *Baglivi*, because both on Account of their Bitterness, Oil, and antispasmodic Virtue, they are highly efficacious in Fevers, and by their gentle Astringency, restore the Tone of the Solids. But if Intermittents are highly obstinate, which is generally owing to an Obstruction of the Pancreas, this Obstruction is by nothing more efficaciously removed than by *Mercurius Dulcis*, Medicinal Regulus of Antimony, and antimonial Sulphur corrected, and prudently exhibited.

In Quartans, the most celebrated Specific is the Essence of Rhubarb and Gentian, prepared with the Lixivium of the Salt of Tartar, and the urinous Spirit of Sal Ammoniac; for in Quartans, the Liver, and its Vessels, are full of gross Blood, the biliary Ducts infarcted with a thick and tough Bile, and the *Primæ Viæ* overloaded with acid Crudities: Hence this Medicine, because it corrects and sweetens the acid Humours, resolves and attenuates the stagnant Blood and lentescent Bile, restores a due balsamic Quality to the Bile, and purges gently, is preferable to all others. But when Quartans are so inveterate and obstinate as to elude the Force of all other Medicines, *Mercurius Dulcis*, or diaphoretic Mercury duly prepared, are highly efficacious; as also, the *Antiquarium of Riverius*, which is possessed of the same Virtue with Mercury. And tho' the Mercurials exhibited should excite a Salivation, yet it is not to be dreaded as dangerous, since frequently the Fever ceases whilst it succeeds.

All Inflammations, which are always accompanied with a Fever and Danger, and generally happen in the Nerveo-membranous Parts, such as the Pleura and Bronchia of the Lungs, are by a certain Specific Virtue cured by purified Nitre, mixed with a small Quantity of Camphire, by Demulcents, gentle Anodynes, Emulives, and fixed Diaphoretics. In extinguishing all febrile Heats, Nitre is preferable to all other Things, because, besides that Virtue by which it fixes and abates the intestine Motion of the sulphureous Parts of the Blood, it resolves and attenuates the thick Blood and Lymph lodged in the narrow Vessels, and at the same time moistens and relaxes the tense and rigid Fibres, and consequently exerts an antispasmodic Virtue.

When there is a malignant Disposition of the Humours, or such a State of the Juices as is prone to Putrefaction, or when by Contagion, such Miasmata are conveyed into the Body as are fit to induce such a putrid Corruption of the Juices both in acute and chronical Disorders, I find nothing more effectual than Camphire, especially when exhibited in Conjunction with Nitre; for the Camphire, by its balsamic Quality, preserves the due Crasis and Mixture of the Blood, diminishes the Force of the Ferment, and by augmenting Perspiration, without exciting an excessive Heat of the Blood, excellently promotes the Elimination of the Sordes, through the Pores of the Skin. But if the Fever or Inflammation are of the malignant Kind, Camphire is never to be exhibited alone, but always mixed with Nitre. In order to restore Strength, which is greatly impaired in almost all Diseases, and especially those of the malignant Kind, I know no more efficacious

efficacious Remedy than Citron Peel, on Account of the Oil which it contains ; as also, Cinnamon, and a weak Water distilled from it, with the fragrant Juices of Straw-berries, Rasp-berries, and Cherries. When the Fever is absent, Oil of Cinnamon, and an Elæosaccharum prepared of it, are of singular Use in restoring the Strength. In a Plague, the most malignant of all Disorders, the best Specific is Vinegar, either simple, or prepared with Alexeterial and Cordial Roots. The Juice of Lemons and Citrons, and the Syrup of Citron Juice, mixed with Oil of Cedar, as Acids, powerfully resist Putrefaction, the Source and Support of which is an exalted alcalino-sulphureous Principle tending to a corruptive Dissolution of the Humours, and a Destruction of their due Mixture.

We now come to treat of Pains, which, if they arise from spasmodic Strictures, such as the Cardialgia, the Colic and the Stone, are most surprizingly relieved by my anodyne mineral Liquor, which is not only possessed of a gently anodyne and discutient, but also of a corroborative Quality not to be found in other Sedatives. When Flatulences become stagnant, and so pent up as to distend the nervous Coats of the Stomach and Intestines with violent Gripings, I have found no more powerful Specific for their Discussion than Orange Peel, Camomile Flowers, Caraway and Cumin ; because, on account of the subtile vaporous Oil they contain, they are anodyne and mitigating, and by their bitter, aromatic, acrid and fragrant Principle, corroborative, and proper to restore the Tone of the Parts. By which Means the Crudities, which are the Cause and Fomes of the Flatulences, are afterwards commodiously eliminated.

Nor are there Specifics wanting for other Disorders. Thus scorbutic and rheumatic Pains of the Limbs, and a wandering Gout, are greatly alleviated by Earth-worms, the Juice or Powder of them, especially, when mixed with Absorbents, Cinnabar and Nitre, and long and copiously used with Asses Milk or Whey. I have, also, seen long continued rheumatic Pains and Contractions of the Limbs, cured by gradually exhibiting the Powder of crude Antimony from about ten Grains to half a Dram. Let this Medicine be taken daily, interposing a mild Decoction of the temperate Woods. Asses Milk, according to *Pliny* and *Dioscorides*, was by the Ancients looked upon as a Specific for the Gout, and frequently used ; and such gouty Patients are also surprizingly relieved by Decoctions of the Roots of Mugwort, Vipers Grass, Sassa-parilla, China-root, Liquorish, Polypody and Hermodactyles, liberally and for a considerable Time used. In a Tooth-ach, an Ounce of Elder Rob drank in Broth, in order to promote a Diaphoresis, and some of the same Rob dissolved in Ale, with which the Mouth is to be frequently washed, affords infallible and present Ease to the Patient.

Hypochondriac and hysteric Disorders have a great Affinity, and principally exert their Violence by inflating and spasmodically constricting the Intestines, by which Means they draw the whole nervous System into Consent. These Disorders have, however, their peculiar Specifics, by which they are allayed, the most considerable of which are hot and cold medicinal Waters, Baths, proper Exercise, fetid Gums and Medicines, such as Asa Fœtida, Sagapnum, Opoponax and Castor, which when exhibited alone in the Form of Pills, or rather with Purgatives, such as corrected Aloes, or the Extracts of Rhubarb and black Hellebore, or mixed with Myrrh and Saffron, and frequently tho' moderately used, surprizingly allay the Spasms, corroborate the Tone of the nervous Parts, and colliquate and gently evacuate the viscid Humours.

In Disorders of the Head, and especially of the Nerves, which proceed from a Weakness of the Brain, and a languid feeble State of the whole nervous System, such as an Hemiplegy, a Palsy, a Diminution of the Senses, a Torpor and Stupor of the animal Functions, a Difficulty of Hearing, a Ringing of the Ears, a Syncope, a Vertigo, a Weakness of the Stomach and Intestines, as also a Diarrhœa and Vomiting, I have found no more infallible and instantaneous Specific than my Balsam of Life, prepared of genuine cephalic and aromatic Oils, and used both internally and externally.

Besides, for Madness, whether of the furious or melancholic Kind, not only Venesection, but, also, the Use of hot and cold medicinal Waters and Emetics are celebrated as Specifics. The Ancients, and *Hippocrates* himself, for this Purpose principally used white Hellebore, the Virulence of which, according to *Prosper Alpinus*, in *Med. Method.* they corrected by Boiling it with Oil or Oxymel, and giving the Patient a large Quantity of Milk before its Exhibition. But this Practice is now obsolete, perhaps, because the Moderns are ignorant of the Method of collecting and exhibiting Hellebore. See *Schulzei Dissert. de Helleborismis veterum*. Nor is it to be doubted but Hellebore is a Specific in Deliriums and Madness, especially if its Operation is assisted by Venesection and Baths of sweet Water, which are beneficial in all Disorders of this

Kind. But in Madness arising rather from the Exorbitance of Passion, than an Obstruction of the Hypochondria, Asses Milk, Nitre, and Asses Blood dried and reduced to a Powder, are excellent Demulcents, greatly allay the excessive Strictures of the nervous Fibres, and in the Beginning of the Disorder, produce happy Effects, especially if the Patient changes his Climate, and avoids every Occasion of Passion.

The more terrible and frightful an Epilepsy is, the more sollicitous Physicians have been about Remedies to remove it ; and certainly there are many Specifics extolled for this Purpose ; but I believe none are better, or more infallible, than the Powder of Earth-Worms, Cinnabar, the Powder of human Secundines, the Shavings of the human Cranium, the Elks Hoof, and human Skin. But as these are proper in an idiopathic and chronical Epilepsy, so in that of the symptomatic Kind, nothing is more efficacious than my anodyne Mineral Liquor, which greatly alleviates epileptic Fits.

When in an Asthma the vesicular and vascular Compages of the Lungs is obstructed, and infarcted with a viscid Phlegm, Gum Ammoniac, Saffron, Peruvian Balsam, and Opoponax, either reduced to Pills, or made into an Essence with Tincture of Tartar, are of all others the best Specifics : But when the Lungs are affected with any Phthisical Disorder, the best Specific is Asses Milk, either alone or mixed with the *Selteran* Waters, which are highly beneficial in Disorders of the Lungs. This Intention is, also, answered by pure distilled Sulphur, especially if dissolved with the Fat of Animals, such as Human Fat, or the recent Fat of a Dog ; as, also, with Sperma Ceti, adding, in order to corroborate the Stomach, a few Drops of the Balsam of Capivi, or of the Oils of Sassafras Wood and Fennel ; for such is the Nature of Sulphur, that it not only strengthens the languid Parts, but, also, dissolves and discusses the viscid Juices, by which means it is highly beneficial in Disorders of the Lungs, such as Exulcerations, Tubercles, and Vomica, arising from a Stagnation and Condensation of a viscid, caseous, and mucilaginous Humour precipitated from the Chyle.

Besides a Phthisis, Dropsies are reckoned among the most dangerous and hardly curable Diseases. But if they admit of a Cure, Elaterum was by the Ancients extolled as a Specific for this purpose ; because, when duly exhibited, it carries the Waters off both by Vomit and Stool. And if the Body is duly prepared, the Humors render'd fluid, and Emollients exhibited both before and during its Use, it is of all other Medicines the most efficacious. But as the Waters are, also, evacuated by Urine, this Intention, if the Waters are disposed for such an Excretion, is excellently answered by the Powder of Cantharides, mixed with Salt of Tartar, adding, in order to prevent any Inflammation, a few Grains of depurated Nitre, and one Grain of Camphire. The Jaundice is also, frequently, a very obstinate Disease ; but besides Emetics which act powerfully on the biliary Ducts, Rhubarb, the Roots of Turmeric and Madder, especially if boiled in Water and Wine with the Addition of Nitre and Salt of Tartar, are found very efficacious in this Disorder ; an Infusion of the middle Bark of Elder, unless the Patient is too much weakened, is, also, useful, by colliquating the viscid Bile, and expelling the small-Stones from the biliary Ducts.

In a calculous State of the Kidneys, the best Specific is an Infusion of the Tops of Yarrow long and frequently used. Nor is a singular and specific Virtue to be denied to dried Strawberries, Winter-Cherries, Hounds-Tongue, Carrot-Seeds, and especially the Bark of the Egyptian Thorn-Root, if either infused in Water or taken in weak Geneva ; for in these Substances there is a traumatic, gently balsamic, and subastringent Quality, by which they corroborate the weakened Tone of the renal Duct, and conglutinate and cure the exulcerated, and, in some measure, dissolved Substance of the Kidneys. Bitter Almonds, on account of their anodyne Oil, and Oil of sweet Almonds, are excellent demulcent and mitigating Medicines under the Paroxysm.

The Diseases peculiar to Women from some Disorder of the Uterus, especially an irregular State of the *Menses* or *Lechia*, are most commodiously treated with corrected Aloes, Myrrh, Saffron, Amber, round Birthwort duly reduced into Pills ; for which reason the *Pilula Berberiana*, and others composed in the same manner, have acquired so great a Character. In Men the Irregularities of the hæmorrhoidal Discharge are corrected by Manna and an Infusion of the Tops of Yarrow, because this Plant contains a subtile Oil, which alleviates Spasms, and with respect to its Smell, Taste, and especially its bluish Colour, greatly resembles the Oil of Camomile.

A Dysentery, which is contagious, weakens the Patient by numberless Stools, and often proves mortal, is not removed by Medicines appropriated to ordinary Fluxes, but by certain Specifics peculiar to itself. Thus 'tis certain from Experience, that Ipecacuanha is of all other Medicines the most powerful

ful Antidysenteric, if exhibited once, twice, or thrice, in due Doses, in the Beginning of the Disorder. Then afterwards other Things capable of obtunding Acrimony, mild Diaphoretics and Correctors internally and externally, as also Rhubarb as the best Laxative are to be used; but the Cascarella Bark is the best Specific for corroborating the flaccid Fibres of the Intestines, and checking their irregular Motions.

Terrible Symptoms are sometimes excited by Worms in the Intestines, for the Extirpation of which there are various Specifics, by the Greeks called Anthelmintics. And though there are numberless Medicines extolled for this purpose, they are not all equally efficacious, the best, however, are *Asa foetida* and *Sagapenum*, especially when reduced to the Form of Pills, with Purgatives, such as *Mercurius Dulcis* and Extract of Rhubarb. Only 'tis to be observed that both before and after the Exhibition of such Pills, the Patient is to take a few Spoonfuls of the Oil of Olives or sweet Almonds, which, like all other oleous Substances, are highly offensive to the Worms, and sooth the intestinal Fibres spasmodically affected by the Corrosion of the Worms, whose Discharge by Stool they procure; for *Asa foetida* and *Sagapenum*, by their ungrateful Smell, kill the Worms as effectually as we know from Experience Garlick does. The Seeds, also, of Worm-seeds, and the Herb Tansey, are successfully exhibited against Worms, but they operate in no other manner than by resisting the putridinous Colluvies, which impairs the Strength, and induces a slow Heat and Languor; whilst, at the same time, by corroborating the Tone of the Intestines, they facilitate the Expulsion of the Worms.

Violent Hemorrhages, from whatever Part, require speedy Relief, and efficacious Remedies, lest terrible Symptoms should ensue. In Cases, therefore, of this Nature, nothing is more efficacious than Nitre dissolved in common Water, and successively applied; and in order to prevent a fresh Hemorrhage, the Powder of the Tooth of the Sea-horse is to be frequently used. Six or eight Grains of the *Pilula de Cynoglossa* may, also, be exhibited with Success; and the Oil and Seeds of Henbane, by their narcotic Quality, obtund the exquisite Sense of the Solids, and by that means hinder the Spasms from solliciting the Blood to a certain Part, where it might be discharged. In seminal Fluxes, especially of the virulent Kind, there is not a more powerful Specific than Venice Turpentine, and its ætherial Oil; or in their stead, the Balsam of Capivi, or that of Mecha, which, after the Use of Purgatives, especially of the mercurial kind, produce excellent Effects, either with or without Camphire, if exhibited either in an Emulsion of the four cold Seeds, Milk or Whey.

In no Disorder is the Impurity of the Humours greater than in the Scurvy, which is principally endemial, arises from bad Aliments, a cold and moist Air, and is increased by a sedentary Life, and especially by Grief. But a long Course of Experience has found the most powerful Specifics for this Disorder to be Marsh-Mallows, Scurvy-Grass, Beccabunga, Cresses and wild Raddish-Root; the Effects of which will be more conspicuous and infallible if their expressed Juices are drank with sweet Whey or Goats-Milk, and the Patient's Body duly prepared for such a Course. But in inveterate Scurvies, accompanied with Pains, I have known singular Relief afforded, by drinking for some time a Decoction of Pine Cones, with an Addition of the Marrow taken from the Bones of Beef and Veal.

A Lues Venerea can hardly be totally exterminated from its latent Recesses, without the Assistance of Specifics, the most powerful of which are Quicksilver, Guajacum and its Bark, and duly prepared Antimony; for there is not in the whole *Materia Medica* a Medicine which so powerfully moves the whole Mass of Lymph and Humours, and excites so copious a Discharge of the Saliva, which is frequently continued for some Weeks, as Mercury, which when conveyed into the Body, by the specific Gravity of its Molecules, which is greater than that of the human Juices, penetrates into the internal Parts of the Body; and passing with Force thro' the smallest Ducts, removes Obstructions in them. It, also, totally changes the Crasis of the Fluids, and, by a certain intestine Motion, induces, as it were, a putridinous Colluviation of them, and by this means, tho' not without some Trouble and Danger, removes the Lues Venerea and other obstinate chronical Disorders arising from an Impurity of the Serum. The softest Mercurial used for exciting a Salivation is *Mercurius Dulcis*, joined with Absorbents, and exhibited for some Days, ascending gradually from five to twelve Grains, till the Saliva begins to flow copiously, and observing at the same time a proper dietetic Regimen. Guajacum, by the subtle, acrid and resinous Salt with which it impregnates the Water in which it is boiled, vellicates the Fibres and Coats of the Vessels, and increases the Circulation of the whole Mass of Humours and Lymph, by which means the viscid Juices are resolved, and the Obstructions removed.

For a malignant Leprosy, Herpes, Itch, and other Defecations and Exulcerations of the Skin, the best Specifics are Preparations and Decoctions of Vipers, Antimony, and especially its diaphoretic Sulphur. The *Plica Polonica*, stopping or preposterously cut off, produces violent Symptoms, for removing which no better Specific is as yet found than a Decoction of the Herb and Seeds of Club-moss, with which the Head is to be often washed; for, by this means, the viscid excrementitious Serum, so much indisposing the Brain and Head, is safely eliminated through the Hairs and Pores of the Skin with which the Cranium is covered. If the Eyes are afflicted with a saltish Defluxion, accompanied with Redness, as in an Epiphora, and if, especially in the Night-time, the Eyelids are conglutinated by a viscid Humor, a Grain of white Vitriol, mixed with fresh Butter, and put upon the larger Orbit of the Eye, affords surprising Relief, and quickly removes the Disorder. Pellicles of the Eyes, intercepting Sight, are quickly removed by dropping the recent Fat of Vipers into the Eye, and a beginning *Gutta Serena* is excellently discussed by Sulphur of Antimony taken internally.

When any Parts are afflicted with Contractions or Rigidity, nothing affords more instantaneous Relief, than frequently putting them into recently opened, and as yet warm Animals, by which mild oleous and natural Warmth, the tense and rigid Fibres are excellently relaxed. When after a Fall, or a violent Contusion or Blow on the external Parts, Stagnations and Concretions of the Blood and Humors produce various untoward Symptoms, a Decoction or Infusion of German Leopards-Bane almost compleats the Cure, on account of its singular inciding, resolvent and discutient Quality.

When treating of Specifics, we must mention Asses Milk, so much extolled by the Antients as highly conducive to Health and Longevity. But with respect to this, the Reader may consult the Article LAC, and *Patinus*, in *Tom. 2. Epistolar.*

These are the most select and approved Specifics in all the *Materia Medica*. But 'tis to be observed, that they are not possessed of absolute, but of relative Virtues, and that their Success depends upon certain limited Conditions and Circumstances, which ought to be duly adverted to in using them. Besides, tho' these Remedies are of singular Use when rightly used, they are, nevertheless, of no manner of service, unless the Body is properly prepared for them, and the Obstacles which might impair or hinder their Operation removed. Thus when there is a Redundance of Blood, and the *Primæ Viæ* are overcharged with Sordes, Venesection must be used, and the Stomach and Intestines freed from the Load of crude, bilious, and excrementitious Sordes, before Specifics can be of any Service.

Nor is it to be thought that when Specifics are used, there is no Necessity for other external and internal Medicines, capable of correcting and evacuating the peccant Humours: For Specifics do not so much affect the peccant Matter as the Motion of the Solids and Fluids, which they assist by reducing it to its natural State; and this they perform best when after the material mortific Causes are removed, and the peccant State of the Humours corrected by Medicines of a temperating, resolvent, discutient, and deobstruent Quality, they are exhibited in a due Dose, at a proper Season, and in a laudable manner. In a particular manner, we are to take Care that the *Primæ Viæ* be free from impure and viscid Juices, by which the Force of the Medicine is greatly obtunded, or totally suffocated: Whereas, when these are cleansed, the Texture of the Medicine remains entire, and produces its desired Effect on the nervous Substance of the Stomach and Intestines; as is obvious with respect to Emetics, Purgatives, Opiates, Analeptics, and all other Substances, small Quantities of which produce considerable Effects.

Lastly, with respect to Specifics, the Physician ought to know not only the Time and Dose in which they are to be exhibited, but, also, how long they are to be used, and what Regimen and Method of Living is most proper for the Patient; for that Method of Cure which consists only in the Prudence and Judgment of the Physician, and his diligent Attention and Observation of the Constitution of the Patient, is of so great Importance to the desired Effect, that it is preferable to the Use of Specifics alone: And without such an Observation and Attention to the State and Constitution of the Patient, he will find the best of Medicines fail, and cannot properly be said to understand his Profession. He who duly considers what has been said, will see how far Art is necessary for the Cure of Diseases. *Frederic Hoffman.*

SPECILLUM. A Probe. *Specilla*, also, sometimes imports Pledgets, or Tents.

SPECULARIS LAPIS. Offic. Boet. 397. Kentm. 26. Mont. Exot. 14. Schrod. 356. Worm. Mus. 56. *Lapis specularis*

cularis Neatericis, Charlt. Foss. 23. *Glacies Mariae*, seu *Lapis Specularius*, Koning. MUSCOVY-GLASS.

It is a foffile Stone, refembling Crystal, transparent, and dividible into very thin *Laminae*. It is erroneously fupposed, fays the learned *P. Amman*, to be the *Glacies Mariae*, [the Virgin *Mary's* Looking-Glaf] as it was formerly believed to be the *Apbrofeline*, or *Selenites*: For both Opinions are fabulous; the first, becaufe it is uncertain whether the Virgin *Mary* ever made use of fuch a Glaf; and the laft, becaufe it neither contains the Image of the Moon, nor increafes or decreafes as that Planet does. We have it imported from *Muscovy*, *Spain*, and other Parts; and it is of Ufe in Surgery, in the Cure of fordid Ulcers. It is of Service, alfo, in difficult Labour, and is an Arcanum againft the Epilepfy; and is, alfo, reckoned among Cosmetics.

SPECULUM. A Probe; or an Instrument for dilating the natural Passages, or Cavities. Thus there are the *Speculum Ani*, represented Tab. 55. Fig. 15. The *Speculum Oculi*, Tab. 38. Fig. 15. and 16. The *Speculum Oris*, Tab. 41. Fig. 11. and 12. And the *Speculum Uteri*, of which there are many Sorts described by Authors.

The *Tunica Aranea* of the Eye is called *Speculum*. *Speculum Citrinum* is yellow Arfenic; *Speculum Album*, white Arfenic.

SPECULUM INDICUM, is Filings of Iron. *Rulandus*.

SPELTA. See *ZEA*.

SPELTRUM. Speltre; the Name by which Mechanics call Zink. See *ZINCHUM*.

SPERAGUS. According to *Blancard*, the same as *ASPARAGUS*.

SPERGULA. A Name for feveral Species of *ALSINE*, which fee.

SPERMA CETI. *Parmacitty*. See *BALÆNA*.

The *Emplastrum de Spermate Ceti* is thus prepared:

Take of White Wax, four Ounces; *Sperma Ceti*, two Ounces; Galbanum diffolved in Vinegar, ftrained and boiled, an Ounce. Mix and make a Plaifter, according to Art.

This Plaifter is esteemed an Emollient, and is much recommended as an Application to the Breasts, to prevent their growing hard, and the Milk from coagulating therein. It is, alfo, faid to be good for ftrumous Swellings.

SPERMATICOS. *σπερματικός*. Spermatic. An Epithet for the Organs of Generation, and the refpective Parts thereof.

SPERMATOCELE. A Species of *Hernia*, confifting in a Tumor of the Spermatic Veffels; a Diforder frequently confequent to a humoral *Hernia*, or venereal Swelling of the Testicles.

SPERMATOPÆA. Medicines which increafe the Seminal Juices.

SPERNIOLA, or **SPERNIOLUM.** Frogs Spawn. *Rulandus*.

SPHACELUS, in Botany, is a Name for the *Scordium Alterum*; five *saliva Agrestis*.

SPHACELUS. *σφακελος*, or *σφακελισμός*. A Sphacelation. See *GANGRÆNA*.

The Terms *σφακελος*, *σφακελισμός*, *σφακελίζω*, *σφακελίζομαι*, have various Significations in *Hippocrates*; sometimes they mean a Sideration and Corruption peculiarly of a Bone, as 7 *Aph.* 79. and in feveral Places, and *Lib. de Traët.* where we read, for instance, *ἐν τῷ κέντρῳ σφακελισμὸς τὸ ὅτι τὸ τῆς πτέρης*, "and thus the Bone of the Heel is in danger of Sideration." They bear the same Sense in many Places of the Book *de Artic.* And this Exposition of the Words is warranted by *Galen*, who, in his Comment on 7 *Aph.* 50. fays, *τὸ σφακελίζω μὴ αἷς πολλὰκις ἔρχεται ἐν τῷ περὶ ἀρθρῶν καὶ ἀρθρῶν ἐπὶ τῷ διαφθίσεσθαι τὸτομα φέρον*, "the Word *σφακελίζω* [to be afflicted with a Sphacelus] is often used in the Books *de Fraët.* and *de Artic.* "for *διαφθίσεσθαι* [to be corrupted.]" *Celsus* uses the Verb *vitiari* in the same Sense concerning a Bone; for instance, *Lib. 8. Cap. 9.* where we read, *Omnia mora vitanda erit, ne Os infra vitiatur*, "All Delays are to be avoided, leaft the Bone underneath fhould be corrupted." But these Words are fpoken, alfo, in general, of the Sideration and Corruption of any Part, whether Flefh, Nerves, or Bones, as *Galen* writes in many Places, and efpecially, *Com. 2. in Lib. de Fraët.* where he fays, *τὸ ὅτι τῆς ὀστέας ἐκείνης μὲν φθόρος, &c.* "The Antients call the Corruption of the whole Substance of any Part a Sphacelus; but to exprefs a Corruption of the fleshy Parts, they use other Words; for which reason he (*Hippocrates*) usually calls the Flefh, in fuch a Cafe, *σάπρις*, μὴ δὲ σαπρὴν, *σπερματικός*. [*Sapran*, *Mydofan*, *Sepomenen*, Words importing Putrefaction] and by other like Names; but when he fpeaks of a Corruption of the whole Substance of the

Bone, he uses the Word *σφακελος*, which Affection is occasioned by a Conversion of the adjacent Flefh into virious Ichos [or Sanies] which by their Irrigation corrupt the Bone." The same Author, *Lib. de Tumor.* has these Words, "I call, fays he, by the Name *σφακελος*, every Corruption of the solid Parts, as well what happens to the Bones as to the Flefh and Veffels;" and he there makes a Gangrene a Species of *Sphacelus*. Agreeable hereto, *σφακελος*, in *Exeg.* is expounded *ὅτι πᾶσα καὶ ὁ αἷς γίγνεται τρέπον*, "every Corruption, after what manner foever it happens." The same Author, *Comm. in 7 Aphorism.* 50. exprefly tells us, that *σφακελος* is sometimes taken for a Sideration or Corruption of a Part which tends to Destruction, but is not yet a confirmed Gangrene; and more he fays to the same purpose, *Com. 4. in Lib. de Art.* where, tho' he distinguishes a *Sphacelus* from a Gangrene, yet, becaufe of their Vicinity, he acknowledges the Words are sometimes erroneously used by Physicians. In this universal Sense, I think, is to be understood the *σφακελος ἱερφακίς*, "the Sphacelus of the Brain," *Lib. 2. de Morb.* the *σφακελισμός ἱερφακίς*, in the second and third Book, and the *σφακελίζομαι ὁ ἱερφακίς*, *Lib. 2.* in two Places; and *σφακελίζομαι ἱερφακίς*, in the same Book; *σφακελος τὸ ἱερφακίς*, *Lib. de Aer. Aqu. & Loc.* *ἐκείνου σφακελισμὸς ὁ ἱερφακίς*, 7 *Aph.* 50. and *ἱερφακίς σφακελισμός*, *Coac.* 187. So that a *σφακελος*, Sphacelus, of the Brain is fo called, when the Brain, from any Cause whatsoever, is fo far corrupted as to be in danger of a Sphacelus. And by *κεφαλῆς σφακελος*, 7 *Epid.* we are to understand an Inflammation of the Head, or fuch a Diforder as threatens a Sphacelus, or a very intense Pain of the Head which naturally tends to the Destruction of the Patient in an acute Fever. Thus again is the *σφακελισμός ἱερφακίς*, of *Archigenes* expounded by *Galen*, *Lib. 2. de Loc. Affet.* of those who have fo intense a Pain, or fo violent an Inflammation on one Side of the Head, as to be in imminent Danger of a Sphacelus. Agreeably to this Sense, *Hefychius* expounds *σφακελος* by *ἄμετρος ἔδωρ*, "an immoderate Pain;" and *Varinus* expounds *σφακελίζω* by *ἀλγὺν μετὰ σπασμῷ*, "to be affected with convulsive Pains." *Pliny*, alfo, *Lib. 17. Cap. 24.* expounds the *σφακελισμός* of the Trees in *Theophrastus*, *Hift. Plant. Lib. 4. Cap. 16.* by *Dolor Membrorum*, "a Pain in the Members," or Branches; and *σφακελίζω*, in *Hefychius*, is *ἐδνῆσαι καὶ ἀλγῆσαι*, [Verbs importing Pain.] These various Senses of the Word *σφακελος* were known to *Galen*, as appears, *Lib. 2. de Loc. Affet.* where he fays, "All are not agreed as to the Signification of this Word *σφακελος*; for some understand by it a violent Pain, others an Inflammation in fo high a Degree as to create Danger of a Corruption of the Part, which some call a Gangrene. Some call a Corruption of the Part itself *σφακελος*; others *σπασμός* [a Convulsion]; others, again, give the Name of *σπασμός*; not to Corruption in general, but only to what proceeds from an Inflammation of nervous Bodies. Some understand it not of a *σπασμός* actually present, but what is expected from the Greatness of the Inflammation; some call it a strong Tension, others a Putrefaction. The *σφακελισμός* *νῆρος καὶ ὀστέας*, "Sphacelismus of the Nerve and Bone," in Wounds, *Prorrh.* 2. seems to be expreffed in *Celsus*, *Lib. 5. Cap. 26.* by *Nervi Resolutio*, "a Resolution of the Nerves." In much the same Sense are we to understand *ὁδὸς σφακελισμός*, "a Sphacelism of a Tooth," *Coac.* 236. *σφακελισμός* *τῆς γνάθου*, "a Sphacelism of the Cheek," *Lib. 5. Epist.* *σφακελισμός* *στομάχου*, "a Sphacelism of the Jaw," from a Tubercle and Abscess, 7 *Epid.* and *ὀσχεὶς ἱερφακίς*, "the Os Ichium was affected with a Sphacelus," from a Luxation, "that is, dead and withered," 5 *Epid.* ὁ πῦρ *ἱερφακίς*, "the Foot was affected with a Sphacelus;" and *πῦρ σφακελισμός*, "a Sphacelism of the Cubit," from a Fall, *Lib. eodem.* There is alfo a *σφακελος* which proceeds from an Inflammation of the Part, *Lib. de Ulcer.* We are told, alfo, by *Galen*, *Com. 4. in Lib. de Art.* and *Com. in 7 Aph.* 50. that *σφακελος* is taken for an incipient Gangrene; in which Sense is to be understood that Passage, 1 *Epid.* *ὅσα σφακελίζω ἀπολαβῆσα τῆς φρένας ἐκείνου καὶ ἱερῆσαι*, "Where Things tend to a Sphacelus, the Veffels are to be cut, a Wound made, and the Cure thus effected." Here the Author plainly gives Directions how to manage an incipient Corruption, or a Gangrene not yet confirmed.

SPHACERUS. *σφακερος*, in *Galen's Exegesis*, is a Word afcribed to *Hippocrates*, for which he quotes a Passage in the Additions to the Book *de Cap. Vulner.* but observes, at the same time, that most Copies read *σφακελος*. *Fæsius* here reads *σφακελος* for *σφακερος*, and fo the Passage quoted will read *κεφαλὴν δὲ καὶ σφακελος τὸ ἦν*, "If there be a Pain of the Head, and a Sphacelus;" whence he infers, that the Word *σφακερος*, in the *Exegesis*, is put for *σφακελος*. What Additions there were to the Book *de Cap. Vulner.* in *Galen's* Time, is not easy to be known; at present there are none remaining but those which relate to the Book *de Aer.* *Lois & Aquis.*

SPHÆNOIDES OS. The Sphænoide, or Cuneiform Bone; from *σφαῖρα*, a Wedge. See **CAPUT**.

SPHÆNOPALATINUS. The Name of a Muscle of the **UVULA**, which see.

SPHÆRION. *σφαῖρα*. A Pill.

SPHÆRISTICA, *five Pila Ludus*, is a Species of gymnastic Exercises performed with a Ball. Of the *Sphæristica*, there were four Kinds in Use among the *Greeks*, which were those with the *little Ball*, the *great Ball*, the *empty Ball*, and the *Corycus*; which last *Mercurialis* reckons among the *Balls*, tho' *Galen*, *Oribasius*, and *Paulus* make it a distinct Thing, because it was, as he says, a *Ball*, or at least something like it, as will appear from the Description below.

The Exercise with the *Ball*, says *Oribasius* from *Antyllus*, induces a greater Promptness to Motion, and strengthens the vital Actions. Of the Exercise with the *little Ball* there were three Kinds: The first was with a *Ball* of a very small Size, in which the Parties held their Bodies very erect, and played with their Hands at a very near distance. This Exercise was very beneficial to the Legs, which were kept very much upon the Stretch all the Time; it was, also, good for the Back, the short Ribs, and Arms, and rendered the Flesh solid.

The second *Ludus parvæ Pila* was with a *Ball* a little bigger than the former; in this they intermingled Arms, but kept off with their Bodies, held their Heads erect, and mov'd in various manners, to this Side, or to that Side, according to the Direction of the *Ball*. This, says *Oribasius*, is the best and most salutary Exercise performed with the *Ball*, rendering the Body not only healthy and prompt to Motion, but robust and vigorous, giving a Person a firm Look, and not loading the Head.

The third Exercise of this Nature, was with a *Ball* of a larger Size than the two former. In this one Party stood while the other moved; the first gave the *Ball* a violent Stroke, which sent it to a great Distance, in which Action there accrues some Benefit to the Arms and Eyes, while the other Party, who is in Motion, is the better for it, not only in the fore-mentioned Respects, but, also, in his Legs on account of Running, and in the Spine of the Back, because of the Inflexions he makes while he runs. And these are the three Exercises with the *little Ball*.

The Exercise with the *great Ball* differed from the former, not only with respect to the Size of the *Ball*, but the Position of the Hands; for all the former were played or performed with the Hands always below the Shoulders, but in this they held their Hands above their Heads, and sometimes moved on Tiptoe, that they might reach the higher; and sometimes vaulted, that they might catch the *Ball* when it flew over their Heads. This Exercise procured Firmness to the whole Body, and was particularly good for the Body, as it drew the Humours downwards. But if the *Ball* be of above a moderate Size, as some there are which require both Hands to throw them, it strengthens, indeed, the Arms in discharging it; but then it gives severe Strokes, and is improper for those who are sick, or upon the Recovery; and not good for Persons in Health.

This Account of the *Ludus parvæ & magnæ Pila*, or the Exercises of the *little* and *great Ball* is found in *Oribasius*, *Med. Col. Lib. 6. Cap. 32.* taken from *Antyllus*. In the *Ludus parvæ Pila* the Philosophers *Epigenes* and *Ctesibius* of *Chalkis*, are said to have excelled: And besides the three Kinds above described, *Pollux* mentions the *Aporraxis* and *Urania*, in which they reclined their Bodies, and threw the *Ball* directly upwards, and intercepted its falling to the Ground.

Among the Kinds of *Parvæ Pila*, *Mercurialis* reckons, also, what, in *Athenæus*, is called *ἀγρᾶν*, *Harpastum*, and *πένινδα*, both because the *Harpastum* is described by *Galen*, in his Book *de Ludis parvæ Pila*, among other Plays of that Kind, and because *Clemens Alexandrinus* makes the *Péninda*, which *Pollux* makes to be the same with the *ἀγρᾶν*, a kind of Play with the *parvæ Pila*. Of the Nature of this Exercise, see below.

As to the *empty Ball*, we have no clear Notion of it, says *Mercurialis*; but if we may be allowed to conjecture from the Words of *Antyllus*, in the Chapter of *Oribasius* above quoted, we may suppose it to be like the rest, sewed up with Leather, but full of nothing but Air or Wind; whereas the others were stuffed with Feathers, or some other Matter. Thus *Mercurialis*; to which we may add from *Antyllus*, that the *empty Ball* was, also, called a *Follicle*, and gave the Party as much Exercise of Motion and Running as the third kind of *Ludus parvæ Pila*, to those who played the moving Part, but was unfizeable and clumsy, and difficult to be managed.

The *Corycus*, and the manner of Exercise with it, is described by *Oribasius* from *Antyllus*, as *Mercurialis* took it from a Copy in the *Vatican Library*, in the following manner:

"The *Corycus* for weak Bodies, who chuse that Exercise, is stuffed with Figs or Floor, but for those of a robust Habit with Sand. The Size of it is accommodated to the Age and Strength; and it is hung to the Roof of the *Gymnasium*, with its Bottom as high above the Floor, as is the Navel of the Person who is to exercise it. The Party takes the *Corycus* in both Hands, and heaves and shoves it, first gently, afterwards with greater Force, so as to follow it when it recedes, and to give way when it returns, as being compelled by its Violence, till at length he discharges it out of his Hands with a Spring, that it may recur with the more Violence on the opposed Body. At last, after many Recourses, he restores it by Degrees to its first Situation and Rest, obviating its Returns, and breaking the Shock sometimes with the Hands protended, sometimes with the Hands upon the Breast, and sometimes with the Breast alone, the Hands being cast behind the Back." From this Passage of *Antyllus* we have good Reason to conjecture, that the *Corycus* was spherical, or at least of a roundish Figure; for if it had been angular, it could not have thus struck upon the Breast and Hands without hurting those Parts. What follows is from *Mercurialis*.

There were, also, four kinds of *Balls* in Use among the *Latins*, which they called the *Follis*, the *Trigonalis*, the *Paganica*, and the *Harpastus*, which some will have to be all comprehended by *Cælius Aurelianus* under the Name of *Italica Sphæra*.

The *Follis* was a great *Ball* made of Leather, and full of nothing but Wind; if it were of a larger Size, it was impelled with the Arm, and was then sometimes simply called *Pila*; and from the Figures in some Coins of the Emperor *Gordian* the third, we may conjecture that every one of the Players had his own *Pila*. If the *Ball*, or *Pila*, were of a lesser Size, it was thrown out of the Hand, and was called a *Follis pugillaris*, as in that of *Plautus's Rudens*, *Extemplo hercle ego te Follem pugillatorium faciam*. And I believe it was sometimes called *Folliculus*, as by *Suetonius* in the Life of *Augustus*, who, he says, took great Delight in playing with it.

The *Pila Trigonalis* was a *little Ball*, and had its Name, as some think, from the Place where it was used, which they suppose to be triangular, but more probably from the Number, Figure, and Situation of the Players. This was sometimes simply called *Follis*, as in that of *Martial*.

Non Pila, non Follis, non te Paganica Thermis
Præparat — — — — —

Non Harpasta vagus pulverulenta rapis.

For if there are only four Kinds of the *Pila*, and the other three are named, the *Pila trigonalis* must here come under the simple Denomination of *Pila*. And I suppose *Celsus* to speak in the same manner, where he says, *Ab alvo citata vexatis Pilam, et reliqua superiores Partes exercitia convenire*. "For those who are molested with a Looseness, the *Pila*, and other Diversions which exercise the upper Parts, are proper." For in this Play the lower Parts remained at rest, while the upper Parts were in continual Agitation, the Players, as we gather from *Martial*, being placed in a triangular Situation, in such a manner as to receive the *Ball* sometimes from the Right, and sometimes from the Left, and always to preserve it from falling to the Ground.

The *Pila Paganica* was so called because it was very common, and used in the Country-Villages called *Pagi*, or in the *Pagi* of the City, which, according to *Dionysius Halicarnassus*, was formerly divided into four Tribes, which were, also, called *Pagi*, and the Inhabitants *Pagani*. This *Pila* was made of Leather, stuffed with Feathers, broader than the *Trigonalis*, and harder than the *Follis*. That this, among the rest, was used in the *Gymnasium*, appears from the Verses of *Martial*, and it was the Custom of the *Romans*, immediately after exercising themselves with the *Pila*, to go into the Bath.

The fourth and last *Pila* of the *Latins* was the *Harpastum*, which from the Name seems to be the same as the *ἀγρᾶν* of the *Greeks* beforementioned. This was a *Ball* which they snatched or wrested one from another; but the Size or Materials are unknown; only it appears from *Athenæus* to have been of a round Figure, though it was probably of Leather like the rest, the Descriptions of all which are omitted by Authors because they were known to every Body in their Time. *Galen*, however, who gives the best Account of it, in his Book before-mentioned, shews it to be a *little Ball*, and not one of a middle Size, as some will have it; whence the Play now called *Foot-Ball*, tho' in some Particulars it resembles that with the *Harpastum*, yet differs from it in the Size of the *Balls*, our *Foot-ball* much exceeding the

Harpastum of the Ancients in Bigness. The Exercise of the *Harpastum* appears, from the before-cited Verse of *Martial*, and other Passages, to have been very laborious and quite improper for Women; and therefore I used to wonder why *Caelius Aurelianus* advises the Nurses of epileptic Children to exercise themselves at playing with the *Sphæra*, or at some kind of Dancing, unless we suppose him to mean by the *Sphæra* the same as the *Follis*, which was used by Children, as well as infirm and aged Persons, as appears from the following Verse of *Martial*.

Folle decet pueros ludere. Folle senes.

Besides what has been said of the good Effects of the Exercise of the *Pila*, we may observe that *Galen* and *Paulus* reckon the Use of the *Parva Pila* among those Kinds of quick Motion, which are not attended with Violence, but have a Virtue of attenuating gross Particles. And I suppose, that *Trallian* had the Play with the *Pila Magna* in view, when, in the Cure of the *Priapismus*, he recommends the Exercise of the *Sphæra*, by which the peccant Matter is diverted to different Parts, and the flatulent Spirit is digested. *Aretæus* was of opinion that the Exercise both of the little and great Ball were bad for vertiginous Persons, because the Circumvolutions and Strainings of the Head and Eyes were subject to produce a Vertigo. *Paulus* reckons that of the *Corycus* among quick Exercises, which having a Virtue, as we said, of attenuating gross Particles, *Caelius Aurelianus* had very good reason to prescribe the Exercise which the Greeks, as he says, call *Corycomachia*, in a *Polysarchia*, or too corpulent a Habit of Body; and *Hippocrates*, *Lib. 2. de Diæt.* that the *Corycomachia*, and the *Chronomia*, will have the same Effects as the *Acrocheiria* [a Sort of Wrestling at Arms-length.] *Antyllus* supposes the Exercise of the *Corycus* to render the Body muscous and robust, and to be adapted to the whole Body, and to all Parts of the Viscera, on account of the Blows to which it exposes the Party. *Aretæus*, also, recommends the *Corycobolia* in an *Elephantiasis*. But if we consider the Blows which are usually received from the *Corycus* on the Breast, we shall be convinced that it must be dangerous for those who are of an infirm Breast to use that Exercise, and that it may possibly produce a Rupture of the Vessels of the Thorax.

Having thus spoken of the good or bad Effects of the Use of the several Kinds of the *Grecian Pila* with respect to Health, we proceed to the like Consideration of the *Latin* or *Roman Pila*, as distinguished into its several Kinds, which, as we have observed, were equal in Number to those of the other. And, in the first place, the Use of the *Follis* exercises the whole Body, and in a particular manner, when it is struck, the Arms and the Back; and strengthens those Parts; for which reason, I suppose, *Caelius Aurelianus* intends this Kind of *Pila*, when he advises epileptic Persons to exercise their Shoulders in playing with the *Sphæra*. When this Sort of Ball is thrown with the Hand, that Part indeed receives most Benefit; but, upon the whole, this kind of Exercise is good for the Viscera, and is of admirable Use in the Expulsion of Stones and Gravel from the Bladder and Kidneys. And therefore *Augustus*, I suppose, who was much subject to these Disorders, used to divert himself, as we are told by *Suetonius*, with the Exercise of the *Folliculus*; which, as it principally employs the superior Parts, is very judiciously advised by *Celsus*, to those who labour under a Flux in the Belly, or a Trembling of the Body. I imagine, also, this kind of Exercise to be meant by *Pliny the Younger*, when, in one of his Epistles, giving an Account of the manner of Living, and of the Regimen observed by *Spurina*, a very prudent Man, and very studious of his Health, he observes, that he exercised his Body with the *Pila*, and with that kind of Exercise used *cum Senectute pugnare*, "to struggle with old Age." So that there is a great deal of Truth in that Verse of *Martial* above quoted.

The *Pila trigenalis*, which was small, and answered to the third Species of the *Parva Pila* described by *Antyllus*, as before mentioned, produced the same Effects as that did; but in a particular manner, it exagitated and exercised the Eyes, which were always necessarily upon the Stretch, and turned sometimes this way, sometimes that way, now upwards, then downwards, but perpetually in Motion. *Horace*, therefore, had reason to say that this Kind of Exercise was bad for a Lippitude, as in the following Verse.

Namque Pila Lippis damnosum & ludere crudis.

It is certain that a Lippitude, or a lachrymous Disposition of the Eyes, are exasperated by the least Motion, but Rest comforts and refreshes them; and the same may be said with respect to those who are molested with Crudities; for it is a general Rule, "That no Exercise is to be undertaken before

"the Food be perfectly digested." But as for those who are molested with Flatulences in the Belly and Stomach, or Pains proceeding from Cold, the Exercise of the *Pila* is so far from being prejudicial, that it proves of very great Benefit, by heating them, and powerfully dissolving those Flatulences. *Caelius Aurelianus*, therefore, deserves Praise, for particularly recommending, among other Exercises, the Use of the *Pila* for the Cholic; and for the same Reason has *Celsus* commended it as proper for those who are of a weak Stomach.

The *Pila Paganica*, on account of its Breadth and Hardness, was difficult to be manag'd, and therefore more proper for Peasants, and those of hard and robust Bodies, than for Citizens, and such as are not inur'd to Labour. And it would be thought utterly unfit in these present Times, for old Men and Children, and those of a valetudinary Disposition of Body, to exercise themselves with this Kind of *Pila*.

The Use of the *Harpastum* is to be reckon'd among quick and violent Exercises, on which Account it may be said to attenuate, expel Excrements, increase Heat, strengthen the Body, and particularly the Arms and Shoulders: "And while they encounter together as *Galen de Ludo parvæ Pila* describes it) and strive to hinder one another, that the Person placed in the Middle might not receive the Ball, there arises a great and mighty Struggle, with much Collaring and Wrestling, by the first of which the Head and Neck, and by the other, the Sides, Thorax, and Belly, from such a Multitude of Liftings, Depressions, Throwings off, and Pushes with the Head, and other Ways of taking hold in use among Wrestlers, are extremely fatigued: The Loins, also, and the Legs, in such Kinds of Exercises are stretched in an extraordinary Manner." We may conclude, therefore, that as the *Harpastum* confirms more and more those who are found and robust, so it is very prejudicial to those who have a weak Head, or infirm Neck, some Defect in the Thorax, or have their Kidneys or Loins overheated. *Mercurialis de Arte Gymastica*.

SPHÆROCEPHALUS. The Name of a Species of *Carduus*, with round Heads, call'd *Carduus Erioccephalus*.

SPHÆROMATA. σφαῖρματα Carnous, round Protuberances of the Buttocks.

SPHAGE. σφαγή. The anterior Part of the Neck, or Throat. Hence,

SPHAGITIDES, The Jugular Veins.

SPHAGNUM. A Species of Mofs. See the Explication of botanick Terms, under the Article BOTANY.

SPHATULA FŒTIDA. The same as **SPATULA FŒTIDA**.

SPHENDAMNOS, according to *Blancard*, is a Name for the Maple.

SPHENDONE. σφινδων. A Sling, or a Bandage resembling a Sling; or a Woman's Girdle. *Galen. Exeges.*

SPHINCTER. A Name appropriated to many Muscles, which close the natural Passages. Thus there is the

SPHINCTER ANI. This is a large, thick, fleshy Muscle, encompassing the Anus; its Figure and Series of Fibres externally, immediately under the Skin, incline to an oblong Oval; it is connected forwards to the *Accelerator Urinæ*, backwards to the *Os Coccygis*: As it is continued farther upon the Body of the *Intestinum Rectum*, its Fibres are circular for near two Inches in Breadth. It is much larger in Man than in other Animals, in whom, by Reason of the erect Position of the Body, there is greater Force required to retain the Fæces, which is the Office of this Muscle. See *Tab. 14. Fig. 1. 5.* See **COELIA**.

The **SPHINCTER GULÆ**, is the **OESOPHAGÆUS**.

The **SPHINCTER LABIORUM**, is the same as the *Constrictor Labiorum*. See **CAPUT**.

SPHINCTER VAGINÆ. This lies immediately under the Clitoris, encompassing the Vagina with circular Fibres, three Fingers in Breadth: In some Subjects, it scarcely appears fleshy.

This acting not only strengthens the Vagina, but thereby, also, it hinders the Blood, in its Return from the Plexus Retiformis of the Pudendum, by compressing some of its subjacent Veins which pass underneath, by which Means the Labia became distended, and the Vagina contracted.

SPINCTER VESICÆ.

Fallepius observes, that the Anatomists of his Age had not well describ'd this Muscle in placing it below the Prostate, in which Case, as he alledges, the Semen in the venereal Act could not be emitted without the Urine; which Observation latter Authors have not taken Notice of, either through Inadvertency in Dissection, or being imposed on by Part of the *Levator Ani*, which remained on the Prostate, which *Riolanus* calls the *Sphincter Externus*. It is seated in the upper Part of the Neck of the Bladder, immediately above the *Glandula*

Glandula Prostata, where (as *Fallopian* says) you must not expect to find an entire Muscle and Substance distinct from the Substance of the Canal, like that of the Anus, but the more fleshy Part of the Neck of the Bladder, composed of many transverse Fibres, whose Contraction hinders the involuntary Egress of the Urine.

To discover these transverse Fibres, our Author advises to immerge the Bladder in scalding Water after Inflammation, the external right Fibres being removed, these will appear underneath.

SPHINGONTA. *σφινγόντα*. Astringent or obstruent Medicines.

SPHONDYLIS. The Name of an Insect about the Size of one's little Finger, with a red Head, white Body, and eight Feet. It is boil'd for medicinal Uses in Oil or Wine, and is esteem'd resolvent, good to fortify the Nerves, to dissipate rheumatic Humours, and is applied to Fractures. *Lemery des Drogues*.

SPHONDYLUM.

The Characters are ;

It has a long perennial Root ; the Leaves are very large, variously jagged, and cut into large Lobes. The Petals of the Flowers are bifid, horned, and the outer Petal larger than the rest. The seed is large, flat, oval, with an Apex emarginated, or sloping inwardly ; it is, also, striated, generally deposits its Invelucrum, or Husk, and is mark'd with black Streaks on the Superficies.

Boerhaave mentions six Sorts of *Sphondylium*, which are ;

1. *Sphondylium* ; vulgare ; hirsutum. *C. B. P.* 157. *Tourn. Inst.* 320. *Boerb. Ind. A.* 66. *Sphondylium*, *Offic. Ger. Quoad descript.* 856. *Emac.* 1009. *Raii Hist.* 1. 408. *Synop.* 3. 205. *Sphondylium vulgare*, *Park. Theat.* 953. *Sphondylium quibusdam, five Branca Ursina Germanica*, *I. B.* 3. 160. **COW PARSNEP.**

It grows on Meadows and the Borders of Fields, and flowers in July. The Seed is commended by *Dr. Willis, de Morb. Convuls.* from *Joannes Anglicus*, as of excellent Service in hysteric Paroxysms. It is reckon'd by *Buxbaum* and *Schröder* one of the five emollient Herbs. *Dale*.

The Virtues ascribed by *Dioscorides* and *Pliny* to the *Sphondylium* seem not to belong to this Plant, whence it is justly doubted whether it be the true and genuine *Sphondylium* of the Antients, though the Description of the *Sphondylium* in *Dioscorides* pretty well agrees with it.

The Root, according to *Tragus*, has the Virtue of mollifying and repressing Tumors, particularly those of the Matrix, Liver and Spleen. The Surgeons use the expressed Juice of this Herb in emollient Ointments. *Fuchs* ascribes the same Virtues to the Root as to that of the *Acanthus Verus*, which is of a drying and somewhat inciding Quality : But *Gesner*, with whom agrees *C. Hoffman*, says it is very far from having the Virtues of the *Acanthus Verus*. *Schröder* says it is of principal Use in Clysters, and other Purgatives, under what Form soever, but generally in Cataplasms. The Inhabitants of *Poland* and *Lithuania*, as *Dodonæus* relates, boil the Leaves and Seeds of *Sphondylium* in Water, and of the same, with an Addition of Ferment, make a Drink called *Parst*, which serves the Poor instead of Beer. The Leaves of *Sphondylium* are very grateful Food to Rabbits. *Raii Hist. Plant.*

The *Sphondylium* has Leaves resembling, in some Measure, those of the Plane-Tree, and shaped much like those of the *Panax*. The Stalks rise to the Height of a Cubit, or more, and are like those of Fennel. The Seed on the Top is like that of *Seseli*, double, but broader, whiter, and more chaffy, and of a strong Smell. The Flowers are white, and so is the Root, and like a Radish. It grows in marshy and watry Places.

The Seed purges pituitous Humours by Stool, and cures those who labour under Disorders of the Liver, the Jaundice, Orthopnæa, Epilepsy and Hysterics. Used in a Suffumigation, it rouses those who are seiz'd with a Cataphora. The Oil is proper in an Embrocation for the Head under a Phrensy, Lethargy, or Head-ach. Applied with Rue, it stops the spreading of a Herpes. The Root is exhibited in the Jaundice, and Disorders of the Liver ; scraped and thrust into Fistula's, it consumes Callosities therein. The Juice of the recent Flowers is good for ulcerated and purulent Ears. It is prepared by Insolation, like other Juice, and then reposit. *Dioscorides, Lib. 3. Cap. 90.*

Pliny gives the same Description and Virtues of the *Sphondylium*, or, as he has it, *Sphondylium*, with *Dioscorides*, whom he seems, in this and other Particulars of the *Materia Medica*, to agree.

2. *Sphondylium* ; maximum ; Transilvanicum ; Ricini folio. *Panaces Heracleum*. *Matth.* 544.

3. *Sphondylium* ; hirsutum ; folio angustiore, minutius laciniato ; caule atropurpureo ; flore rubello.

4. *Sphondylium* ; majus ; five *Panax Heracleum quibusdam*. *J. B.* 3. 2. 161. *Panax, Sphondylii folio, five Heracleum*, *C. B. P.* 157.

5. *Sphondylium* ; hirsutum ; foliis angustioribus. *C. B. P.* 157. *Prodr.* 83.

6. *Sphondylium* ; Alpinum ; glabrum. *C. B. P.* 157. *Prodr.* 83. *J. B.* 3. 163. *Boerb. Ind. Alt. Plant.*

It is called *Sphondylium*, because it has an unpleasant Smell, like the Animalcule, or Insect called *Sphondylis*.

It is of an acrimonious Quality, like the *Ferula* and *Thapsia*, and not receiv'd in Medicine, though it be look'd upon in the Country as an Emollient. The Plant, however, is said to be very good in Clysters and Cataplasms, and to be of service in the Epilepsy. A Decoction of the Leaves or Roots is good for the Hysterics. *Hist. Plant. ascript. Boerhaave*.

SPHONDYLUS. The Name of a Stone, found in the Head of the *MUGIL*.

SPHYGMICA. That Part of Medicine which treats of Pulses, from *σφύγμις*, a Pulse.

SPHYRA. *σφύρα*. The Ankle.

SPHYRÆNA. *σφύρα*. The Name of a long, thin Fish, with a pointed Nose like a Beak.

SPICA. A Spike. See the Explication of botanic Terms under **BOTANY**.

SPICA NARDI. See **NARDUS INDICA**.

SPICA TRIFOLIA. A Name for the *Melilotus* ; *Cretica humillima* ; *humifusa* ; *flore albo, magno*.

SPICA VULGARIS. A Name for the *Lavandula* ; *angustifolia*, and, also, for the *Lavandula* ; *angustifolia* ; *flore albo*.

SPICA, in Surgery, is a Species of Bandage. See **FASCIA**.

SPICATUM. An Epithet for a precious Ointment mention'd frequently by *Galen*, and much us'd by the Rich and Luxurious.

SPINA. The *Spine* is that long Pile of Bones reaching from the *Condylode* Processes of the *Occiput*, to the Extremity of the Rump. It somewhat resembles two unequal Pyramids, whose Bases are common, or joined together. The Spine is not however strait, but has four or five remarkable crooked Turns ; for in descending from its superior Part, it is made to advance forwards by the Force of the Muscles, which pull the Head and superior *Vertebra* back, being greater than the contracting Power of the Flexors, and thereby it supports the *Oesophagus*, and Vessels of the Head. Its Middle gives Way backwards to the Heart and Lungs, then it is again bended forwards, to support the *Viscera* of the *Abdomen* ; afterwards a second Time turns back for the Enlargement of the *Pelvis* ; and, lastly, is reflected forwards for sustaining the last great Gut. We should however observe, that notwithstanding this crooked Figure of the Spine, it is so contrived, that the Centre of Gravity of all that Part of it which sustains any considerable Weight, falls on the Middle of the common Base.

The *Spine* is commonly divided into *true* and *false Vertebra*, the former constituting the superior long Pyramid with its Base inferior, while the *false Vertebra* make the inferior shorter Pyramid, whose Base is superior.

True Vertebra are the twenty-four superior Bones of the *Spine*, on which the several Motions of the Trunk of our Bodies are performed, from which Use they have justly got their Name.

Each of these *Vertebra* is composed of its Body and Processes.

The Body is the thick, spongy, anterior Part, which is convex before, concave backwards, horizontal and plain in most of them above and below ; their anterior and posterior Surfaces having several remarkable Holes made in their thin external Plate, both for the firmer Connexion of the Ligaments, and for the Passage of Vessels into their cellular Substance.

Between these Bodies of each two adjoining *Vertebra*, a Substance between the Nature of Ligament and Cartilage is interposed ; which is composed of concentric curve Fibres, the exterior of which are the most solid and hardest, while those in the Centre are very soft and full of a glairy Liquor, and therefore this Substance was not improperly called by the Ancients *Ligamentum mucosum* : This is firmly fixed to the horizontal Surfaces of the Bodies of the *Vertebra*, and therefore not only allows these Bones to recede from each other, and to be prest closer together without breaking, but serves to connect them, in which it is assisted by a strong membranous Ligament, which lines all their concave Surface, and by still a stronger Ligament that covers all their anterior convex Surface. This last it is, that *Blancard* assures us he discovered to consist of two Rows of tendinous

Fibres, decussating each other in Form of X, so as to be alternately disposed through all the *Vertebrae*, that is, the first, third, fifth, and seventh, should be similar, and the second, fourth, sixth, and eighth, distinct from the first Class, but alike among themselves.

We may lay down as a general Rule, notwithstanding some Exceptions, that the *Bodies* of the *Vertebrae* are smaller and more solid above, but as we reckon downwards, appear larger and more spongy, and that the Cartilages between them are thick, and the surrounding Ligaments strong in Proportion to the Largeness of the *Vertebrae*, and to the Quantity of Motion they are to perform: By which Disposition the greater Weight is supported on the broadest best secured Base, and the Middle of our Body is allowed a large and secure Motion, which is of considerable Benefit to us.

From each Side of the Body of each *Vertebra*, a bony Bridge is produced backwards and to a Side; from the posterior Extremity of which, one slanting Process rises, and another descends; the smooth, and what is generally the flattest Side of each of these four Processes, which are called the *oblique*, is covered with a smooth Cartilage, and the two inferior oblique Processes of each *Vertebra* are fitted to, and articulated with the two superior or ascending oblique Processes of the *Vertebra* below.

From between the superior and inferior oblique Process of each Side, the *Vertebra* is stretched out laterally in Form of a Process, that is universally named *Transverse*.

From the posterior Roots of the two oblique and of the transverse Process of each Side, a broad oblique bony Plate is extended backwards, where these meet the seventh and last Process of the *Vertebra* takes its Rise and stands out backwards; this being generally sharp-pointed and narrow-edged, has therefore been called *Spinal Process*, from which this whole Chain of Bones has got its Name.

Besides the common Ligament which lines all the interior Surface of these Processes, as well as of the Bodies, there are particular Ligaments that connect the Processes of each two contiguous *Vertebrae*.

The Substance of the Processes is considerably stronger and firmer than that of the Bodies of the *Vertebrae*, having a thicker external Plate, and without so many large Holes made in it.

The seven Processes considered conjunctly, as forming the posterior Shares of the *Vertebrae*, are hollow at their anterior middle Part; which Concavity, joined with that at the posterior Part of the Bodies, makes one great *Foramen*, which answers to such another in the *Vertebra* above and below: Therefore the *Foramina* of all the *Vertebrae* taken together, form a long great Conduit, which is widened or straitened in Proportion to the Size of the *Medulla spinalis* which it contains.

In the lateral Bridges, which join the Bodies to the Processes of each *Vertebra*, a semicircular Notch is observable both above and below; which, exactly corresponding with others in the contiguous Bones, when the *Vertebrae* are joined, form a round Hole in each Side, between each two *Vertebrae*, through which the Nerves that proceed from the *Medulla spinalis* and the Blood-vessels pass.

The Articulations then of these true *Vertebrae* are plainly double; for their Bodies are joined by *Synchondrosis*, and their oblique Processes are articulated by the third Sort of *Ginglymus*. Hence it is evident that their Centre of Motion is altered in different Positions of the Trunk: For when we bow forwards, the superior moved Part bears entirely on the Bodies of the *Vertebrae*; if we bend back, the oblique Processes support the Weight; if we recline to one Side, we rest upon the oblique Processes of that Side and Part of the Bodies; if we stand erect, all the Bodies and oblique Processes have their Share in our Support.

Hence it follows: 1. That because the Joints, of which the Spine is composed, are so numerous, the *Medulla spinalis*, Nerves, and Blood-vessels, are not subject to such Compression and Overstretching in the Motion of the Trunk of the Body, as they would be otherwise; since several *Vertebrae* must be concerned in every Motion of the Spine, and therefore a very small Curvature is made at the Conjunction of any two *Vertebrae*. 2. That an erect Posture is the surest and firmest, because the Surface of Contact of the *Fulcra* is largest, and the Weight is most perpendicular to them. 3. That the Muscles which move the Spine act with greater Force in bringing the Trunk to an erect Posture than in drawing it to any other: For in bending forwards, back, or to a Side, the Muscles which perform any of these Actions are nearer the Centres of Motion; consequently the Lever, with which they act, is shorter than when the Centre of Motion is on the Part of the *Vertebra* opposite to that where these Muscles are inserted, which is the Case in raising the Trunk. This is extremely necessary, since in the Deflexions of the Spine

from a perpendicular Bearing, the Weight of the Body soon inclines it which Way we design; whereas in raising us erect, this great Weight must be more than counteracted. 4. In calculating the Force exerted by the Muscles which move the Spine, we should, with *Borelli* and *Parent*, always make Allowance for the Action of the Cartilages between the *Vertebrae*, which must, in every Motion from an erect Posture, be stretched in one Side, and compressed on the other, to both which they will resist; whereas, in raising the Trunk, these Cartilages will assist by their springy Force. 5. We are hence naturally led into the Reason of the *Phænomenon* observed by *Mr. Wasse*, that our Height of Stature is increased in the Morning, and diminished at Night: For the intermediate Cartilages of the *Vertebrae* pressed all Day long by the Weight of our Body, in the Evening become more compact and thin; but when in the Night they are relieved from this Pressure, they again expand themselves to their former Thickness; and seeing the Bulk of any Part must vary according to the different Distension or Repletion of the Vessels composing it, we may understand how we become taller after a plentiful Meal, and decrease after Fasting or Evacuations, which Difference the *Abbé Fontenu* has proved to depend mostly, if not solely, on the different Thickness of these Cartilages. 6. From the different Articulations of the Bodies and oblique Processes of the *Vertebrae*, and the different Strength of the Ligaments, it is plain that they are formed so as to allow a much larger Motion forwards than backwards; this last being of much less Use, and might be dangerous by overstretching the large Blood-vessels that are contiguous to the Bodies of the *Vertebrae*.

The *Vertebrae* at the ordinary Time of Birth consist of three bony Pieces, connected by Cartilages; that is, the Body, which is not fully ossified; and a long curved Bone of each Side, on which we see a little Share of the bony Bridge, the oblique Processes complete, the beginning transverse Processes, and the oblique Plate, but no spinal Process; so that the Teguments might be in no Danger of being hurt by the sharp Extremities of these spinal Processes, as they would be, if there were any such sharp bony Processes, while a Child is in the bended Posture it remains in in the Womb, nor by the Pressure which it undergoes in the Birth.

From this general Mechanism of the Spine, an Account is easily deduced of all the different preternatural Curvatures the Spine is capable of: For if one or more *Vertebrae* are of unequal Thickness in opposite Sides, the Spine must be reclined over to the thinner Side; which now sustaining the greatest Share of the Weight, must still be more compressed, consequently hindered from extending itself in Proportion to the other Side, which, being too much freed of its Burden, has Liberty to enjoy a luxuriant Growth. The Causes, on which such an Inequality of Thickness in different Sides of the *Vertebrae* depend, may vary: For either it may be owing to an Overdistension of the Vessels of one Side, and from thence a preternatural Increase of the Thickness of that Part; or, which more commonly is the Case, it may proceed from an Obstruction of the Vessels, by which the Application of proper Nourishment to the bony Substance is hindered, whether that Obstruction depends on the faulty Disposition of the Vessels or Fluids, or if it is produced by an unequal mechanical Pressure, occasioned by a paralytic Weakness of the Muscles and Ligaments, or by a spasmodic Overaction of the Muscles on any Side of the Spine, or by a Person's continuing long, or putting themselves frequently into any particular Posture, declining from the erect Posture: In all these Cases, one common Effect will follow, that is, the *Vertebrae* turn thick on the Side where the Vessels are free, and remain thin on the other Side where the Vessels are straitened or obstructed. Whenever any morbid Curvature is thus made, almost necessarily a second Turn, but in an opposite Direction to the former, must be formed. Both because the Muscles on the convex Side of the Spine being stretched, must have a stronger natural Contraction to draw the Parts to which their Extremities are fixed, and that the Patient will make Efforts to keep the Center of Gravity of his Body perpendicular to its Base, that the Muscles may be relieved from a constant violent contractile State, which always creates Uneasiness and Pain.

When once we understand how these crooked Spines are produced, there will be little Difficulty in forming a just Prognosis of our Patient's Disease, and a proper Method of Cure may be contrived, which must vary as to the internal Medicines, according to the different Causes on which the Disease depends; but one general Indication must be pursued by Surgeons, which is to counteract the bending Force, by increasing the Compression on the convex Part of the Curvature, and diminishing it on the concave Side. The Manner of executing which in particular Cases must be very different, and requires a very particular Examination of the Circumstances both of the Disease and Patient. In many such Cases

I have found some simple Directions as to Postures in which the Patients Body should be kept, of very great Advantage.

Hence also it is easy to deduce the Reason of old People generally bowing forwards, and at last being incapable to raise their Spine erect; since the Cartilages shrivel in becoming more solid: And as this must happen most and soonest where these Gristles are least stretched and extended, therefore this Curvature is generally first most remarkable in the *Vertebrae* of their Back, or they become round-shoulder'd.

Tho' the true *Vertebrae* agree in the general Structure which I have hitherto described, yet because of several Specialties proper to a particular Number, they are commonly divided into three Classes, that is, *Cervical*, *Dorsal* and *Lumbar*.

The *Cervical* are the seven superior *Vertebrae*; which are easily distinguished from the rest by these Marks. They are all, except the first, of near an equal Breadth. Their Bodies are smaller and more solid than any others, and flattened on the Fore-part, to make Place to the *Oesophagus*; or rather this flat Figure is owing to the Pressure of that Pipe, and to the Action of the *longi Colli* and anterior *recti* Muscles. The posterior Surface, which is also flat, is generally rough, or has small Processes rising from it, where the Ligaments are fixed. The superior Surface of the Bodies of each *Vertebra* is made hollow, by a slanting thin Process being raised on each Side; and the inferior Surface is also excavated, but in a different Manner from the former; for the posterior Edge is raised a little, and the anterior is produced a considerable Way. Whence we see how the Cartilages between those Bones will be more firmly connected, and the Articulation of any two *Vertebrae* will be more secure.

The Cartilages between these *Vertebrae* are thicker, especially in respect of their Bulk, than those belonging to the *Vertebrae* of the Thorax, because of the larger Motion that is allowed here; and they are thickest at their Fore-part, which is one Reason of the *Vertebrae* advancing forward as they descend.

The oblique Processes of these Bones of the Neck more justly deserve that Name than those of any other *Vertebrae*. They are situated slanting, the superior Processes having their smooth, and almost flat Surfaces, facing obliquely backwards and upwards, and the inferior oblique Processes, with these Surfaces, facing obliquely forwards and downwards.

The transverse Processes of these *Vertebrae* are framed in a different Way from those of any other Bones of the Spine: For besides the common Process rising from between the oblique Processes of each Side, there is a second that comes out from the Side of the Body of the *Vertebrae*; and the two, after leaving a circular Hole for the Passage of the cervical Artery and Vein, being united, are considerably hollowed at their upper Part, with rising Sides to protect the Nerves that pass in the Hollow; and at last each Side terminates in a tuberculous Point, for the Insertion of Muscles.

The spinal Processes of these cervical Bones stand pretty strait backwards, are shorter than those of any other *Vertebrae*; and are forked or double at their Extremity; and hence allow a more convenient Insertion to the Muscles, and a larger Motion backwards.

The Holes between the bony cross Bridges, for the Passage of the Nerves from the *Medulla spinalis*, have their largest Share formed in the lowest of the two *Vertebrae*, to which they are common.

The Substance of the cervical *Vertebrae*, especially of their Bodies, is not so porous or tender as of the other two Classes.

So far the cervical *Vertebrae* agree in their general Characteristics, but still have some particular Differences, which oblige us to consider them separately.

The first, from its Use of supporting the globular Head, has got the Name of *Atlas*; and by several Authors is called *Epistrophea*, from the Motion it performs on the second.

The *Atlas*, contrary to all the other *Vertebrae* of the Spine, has no Body; but instead of it there is a bony Arch; in the anterior convex Part of which, a small Rising appears, where the *Musculi longi colli* are inserted; and on each Side of this Protuberance a small Cavity may be observed, where the *Recti interni minores*, commonly (tho' wrongly) ascribed to *Cowper*, take their Rise. The superior and inferior Parts of the Arch are rough and unequal, where the Ligaments that connect this *Vertebra* to the *Os occipitis* and second *Vertebra* are fixed. The posterior Part of the Arch is concave, smooth, and covered with a Cartilage in a recent Subject, to receive the Tooth-like Process of the second *Vertebra*. This Hollow makes the Passage for the *Medulla spinalis* seem much larger in this *Vertebra* than in any other. On each Side of this Concavity a small rough Sinuosity may be remarked, where the Ligaments going to the Sides of the Tooth-like Process of the following *Vertebra* are fastened; and on each Side a small rough Protuberance and Depression is observable, where the transverse Ligament, which secures the Tooth-like

Process in the Sinuosity, is fixed, and hinders that Process to injure the *Medulla spinalis* in the Flexions of the Head.

The *Atlas* has no more spinal Process than Body; but instead of it there is a large bony Arch, that the Muscles which pass over this *Vertebra* at that Place, might not be hurt in extending the Head back. On the posterior and superior Part of this Arch there are two Depressions, where the *Recti posteriores minores* take their Rise; and at the inferior Part are two other Sinuosities, into which the Ligaments which connect this Bone to the following are fixed.

The superior oblique Processes of this *Atlas* are large and hollow, rising more in their external than internal Brim; by which their Articulations with the *Condylode* Processes of the *Os occipitis* are firmer; for, as I remarked from *Galen*, in the Description of these *Condyles*, they cannot slip to either Side; and then this Protuberance serves to defend the *Fossa* or Channel formed behind the external and posterior Part of each of them, in which the vertebral Arteries make the circular Turn, as they are about to enter the great *Foramen* of the occipital Bone, and where the tenth Pair of Nerves go out. The inferior oblique Processes are large, extended from within outwards and downwards, and are slightly hollowed: So that this first *Vertebra*, contrary to the other six, receives the Bones with which it is articulated both above and below.

The transverse Processes are not much hollowed or forked, but are longer and larger than of any other *Vertebra* of the Neck, to serve for the Origin and Insertion of several Muscles. Those of the Muscles fixed to the transverse Processes that serve to move this *Vertebra* on the second, gain a considerable Lever to act with, by the Distance which each of these long Processes make from the Axis of Revolution.

The *Condyles* of the *Os occipitis* move forwards and backwards in the superior oblique Processes of this *Vertebra*, by means of their double *Arthrodia*, which makes the third Species of *Ginglymus*; but very little Motion can here be allowed to either Side, and there must be still less circular Motion, which the Head obtains principally by the Circumvolution of the *Atlas* on the second *Vertebra*.

In new born Children this *Vertebra* has only the two lateral Pieces ossified, the anterior Arch, which it has instead of a Body, being cartilaginous.

The second *Vertebra* of the Neck is called *Dentata*, from the Tooth-like Process on the superior Part of its Body. Some Authors call it *Epistrophea*; but improperly, since this Designation is only applicable to the first, which moves on this as on an Axis.

The Body of this *Vertebra* is somewhat of a pyramidal Figure, the inferior Part being large, and produced, especially at its Foreside, to enter into a Hollow of the *Vertebra* below; while the superior Part has a square Process, with a small Point standing out from it. This it is that is imagined to resemble a Tooth, and has given Name to the *Vertebra*. The anterior Surface of this Process is cylindrical, smooth, and covered with a Cartilage, where it plays in the Hollow of the anterior Arch of the first *Vertebra*. The posterior Surface is much the same Way disposed, for moving on the cross Ligament, which is cartilaginous in the Middle. From the Sides of the *Processus dentatus*, the Ligaments go off to fix it to the first *Vertebra*; and from its Point a strong one is sent out to the *Os occipitis*. Immediately below the two lateral Ligaments, a Sinuosity may be observed on each Side, where the first vertebral Nerves escape.

The superior oblique Processes of this *Vertebra dentata* are large, very near in a horizontal Position, and slightly convex, to be adapted to the inferior Processes of the first *Vertebra*. A moveable Cartilage is said by some Authors to be interposed between these oblique Processes of the first and second *Vertebra*; but I could never find it. The inferior oblique Processes of this *Vertebra dentata* answer exactly to the Description given of those common to all the cervical *Vertebrae*.

The transverse Processes differ from those of the other cervical *Vertebrae* in this, that they are shorter, very little hollowed at their superior Part, and not forked at their Extremities; and that the Canals through which the cervical Arteries pass, are about the middle Substance of the Process reflected outwards, so as the Course of these Vessels may be directed towards the transverse Processes of the first *Vertebra*; which are further produced, and therefore make a Turn of the Arteries necessary: But if this had been any where in such a moveable Part as the Neck is, and the Artery not defended by a Bone, and fixed to that Bone, scarce a Motion could be performed without the utmost Hazard of Compression, and a Stop put to the Course of the Liquids, with all the Train of its ill Consequences. Hence we observe this same Mechanism several Times made Use of, when there is any Occasion for a sudden Curvature of a large Artery. This is the third remarkable Instance of it we have seen: The first was the Passage of the *Carotides* through the *Ossa temporum*

rum; and the second was that lately described in the vertebral Arteries, turning round the oblique Processes of the first Vertebra, to come at the great *Foramen ossis occipitis*.

The spinal Process of this *Vertebra dentata* is thick, strong and short, to give sufficient Origin to the *Musculi recti majores*, and *obliqui inferiores* and to prevent the Contusion of these Muscles in pulling the Head back.

This second *Vertebra* consists at the Birth of four bony Processes; for besides the three which I already mentioned as common to all the Vertebrae, the Tooth-like Process of this Bone is begun to be ossified in its Middle, and is joined as an Appendix to the Body of the Bone. Whence we may deduce one good Reason, why Midwives ought to apply Stay-bands to keep the Heads of new-born Children from falling too far backwards, till the Muscles attain Strength enough to be able to prevent that dangerous Motion.

When we are acquainted with the Structure and Articulation of the first and second Vertebrae, and know exactly the Strength and Connexion of their Ligaments, there is no Difficulty in understanding the Motions that are performed upon or by the first, tho' this Subject was formerly Matter of hot Dispute among some of the greatest Masters of Anatomy. 'Tis none of my Purpose at present to enter upon a Detail of the Reasons advanced by either Party, but to explain the Fact as any one may see it who will remove the Muscles, which in a recent Subject hinder the View of these two Joints, and then will turn the Head into all the different Positions it is capable of. This done, he will observe the Head to move forwards and back on the first *Vertebra*, as was already said; while this *Atlas* performs the *Circumgyration* upon the second *Vertebra*, the inferior oblique Processes of the first *Vertebra* shuffling easily in a circular way on the superior oblique Processes of the second, and its Body or anterior Arch having a Rotation on the Tooth-like Process, by which the perpendicular Ligament that is sent from the Point of the Tooth-like Process to the occipital Bone is twisted; while the lateral Ligaments that fix the *Processus dentatus* to the Sides of the first *Vertebra* are very differently affected, for the one upon the Side towards which the Face is turned by the *Circumgyration* is much shortened and lax, while the opposite one is stretched and made tense, and yielding at last no more, prevents the Head from turning any further round on this *Axis*, so that these lateral Ligaments are the proper *Moderators* of the *Circumgyration* of the Head here, which must be larger or smaller as these Ligaments are stronger or longer, and more or less capable of being stretched. Besides this Revolution on this *Axis*, the first *Vertebra* can move a small Way to either Side, but is prevented from moving backwards and forwards, by the anterior Arch of the first *Vertebra*, and by the cross Ligament which is closely applied to the Tooth-like Process. The Motion forwards here would have been of very bad Consequence, as it would have brought the Beginning of the *Medulla spinalis* upon the Point of the Tooth-like Process.

The rotatory Motion of the Head is of great Use to us on many Accounts, by allowing us so quickly to apply our Organs of Sense to Objects, and the *Axis* of Rotation was altogether proper to be here; for if it had been at a greater Distance from the Head, the Weight of the Head, if it had at any time been removed from a perpendicular Bearing to the small very moveable Joint, and thereby had acquired a long Lever, would, at every Turn inconsiderately performed, have broke the Ligaments to Pieces; or these Ligaments must have been formed much stronger than could well have been connected to such small Bones: Neither could this circular Motion be performed without Danger on the first *Vertebra*, because the immoveable Part of the *Medulla oblongata* is so near, as at each large Turn the Beginning of the *Medulla spinalis* would have been in Danger of twisting, and suffering by the Compression this would make on its tender Fibrils. On the whole, we may be convinced, that the quick circular Motion of our Head is of good Use to us; and that this second *Vertebra* of the Neck is altogether proper, both by its Structure and Situation, for being the *Axis* on which that Motion is to be performed.

But then I must take notice that the lateral, or the *Moderator* Ligaments, confine the Motion of this Joint so much, that tho' it may serve us in several Occasions, yet we often require to turn our Faces so far round as this Joint could never allow, without the greatest Danger of immediately twisting the spinal Marrow too much, and also of the oblique Processes of the *Vertebra* being luxated; therefore, in the large Turns of our Face backwards, we increase the Rotation by a little Assistance from each of the Vertebrae of the Neck, from the Vertebrae of the Loins, and from most of the Joints of the lower Extremities. This Combination of a great many Joints towards the Performance of one Motion, is also to be observed in several other Parts of the

Body; notwithstanding such Motions being generally said to be performed by some one Joint only.

The third *Vertebra* of the Neck is by some called *Axis*; but this Name is given without any Reason to this third *Vertebra*, while it might be applied very properly to the second. This third and the three below have nothing particular in their Structure, but all their Parts come under the general Descriptions formerly given, each of them being larger as they descend.

The seventh *Vertebra* of the Neck comes near to the Form of those of the Back, having the upper and lower Surfaces of its Body less hollow than the others, the oblique Processes are more perpendicular, neither spinal nor transverse Processes are forked. This seventh and the sixth *Vertebrae* of the Neck have the Hole in each of their transverse Processes more frequently divided by a small cross Bridge, that goes between the cervical Vein and Artery, than any other *Vertebrae*.

The twelve *Dorsal* may be distinguished from the other *Vertebrae* of the Spine, by these proper Characteristics. Their Bodies are of a middle Size, betwixt those of the Neck and Loins; are more convex before than either of the other two Sorts, and flattened laterally by the Pressure of the Ribs, which are inserted into small Cavities formed in their Sides. This Flattening on their Sides, which makes the Figure of these *Vertebrae* near an half Oval, is of good Use, as it affords a firmer Articulation to the Ribs, allows the *Trachea arteria* to divide at a smaller Angle, and the other large Vessels to run secure from the Action of the vital Organs. The posterior Part of these Bodies is more concave than in any of the other two Classes. Their superior Surfaces are all horizontal, with their Edges tipped with *Epiphyses*, which *Fallopian* alleges are only some Parts of the intervening Ligaments become bony. The Cartilages interposed between the Bodies of these *Vertebrae* are thinner than in any other of the true *Vertebrae*, and contribute to the Concavity of the Spine here at its Fore-part, by their being thinnest near the anterior Edge of the *Vertebrae*.

The oblique Processes are placed almost perpendicular, the superior slanting very little forwards, and the inferior as much back. Neither they, nor the oblique Processes of the Bones of the Neck, have as much Convexity or Concavity as is worth remarking. At their Roots a small Roughness is observable, where the Ligaments that surround their Articulations are inserted; and on the posterior Surface of the Bone, between the Processes of opposite Sides, several sharp little Processes stand out, where strong Ligaments are fix'd.

The transverse Processes of the *dorsal Vertebrae* are long, thicker at their Extremity than in the Middle, and turned obliquely backwards, which may be owing to the Pressure of the Ribs, the Tubercles of which are inserted into a Depression near the Extremity of these Processes.

The spinal Processes are long, small-pointed, and run sloping down; and at the superior Part of their posterior Surface, a small Ridge rises, which is received by a small Channel in the anterior Surface of the spinal Process immediately above, which is connected to it by a Ligament. Hence little Motion can be allowed of here, lest the Heart and Lungs should be disturbed in their Actions.

The Conduit of the *Medulla spinalis* is more circular, but corresponding to the Figure of that Cord, smaller here than in any other *Vertebrae*; and a larger Share of the Holes in the bony Bridges, for the Transmission of the Nerves, is formed in the superior than in the inferior *Vertebrae*.

The Bodies of the four superior *dorsal Vertebrae* deviate from the Rule of the *Vertebrae* becoming still larger as they descend, for the first of these four is the largest, and the other three inferior gradually become smaller, to allow the *Trachea* and large Vessels to divide at smaller Angles.

The two uppermost *Vertebrae* of the Back, instead of being very prominent forwards, are flattened by the Action of the *Musculi longi colli* and *recti majores*.

The proportional Magnitude of the two little Depressions in the Body of each *Vertebra* for receiving the Heads of the Ribs, seems to vary in respect to each other, in this manner; the Depression on the superior Edge of each *Vertebra*, decreases as far down as the fourth, and always after that increases.

The transverse Processes are longer in each lower *Vertebra* to the seventh or eighth, with their smooth Surfaces, for the Tubercles of the Ribs; facing gradually more downwards; but afterwards as they descend become shorter, and the smooth Surfaces are directed more upwards.

The spinal Processes of the *Vertebrae* of the Back become gradually longer and more slanting from the first, as far down as the eighth or ninth *Vertebra*, from which they manifestly turn shorter and more erect.

The first *Vertebra*, besides an oblong Hollow in its inferior Edge, that affixes in forming the Cavity wherein the second Rib is received, has the whole Cavity for the Head of the first Rib formed in it.

The second has the Name of *Axillary*, without any Thing particular in the Structure of it.

The eleventh often has the whole Cavity for the eleventh Rib in its Body, and wants the smooth Surfaces on each transverse Process.

The twelfth always receives the whole Head of the last Rib, and has no smooth Surface on its transverse Processes, which are very short. The smooth Surfaces of its inferior oblique Processes face outwards as the *Lumbar* do. And indeed we may say in general, that the superior *Vertebrae* of the Back come nearer the Resemblance of those of the Neck, while the inferior are liker the *Lumbar*.

The inferior and last Class of the true *Vertebrae* is the *Lumbar*, which five Bones may be distinguished from any others by these Marks; 1. Their Bodies, though of a circular Form at their anterior Part, are somewhat oblong from one Side to the other, which may be occasioned by the Pressure of the large Vessels, and of the *Viscera* contiguous to that Fore-part. The *Epiphyses* on their Edges are larger, and therefore the superior and inferior Surfaces of their Bodies are more concave than in the *Vertebrae* of the Back. 2. The Cartilages between these *Vertebrae* are much the thickest of any, and render the Spine convex within the *Abdomen*; by their greatest Thickness being anterior. 3. The oblique Processes are strong and deep, those in opposite Sides being almost placed in parallel Planes, the superior, which are concave, facing inwards; and the convex inferior ones outwards, and therefore these *Vertebrae* do plainly receive each other above, and are received below, which is not so evident in the other two Classes already described. 4. Their transverse Processes are small, long, and near erect, for allowing a large Motion to each Bone, and sufficient Insertion to Muscles, and for supporting and defending the internal Parts. 5. Betwixt the Roots of the superior oblique and transverse Processes, a small Protuberance may be observed, where some of the Muscles that raise the Trunk of the Body are inserted. 6. Their spinal Processes are strong, strait, and horizontal, with broad flat Sides, and a narrow Edge above and below, this last being depressed on each Side by Muscles. And at the Root of these Edges, we see rough Surfaces for fixing the Ligaments. 7. The large Canal for the *Medulla spinalis* is rather larger here than in the Back. 8. The Holes for the Passage of the Nerves are more equally formed out of both the contiguous *Vertebrae* than in others, but the superior furnishes however the larger Share of it.

Both transverse and spinal Processes of the middlemost *Vertebra* of the Loins are longest and thickest, and on each Side of that they decrease, so that these Processes of the first and fifth are the least, which is very necessary, especially as to the transverse Processes of these two *Vertebrae*, lest if they had been long, they had struck on the Ribs or *Ossa Ilium* or bruised the interposed Muscles in the Deflexions of the Spine to a Side.

The *Epiphyses* round the the Edges of the Bodies of these *Vertebrae* are most raised in the two lowest, and consequently make them appear hollower in the Middle, than the others are.

The Body of the fifth *Vertebra* is rather thinner than that of the fourth. The spinal Process of this fifth is smaller, and the oblique Processes face more backwards and forwards, than in any other *Lumbar Vertebra*.

From the whole, we may deduce the Uses of the true *Vertebrae* in these few general Heads. To give us an erect Posture; to allow a sufficient and secure Motion to the Head, Neck, and Trunk of the Body on all necessary Occasions; and to support and defend the *Viscera* and other soft Parts.

After considering the Structure of the particular *Vertebrae*, and their mutual Connexion, we may observe in each a solicitous Care taken that they shall with great Difficulty be disjoined; for their Bodies enter either so into each other, as to prevent their being displaced any how, as in the *Vertebrae* of the Neck; or these Bodies are prop'd on all Sides, as these of the Back are by the Ribs; or their Surfaces of Contact are so broad, and the Ligaments so strong and firmly connected, as to render the Separation almost impracticable, as in the Loins; while the Depth and Articulation of the oblique Processes are exactly proportioned to the Quantity of Motion the other Parts of the Bone will allow, or the Muscles can perform: Yet as these oblique Processes are small, and therefore not capable of so secure a Conjunction as the larger Bodies, they may sooner yield to a disjoining Force; but then their Dislocation is not of near so bad a Consequence; for by

their being displaced, the Muscles, Ligaments, and *Medulla Spinalis*, are indeed stretched; whereas, when the Body of the *Vertebra* is removed out of its Place, the *Medulla Spinalis* must be completely compressed, or intirely destroyed.

The *Falſe Vertebrae* compose the under Pyramid of the Spine. They are distinguished from the former justly enough by this Epithet of *Falſe*; because tho' each Bone resembles the true *Vertebrae* in Figure, yet none of them partake of their Use of serving in the Motion of the Trunk of the Body, all of them being intimately united, except at one Part where there is a moveable Joint; whence the common Division of these false *Vertebrae* into two Bones, *Os Sacrum* and *Coccygis*. See *Coccyx*, and *SACRUM Os*. *Monro's Osteology*.

The Cartilages of all the *Vertebrae* in general, are of two Kinds; one proper to each *Vertebra*, the other common to the two *Vertebrae* that lie next each other: The first I term Cartilages of Articulation, the others, Cartilages of Symphysis.

The proper articular Cartilages of each *Vertebra* of the whole Spine, are those four which cover the Surfaces of the four small articular Apophyses. In the natural State they are very white and smooth, and much thicker than in dry Bones. Their Circumference is the same with that of the articulated Sides of the Apophyses, except in those Places where there are small superficial Notches. In the first *Vertebra* of the Neck, and *Vertebrae* of the Loins, these Cartilages are thicker than in the rest.

The two inferior articular Cartilages of the first *Vertebra*, and the two superior Cartilages of the second, seem to be disproportionate, tho' not so much as in dry Bones; and in some Subjects we find moveable or inter-articular Cartilages between the Apophyses of these two *Vertebrae*.

The first *Vertebra* of the Neck has a small cartilaginous Incrustation in the Middle of the concave Side of its anterior Arch, answering to another on the Fore-side of the odontoid Apophysis of the second *Vertebra*; so that these two *Vertebrae* have five articular Cartilages each, besides the inter-articular ones already mentioned.

The *Vertebrae* of the Back, besides the four Cartilages of their small Apophyses, have others which do not belong to their Articulations with one another, that is, those that cover the lateral Fossulae in the Bodies of these *Vertebrae*, and the Fossulae of their transverse Apophyses, by both which they are articulated with the Ribs.

The Cartilages of Symphysis lie between the Bodies of the *Vertebrae*, one of them being contained between, and closely joined to the lower Surface of the Body of one *Vertebra*, and to the upper Surface of that next under the former; the Breadth and Circumference of them answering exactly to that of the Surfaces to which they are connected; but their Height or Thickness is different in each Class of the *Vertebrae*. In the *Vertebrae* of the Loins they are a quarter or third Part of an Inch in Thickness, according to the Stature of the Subject. In those of the Neck, they are not so thick, and the thinnest of all are those of the *Vertebrae* of the Back.

These Cartilages are not of an equal Thickness in all their Parts. Those of the Neck and Loins appear to be thickest on the Fore-side, and those of the Back rather thickest on the Backside; but these Differences are most remarkable in the *Vertebrae* that lie near the Middle of each Class.

The internal Structure of these Cartilages is different from that of all the other Cartilages of the Body; and indeed they resemble the rest in nothing but Whiteness and Elasticity. When we view their Circumferences only, they seem to be one uniform Mass, as the others generally are; but when they are divided by an Incision parallel to the Surface of the *Vertebra* to which they are joined, we see that they are made up of a great Number of cartilaginous concentric Rings contained within each other, a small Distance being left between them. They are closest and thinnest near the Centre, and about the Middle seem to degenerate into another softer kind of Substance.

These Rings do not form an entire Circumference, being turned inward on the Backside, answerably to the posterior Slope in the Body of each *Vertebra*. They lie horizontally, one Edge being fixed to the lower Side of one *Vertebra*, and the other to the upper Side of the *Vertebra* next below the former. The Interstices between the Rings are filled with a mucilaginous Substance, less fluid than that of the Joints; and their Breadth or Height is proportionable to the Distance of the *Vertebrae* between which they lie.

Each cartilaginous Lamina taken separately, is very pliable according to its Length; but taken altogether, they are not so easily bent, partly because of their circular Figure, and partly

partly because of their Proximity and Multiplicity. They yield, however, in the Inflections of the Spine, and their external Surface, which, in the ordinary Situation of the Spine, is even with the Surface of the Vertebrae, becomes prominent, or jets out on that Side towards which the Inflection is made, the Cartilages being then compressed by the Vertebrae.

They likewise yield on all Sides without any Inflection of the Spine, to the Weight of the Head and upper Extremities; but this is done by very small and imperceptible Degrees, and most of all, when the upper Parts of the Body are loaded with any exterior Weight.

They restore themselves afterwards merely by being freed from Compression; so that a Man is really taller after lying some time, than after he has walked or carried a Burden for a great while: The most natural and simple Reason that can be given for the different Heights of the same Persons at different Times, first observed in *England*, and afterwards confirmed by M. *Morand*, a Member of the Royal Academy of Sciences; being the different State of the inter-vertebral Cartilages.

The inter-vertebral Cartilages of the Neck, lying for the most part between the convex Side of one Vertebra, and the concave Side of another, are of a greater Extent in proportion to the Size of these Vertebrae than those of the Back and Loins. Without the Convexity and Hollowness in these Vertebrae, which are the least of all, the Cartilages could not have been made large enough to be able to resist Strains and great Motions.

The Vertebrae are strongly connected to each other by three Kinds of Ligaments. Each Vertebra is connected to that above and below it, by a great Number of very short and strong Ligaments, which cross each other obliquely, and are fixed round the Edges of the Body of each Vertebra.

These crucial Ligaments cover the Circumference of the inter-vertebral Cartilages, and adhere closely to them. They seem to be looser in the cervical and lumbar Vertebrae than in those of the Back, and by that means yield to the Cartilages in the different Inflections of the Spine already mentioned.

The Bodies of all the Vertebrae from the second of the Neck to the Os Sacrum, are covered by ligamentary half Vaginae on the convex Side, in which these Vaginae are fixed, surrounding all the crucial Ligaments, and made up of ligamentary Fasciculi and Filaments, partly oblique, but mostly longitudinal.

All the Vertebrae are likewise strongly connected by a ligamentary Tube, which lines the inner Surface of the medullary Canal from the occipital Hole, to the Os Sacrum, representing a kind of long flexible Funnel, its Cavity at the upper Part being equal to that of the occipital Foramen, and ending in a small Point at the Os Sacrum.

This Ligament is made up of several Strata of longitudinal and oblique Fibres interwoven together, adhering closely to the Inside of the great Foramen in each Vertebra, by a great Number of Filaments detached from it to the porous Substance of the Vertebra.

The first Vertebra is not only fixed to the Os Occipitis by a Portion of this ligamentary Funnel, but, also, by a distinct and very strong ligamentary Covering, which surrounds and adheres very closely to that Portion of the Funnel. This Covering is fixed above, round the great occipital Foramen, where it begins to adhere to the Funnel, and below, quite round the Circumference of the first Vertebra. The second Vertebra has two Ligaments peculiar to it, one which connects the Apophysis Dentiformis to the Os Occipitis; and another transverse, which confines this Apophysis within the anterior Portion of the Cavity of the first Vertebra. The first may be termed the Occipital, and the second, the transverse Ligament of the odontoid Apophysis.

The occipital Ligament is very strong and thick, and adheres in a very singular manner to the three Planes of the Apex of the Apophysis, and is afterwards divided into two or three Portions which are fixed in the like manner, in the anterior Edge of the great occipital Foramen, and in the Inequalities of the Apophysis Basilaris near that Hole.

The transverse Ligament may be said more justly to belong to the first Vertebra, both Ends of it being inserted in the lateral Impressions of the inner Surface of that Vertebra; but is ranked among the Ligaments of the second Vertebra, because of its Use, and because of the Insertion of its middle Portion.

This thick Ligament is stretched from one Side of the inner Surface of the first Vertebra to the second about the Middle of the Foreside, its Texture is very close, and it is fixed by this Portion in the Back-Part of the Apophysis Dentiformis; and sometimes it seems to have additional Fasciculi, which adhere by one End to both Extremities, and by the other to each Side of the Apophysis.

Along the whole bony Canal of the Spine, between the Basis of each spinal Apophysis, lies a flat and very elastic Ligament, of a yellowish Colour, which fills up the posterior great Noches of the Vertebrae adhering to their Edges, and likewise to the neighbouring Portions of the Funnel or great ligamentary Tube.

Between the Extremities or Apices of the spinal Apophysis, we find small ligamentary Ropes which run from one Spine to that next it, and which are really double, though they seem to be single in the Vertebrae of the Back and Loins. In the Vertebrae of the Neck they are fixed separately to the forked Extremities of the Spines.

Between all the spinal Apophyses, from their Apices to the Middle of the Bases, lies a ligamentary Membrane going between each two Apophyses, and thereby distinguishing the Right Side of the Vertebra from the Left. There is a Ligament of the same kind between the transverse Apophyses.

These are inter-muscular Ligaments, or ligamentary Septa, which divide the Muscles of one Side from those of the other. The first Kind may be termed *Inter-Spinales*, and the other *Inter-Transversales*.

The articular Ligaments of the Spina Dorsi, are those which tie the glenoid Cavities of the first Vertebra to the Condyles of the Os Occipitis; those that join the cartilaginous Surface of the Apophysis Dentiformis, to the anterior Cavity of the first Vertebra; and those by which all the oblique or articular Apophyses are connected together.

These are all small, short, strong ligamentary Fasciculi, fixed by both Extremities, round the cartilaginous Surfaces of the Apophyses, surrounding very closely all the capsular Ligaments of these Articulations.

The vertebral Ligaments of the Ribs, or these which connect the Ribs to the Bodies, and transverse Apophyses of the Vertebra of the Back, are of the same kind, being inserted round the cartilaginous Fossulae, in the Body and Apophyses of each Vertebra.

Besides all these Ligaments of the Spina Dorsi, there is one which goes in form of a Membrane, from the Os Occipitis, all the Way to the last two Vertebrae of the Neck. It is broad at the upper Part, and from thence diminishes gradually, by its upper broad Extremity; it is fixed along the occipital Spine, and by one Edge, in the posterior Tubercle of the first Vertebra, between the two spinal Furcae of the following Vertebrae, and in the Apices of the spinal Apophyses of the lowest Vertebrae; but the other Edge is loose. This is a true inter-muscular Ligament, and I give it the Name of *Ligamentum Cervicale Posterius*.

There are two lateral Ligaments of the same Kind fixed to the transverse Apophyses of the Vertebrae of the Neck.

THE MUSCLES OF THE SPINE.

The Muscles which lie along the Spine, the greatest Part whereof serve for the Motions of the Neck, Back and Loins, have, by the greatest Anatomists, been thought very difficult to be well dissected and clearly described, especially those of the Back. All these Muscles are very complex, interwoven with each other, and multiplied in various Manners; so that it becomes necessary either to make their Number much greater than that of the Vertebrae, or to reduce them to a small Number of long Muscles intersected at different Places.

Steno, in order to facilitate the Knowledge, Dissection and Description of these Muscles, thought proper to rank them in the following manner. By Vertebral Muscles he understands those which are fixed in the Vertebrae alone; and he distinguishes them all into *Recti* and *Obliqui*. The *Recti* are those which run parallel to the Medulla Spinalis, or whose Direction is longitudinal. The *Obliqui* are those which run obliquely between the spinal and transverse Apophyses.

He divides the *Recti* into Middle and Lateral; the middle *Recti* are those which are fixed to the Spinal Apophyses; the lateral, those fixed to the transverse Apophyses.

He moreover divides all these Muscles into Simple and Compound; the Simple being those which are fixed in two Vertebrae only; the Compound, those fixed in are more than two.

The *Obliqui*, according to him, are of two Kinds; some run up from the transverse to the spinal Apophyses, approaching each other; and some run up from the spinal to the transverse Apophyses, diverging from each other. The first Sort he terms *ad medium vergentes*; the second, *a medio recedentes*. These Terms are borrowed from Optics; and accordingly these two Kinds of Muscles might be named converging and diverging Muscles. Lastly, he adds, that several Muscles of the first kind go from one transverse to several spinal

spinal Apophyses, and from several transverse to one spinal Apophysis.

According to this Account of the Vertebral Muscles, the ancient Terms *Spinales Transversales* and *Semi-spinales*, may still be applied to them, understanding by *Spinales* those Muscles which are wholly fixed in the spinal Apophysis; by *Transversales*, those which are wholly fixed in the transverse Apophyses; and by *Semi-spinales*, those which are fixed in the spinal Apophysis by one Extremity only. At present the two Kinds of oblique vertebral Muscles are better expressed by the two compound Terms *Transverso-Spinales* and *Spino-Transversales*.

It is, however, necessary to retain the general Names of *Vertebrales Recti*, and *Vertebrales Obliqui*, because though the Terms already mentioned agree very well to the posterior Obliqui, they cannot be applied to the anterior Obliqui, one End of which is fixed not in the spinal Apophysis, but in the Bodies of the Vertebrae.

The small simple Muscles which go between two Vertebrae, may be termed *Vertebrales Minores*; and the large compound Muscles that reach several Vertebrae, *Vertebrales Majores*; both Sorts being afterwards divided into *Spinales* and *Transversales Majores* and *Minores*. The small Muscles are likewise called *Inter-spinales* and *Inter-transversales*; and as there are some small oblique Muscles that cannot be said to reach either the transverse or spinal Apophyses, these may be termed simply *Inter-vertebrales*.

The *Transverso-Spinales* that go from several transverse to one spinal Apophysis, are disposed in this manner: The Portion that comes from the most distant transverse Apophysis, is inserted in the Extremity of the spinal Apophysis, the Portion from the next transverse Apophysis is inserted more laterally; and the same Rule holds in all the other Portions, except in that which comes from the transverse Apophysis, which is nearest the spinal Apophysis.

This last Portion is not fixed in the spinal Apophysis, but rather in its Root or Basis, and likewise very near the Basis of the transverse Apophysis; so that it is more properly *Inter-vertebralis* than *Transverso-spinalis*. Thus in the *Transverso-spinales*, that go from the ninth, eighth, seventh and sixth transverse Apophyses of the Back, to the fifth spinal Apophysis of the same Class, we find that the last and smallest is fixed in the Basis of the sixth Transverse and of the fifth spinal Apophysis.

The *Transverso-Spinales* which go from one transverse to several spinal Apophyses, are disposed in this manner. The Portion that goes from the Basis, or near the Basis of the transverse Apophysis, is fixed either in or near the Basis of the spinal Apophysis immediately above it. The next Portion which is more distant from the Basis of the transverse Apophysis, runs up beyond the next spinal Apophysis, and is inserted in that above it, a little further from the Basis.

The other Portions observe the same Order, that which comes from the Apex of the transverse Apophysis, being inserted in the Apex of the most distant spinal Apophysis. From this Disposition we see, that the most superior vertebral Muscles which go from one transverse to several spinal Apophyses, are the most inferior of those which go from several transverse to one spinal Apophysis.

It must be observed, that in speaking of the oblique vertebral Muscles, I consider their Direction from below upward, and not from above downward; because the inferior Vertebrae commonly support those above them, except when a Person stands upon his Head, with his Feet erect, in which Case the superior Vertebrae sustain the inferior.

We ought likewise to remark, that in speaking of these Muscles the Term *Transversalis* is more proper than *Transversus*, which last points out a certain Direction very different from that which these Muscles have; whereas the other marks the Relation which they have to the transverse Apophyses.

Besides the Vertebral Muscles properly so called, several other Muscles, not inserted wholly in the Vertebrae, serve to move them. Some of the Ancients called these *Semi Spinales*, to distinguish them from those they termed *Spinales*, which included all the vertebral Muscles; and therefore as we have termed these *Vertebrales*, the other may be named *Semi Vertebrales*.

Among the *Vertebrales* properly so called, some from their Insertions seem to be common to the Neck and the Back, some to the Back and Loins; but for Distinction Sake, I reckon among those of the Neck, not only the Muscles entirely fixed in the Vertebrae thereof, but, also, those whose superior Insertion is in the seventh Vertebra of the Neck, though all their other Insertions be in those of the Back; and I observe the same Method with respect to the Loins.

All these Muscles vary very much in their Insertions and reciprocal Communications; by which last they are often so much confounded together, that it is a very difficult Matter to distinguish them for those who are not previously acquainted

with them. In general, they are more easily distinguished in Children than in Adults, and in Adults than in very aged Persons.

The Muscles which move the *Vertebrae* of the Neck, are, by *Winslow*, reduc'd to twelve, six on each Side, which are,

1. The *Longus Colli*.
2. *Transversalis Colli Major*.
3. *Transversalis Gracilis*, five *Collateralis Colli*.
4. *Semi-Spinalis*, five *Transverso-Spinalis Colli*.
5. *Spinalis Colli parvi*, five *Inter Spinales*.
6. *Transversales Colli minores* five, *Inter Transversales*.

See a Description of these Muscles, under the respective Articles of their Names.

The *Spinales Minores*, and *Transversales Minores*, are here reckoned collectively; for if we take them separately, there are six or seven of each Sort on each Side of the Neck; neither is the Number of them always the same. The *Transversalis Gracilis* has often been looked upon as a Portion of that long muscular Mass termed *Longissimus Dorsi*. It has likewise been taken by some for the *Cervicalis Descendens* of *Diemerbreck*; and by others it has been called *Accessorius Stenonis*.

We ought likewise to reckon among the Muscles of the Neck, the *OBLIQUUS MAJOR*, and *RECTUS MINOR*; which see under their Names.

The Muscles which move the Vertebrae of the Back and Loins would amount to a much greater Number, and be much more difficult to conceive, than those of the Neck, were they to be reckoned separately as vertebral, or semi-vertebral Muscles. It is therefore proper to reduce them to a collective Number, which may conveniently enough be fixed to twenty-four, twelve on each Side, that is,

1. *Sacro Lumbaris*.
2. *Longissimus Dorsi*.
3. *Spinalis Dorsi Major*.
4. *Spinales Dorsi Minores*.
5. *Transversalis Dorsi Major*.
6. *Transversales Dorsi Minores*.
7. *Semi Spinalis*, five *Transverso Spinalis Dorsi*.
8. *Semi Spinalis*, five *Transverso Spinalis Lumborum Sacro Veterum*.

- 9, 10. *Spinales & Transversales Lumborum*.
11. *Quadratus Lumborum*, five *Lumbaris Externus*.
12. *Coccygai*.

The Vertebrae of the Back, and especially those of the Loins may likewise be moved by the Muscles of the Abdomen. The inferior Portion of the *Longus Colli* may contribute something to the Motion of the upper Vertebrae of the Back; the *Psoas* to that of the Vertebrae of the Loins, and the *Gluteus Maximus* to that of the *Os Coccygis*.

The Descriptions and Uses of these Muscles may be found under their respective Names, except those of the Muscles of the *Os Coccygis*, which are omitted under the Article *Coccyx*.

These are small, thin, radiated Muscles, lying on the inner or concave Side of the *Os Sacrum*, and neighbouring Parts of the Pelvis: They are four in number, two on each Side, whereof one is placed more forward, the other more backward; for which Reason the first may be termed *Coccygæus anterior*, five *Ischio-Coccygæus*; the other *Coccygæus posterior*, five *Sacro-Coccygæus*.

The *Coccygæus anterior* is fixed by a broad Insertion in the anterior Portion of the small transverse Ligament at the upper Part of the Foreman Ovale of the *Os Innominatum*, which is no more than a particular Fold of the great transverse Ligament of the Pelvis: From thence it runs between this great Ligament and the *Musculus Obturator Internus*, with which it is often confounded by Anatomists; and contracting in Breadth, it is inserted in the lower Part of the *Os Coccygis*.

The *Coccygæus posterior*, or *Sacro-Coccygæus*, is fixed to the inner or concave Edge of the two first Vertebrae of the *Os Sacrum* to the inner and lower Edge of the *Ligamentum Sacro-Sciaticum*, and to the Spine of the *Os Ischium*: From thence contracting in Breadth, it is inserted in the Inside of the *Os Coccygis* above the former Muscle. *Winslow*.

SPINA ACIDA. See BERBERIS.

SPINA ACUTA. A Name for the *Mespilus*; *Apii folio*; *syvestris*; *spinosa*; five *Oxyacantha*; and, also, for the *Mespilus*; *spinosa*; *Pyri folio*.

SPINA ALBA. A Name for the *Mespilus*; *Apii folio*; *syvestris spinosa*, five *Oxyacantha*; and, also, for the *Echinops*, *folio Acanthi aculeati tenuiter laciniato, flore albo*.

SPINA ARABICA. Offic. *Carduus spinosissimus sphaerocephalus rigidis aculeis armata*. C. B. 385. *Carduus spinosissimus sphaerocephalus, Cardui Arabici nomine missus*, Park. Theat. 978. ARABIAN THISTLE.

It is easily naturaliz'd in Gardens, and flowers in Summer. The Root and Leaves are used.

The *Spina Arabica* seems to be of a like Nature with the *Spina Alba*, for it is astringent, and good for the Fluor Uterinus, Vomiting of Blood, and other Kinds of Fluxes, as is the *Spina Alba* beforementioned. *Discozides Lib. 3. Cap. 15.*

The *Spina Arabica* of *Discozides* is to be reckon'd among ambiguous Plants, and no Wonder, since all that he says of it is, that it appears to be of the Nature of the *Spina Alba*; which is so obscure an Expression, that it has been almost impossible for any one to untie this Gordian Knot. *C. Baubine*, and after him *Parkinson*, affirm it to be the Plant which, on their Authority, I have here mention'd; but *Casalspinus* and *Anguillara* have refer'd it to the *Carduus tomentosus Adversariorum*.

SPINA CERVINA. See } RHAMNUS CATHARTICUS.
SPINA INFECTORIA. See } TICUS.

SPINA LUTEA. A Name for the *Scolymus*; *chrysanthemum*.

SPINA SOLSTITIALIS. A Name in *Boerhaave* for several Sorts of *Jacea*.

SPINA SOLUTIVA. See RHAMNUS CATHARTICUS.

SPINA TOMENTOSA. A Name for the *Carduus tomentosus*; *acanthi folio*, *angustiore*.

SPINA VENTOSA. The Name of a Disorder of the Bones. See Os.

SPINACHIA.

The Characters are;

The Root is annual; the Flowers apetalous, staminous, seated at the Wings of the Leaves, consisting of a quadrifid Calyx and Stamina, on a separate, or male Plant. The Ovary is a Capsule, either turbinate, horned, or angulated, furnished with hairy Tubes, and contains a turbinate Seed on the female Plant.

Boerhaave mentions four Sorts of *Spinachia*, which are;

1. *Spinachia*; vulgaris; capsulâ feminis aculeata. *Tourn. Inst. 533. Boerb. Ind. A. 2. 103. Spinachia. Offic. Ger. 260. Emac. 330. Raii Hist. 1. 162. Spinachia sive Olus Hispanicum. Park. Parad. 496. Spinachia femina. J. B. 2. 963. Lathum hortense, seu Spinachia femine spinosa. C. B. P. 114. SPINACHE.*

Spinache has a long whitish Root, from which springs several pretty broad, sharp-pointed Leaves, hollowed in next the Stalk, and in Shape somewhat like *Aron*; but they are more wrinkled, and covered with an unctious Measiness. The Stalk is fat and succulent, growing to be about two Foot high, having the like but smaller Leaves growing on it, with several Spikes of green herbaceous Flowers, and after them come large prickly Seed. It is sown yearly in Gardens.

It is more used for Food than Medicine, being a good boiled Salad, and much eaten in the Spring, being useful to temper the Heat and Sharpness of the Humours. It is cooling and moistning, diuretic, and renders the Body soluble. *Milner's Bot. Off.*

Spinache, which is now so celebrated and useful a Green, seems unmention'd and unknown to the Antients. It is so called by the Moderns, from its spinous Seed, though there is, also, a Species of it which bears Seed which is smooth. We are not certain where it grows spontaneously, but it is probably of *Spanish* Original, since some call it *Olus Hispanicum*; but it refuses no Soil or Climate, and is in Use in almost all Parts of *Europe*. It is boiled without Water, for it affords Liquor enough in the Dressing to boil itself without the Help of any other.

Among all culinary Greens, says *Tragus*, *Spinache* is, in my Opinion, the most laudable and grateful, whence it may be eaten in almost all Kinds of Diseases. It is very serviceable in feverish Disorders, and is proper for old Persons who are subject to Costiveness: In the first, by allaying the Heat, though it be even of a hectic Quality; and for aged Persons, by lubricating the Belly, which is much better than by always stimulating it to Excretion by Cathartics and Suppositories. It is cooling and moistening, by its nitrous Quality, mollifies the Belly, cures Roughness of the *Apera Arteria*, and is good for a dry Cough. It easily creates a Nausea, unless it be seasoned with Ginger or the like. The Juice and distill'd Water mitigate the Heat and gnawing Pain of the Stomach, and are said to procure Milk. Externally, it is apply'd by way of Cataplasm to the Stomach and Liver, in order to remove a Pain and Inflammation. *Raii Hist. Plant.*

2. *Spinachia vulgaris*; sterilis. *T. 533. Lathum, hortense, seu Spinachia sterilis. C. B. P. 115.*

3. *Spinachia*; vulgaris; capsulâ feminis non aculeatâ. *T. 533. Lathum, hortense, seu Spinachia femine non spinosa. C. B. P. 115.*

4. *Spinachia*; Cretica; supina; capsulâ feminis aculeatâ, *T. 533. Beta, Cretica, femine spinose. J. B. 2. 963. Lathum Creticum ejusdem. Ibid. Boerb. Ind. Alt. Plant.*

Spinache is mollifying, but not nourishing; for if one eat a Pound of it, he voids it all again by Stool, for the Juice goes all off in Concoction, and spends itself in loosening the Belly. The fresh Herb affords a thick, but very wholesome Juice, which mitigates the Asperity of the Lungs, and is of Service in Inflammations of the Intestines. *Hist. Plant. ascript. Boerhaave.*

SPINALIS MEDULLA. The Spinal Marrow. See CEREBRUM.

SPINALIS. Spinal; belonging to the Spine. This is an Epithet of certain Apophyses of the Vertebra of the Spine; and of several Muscles. Thus there are the

SPINALIS COLLI MINORES. See INTERSPINALES.

SPINALIS DORSI MAJOR.

This is a pretty long and slender Muscle, lying upon the lateral Part of the Extremities of the spinal Apophyses of the Back.

It is composed of several muscular Fasciculi of different Lengths, which crossing each other, are inserted laterally by small Tendons in the spinal Apophyses from the second, third, or fourth Vertebra of the Back, and sometimes, though seldom, from the last of the Neck or the first of the Back; all the Way to the first or second Vertebra of the Loins, with several irregular Decussations, which vary in different Subjects.

The longest Fasciculi are a little incurvated, because they inclose the rest, which are gradually disposed between the long ones and the spinal Apophyses, so that this Muscle, which terminates by both Extremities in Points, is of some considerable Breadth in the Middle.

It communicates by some Fibres with the *Longissimus Dorsi* and *Semi Spinalis* or *Transverso-Spinalis*; and it sends off Fasciculi to several transverse Apophyses of the Back, from the fourth to the eleventh.

It is commonly named *Semi-Spinalis*, but very improperly.

SPINALES DORSI MINORES.

These Muscles are of two Kinds; some go laterally from the Extremity of one spinal Apophysis to another, being often mixed with the short Fasciculi of the *Spinalis Major*: The rest lie directly between the Extremities of two neighbouring spinal Apophyses, being separated from their Fellows on the other Side by the spinal Ligament: They are smaller and thinner than those of the Neck, and are properly enough termed *Inter-spinales*.

All the *Spinales* and *Transversales* of the Back and Loins belonging to the Class of the *Vertebrales Recti*, the *Spinales* to the middle Muscles, and the *Transversales* to the lateral, are principally useful to assist, moderate and maintain the Motions of Extension and lateral Inflection, whether simple and direct, or oblique and compound; much in the same Manner as is done by the like Muscles of the Neck.

The *Spinales Majores* and *Transversales Majores* have this peculiar to them, that their fleshy Portions not lying in a strait Line between their Insertions, they may perform not only direct Motions when they act in even Numbers, but, also, oblique Motions, when the Numbers of each Side are unequal. The small *Spinales* and *Transversales* being confined between two neighbouring Vertebrae, cannot co-operate but in direct Extensions and Inflections.

SPINALES ET TRANSVERSALES LUMBORUM.

There are some Fasciculi which run up from the superior false Spines of the *Os Sacrum* to the lower spinal Apophyses of the Loins, which may be looked upon as so many *Spinales Lumborum Majores*. There are likewise some *Spinales Minores* between the spinal Apophyses of the Loins, and *Transversales Minores* between the transverse Apophyses, which are sometimes of a considerable Breadth. *Winslow's Anatomy.*

SPINUS ALBUS. A Name for the *Mespilus*; *Apia folio*; *silvestris*; *Spinosa*; *sive Oxycamba*.

SPINUS; or *Ligurinus* of *Jonston*, is a little Bird, of the Size of a Goldfinch, generally of a yellow and black Colour. Its Beak is of a moderate Length, slender, and pointed. It feeds upon Seeds, and is found in warm Countries. It builds its Nest in mountainous Woods, and sings very agreeably. It contains a large Quantity of volatile Salt, and, when eaten, is reckon'd good for the Epilepsy.

SPIPOLA. The Name of a small Bird, of which *Aldrovandus* reckons several Species.

SPIRACULA. The Pores of the Skin.

SPIRÆA.

The Characters are ;

The Calyx is monophyllous, quinquefid, and stellated ; the Flowers rosaceous and pentapetalous ; the Petals growing out of the interior Margin of the Calyx, at the Interstices of the Segments ; the Stamina are very numerous. The Ovary in the Bottom of the Calyx becomes a Fruit composed of five Pods, each growing on its Placentula, and full of an oblong Seed.

Boerhaave mentions four Sorts of *Spiræa*, which are ;

1. *Spiræa* ; *Salicis folio*. Tourn. *Infl.* 618. Boerb. *Ind.* A. 2. 238. *Spiræa* ; Offic. Raii *Hist.* 2. 1699. *Spiræa Theophrasti forte Clusio*. J. B. 1. 559. Park. *Theat.* 1437. *Frutex spicatus foliis salignis serratis*. C. B. P. 475.

SPIKED WILLOW.

It is cultivated in Gardens, flowers in July, and the Seed is ripe in August. The Part of Use in Medicine is the Seed, which is of an astringent Quality.

2. *Spiræa* ; *Opuli folio*. T. 618. *Anonymos, Ribesii foliis* Icon. Roberti. *Eunymus Virginiana, Ribesii folio capsulis eleganter bulatis*. H. A. 1. 169. See ANONYMOS RIBESII FOLIIS.

3. *Spiræa* ; *Hyperici folio, non crenato*. T. 618. *Prunus sylvestris affinis Canadensis*. C. B. P. App. 517. *Hypericum, frutescens, Canadense*. Robin.

4. *Spiræa* ; *Africana ; odorata ; foliis pilosis*. Commel. *Rar.* 3. Boerb. *Ind.* *Alt. Plant.*

SPIRITUS. Spirit. Any fine volatile Substances, which exhale from Bodies in a given Degree of Heat, are called Spirits : Hence, by a Sort of imaginary Analogy, upon a Supposition of their extreme Fineness and Volatility, the nervous Fluid has had the Name of *Spiritus*, Spirits appropriated to it. Upon the nicest Scrutiny, it appears, that the cortical Substance of the Brain is a Collection of extremely minute Glands, from whence distinct medullary Fibres arise, which by their Union form the *Medulla Oblongata* ; that a vast Quantity of pure, fine, arterial Blood is convey'd to the Brain ; that a large Quantity of a very thin Fluid is found in the medullary Part of the Brain when cut, which in Disorders of the Head, and nervous System, is often found to be more copious ; and that the Blood convey'd to the Head, is afterwards returned by the Veins to the Sinuses, thence to the Jugular Veins, and by these to the Heart. This Structure renders it highly probable, that the cortical Substance of the Brain consists of minute Glands, which secrete a very fine Fluid, to be convey'd by the medullary Fibres to the *Medulla Oblongata*, whence, and from the spinal Marrow (a Continuation thereof) all the Nerves of the Body arise.

It is, farther, remarkable, that all the Nerves consist of the same medullary Substance, inclos'd in a Coat borrow'd from the *Pia Mater*, and another from the *Dura Mater* ; that if the *Medulla* of the *Cerebrum*, or *Cerebellum*, is any Way injur'd by a Wound, Compressure, Putrefaction, or Corrosion, every Action of the Body depending upon the Nerves which arise from those Parts, immediately ceases, though the Nerve itself remains intire ; that the Nerves, notwithstanding their Laxity, Incurvation, and winding Progress, very readily convey Sense and Motion to all the Parts of the Body ; that if any of the Nerves are divided, or compress'd, all Sensation and Motion betwixt the Division or Ligature, and Part to which that Nerve is distributed, immediately ceases, though it remains in the Parts betwixt the Division or Ligature, and the Origin of the Nerve. Hence 'tis evident, that Sensation and Motion are convey'd to all the Parts by Means of the Nerves : And it is concluded, though not with an equal Degree of Certainty, that the Animal Spirits are the Instruments of Sensation and Motion.

This is all that is certainly known of these Spirits, which are distinguish'd into Natural, Vital, and Animal. The Natural are said to preside over the Digestion of the Aliment, and Elaboration of the Chyle, or the natural Actions : The Vital over the Motion of the Lungs, and Heart, or vital Actions : And the Animal, over the animal Actions, as Sensation, voluntary Motion, &c.

Upon so precarious an Hypothesis, as that of the real Existence of these Spirits, many elaborate Theories have been form'd, which have introduc'd a great deal of Error, Confusion, and bad Practice. Thus Morton speaks much about something deleterious conceal'd in the animal Spirits, which, according to his System, must be drove out by warm Cordials ; a Practice which has destroy'd more Lives than War, Pestilence, and Famine. And thus Willis amuses us with a *Pblegosis*, or Inflammation of the animal Spirits, with no great Degree of Information to his Readers.

Dr. Cheyne, a Gentleman who had Candour enough to own the Errors of his Profession, and Spirit enough to think for himself, thus treats of the animal Spirits.

The Doctrine of Spirits, to explain the animal Functions and their Diseases, has been so readily and universally received from the Day of the Arabian Physicians (and higher) down to our present Times, that scarce one (except here and there a Heretic of late) has called this Catholic Doctrine in question. And those, 'who perhaps had Courage or Curiosity enough to doubt of, or examine the Matter, either out of Laziness, or to avoid a tedious Way of expressing themselves, have implicitly gone into the common Dialect, which is now very convenient. The System first was but rude and imperfect, but having been adopted by Philosophers and Mathematicians, as well as Physicians, they have brought it to a more consistent and less absurd Theory. Borelli gave it a great Countenance, by receiving it to explain Muscular Motion, in his Book *de Motu Animalium*. Willis gave it all the Advantages of Eloquence and Metaphor. John Bernoulli has added to it a kind of Geometry and Calculation. And last of all, Monsieur des Molières, in the *Memoirs de l'Academie Royal* for 1724, has added Plainness, and some Conformity to the natural Appearances, and taken off most of the common Objections. I shall not tire myself nor the Reader, by detailing the System at length, nor the several Steps by which it has been reformed and amended. Goelike, Professor at Frankfurt, in a small Treatise, has solidly exposed and ridiculed it, as far as Borelli went, or the precedent or co-temporary Physicians : And Dr. Pemberton has, I believe, geometrically shewn the Insufficiency of what Bernoulli has advanced to mend the Matter, in his Preface to Mr. Cowper's Book on the Muscles. I shall therefore only suggest some general Reflexions, which perhaps equally distress this System, however improved or amended.

I will not urge, that the best Eyes or Senses, however assisted, have not hitherto been able to discover any Cavity in the Substance of the Nerves, or in the small Filaments into which they are divided ; that, on the contrary, as far as *Leeuwenhoek*, doubtless the best Observer, or others who have examined the Matter with great Accuracy, could perceive, they appear solid, transparent, and with broken Reflections, even when dry, like crack'd Glass, Wire, Horn, or any other solid Substance, without any apparent Cavity. Nor that by compressing them by Ligatures, stopping the Influx, or by stroaking and milching their Lengths, are any Appearances to be observed like those in other Vessels, which we know carry Fluids in them, more than must necessarily happen from compressing the small Arteries that go along by them. It is true, that by stopping and tying the Trunks of the greater Nerves, the Muscle itself will turn paralytic and motionless, but it will equally do so, upon intercepting the Motion or Influx of the Blood, which concludes nothing but this, that these Nerves are necessary towards the Action of the Muscles, whether from their carrying a Fluid, or from their own tonic Nature, their internal Configuration, or any other Manner they may act, is not thereby determined. And if Probabilities could any Way influence a Fact, they must lie on the other Side of the Question, since that thin and soft Liquor, which seems only fit to keep them moist and lax, rather derogates from the Existence of any spirituous Fluid in them, proper for the intended End. Nor, thirdly, will I urge against it Dr. Glisson's Experiment, of putting the Arm of a strong, brawny Porter into a large Tube full of Water, and fixing it close to his Shoulder, that the Water might not get out, but ascend into a small conical Tube, passing out of the Side of the larger one ; whereby he found, that upon the strongest Action of the Muscles, the Water subsided and fell in the small Tube, and rose again upon their ceasing to act ; from whence he concludes, that muscular Motion is not performed by the Inflation or Swelling of the Muscles, but that, on the contrary, when they are moved, they are contracted into a lesser Figure, and more compact Substance, or are hardened ; which would scarcely happen, if any Matter, how subtle so ever, flowed in the Nerves, and thereby was added to the Substance of the Muscles : For since the Impenetrability of Matter is demonstrable, the least such an Addition could effect, was, that tho' the Fluid, by its Subtlety, would not sensibly increase the Bulk, yet surely it could not lessen it. I say, I shall not urge these obvious Objections against this Doctrine ; because, tho' I think they cannot be solidly answered, yet they may be evaded ; but shall proceed to offer a few Considerations, which I think equally distress it, in all the Improvements that have been made on it.

Some have imagined the Nature of this Fluid of animal Spirits, to have some Resemblance with that of Light, (the most subtle, active, and penetrating Fluid apparent in this our System) which would make them quickly penetrate, fly through, tear, break, and consume their rare and tender Prisons, which could be of no more Use to them, to determine them to regular and uniform Motions, than Glass Tubes are to Light. And were they like urinous or inflammable

flammable Spirits, yet neither would such slender Prisons contain them any Time, or convey them uniformly for regular Purposes. And lastly, if they were like Water or aqueous Fluids, they could neither have Activity nor Subtlety sufficient to solve the Appearances, nor could they move with Velocity enough to answer the Purposes of Volition, Sensation, and voluntary or involuntary Motions, under that more gross and sluggish Form, and would even then ouze through their containing Tubes.

In a Word, give them what Nature you will, they will never answer the animal Functions and Appearances. For suppose them to have any Resemblance to the other Fluids in our System, if extremely volatile and active, they would fly away, and tear, in a very short time, their containing Tubes, and Canals of the Nerves, and could not receive regular Determinations from them; and yet such they must be, to answer the Ends of Volition and Sensation: And if they were grosser, denser, and less refined, they would not answer quick and sudden Motion and its Cessation. And they can never be supposed to be extremely active and volatile, and gross and thick at the same Time. We find in Dropsies, that a grosser Fluid than they can be supposed to be, will ouze in great Quantities through Vessels of as close a Texture as theirs, not to mention the sudden Effects of all Kinds of Spirits (taken inwardly) upon the Nerves, which from this Appearance must even be supposed to penetrate the Substance of these Nerves, and yet the nervous Fluid must be, at least, as subtle and penetrating as they.

Quick and instantaneous, strong and violent Motions, (increased by adding great Weights, as we know by Experience) seem absolutely to have determined the Nature of animal Spirits, to that of the most active and volatile Kind of Fluids imaginable, because none else is capable of so quick and strong Actions, in order to determine the instantaneous Obedience of the Muscles to the Orders of the Will: And such strong, violent, and quick Motions, must necessarily make a great Waste and Expence of these animal Spirits, so as to require a constant Supply of such fine and subtle Parts from the Food: And yet we find, that aqueous, vegetable, and earthy Substances only, make up most of the Nourishment of those who have the best and strongest Spirits, and live in a constant Course of such Action; and the animal Heat employed to generate them, rises no higher than that of Vegetation or Incubation only, which is not sufficient for any other Kinds of Spirits, inflammatory or urinous. But how any Fluids at all, of what Kind soever, can be supposed or imagined to go backwards and forwards in the same indivisible Instant almost, (to convey Pain, for Example, to the sentient Principle, and muscular Action at the same Instant, to shut the Eyes upon Appearances of Danger, or to actuate all the Muscles necessary for running away under a Panic, and a thousand other Instances that may be given) seems very hard to explain from the known Nature of Fluids.

The Existence of animal Spirits has been principally contrived to solve the Appearances of nervous Distempers, as Obstructions of the Nerves, or their Incapacity to act under some Circumstances. Now, if these Appearances can be accounted for, more conformably to the Analogy of Nature, without this Supposition than by it, then the Dispute will be at an End, and they useless. As to the Obstructions of the Nerves, since they are plainly cylindrical (or nearly such) it does not seem agreeable to Mechanism, that any Fluid should readily be obstructed in them. For whatever Fluid, of whatever Nature, can enter the one Extremity in the Brain, will move on by the same Impulse to the other. For Example, a Ball of the same or less Diameter than the Cavity of a cylindrical Tube, will move on (by the Force first impressed) from one End to the other, without Stop or Hindrance from the Tube; and the same may be concluded of any Fluid; which makes Obstructions pretty unaccountable in cylindrical Tubes. Besides, it is no small Prejudice against any Fluids moving in the nervous Fibres, even that their Figure is cylindrical; for we see in all Tubes that contain Fluids (as the Veins, Arteries, and Lympheducts) to accelerate the Motion of the Fluid, their internal Figure is conical, or tapering or nearly so, which readily accounts for the Obstructions in these last mentioned Vessels; and it is not improbable that Nature, which is always similar or consistent with itself, had the Nerves been designed to carry a Fluid, would have hollowed them in this Form. And on the contrary, the frequent Obstructions that happen in those Vessels, which are of this mentioned conical Figure, and the Hardness of such Obstructions, may be sufficient to account for the Obstructions of the Nerves themselves. From all which we may, I think, pretty firmly conclude, that the Notion of animal Spirits is of the same Leaven with the substantial Forms of *Aristotle*, and the celestial System of *Ptolemy*.

Perhaps there may be in Nature material Systems of Fluids of several Degrees of Rarity and Subtlety, even indefinitely many and different. What makes it not impossible that there may be more such Systems of subtle elastic Fluids, than that mentioned *Æther* described by Sir *Isaac Newton*, is, that the Elasticity, Attraction, and other Qualities of this *Newtonian* *Æther*, must necessarily be caused by some other more æthereal and subtle Fluid, else we must admit Elasticity, Attraction and Activity in the Particles constituting this *Newtonian* *Æther* without a Cause; or we must suppose these Qualities innate to them, and to have been impressed on them immediately by the first and supreme Cause. And thus we are necessarily thrown into one or other of the two Horns of this Dilemma, either to admit of Fluids descending in infinitum, in Tenuity and Subtlety, to produce Elasticity and Attraction, or allow Particles of Matter impressed with these Qualities in their Creation immediately by the Supreme Being. It is true, this *Newtonian* *Æther* advances us one Step further into the Nature of Things; but here we must necessarily stop, the Works of God appearing literally inscrutable to Perfection. A few of the first Steps we may go in this infinite Progression, but in all the Works of God there is a *ne plus ultra*; perhaps it may be in the inanimate material System of Things, as it is most certainly in the Animal Kingdom, that Nature and its Author, to distinguish itself from finite Mechanism, always operates by Systems and Organs in Number even infinite, if not infinite in the highest Sense, yet certainly indefinite or infinite in a relative Sense, and in regard to a finite Capacity; and thus he leaves Images and Signatures of himself on all his Works, as is manifest in Quantity, Time, and Motion; and their Signs or Characters, infinite Divisibility, infinite Progressions, Eternity, Series's and Fluxions. Mercury is grosser or denser than Water, Water than Air, Air than Light, Light than *Æther*; and how far further Nature may go in descending in Tenuity, Subtlety, and refining of other Systems of Fluids, none alive can certainly tell. This is a Conjecture of the Analogy of Things, the infinite Divisibility, or Increase of Matter, from finite, till it becomes infinitely great or small, at least, as to our Conceptions, Nature's never passing from positive to negative Quantities, till it goes through the Medium of Nothing, or infinitely small of the same Denomination; its never passing from Motion to Rest, but through infinitely small Motion: In a Word, its never acting in generals, by Starts, Jumps, or unequal Steps; I say, all these Hints seem to point out something like this. From all which, and a great deal more might be urged, it may not be improbable, that as in Quantity there is one or more means between the least and the greatest; so in Substances of all kinds, there may be Intermediates between pure, immaterial Spirit and gross Matter, and that this intermediate, material Substance, may make the Cement between the human Soul and Body, and may be the Instrument or Medium of all its Actions and Functions, where material Organs are not manifest: And may possibly be the Cause of the other secret and inscrutable Mysteries of Nature, and the same (for ought I know) with Sir *Isaac Newton's* infinitely fine and elastic Fluid or Spirit; for since he has not, I believe none else will take upon him to determine its Specific Nature, or indeed, whether it actually be or not: The innumerable Appearances seem to imply some such Thing.

To conclude this dark Subject of Animal Spirits, if they must be supposed, we may affirm they cannot be of the Nature of any Fluid we have a Notion of, from what we see or know. Indeed, the large Size, the wonderful Texture, and the great Care and Security Nature has employed about the Brain, makes it probable it has been designed for the noblest Uses, that is, to be the Temple or Sensorium of the sentient and intelligent Principle. And its Resemblances, in many Circumstances, to the other Glands, which certainly separate Liquors, makes it not impossible that it may have Uses analogous to these. But how to assign them, explain, or accord them with what has been suggested above, I know not. May not the sentient Principle have its Seat in some Place in the Brain, where the Nerves terminate, like the Musician shut up in his Organ Room? May not the infinite Windings, Convulsions, and Complications of the Beginning of the Nerves which constitute the Brain, serve to determine their particular Tone, Tension, and consequently the intestine Vibrations of their Parts? May they not have interwoven Blood-Vessels and Glands to separate a milky Liquor; to soften, moisten, and continue their Elasticity, and innate mechanic Powers through the whole nervous Systems? And, also, to keep them in a proper Condition to play off the Vibrations, Tremors and Undulations made on them by Bodies, or their Effluvia? May not these Vibrations be propagated through their Lengths, by a subtle, spirituous, and infinitely

infinitely elastic Fluid, which is the Medium of the intelligent Principle? As Sound is conveyed through Air to the Tympanum, and by it to this Medium or Æther, and from the Medium to the intelligent Principle, and as Sight is performed through or by Light; and is not the Analogy of Nature and Things thus in some measure preserved? I own it is much easier to confute than establish; and I should not be very sanguine about the Non-Existence of Animal Spirits, but that I have observed the Dwelling so much upon them has led Physicians too much to neglect the mending the Juices, the opening Obstructions, and the strengthening the Solids, wherein only the proper and solid Cure of nervous Distempers consists; and apply to Volatiles, Fetids, and Stimulants; which, at best, are but a Reprieve, and is not unlike blowing up the Fire, but at the same time forcing it to spend faster, and go out sooner; for Volatiles, Aromatics, and Cordials, are much of one and the same Nature, and all but Whips, Spurs, and pointed Instruments to drive on the resty and unwilling Jade. *Cheyne's English Malady.*

Upon the whole, it should seem, that whoever lays any Stress upon the precarious Doctrine of Animal Spirits, in accounting for Distempers, or investigating Remedies, is either weak enough to be imposed upon himself, or malicious enough to amuse others.

SPIRITUS RECTOR. The prevailing, or ruling Spirit of Vegetables. This resides in the Oil of Plants, and is extremely volatile, being inimitable by Art, and imparting that Smell and Taste to every individual Plant, which is peculiar to it, and to be found in no other.

In Pharmacy, there are many Liquors which go by the Name of Spirits, the principal of which are the following.

SPIRITUS ACETI. Spirit of Vinegar. See **ACETUM.**
SPIRITUS ALKERMES.

Take Spirit of Cinnamon, Citrons, black Cherries, and Rosemary, of each four Ounces; Juice of Chermes, two Ounces; Sugar, two Ounces. Mix all well together, and let them stand to settle a proper Time; decant off clear by Inclination, and filter the Remainder. To the whole add ten Leaves of beaten Gold, broke small, and keep for Use.

This is a mighty grateful Cordial, and by the Virtues of its respective Ingredients, cannot but be good in all Intentions where the Spirits are to be raised, and the Nerves strengthened; and from the Chermes it is supposed to be particularly useful in assisting Delivery. It may be taken at Discretion.

SPIRITUS ANTI-EPILEPTICUS PUERORUM.

An anti-epileptic Spirit for Children.

Take Flowers of Lavender, Rosemary, Marjoram, Sage, of each two Handfuls; Castor, two Ounces; Camphire, three Ounces; Spirit of Wine, three Pints; Sal Ammoniac, four Ounces; Salt of Tartar, three Ounces; and simple Lavender Water, enough to cover the Ingredients. Then, after a Digestion of three or four Days, draw off one Pound and a half or two Pounds by a Retort, in which drop Oil of Rue, thirty Drops; Amber, twenty Drops; Oil of Mace and Juniper, of each forty Drops, and they will perfectly dissolve in it.

This is taken out of the *Collectanea Chymica Leydensia*, where it stands prodigiously recommended for all spasmodic Affections, and whatsoever appears with Convulsions of the Nerves, and particularly in those of Children. The Ingredients sufficiently demonstrate its Properties that way, and it is very convenient for taking; tho' if the chymical Oils were omitted it would be better, and not much the worse in Efficacy: For the other Ingredients pretty well fate it, inso-much as to turn an aqueous Vehicle it is dropt into milky. It may be given from two to twenty Drops in any proper Liquor, and repeated according to the Urgency of the Symptoms.

SPIRITUS AURANTIORUM.

Spirit of Oranges.

Take Orange-Peels, fresh and clear'd from the White, one Pound; Proof Spirit, two Gallons. Draw off, in an Alembic, one Gallon and a half, and dulcify it with fine Loaf-Sugar at Pleasure.

This makes an excellent pleasant Dram, and can hardly be exceeded by any Thing, if a few fresh Orange Flowers be

strew'd upon its Surface afterwards. The last Running makes a good Carminative; and if no such Use takes it off in the Shop before, it will be worth keeping to throw into the Still at the next making of the Spirit. After the same manner are to be made the Spirit of Citrons, Lemons, or any Thing of the like Kind; and their Flavour will be greatly heightened with the least Touch imaginable of Ambergrease.

SPIRITUS BENZOINI. See **BENZOINUM.**

SPIRITUS CASTOREI. See **CASTOR.**

SPIRITUS CERASORUM NIGRORUM.

Spirit of black Cherries.

Take any Quantity of the Cherries, and bruise them, so as to break all the Stones and Kernels; then let them stand till they ferment, and draw off what is spirituous by an Alembic.

The Dose is from two Drams to one Ounce.

SPIRITUS COCHLEARIE.

Spirit of Scurvy-Grass.

Take of Garden Scurvy-Grass in Flower (or fresh and newly gathered at any other Time) twenty Pounds; bruise it grossly, and put it into a Copper-Still finned within; put to it of the Grounds of Ale, three Gallons, with one Pint of new Yeast; stir them well together; lute on the Head, and kindle a little Small-Coal under it, to give just a fermenting Warmth; let it stand twenty-four Hours, and then give Fire to distil the Spirit. That which comes first is the best, and must be kept by itself; the other Running will serve for more Grass, in the Room of common Water, another Time.

The great Quickness and Volatility of the Herb seems so little to want any of this Help, that it is to be feared it is the worse for it; for let the Head be ever so close luted, some will make its Escape. Therefore we take the following to be much the better Way.

Take the same Quantity of Scurvy-Grass, and put to it of common Proof Brandy, two Gallons; a gentle Fire will bring over the Spirit, which may be drawn to near the Quantity of Spirit of Wine put in.

This will be strongly impregnated with the volatile Parts of the Grass, and keep much longer than the other; the Pungency of the Grass being naturally kept alive, as it were, in this Spirit, which of itself would either find an Escape, or die and flatten, as it will do in Time, with all the Contrivances that can be invented to prevent it. If two or three Pound of Horse-Radish be added to it, it will be much the better. This is given in all scorbutic Cafes in common Liquors, from twenty to one hundred Drops; and possesses the principal Virtues of the Herb itself in Substance.

SPIRITUS COCHLEARIE AUREUS.

Golden Spirit of Scurvy-Grass.

Take of the foregoing Spirit, one Pound; and dissolve in it of Resin of Jalap, or Scammony, or Gamboge, one Ounce. If there be any Sediment, decant the tinged Spirit off carefully from it.

This is kept up in great Esteem amongst the common People, by the great Pretensions of several Venders of it; but it is an indifferent and useless Medicine, unless to athlectic Constitutions, and is very unfit to answer the Expectations its Name raises. Its Dose is from twenty to sixty Drops.

SPIRITUS CORNU CERVI. See **ALCALI** and **CERVUS.**

SPIRITUS CROCI. See **CROCUS.**

SPIRITUS JUNIPERI.

Spirit of Juniper.

This is made as that of the Oranges; two Pounds being allowed to one Gallon of Spirit of Wine. The poor and common People have it in a great Esteem, but theirs is made with the worst of Spirits, inso-much that it passes by the Name of the Beggar's Cordial, and is most commonly called Gin.

Spirit of Lavender.

The Manner of making this, from the College Dispensatory, is already described under the Article LAVENDULA, which see. But Boerhaave orders it to be prepared in the following manner.

Take six Ounces of fresh and ripe Lavender-Flowers, gathered in a warm clear Afternoon, and twelve Pounds of common Spirit of Wine, and distilled by the Rules of the Art, in the Alembic and Worm, till the Liquor begins to come over milky. What arises first, is a limpid Spirit impregnated with the Taste and Odour of the Plant, and must be kept separate. A thick white Liquor will now begin to follow; a Pint whereof is to be collected and kept apart, there will remain behind a brownish black Liquor, together with the Flowers, but not much of the manifest Virtue thereof. The first Liquor is called the Spirit, and the second the Water of Lavender.

Take three Ounces of the like Flowers, and pour the former Spirit and Water upon them, and distil as before. Keep the pure limpid Spirit separate, under the Title of the double Spirit of Lavender, but draw off none of the white Water, for fear of Burning. A Quart of fresh Water may, however, be poured into the Still, and then a Pint drawn over, which will serve in other the like Distillations. In the same manner, two Ounces of recent Flowers may be distilled with the preceding double Spirit, and the Water be afterwards obtained; by which means the Spirit will be so much the richer in the native Spirit of the Lavender. Water is here added, lest the Flowers, added after the first Distillation, should become dry, and burn, whilst the last Spirit was running off, and by repeating the Distillation with fresh Flowers every time, the Spirit thus becomes excellent. The same Operation may be performed, tho' slower, in a Glass-Body or Retort, with little Trouble, and without Foulness. And thus I have often carried these Spirits to the highest Perfection. And this Operation is universal for obtaining all the Spirits from odoriferous, aromatical Flowers; the principal whereof are Garden-Cloves, Saffron, Jafmin, Lavender, Lilies, Marum, Orange-Flowers, and Rosemary Flowers, but a principal Spirit of this Kind is that of Rosemary every where celebrated, and too much used under the Name of *Hungary Water*.

R E M A R K S.

It is easy to perceive that the essential Oil of the Flowers is here raised in the Distillation; and along with this Oil the Spirit of Wine rises almost pure, like Alcohol; and therefore this Spirit dissolves the Spirit of Lavender, and the Oil that rises with it: But after the Alcohol is drawn off, and the Water begins to follow, then the ascending Oil turns the Water milky. Whence is easily understood how these Spirits are procured by Art, and exalted at the Pleasure of the Artist.

SPIRITUS MELLIS.

Spirit of Honey.

Mix one Pound of Honey with three Pounds of clean Sand, and put it into a Retort in a Sand-Furnace; make a Fire of the first Degree for two Hours; increase it to the second for two Hours more, and so go on to the third; where let it remain till no more Fumes nor Drops will fall: There will then come over an empyreumatical Spirit and Oil: Put them both into a Cucurbit, and with a Fire of the first Degree draw off the insipid Water, and the second will raise the Spirit.

This is a Spirit only in the same Sense that other Acids are; for this is an Acid, and will dissolve Coral or Pearl, as distilled Vinegar. It is affirmed to be good to make the Hair grow, and used so much for that Purpose, by rubbing any bald Place with it, that it is to be met with almost in every Shop, altho' it is of no Value for any one thing else.

SPIRITUS, SAL VOLATILE, ET OLEUM
MILLEPEDUM.*Spirit, Volatile Salt, and Oil of Hog-Lice.*

Put any Quantity of Millepedes into a long-bodied Retort, so that it be not above half full; place it in a

Sand-Furnace, lute on its Receiver, and give it the first Degree of Fire till the Retort is thoroughly hot; then increase the Fire to the second, in which keep it two or three Hours, according to the Quantity of Millepedes made use of, and some Liquor will drop into the Receiver, and the volatile Salt will begin to rise; increase it to the third and fourth Degree, then cease and take off the Receiver, when it is cool, where there will be a Spirit, and Oil, and a Salt, which must be separated and rectified apart, or put altogether into a long-neck'd Matrass, luting on a Head and Receiver, and separate the Salt by Sublimation, as that of Vipers.

The volatile Salt is the only Part this Process produces that is of Value; and this has the Virtues of the Millepedes in Substance, and is good for all the Purposes of the *Vinum Millepedum*. Its Dose is from four to sixteen Grains in a Bolus, which is the best Form for its Administration.

SPIRITUS NITRI. See NITRUM.

SPIRITUS NITRI BEZOARTICUS. See BEZOARTICUM MINERALE.

SPIRITUS NITRI DULCIS. See NITRUM.

SPIRITUS NITRI CUM OLEO VITRIOLI. See NITRUM.

SPIRITUS SACCHARI.

Spirit of Sugar.

To one Pound of powder'd Sugar put three Pounds of Fullers-Earth also in Powder, or in its Room so much Sand clean washed; place a Receiver half full of the Mixture in a Sand-Furnace, and give it Fire of the first Degree for two Hours; then increase it to the second for two Hours more; proceed to the third, where keep it till no Fumes appear in the Receiver. Then let all cool, and in the Receiver there will be found a fetid Oil and Spirit, which separate as usual. Put the Spirit into a Retort or Cucurbit; set to it a Receiver unluted; make Fire of the first Degree, and there keep it till the Drops have a little Acidity; put away the Phlegm, lute on the Receiver, increase the Fire to the second Degree, where keep it till all is come off.

This will dissolve Pearl or Coral, and is also accounted a good Medicine in the Stone and Gravel in the Bladder or Kidneys; but it is hardly made or prescribed. The Dose is from ten to fifty Drops. There is another Spirit of Sugar, which the Chymists call Compound, that has half as much Sal Ammoniac as Sugar. It makes a finer and still more aperient Spirit, but is not used.

SPIRITUS SACCHARI ARDENS.

A burning Spirit of Sugar.

Take of coarse Sugar or Molasses, any Quantity at pleasure, in proportion to the Still; put to it ten or twelve times its Weight of Water; and let them stand a sufficient time to ferment: As soon as the Fermentation is over, put the Liquor into a Copper-Still with its Refrigeratory, and give it gradual Fire till it begins to drop. Observe so to manage the Fire, that the Spirit come from the Mouth of the Worm in a small Thread, and so continue till it runs insipid; then let out the Fire, and rectify the Spirit by a second Distillation, either in a Glass Body or Head; or if the Quantity be great, in a Copper-Vessel, observing to separate the Spirit from the Phlegm, as in the first Distillation, which may be further rectified till it will burn all away, and then it is called Alcohol.

This is of the same Use as the Spirit of Wine, and is much preferable to our Malt Spirits, both for Softness and Flavour, and is exceeded by none but that of the Grape.

SPIRITUS SALIS. See SAL.

SPIRITUS SALIS AMMONIACI. See AMMONIACUM.

SPIRITUS SALIS AMMONIACI SUCCINATUS. See AMMONIACUM.

SPIRITUS SALIS DULCIS. See SAL.

SPIRITUS SALIS MARTIS.

Spirit of the Salt of Iron.

Put into a Retort of Stone, or of Glass, covered with Clay, eight Ounces of the Salt of Iron, made with Oil of Vitriol, and Spirit of Wine; place the same in a Refrigeratory,

verberatory, cover the Junctures exactly with Clay, and make a small Fire of the first Degree, in order to heat the Vessel gently: Augment the Fire to the second Degree; when nothing more comes over, augment the Fire to the third Degree; and white Vapours will arise, so as to fill the Receiver: Continue this Fire till these Vapours clear up; then augment it to the fourth Degree, and continue the same till nothing more comes out from the Retort. The Operation ordinarily lasts twelve Hours. Let the Vessels cool, and take the Clay from them, and there will come out of the Receiver a very strong Smell of Sulphur; and one shall find there five Ounces and five Drams of a clear Spirit, having an acid Taste almost like the ordinary Spirit of Vitriol, but more stiptic, and participating much of the Spirit of Steel. Keep it in a Glass Bottle well stoppt.

The Author of it says, the Iron will not rise so well without a Mixture of Spirit of Wine in its Preparation; but it is the Degree of Fire to which such Rise is rather to be attributed. It may be given from four Drops to twelve in any convenient Liquor.

SPIRITUS SALIS CUM OLEO VITRIOLI. See **SAL.**

SPIRITUS SALIS VOLATILIS OLEOSUS. See **AMMONIACUM.**

SPIRITUS SAMBUCL

Spirit of Elder.

Ferment any Quantity of the Berries, and draw off the Spirit by an Alembic.

After the same manner is to be obtained the Spirit of any Fruit or vegetable Substance. The last Spirit is commended for possessing the Virtues of the Elder in internal Uses, and is applied outwardly as the *Spiritus Cerasorum Nigrorum*. The Dose is one, two, or more Spoonfuls.

SPIRITUS SAPONIS.

Spirit of Soap.

Cut into small Pieces sixteen Ounces of *Alicant* Soap, and soften it in an Earthen Vessel by a gentle Fire, and mix in it seven or eight Ounces of Clay-Powder: Put the Mixture in a Retort big enough that one third Part may remain empty; place the same in a Furnace of Reverberation, adopt a Recipient, lute the Joints exactly, and make a little Fire in the Furnace to the third Degree; and continue doing so till nothing more distills. Separate the Vessels when cooled, and pour the whole contained in the Recipient into a Funnel furnished with grey Paper, and there will come out a watery and clear Liquor, which is yellowish and of a bitter Taste; which may be called the Spirit of Soap, of which there will be six Ounces.

I do not know that this has been made in our Shops, but it seems naturally suited for so many Purposes of Moment, as to deserve Recommendation; for it cannot but be very opening and resolute, both inwardly and outwardly applied; and seems admirably calculated for Embrocations, with other suitable Ingredients, against arthritic and such like obstinate Pains. I cannot, also, but think it efficacious in the Jaundice, Scrophulas, and the like glandulous Foulnesses; as also, a good Menstruum for Opium, to make a liquid Laudanum with.

SPIRITUS TARTARI.

Spirit of Tartar.

Take of the pure Crystals of Tartar four Pounds; distil in a Retort with a large Receiver, increasing the Fire by Degrees till the Fumes altogether disappear. There will come out a Phlegm, a Spirit, and an Oil: After the last of these is separated, put the other into a Glass Cucurbit, and rectify in a Sand-Heat two or three times over, drawing off every time not above a third Part. Of the Remainder may be made a Salt of Tartar by Calcination; from whence, also, may be obtained an Oil of Tartar by Fusion.

The Spirit is extremely aperitive; but to make it yet more so, to three Parts of the Oil and Spirit which were procured by Distillation, put one Part of *Spiritus Nitri Dulcis*; shake them well in the Receiver, and put them carefully into a clean Glass Retort, which set in a Sand Furnace; fit and lute on a Receiver, and give it a Fire of the first Degree, till the Lute

be dry; then advance to the second, in which will come over a penetrating and grateful Spirit, which is a most powerful Diaphoretic, and also affits by Urine. It is given from two Scruples to two Drams, in any proper Vehicle, in the most obstinate chronic Diseases.

AQUA SEU SPIRITUS THERIACALIS CAMPHORATUS, CROLLII.

Take of Theriaca Andromachi, five Ounces; choice Myrrh, two Ounces and a half; Oriental Saffron, half an Ounce; Camphire, two Drams: Mix them, and pour thereto ten Ounces of rectify'd Spirit of Wine. Put them in a Cucurbit, and place thereon an Alembic will closed, and let them stand in a warm Place for four and twenty Days; after which distil them in *Balneo Mariae*, by which means you will obtain a fine Spirit, which you must pour again upon the Dregs; digest them in the Cucurbit, and distil them over again, and repeat it the third Time.

R E M A R K S.

The Myrrh must be grossly pulverized, and put together with the Saffron into a Glass Cucurbit; the Camphire and Theriaca must be dissolved in Spirit of Wine, and this Solution poured into a Cucurbit, which must be carefully cover'd, and set in a warm Place, where the Matter must be suffered to digest for twenty four Days; after which you must adapt a Head and Receiver to the Cucurbit, exactly luting the Junctures, and distil off the Liquor in *Balneo Mariae*. You are to pour back the distilled Spirit on the Dregs in the Cucurbit; and after a Digestion of four and twenty Hours, distil as before; and the same Distillation, or Cohobation, must be repeated the third Time, and the distilled Water or Spirit reserved in a Bottle well stopped.

It provokes Sweat, and represses Vapours; resists Poison, and the Malignity of Humours, and is of Service in pestilential Seasons. The Dose is from one to two Drams.

The Author directs a long Digestion of the Ingredients, and several Cohobations, the better to exalt and separate all the volatile Parts in the Distillation. But it is to be feared, that in those repeated Cohobations the most subtle of these Particles will be dissipated, either through the Pores of the Glass, or through the Junctures, let them be never so well luted. I should rather think, therefore, that one Distillation was enough, after a Digestion of four and twenty Days, so long a Time being sufficient to render it easy for the Dissolvent to dissolve, and exalt all the Ingredients which enter that Composition, and so much the more as those Principles are almost wholly sulphureous and volatile. *Lemery Pharmacopée universelle.*

Heister in many Places bestows great Encomiums on the *Spiritus Vini Theriacalis*, (by which, I presume, he means the Medicine here described) and speaks of it as an external Remedy of great Efficacy in Gangrenes, Whitlows, and several other Chirurgical Cases.

SPIRITUS VENERIS.

Spirit of Copper.

This is an acid Liquor drawn from the Crystals of Copper by Distillation, and may be prepared in the following manner.

Fill two Thirds of a Glass Retort with Crystals of Copper, prepared with distilled Vinegar. Put your Retort in Sand, adapt a large Receiver, and lute the Junctures. Use at first a gentle Fire, in order to raise by Distillation a small Quantity of insipid Water. This Water will be followed by a volatile Spirit. Then augment the Fire by Degrees, and the Head of the Retort will be filled with white Clouds. Towards the End of the Process surround the Retort with Live-Coals, in order to make the last Spirit, which is the strongest, come over. When the Clouds disappear, and the Receiver is cold, suffer the Fire to go out, unlute the Junctures, and pour all that is contained in the Receiver into a Glass Alembic, in order to distil it to Dryness with a Sand Heat; and this will be the rectified Spirit of Copper.

This Medicine is used against Apoplexies, Palsies, Epilepsies, and other Disorders of the Brain. Seven or eight Drops of it are to be taken in any proper Liquor. It dissolves Pearls, Corals, and other Substances of a like Nature.

There remains in the Bottom of the Retort a black Matter, which may be again converted into Copper, by fusing it in a Crucible, with the Addition of a little Saltpetre and Tartar. *Lemery Cours de Chymie.*

SPIRI-

SPIRITUS VINI. See ALCOHOL.
 SPIRITUS VINI CAMPHORATUS. See CAMPHORA.
 SPIRITUS VINI RECTIFICATUS. See ALCOHOL.

SPIRITUS VINI TARTARIZATUS.

Tartarized Spirit of Wine.

Take Salt of Tartar, two or three times coagulated and dissolved, one Pound; give it a strong Fusion in a Crucible, for two Hours; powder it in a warm Mortar, and whilst warm put it into a Matrafs to four Pints of rectified Spirit of Wine: Shake them well together, and place them in a Sand-Furnace; lute the Juncures of the Head and Receiver; give Fire to such a Degree, as may make the Drops succeed each other very quickly, and continue it till all the Spirit is come over.

This Spirit volatilizes and carries over some Part of the Salt of Tartar along with it; which is demonstrable by the Salt sustaining the Loss of, at least, one Ounce of its Weight. And by this Operation the Spirit of Wine obtains a more agreeable Scent and Taste than before, and is, also, more subtle and penetrating.

Another Way.

Take the Salt of Tartar left in the Bottom of the Matrafs in the foregoing Operation, dissolve it in pure rectified distilled Vinegar; filter the Dissolution, and coagulate the Salt, which dissolve again in more distilled Vinegar; filter and coagulate as before. Repeat this Operation so often, that no black Fæces remain, and that the distilled Vinegar comes off as strong as it was put upon the Salt. And then is the Salt prepared, which some call volatile Salt of Tartar.

If a farther Exaltation of this Salt is required, take of the foregoing Salt of Tartar four Ounces, and put to it of the Spirit of Wine one Pound, which will readily dissolve it. Let the Dissolution stand quiet for three or four Hours, and decant it gently from the Fæces; draw off the Spirit of Wine in a gentle Sand-Heat in a Retort: Dissolve the Salt again in the same Spirit of Wine, and repeat the Operation till no Fæces remain: Return the Salt again into the Spirit of Wine, in which it will totally dissolve.

This is the true tartarized Spirit of Wine, with which Mr. George Wilson says he used to extract the Tincture and anodyne Sulphurs of Metals, and unite them with vegetable fixed, and animal volatile Alkalies; and he farther owns it to be the principal Ingredient in the anti-rheumatic Tincture (of which he does not give the Recipe) that cured him of a violent Rheumatism, which afflicted him three Years successively; and that he was not only freed from those acute Pains which attend the Distemper, but then continued without any Return, which was about fifteen Years after. Nor are its Virtues (he continues to inform us) confined to that Disease only; for the Gout, Scurvy, Dropsy, Jaundice, Colic, Green-Sickness, and Stone in the Bladder or Kidneys, give way to it. Its Dose (that is of this Spirit) is from fifty Drops to two Drams, diluted in Wine and Water, or both mixed.

SPIRITUS VITRIOLI. See VITRIOLUM.

SPIRITUS VITRIOLI DULCIS. See VITRIOLUM.

SPISSAMENTUM. The same as STYMA; which see.

SPITHAMA. σπιθαμή. A Measure of Length, called a Span, which is usually said to be twelve Fingers Breadth, or as much as from the End of the Thumb to the End of the little Finger, when extended.

SPLANCHNICA. σπλάνχνα, from σπλάνν. An Entrail or Bowel. Medicines appropriated to the Diseases of the Bowels or Viscera.

SPLEN. The Spleen. See LIEN.

SPLENECTOMIA. An Excision of the Spleen.

SPLENETICA. Remedies for Disorders of the Spleen.

SPLÉNIA. Compresses.

In dressing Wounds, after the Plaister and other Necessaries, it is usual to apply Compresses, which are made of clean soft old Linen, four, six, or eight times doubled. They were called *Splénia* by the ancient Physicians, because of the frequent Resemblance of their Figure to that of the Spleen; and they are called Compresses, because they serve to keep the Plaister and other Dressings firm. Compresses are also often applied without Plaisters, sometimes dry and sometimes moistened with Waters, Spirits, &c. of different Kinds and Qualities, according to the Nature of the Disorder.

The Figure and Size of Compresses are different, according to the different Parts of the Body to which they are applied. Sometimes they are square, as in Tab. 23. N^o. 12. oblong, as in N^o. 13. triangular, as in N^o. 14. crucial, as in N^o. 15. According to their Situation, also, they are called right,

oblique, and transverse, and sometimes angular, when they surround the Arm or Leg. Some are shaped like an Asterisk or Star, as in N^o. 16. Some are cut either on one Side or both Sides, as far as the Middle, see N^o. 17, 18. Some are hexagonal, like N^o. 19. and others are globular, like a Ball, which are placed under the Arm-pits, in Luxations of the Shoulder-bone, see N^o. 20. Some are small and square, like N^o. 21. which are used in stopping Hæmorrhages from wounded Blood-vessels; others are slender, as N^o. 22. and are useful in Sutures of Wounds and Ligatures of the Arteries. Those which are designed for covering Plaisters, ought to be made broader than the Plaisters.

The principal Intentions of Compresses are, 1. To cherish the natural Heat of the Part affected, and keep out the Cold. 2. To secure the Dressings under them. 3. To convey liquid Remedies to the Parts wounded, or otherwise disordered, and to contain them longer on the Part. 4. To fill up any Inequalities or Depressions about the wounded Part, that the Dressings may be kept firm, especially in Fractures. 5. To prevent the Skin from being irritated by the Stricture of Bandages, which might occasion troublesome Itchings, and even Pain. *Heister's Surgery.*

SPLENICA. Medicines appropriated to Disorders of the Spleen.

SPLENISCOS. σπληνισκος. A Compress.

SPLENITIS. σπληνίτις. An Inflammation, or Tumor of the Spleen. *Splenitis* is, also, a Name for a Vein in the Left-Hand, the same as the *Salvatella*, which in the Right-Hand is called *Jecoraria*.

SPLENIUM. The same as the *Asplenium*, or *Ceterach*.

SPLENIUS MUSCULUS. See MASTOIDÆUS SUPERIOR.

SPLIT. A Name for the *Fumaria lutea*.

SPODIACON. σποδιακόν, from σποδός, *Athes*. The Name of a Collyrium, described by *Paulus Ægineta*, and thus called, because it was of an Ash Colour.

SPODITES. σποδίτης. An Epithet for Bread, importing its having been baked under the Embers. — *Galen. Exiges*.

SPODIUM. See CADMIA.

SPODOS. σποδός. The same as Spodium. Properly it signifies Ashes.

SPOLIATORIUM. The same as APODYTERIUM.

SPONDYLIIUM. See SPHONDYLIIUM.

SPONDYLOS. σπώδυλος. The second Vertebra of the Neck, or a Vertebra in general.

SPONDYLOLITHOS. A Sort of Stone found in the Country of *Tirol*, resembling the Vertebra of a small Animal.

SPONGIA.

The Characters are;

It is a thin, bibulous, and strangely implicated Substance, generally softer than the *Keratophytus*.

Boerhaave mentions seventeen Sorts of *Spongia*; which are;

1. *Spongia*; ad usum præstantissima; foraminibus exiguis pervia. *T. 575.*

2. *Spongia*; compressa, magna. *C. B. P. 368.*

3. *Spongia*; globosa. *C. B. P. 368. Imp. 635. Tourm. Inf. 575. J. B. 3. 816. Raii Hist. 1. 80. Boerh. Ind. A. 8. Spongia marina alba. Ger. 1383. Emac. 1577. Spongia marina usualis, Park. 1303. SPONGE.*

The Sponge is an imperfect Plant, or Sea Vegetable growing under Water at the Bottom of the Sea, upon the Rocks and Stones, of a kind of woolly or hairy Substance, of a springy Nature, full of a great Number of small Cavities, light and porous.

Sponges uncalcined, are never used inwardly, being accounted of a poisonous Nature, swelling up the Stomach, and not digesting; they are used by Surgeons in Embrocations, and to stop Bleeding. *Miller's Bot. Off.*

Of Sponges, those which are full of fine Perforations, some call male Sponges, and of these the hardest *Tragi*; those which are of a contrary Disposition to the before-mentioned, they call female Sponges; they are burnt like the *Alcyonium*.

Sponges, while new and not pinguious, are vulnerary, and repress Tumors; applied with Water or Posca, they conglutinate recent Wounds, and with boil'd Honey heal old Sinuses. Old Sponges have no such Effect, tho' they serve to separate and widen the Lips of Ulcers and Calluses when ready to close, by being tied up dry in a Linen Rag, and intruded after the Manner of Lint. New Sponges applied, dry rheumatic and cancerous old Ulcers, and repress Hæmorrhages. Burnt with Vinegar they are serviceable in a dry Lippitude, and where Abstersgents or Astringents are required; but for Ophthalmic Remedies they do best washed. Burnt with Pitch, they are good for an Hæmorrhage. Those which are softest are whitened in the hot Season by irrigating them with the Spume of the Salt, which sticks to the Rocks, and then expelling them

them in the Sun, in doing which we must be careful to turn the hollow Part upwards, and that by which they were cut off downwards. If the Weather be fair, they may be exposed by Moon-light, being irrigated with the Spume of Salt, or with Sea-water; and Spunges so exposed become whitest of all. *Dioscorides, Lib. 5. Cap. 138.*

A burnt Sponge is of an acrimonious and digestive Faculty. Impregnated with Bitumen, and used while it is on Fire in order to be dried, it stops an Hæmorrhage from a Wound. If Bitumen be wanting, Pitch may serve. A new Sponge is manifestly drying, for if you apply it to a Wound either with Water, Posca, or Wine, it will prove as good an Agglutinant as those Medicines which are applied for stopping an Hæmorrhage. *Oribas. de Virt. Simpl. Lib. 2. Cap. 1.*

The Use of a Sponge is in deterring Sordes, Sanies, Blood, Pus, or Medicines themselves from the Body, or in relieving the same under a biting or itching Sensation. But for the Face we use a Sponge in order to revive and raise the Spirits when sunk, as in a Lipothymy, for which Purpose we apply a Sponge, dipt in the Summer in cold Water, but in the Winter in what is Milkwarm. But we must be cautious in such Cases, and not make the Application in the Beginning or Increase of the Fit, but in the State or Decline thereof; for in the Beginning we make Use of odoriferous Things. *Archigenes* for a burning Fever, when near its Height, would have us apply the Sponge not only to the Face, but also to the Breast. *Actius, Tetrab. 1. Serm. 3. Cap. 170.*

4. Spongia; cinerea; cava; vaginam referens.

5. Spongia; Americana; compressa; spinosa; echinata; eleganter punctata.

16. Spongia; ramosa; fistulosa; millepora.

17. Spongia; pulcherrima; reticulata; fistulosa; lacunata. *Boerh. Ind. Alt. Plant.*

Sponge is a soft, light, porous Plant, resembling a Fungus, and adhering to the Rocks in the Sea. Almost all Spunges are brought from the *Mediterranean* Sea. Spunges are of Use for enlarging Wounds when too small, and being burnt, afford an excellent Powder for cleaning the Teeth. There are sometimes found in Spunges some very small Corpuscles, which, by the Help of a Microscope, appear to be small *Conchæ*, which being reduced into Powder, are said to be good for the Sand and Gravel in the Kidneys, and the Scrophula, and also for Worms in Children. All these being burnt together, afford a very absorbent Powder, and emit a Smell like that of burnt Horn. *Hist. Plant. ascript. Boerhaave.*

Sponge is a very remarkable Plant, because when subjected to Distillation, it affords an urinous Spirit, exactly resembling that procured from animal Substances. Calcined Sponge is celebrated for its Virtues in curing the King's Evil, and not without Reason; for 'tis certain that in this Distemper many remarkable Cures have been performed by it.

SPONGIÆ LAPIS. *Offic. Lapis Spongiae, Boet. 407. De Laet. 135. Schrod. 357. Worm. 54. Charlt. Foss. 23. Lapides in Spongiis, Matth. 1390. Spongites, Aldrov. Mus. Metall. 671. SPUNGE STONE.*

It is a Stone quite friable, concreted in a Sponge, and of a white or grey Colour. It is an Attenuant without any remarkable Heat, and is good to break the Stone in the Kidneys and Bladder, and also to discuss strumous Swellings.

The Stones found in Spunges being taken in Wine, are good to break the Stone in the Bladder. *Dioscorides, Lib. 5. Cap. 163.*

SPONGIOLI. Small Mushrooms which are produced in the Spring, and are esteemed, of all others, the best.

SPONGION. *σπγγιον.* The Name of an Epithem, and of a Malagma, described by *Paulus Aegineta*, thus called, because said to imbibe hydropic Humours like a Sponge.

SPONGIOSUM OS. A Name for the *Os Ethmoides*, or *Cribiforme* of the Head. See **CAPUT.**

SPONGOS. *σπγγος.* A Sponge.

SPONSUS. Mercury. *Rulandus.*

SPONTUM. Ashes wetted with Water, and used in the Depuration of Gold or Silver.

SPORADES. *σποράδες.* An Epithet for Diseases, importing *interspersed* or *disseminated*. Sporadic Diseases are such as seize particular Persons at any Time or Season, or in any

Place; whereas epidemical Diseases are peculiar to certain Times or Seasons, and endemial to particular Places. The Word is derived from *σπείρω*, to sow, or scatter.

SPORADICI MORBI. Sporadic Diseases. See **SPORADES.**

SPORETOS. *σπορέτος.* The Beginning of Winter, or latter End of Autumn, in which the Seed of Winter-Corn is sown.

SPOROS. *σπός.* The seminal Fluid.

SPUMA. Froth or Foam. *Spuma Argenti* is Litharge. See **LITHARGYRUS.** *Spuma* in Chymistry, is Ashes. *Spuma Maris*, is the *Halcyonium*.

Spuma Nitri, is the *Apronitrum*. *Spuma trium Draconum*, is Butter of Antimony.

SPURIUS. Illegitimate. This is applied as an Epithet to various Diseases. The Ribs, also, which do not reach to the Sternum, are called *Spurious Ribs*.

SPUTAMEN. The same as **SPUTUM.**

SPUTUM. Prognostics from Spit, or Excretions by Spitting.

Tho' the Name *Sputum*, Spit, be given by Physicians to whatever comes from the Mouth, except what is discharged by Vomiting, in which Sense it comprehends all Excretions by Screation or Hawking, simple Spitting and Coughing, yet the Word is more properly applied by them to the Matter excreted by means of a Cough, and under this Acceptation we shall now consider it with respect to the Signs on which we may ground our Predictions concerning the Death or Recovery of the Patient.

The Matter discharged by Coughing, provided it be simple, and not in the least mixed with other Humours, is a mucous, pituitous Excrement distilled from the Lungs. Sometimes indeed bilious, or merely purulent Substances are discharged, but these are the Effects of very bad Disorders. Now these Excretions by Means of a Cough, to which, as was said, we shall give the Name of *Spit*, are, as *Galen* tells us, Indications of the Affections of the Lungs, Thorax, *Aspera Arteria* and Throat, and, in short, of all the Organs of Respiration. And they differ from one another in Substance, Figure, Colour, Quantity, Simplicities and Mixture, Smell, Taste, Facility of Screation, an in Alleviation or Aggravation of the Pain and Cough. In respect of Substance, they are either thin or thick, viscid or not viscid; in regard to the Figure, they are called smooth, equal, round, spumous, bloody and purulent; as to Colour, they are said to be white, pale, yellow, russet, red, green, livid, black, and sometimes particoloured; in Quantity, they amount to much, or little or nothing; in respect to Simplicities and Mixture, they are either merely simple, or more or less mixed; as to their Smell, they are either said to have an ill Smell, or to have no ill Smell; in Taste they take the Epithets of insipid, sweet, salt, bitter and acrid; as to Facility or Difficulty of Excretion, we say they are easily, or with Difficulty, or by no means dischargeable by Coughing; they are also either such as mitigate or increase the Pain and Cough; and, to seek for no more Distinctions, are either concocted, or crude and malignant.

The Causes of all these different Excretions by Coughing, are to be known and understood; and, first, as to *thin* and *liquid Spit*, its Thinness proceeds, according to *Galen* on the sixth of the *Epidemics*, from the weak Heat of the Brain, which is incapable of concocting the aqueous Excrement, as are also the Lungs on the same Account, or a Defect of Heat sufficient to thicken the Humour. This Sort of *Spit*, in a Pleurisy, he makes the Beginning of Concoction, as the thick *Spit* is a Sign of perfect Concoction; for *Spit*, in its State of Maturation, grows thicker and thicker.

Spit becomes moderately viscid, when the thin or liquid Parts are thoroughly concocted, but an extraordinary Viscidity indicates an intense Heat resolving the Humid, by which Means, the Phlegm being agitated by a high Degree of Heat, thickens and becomes viscid. Such a Viscidity of the *Spit* is very pernicious in pleuritic and pulmonic Disorders, because it adheres so firmly to the Parts as hardly to be disengaged, and oftentimes, by obstructing the small Arteries of the Lungs, induces a Suffocation, of which *Galen, Lib. 4. de Loc. Affect. Cap. 6.* gives an Instance in *Antipater*, a Roman Physician. For in a Pleurisy, or Peripneumony, and even in an Asthma, what cannot be thrown off induces a Stertor and Ebullition, and is frequently the Cause of Suffocation or an Empyema. But a watery and fluid Phlegm, which is void of the least Viscidity, is a Sign of a weak Heat, which is incapable of confining the thin Humidity.

A *smooth* and *equal Spit* indicates the Phlegm to be not only of one simple Substance, but that it is equally agitated in all Parts by the Heat; as one unequal and variously figured, indicates the contrary.

Spumous, or frothy Spit, in which the Spume continues for a considerable Time, is from a pituitous and viscid Substance, agitated with a great Degree of Heat; *Spit* remarkably spumous is justly condemned by *Galen*, *Lib. de totius Morbi Temp.* This Sort of *Spit* may proceed also from a flatulent Spirit mixed with the Phlegm, or some other Humour, as it happens when the excrementitious Parts discharged from the Lungs are mixed with a great Quantity of Air. In this respect we are told by *Paulus*, that spumous *Spit* is frequently discharged from the Throat, because it is a Part concerned in Respiration. In a Pleurisy and Peripneumony what is expectorated by Coughing appears spumous, not from a flatulent Spirit, but an igneous Heat contracted by the affected Parts. Under these Disorders, if spumous Blood appear among the *Spit*, it shews the Substance of the Lungs to be injured, as we are taught by *Galen*; and it appears from *Hippocrates*, 5 *Aph.* 13. that the spitting of spumous Blood is a certain Sign of an Ulceration in the Substance of the Lungs.

Spit of a round Figure expectorated by Coughing, is from a thick and tenacious Humour collected in the Fibres of the Lungs, and agitated by an extraordinary Degree of Heat, according to the Sentiments of *Galen*, *Com. in 6 Epid.* to which we add, that it takes this round Form, because the glutinous Humour contained in the Aspera Arteria, assumes the same Figure with that Part, which is globous, as having its interior Cavity turned orbicularly. I have observed this Sort of *Spit* in some Persons who were free from a Fever, and for a very long Time seemed to be no way indisposed, but at last died all of them of Consumptions. Round *Spit*, according to *Hippocrates*, 6 *Epid. Sect. 3. Aph. 27.* and *Sect. 6. Aph. 21.* indicates a Delirium, perhaps from the Heat signified by it, which, as *Galen* says, *de loc. Affect. Lib. 4. Cap. 8.* fills the Head, but it can never by itself, and alone, portend a Delirium.

Of much the same Kind with round *Spit*, is *Spit* in the Figure of Hailstones; this was observed by *Galen*, of a certain Person who could not avoid falling into a deep Consumption.

Bloody Spit is from an Extravasation of Blood, occasioned sometimes by an Aperture of the Mouths of the Veins, which the *Greeks* call *Anastomosis*; an Effusion of this Kind is not attended with Pain, Inflammation or Fever, and the Blood is thin and watery, and much in Quantity, if proceeding from large Veins, and but little, if issuing from smaller Vessels. Sometimes the Extravasation and consequent Hæmoptoe is caused by an Erosion of the Vessels, called *Diabrosis* and *Anabrosis*, which Affection is indicated by a troublesome Cough without a manifest Cause. The Blood in the Beginning is but little in Quantity, and is evacuated at Intervals, tho' sometimes, when the Erosion is considerable, or affects the larger Vessels, there is a copious Efflux. In the third and last Place, the Hæmoptoe may be occasioned by a Rupture of the Veins, which Affection is called a *Perirrhesis*, and is indicated by a Pain, especially if the Flux proceed from a Rupture of the Vessels about the Thorax or Lungs near a Membrane, and the Blood is also much in Quantity, if the Rupture be occasioned by a Redundance of Humours, violent Motion, Clamor, a Fall, a Blow, or the like. *Bloody Spit* then you see, is occasioned by an Aperture, Corrosion, or Rupture of the Veins. But in a Pleurisy this Kind of *Spit* shews that Nature attempts the Concoction of the morbid Matter by gently attenuating the same, whence the Passages being dilated for the Exhalation of the Vapours, the thinner Part, and what is next to the Vapours, takes Occasion from the Laxness of the Pores to slip through them into the internal and neighbouring Spaces, from which, by the Rise of a Cough, and Expectoration of *Spit*, an incipient Concoction is indicated. This kind of bloody *Spit* is mixed with Phlegm, and is incident to those Pleurisies which *Galen*, *Com. 3. in 6 Epid.* pronounces of the mildest Sort. But very bloody *Spit* in pleuritic Disorders, is utterly condemned by the Author of *Coac.* 390, because it is much the same as if pure Blood were expectorated, and indicates another kind of Disorder, which is either a *Diabrosis* of some of the Vessels by an acrimonious and corroding Bile attenuating the Blood, and opening the Veins; or a *Rhexis*, that is, a Rupture from a violent Compression of the Thorax, which proved ineffectual in discharging the Contents of the Phlegmon.

Purulent after bloody *Spit* indicates an approaching Pthitis, 7 *Aph.* 15, 16. but in a Pleurisy and Peripneumony it is a Sign of a Suppuration and Empyema, whence proceeds a Consumption; for if the peccant Matter be not removed in fourteen Days, it either destroys the Patient by Suffocation, or becomes more putrid, and is converted into Pus, the Signs of which are a Horror, either recent or increased, or violent Fever, and a Weight or Load. Agreeable to this are the Sentiments of *Hippocrates*, 2 *Aph.* 47. where he says, "That

"Pains and Fevers happen more about the Time of the Generation of Pus, than after it is generated."

With respect to the Colours of the *Spit*, or Matter excreted by Coughing, it appears white when it is either pituitous or purulent. White *Spit* from Phlegm, in pituitous Diseases, is of Service; in bilious Disorders, it is not only of no Benefit, but a bad Sign, as indicating that nothing of the Matter which causes the Distemper, for Instance a Pleurisy, is discharged. Of white *Spit* from Pus we have spoken just now.

Yellow, pale, and black *Spit*, are from Bile of the same Colours impregnating the same. *Com. 4. in 6 Epid. T. 4.* The same Author, *Lib. 2. de Loc. Affect. Cap. 9.* comprehends the Colours of *Spit*, with their various Causes, in the following Passage: "We have already shewn, he says, that all Inflammations proceed from a Conflux of Blood; wherefore if the Blood be bilious, the *Spit* will be yellow, or pale; if pituitous and spumous, the *Spit* will be white; if the Blood be melancholic, the *Spit* will be either black or livid; if none of these Humours affect the Blood, the *Spit* will be red. In Pleurisies, the *Spit* is frequently observ'd to have more of a bilious Hue; in a Peripneumony it has usually more of a phlegmatic Cast."

Party-colour'd *Spit*, according to *Galen*, indicates a Variety of Affections, and consequently a difficult and hazardous Distemper.

Much *Spit* indicates a Multitude of Humours, and if expectorated with Ease, and white and thick, shews the Phlegmon to be concocted and subdu'd. If it be much and purulent, and the Pus therein be white, smooth, equal, and not fibred, it signifies that the suppurated Phlegmon will be ended by an Excretion of the Pus. Much bilious, green, livid and black *Spit*, shews the Disease to be very crude and malignant, and very difficult to be subdu'd by Nature.

Spit little in Quantity with respect to the Disease, tho' concocted, is of no Service, and therefore justly to be dreaded in a Peripneumony, as we are taught by the Author of the *Coac.* 416. and find confirm'd by an Instance in *Hippocrates*, 7 *Epid. T. 58.* of the Wife of *Euxenus*.

No *Spit* at all excreted in pleuritic and peripneumonic Disorders is highly dangerous, especially when the Patient has not the Benefit of Expectoration either in the Progress or Beginning of the Disorder. Not to spit in a Pleurisy is of the same Signification as aqueous Urine in other Fevers, indicating the extraordinary crude State of the Disease, as *Galen* tells us, *Lib. 1. de Crisibus, Cap. 18.* The same Author, *Com. in 1 Aph. 12.* says, that want of spitting shews the Inflammation or Phlegmon to be difficult of Concoction, and of long Continuance. And, *Lib. de Constitut. Art. Medend. Cap. 16.* he says, that to spit nothing is pernicious, partly because it signifies that the Matter is as it were bound up in the Phlegmon, and partly in that the inward Parts are universally corrupted by its Detention. Hence the Author of the *Coac.* 381. justly pronounces dry Pleurisies, in which nothing is discharged by spitting, very dangerous. And *Galen*, *Lib. 2. de Crisibus, Cap. 10.* expresses himself to the same Purpose, as follows: "When the Disorder, he says, is exquisitely strait, and binds up, as it were, in itself the whole Flux [Confluence of Humours] it produces deadly Distempers, which are called *ἄπυσι* (*Aptysi*) spittleless." And *Lib. de Totius Morbi Temp. Cap. 16.* he positively determines, that want of spitting, attended with great Pain and a Difficulty of Respiration, is mortal.

It is no less fatal under the same Disorders for spitting to be suppressed for no manifest Reason, as the same Author observes, *Lib. de Constit. Art. Med.* for such a Suppression, he says, *Com. 2. in Prognost.* is owing either to the Thickness and Viscidity of the Humour, or to the Laxness of the Membrane which incloses the Lungs; or, lastly, to the Weakness of the Faculty in the Patient. To the same Purpose the Author of *Prorrhet.* 97. tells us, that "They who are affected with a Pain of the Side attended with bilious Spittings, if these cease for no Reason, are seized with Madness." Here *Galen*, in his Comment on the Place, writes, that "This is not always the Consequence, but only when there is a Translation of the bilious Humour to the Head." In a Tabes and Suppuration there is nothing worse than a Suppression of *Spit*; in the latter Case it signifies a Pthitis or Death, and in the former it portends a fatal Event. *Galen*, in 7 *Aph.* 16. says, that consumptive Persons live under their Extenuation as long as they can cleanse and free their Lungs by coughing; but when the Pus remains within, the Passages for Respiration being by that Means obstructed, the Patient is suffocated on a sudden. To the same Purpose we are told by *Hippocrates*, 7 *Aph.* 16. that "Upon spitting of Pus comes a Pthitis; and when the

"Spit is retained, the Patients die." An Excretion, also, which is weak and fruitless, and is not projected by the Lungs, but on Account of an excessive Plenitude rattles in the Throat, shews either the Redundance and Viscidity of the Humours, or the Weakness of the Faculty.

In a Pleurisy, Peripneumony, Empyema, and Tabes, for the Patient to be able to spit out readily and freely, is a very good Sign, as we are told by *Galen, Lib. de Constitut. Art. de Medend.* This in a Pleurisy and Peripneumony, shews that Nature has begun her Work of Concoction, and that the Spit has no bad Quality; and in a Suppuration it gives Hopes that the Pus may this Way be evacuated, and a Phthisis prevented. Of such Sputum we find *Hippocrates* speaking in *Prognostic.* where he says, "That in all Pains and Disorders about the Lungs and Sides, a prompt and easy Excretion is required." For this shews both the Strength of the vital Faculty, and, also, of the animal Faculty in the Brain, and that Nature's Instruments, the Muscles, are no way incommoded in Respiration by an Obstruction or Compression of the Passages; and, also, that the Matter is neither so viscid as not to be separated from the Parts, nor too thick nor too thin to be raised.

Pure, or simple and unmixed Spit, except such as is merely pituitous, is occasion'd, as we are told by *Galen, Lib. de Humoribus*, from a Consumption of all the aqueous Humidities by a flameous Heat, whence it shews an internal Burning of the Parts, and that the Disease is of a very difficult and dangerous Nature, because such Spit is of a malignant Quality, and can hardly be expectorated. *Hippocrates* in his *Prognostics* condemns pure or simple yellow Spit, but most of all black Spit when pure.

Spit appears mix'd with an aqueous Humid, when either the humid Parts are not consumed by the febrile Heat, or there is a Redundance of the pituitous Humour.

What we call various or Party-colour'd Spit, appears mix'd with a Variety of Humours; and this is much worse than the former, as indicating a Complication of Disorders.

Fetid Spit, by its ill Smell, denotes a considerable Putrefaction in the Humour of which it is composed. For this Reason *Galen, Lib. de Tot. Morb. Tempor.* highly condemns very fetid Spit in a Pleurisy and Peripneumony: And *Hippocrates, Coac. 406. 409.* pronounces it mortal in an Empyema.

Insipid Spit is occasioned by crude Phlegm, sweet Spit by Phlegm concocted, bloody Spit by concocted Phlegm mixed with Blood. Salt Spit is from salt Phlegm, which acquires its Saltiness from an excessive Agitation and Aflation by Heat, and, also, according to the Sentiments of the Arabian Physicians, from torrid Vapours, or a Mixture of bilious Humours. Acrimonious and bitter Spit is from yellow, russet and æruginous Bile; acid Spit from a melancholic Humour.

Spit, by which a Mitigation of Pain is occasion'd, is esteemed very salutary, because it indicates a due Evacuation of the Humours, according to that of *Hippocrates, 1 Aph. 25.* "When Things are evacuated which require Evacuation, it conduces to Health." And, as he says in another Place, 2 *Aph. 2.* "That Sleep which removes a Delirium is good, but the contrary bad;" thus it happens in Affections of the Pleura and Lungs, that where Spit causes no Alleviation of the Pain, it is of no Service, but of worse Consequence when the Pain increases by it: For Spit which gives no Relief to the Patient under his Pain and Anxiety, though in itself of no bad Quality, prognosticates a Suppuration, according to *Hippocrates* in the following Passage of his *Prognostics*: "Whenever a Pain in those Parts is not removed either by Expectoration, or Evacuation of the Belly by Stool, or Venesection, or Medicines, or Diet, the Disorder tends to a Suppuration." And to the same Purpose he says just before, "That all Excretions which remove not the Pain are bad; but the worst of all are the black, whereas those by which the Pain is alleviated are of the best Kind."

In the same Manner, Spit by which the Cough ceases is a very good Prognostic, because it indicates that the Humour which is the Cause of the Cough and Inflammation, discharges itself the most commodious Way. Spit and Excretions which, on the contrary, excite much Coughing, are pernicious; for the Humour, either through the Depravity of the Matter detained in the Lungs, or the Weakness of the Organ, or of the Faculty, or its own Thickness, is with great Difficulty raised, and is sometimes intercluded in a narrow Passage, in such a Manner, as to occasion Suffocation. Sometimes it contracts such a Degree of Viscidity, as not to be separable from the Parts to which it adheres; and oftentimes when it is raised into the Tubes of the Lungs, is there detained, and adheres to them like Glue. Thin Spit, on account of its Diffuence and Inco-

herence, is no less difficult to be expectorated. By all these Kinds of Spit then, or Excretions, much Coughing is excited, which, on the contrary, is restrained by Spit of a moderate Consistence; and not too viscid or too thin. For such Reasons *Hippocrates*, in his *Prognostics*, utterly condemns all Expectoration of Spit which provoke much Coughing.

Concocted Spit in a Pleurisy or Peripneumony, is white, light; neither too thick nor too thin, as *Galen* says; *Com. 2. in Prognost.* which is easily discharg'd by Screation, and is of equal Consistence; this is from Nature having got the better of the Distemper.

In a Suppuration, *Hippocrates Prognostic.* requires Spit which is white, pure, and free from Fetidness. And in the same Treatise he commends such Spit as is mixed with yellow Bile, especially in Pleurisies, as indicating that a great Part of the Matter which caused the Inflammation discharges itself in a due Manner. On the contrary, thin Spit, or what is too thick, or too thin, or too viscid, is of a crude Substance, and shews that Nature has not as yet concocted anything.

Of a malignant Kind are the purely yellow, russet, green, livid, black, party-colour'd, highly fetid Spit, with such as increases the Pain and Cough, or is attended with a great Difficulty of Respiration. And so much for the Causes of the different Kinds of Respiration; we shall now treat of the salutary Kinds of Spit.

Of the good Kinds of Spit, which are Prognostics of Recovery.

In speaking of the good Kinds of Spit, we shall first observe how they ought to be when the Subject is or is not molested with a Fever, Cough, Difficulty of Respiration, or a Pain: Secondly, what Kind of Spit is requir'd in a Pleurisy and Peripneumony: And, thirdly, what is to be desir'd in an Empyema, or Suppuration.

First then, in Affections of the Thorax, without an Inflammation or Fever, the best Spit is what is white, smooth, equal, moderately thick, with a slight Degree of Viscidity; ting'd with no bad Colour, that is to say, yellow, pale, russet, green, livid or black; for Spit ting'd with Colours, and especially yellow, is utterly condemned by *Galen, Lib. 4. de Loc. Affect. Cap. 8.* That Spit is, also, well circumstanced which is easily excreted, without much Coughing, and which, also, restrains a Cough, and gives Relief under a Difficulty of Respiration.

In a Pleurisy and Peripneumony, the Spit is esteem'd salutary which resembles that of Persons in Health, as we are assured by *Galen, de Crisibus, Lib. 1. Cap. 7.* for it is not possible that, when the Parts of the Thorax and Lungs are very much injur'd, the Spit should be like that of sound Persons, but there must of Necessity be a Difference. Now Spit which resembles that of healthy Persons, is never discharg'd but in the State of the Disease, at which Time there is a perfect Concoction. Hence *Galen, in 1 Aph. 12.* says, that concocted Spit is white, smooth, equal, neither too thick nor too thin, and which is easily and readily excreted. The same Author, in 6 *Epid.* tells us, that in a Pleurisy and Peripneumony, which are of a favourable Kind, the Patients have some Discharge of Spit at the Beginning of the Distemper, and that this Discharge indicates that the Concoction is begun, and that if the Matter discharged be thin, it is a Sign of a moderate Concoction, if thick, of a perfect one. And *Com. in 1 Aph.* he says, that for the Sick in those Disorders not to spit, indicates a very crude State of the Disease; to spit something, but of a thin Consistence, shews the Concoction is begun; for the Spit afterwards to become thicker, indicates a greater Concoction; and when it comes thick, as was said, white, smooth, equal, and is easily discharged, it indicates a perfect Concoction. The best Spit, therefore, has these Qualities; and such was that observ'd by *Hippocrates of Anaxion, on the twenty-seventh Day, 3 Epid. Sect. 3. Ægr. 8.*

But this, perhaps, may be liable to Objections; if it be just what *Hippocrates* says, *Lib. Prognost.* where we read, in such Cases, "The Spit should appear deeply tinged with yellow Bile." And a little after it is said, "That an Excretion of yellow Spit, not mixed with much Blood, in the Beginning of a Peripneumony, is very salutary." To the same Purpose we are told by the Author of *Coac. 386.* "That in pleuritic Pains it is good for the Spit to be coloured," and *ibid. 390.* "That in all Pleurisies and Peripneumonies it is best when the Spit is easily and readily discharged, and has a yellow Mixture." Hence it follows, that not only white Spit is good, but, also, if yellow, bloody, and pale Matter be mixed with the same.

This indeed is very true, but not in the State or Height of the Disease, but in the Beginning or Increase of the same; for which no other Reason is to be given, than that these Kinds of *Spit* shew the Inflammation to proceed from yellow Bile and Blood, which, as *Galen* shews, is less dangerous than such as are excited by other Humours, and, also, discharges some of the Matter which is the Cause of the Inflammation; so that these Kinds of *Spit* discharg'd in the Beginning or Increase of the forementioned Disorders are not unserviceable. But if such *Spit* happens later, it is less safe, and shews that the Disease will be slow in Concoction, *Coac.* 385. 390. or of long Continuance, and not void of Danger. It is not, however, mortal, but only foreshews a long Disease; nor yet useless, as was said, because it signifies that some Part of the Humour which is the Cause of the Inflammation is evacuated, and, also, that the Inflammation itself is not of a malignant Nature, but milder, and less dangerous than when it proceeds from other Humours. Hence it appears, that neither green, nor black, nor party-colour'd *Spit* is good, since it signifies that the Inflammation is excited by very depraved Juices, and consequently that green and black *Spit* is more depraved than the yellow and bloody.

That is to be esteemed good *Spit*, also, which, besides the foremention'd Characters, has moreover this, that it is easily and freely discharged, according to that of *Hippocrates*, *Lib. Prognost.* where it is said, "That in all Disorders affecting the Parts about the Ribs and Lungs, it is requir'd that an Excretion of the *Spit* be soon and readily perform'd." It is early and seasonable enough, when it happens within the third and fourth Day; and if it be, also, of a good Kind, it is a Sign that the Disease will be short and favourable, as we are assur'd by *Galen*, *Com. 3. in Aph.* and *Lib. 1. de Crisibus*, and *Com. 3. in 6 Epid.*

Spit much in Quantity, and concocted, on a critical Day is a very good Sign, and one of those which are critically determining; and if it removes the Pain, Cough, and Fever, there will be no Necessity of any other Sign to pronounce it very good and critical. We have an Instance to this Purpose, *3 Epid. Sect. 3. Aeg. 8. in Anaxion*, of whom it is said, "That on the seventeenth Day he began to spit a little concocted Matter, and found some Relief; on the twenty-seventh the Fever returned, he cough'd, and expectorated plenty of concocted Matter, his Urine had a large, white Hypostasis, his Thirst went off, and he fell into a Sleep."

We may add to what has been mention'd, that this *Spit* is very good and salutary, when it appears in Conjunction with some other good Evacuation.

In Suppurations, also, the *Spit* is to have the same Qualifications as are mention'd in the aforesaid Disorders, and are requir'd by *Hippocrates*, *Lib. Prognost.* where he says, that "The best *Spit* is white, smooth, of one Colour, free from Phlegm, and expectorated without Pain, or violent Coughing." To which we may add, that it is copious, and removes the Fever, Thirst, Cough, and bad Respiration.

Of bad SPIT, which is a Prognostic of a fatal Event.

We shall here, first, enumerate the bad Kinds of *Spit*, which portend a fatal Event to those who labour under no Disease, beginning with the *pituitous*.

A pituitous Matter, or *Spit*, which has for a long Time distilled from the Lungs, and is in Substance immoderately thin or thick, or viscid, much in Quantity, of a round Figure; or of a saltish or acrimonious Taste, are generally very much suspected. *Spit* very thin excites a very troublesome Cough; and the thick, by obstructing the Passages of Respiration, endangers a Suffocation; as does, also, the viscid, by long adhering to the Bronchia of the Lungs. A saltish or acrimonious *Spit*, by corroding the Arteries, paves the Way to a Hæmoptoe, and from thence to spitting of Pus, and so at last to a *Phthisis*. Round *Spit*, which has been shewn before to proceed from a thick and tenacious Phlegm, agitated by excessive Heat, always renders a Person very subject to a *Phthisis*, as appears from the beforemention'd Instances recorded by *Galen*.

Bilious *Spit*, also, is condemn'd by *Galen*, especially in such as are suspected to be consumptive. This Kind of *Spit* is known by the Colour, which is either yellow, pale, or ruflet; and by the Taste, which is acrid or bitter. Those Colours, especially the yellow and the pale, are evident Characters of bitter Bile, as we are assur'd by *Galen*, *Lib. 2. de Loc. Affect. Cap. 10.* By the Colours, then, we manifestly discover when *Spit* is of a bilious Kind; but we are not so certain with regard to the Taste, which may be blunted and obscured by a Mixture of Phlegm. Hence Physicians, otherwise very skillful, sometimes happen to be deceived in not discovering the bilious Humour concealed within the

the Lungs, because the *Spit*, tho' appearing of a yellow, pale, or ruflet Colour, is not observed by them to have the least Taste of Acrimony or Bitterness, when all the while the Lungs are corroded, and the *Spit* at length by this means is rendered bloody, or purulent, whence proceeds a *Phthisis*. We have Instances to this Purpose related by *Galen*, *de Locis Affect. Lib. 4.* "A certain Person, he says, on a sudden, spit out a Humour very much resembling liquid Bile in Colour, which was between yellow and pale, but of no acrid Taste; after that he continued to spit up a greater Quantity every Day, till at length a slow Fever coming upon him he began to decline, and expectorated purulent Matter, and continued so to do for the Space of four Months, when he brought up Blood with the Pus, and the Fever with the *Phthisis* increased, together with the spitting of Pus, of which he expectorated a vast Quantity. The Fever still increasing, and the Strength at last being exhausted, the Patient dy'd under all the Marks of a Consumption. I knew one who laboured under much the same Disorder for six Months, and another who lingered a long Time. The first of these Patients, with whom I was concerned, seem'd at first to be free from any Distemper, but was at last affected in a most miserable manner. The second of these Patients, whom also I attended, I endeavoured to relieve by immediate Remedies, as knowing his Disorder from the Beginning, and much more that of the third Person, who applied himself to me. But tho' I endeavoured with much Application of Thought, to effect the Cure of these Disorders, yet neither of the Persons, in the Circumstances before-mentioned, nor any one since them, could be recovered; for when they were very near their End, they spit out putrid Pieces of their very Lungs."

It seems strange that such a kind of *Spit*, when free from Bitterness and Acrimony, should corrupt the Lungs; but it is still more surprising, how the Lungs can be infected by *Spit*, which appears to be pituitous, and is free from any thing of an acrimonious, salt or bitter Taste. To account for this latter Circumstance, it must be supposed, either that all the bilious and acrimonious Humour lies concealed within the Lungs, and by adhering to their Bronchia corrodes them; or that the Phlegm, by Putrefaction, acquires an Acrimony, by which it is rendered capable of corroding and putrefying the Lungs; in the same manner, perhaps, as when the Air, being infected with a phthical Contagion, or rendered highly acrimonious, infects the Lungs of those who live and breathe in it. But how comes it to pass, when the *Spit* appears yellow or pale, but has nothing in its Taste of Acrimony, Saltiness or Bitterness, the Subject should fall into a Consumption? The Reason of this is, because by the Mixture of the pituitous Humour in them, the Taste is more easily concealed and disguised than the Colour, and that a most acrimonious and highly putrid Humour, by its Diffillation upon the Lungs, corrodes them: Or, it must be said, that the Appearance of this same yellow and pale *Spit* is a Sign of a Collection of much bilious Humour within the Lungs, by which they are putrefy'd and corroded, and the Patient brought into a Consumption.

Black and melancholic *Spit* is of a very bad kind, as appears from *Galen*, *Lib. de Constit. Art. Med. Cap. 16.* where he writes, that a melancholic Humour, when predominant, is very pernicious, both on account of its very bad Qualities, and that it is highly corrosive, difficult of Concoction, and not easy to be expelled; and, also, because it indicates an extraordinary Heat, which is necessary for its Generation and Assation. *Spit* of this Kind is frequently succeeded by Bloody *Spit*, which is more to be dreaded by Persons in Health than under a Pleurisy, agreeably to that of *Hippocrates*, *4 Aph. 25.* "Blood of any kind discharged upwards is bad." In such *Spit* Blood thrown up by a Cough is always to be dreaded, tho' it be not constantly succeeded by a mortal Distemper, especially if it distills from the Head upon the Fauces, and is thence discharged by Help of a Cough, as I experienced in myself, when after a quartan Fever I threw up a great Quantity of Blood by Coughing, which was a critical Excretion, and removed the Fever. But whenever it is not the Matter of a Diffillation from the Head, but proceeds from the Breast and Lungs, it induces Danger of a *Phthisis*. *Galen*, indeed, *Lib. 5. Meth. Med.* writes, that he recovered a Roman Matron and a young Man of an Hæmoptoe, and all others who applied to him for the same Disorder, on the first Day of their Illness; but as for those who delayed it for some Days, or till a Phlegmon had seized them in such a manner as to render their Urine like that of feverish Persons, he never knew one of them perfectly cured. Justly, therefore, is spitting of Pus, after spitting of Blood, pronounced by *Hippocrates*, *7 Aph. 15.* a bad Sign: And *Galen*, in his Comment, truly says, that all spitting of Blood is not malignant, but such as is succeeded by Pus, for this induces

induces a Phthisis, according to 7 *Aph.* 16. which says, "After spitting of Pus comes a Phthisis." We have just Reason, therefore, to conclude, that bloody *Spit* expectorated from the Breast and Lungs, and succeeded by a Discharge of Pus, is a mortal Prognostic.

All copious Discharges of *Spit*, also, which no way relieve the Patient, nor alleviate the Pain, Cough, or Difficulty of Respiration, are always useless, and portend a bad Event. And these are the bad Kinds of *Spit* in the Subjects before-mentioned.

In Persons under a Pleurisy or Peripneumony, *Spit* very thin, or very thick, or viscid after the Beginning or first Days of the Disorder; also *Spit* which is spumous, round, copious but useless, scanty or none; *Spit* suppressed, frequent, white, yellow, pale, ruflet, green, æruginous, porraceous, of a deep yellow, livid, black, parti-coloured, fetid, pure or unmix'd, excreted with great Difficulty, or with a Stertor and Rattling in the Throat, and such as no way mitigates the Pain, Cough, and Difficulty of Respiration, are all condemned; but the worst of all, and most destructive, is what excites and exasperates the Cough, Pain, Difficulty of Respiration, and Fever.

Spit very thin, or very thick and viscid, which Kinds indicate the Disease to be considerably crude, if they happen in the Beginning, are esteemed not wholly unserviceable, since they give Hopes that they may be concocted in Time; but if they appear afterwards, that is to say, after many Days, and are not concocted, they are very bad Signs. *Spit* very spumous is also condemned, and more particularly the unmixed, bilious, ruflet, green, livid and black; for these Kinds, as we have shewn, proceed from an immoderate Burning, or colliquative Heat.

Whitish *Spit*, and what is spumous, consisting of Phlegm agitated by Flatulences, as in the Case when the pituitous Matter in its Passage from the Lungs becomes spumescient by contracting much Air, are not so dangerous. In a Peripneumony the Blood which is discharged by Spitting is generally spumous. The Author of the *Coac.* 408. says, "That in a Pain of the Right Hypochondrium, the spumous Blood discharged by spitting flows from the Liver, and the Patient generally dies."

Spit of a round Figure is very much condemned, because it is a Sign of an immoderate internal Heat, by which the Humour is dried; the same *Spit*, perhaps on account of a Repletion of the Head by the same inward Heat, is said by *Hippocrates*, 6 *Epid.* Sect. 3. *Aph.* 27. and Sect. 6. *Aph.* 21. to portend a Delirium. The Author of the *Coac.* 390. condemns round *Spit*, as pernicious in a Pleurisy; but *Hippocrates*, *Lib. Prognost.* says more justly, "That round white *Spit*, in pleuritic Disorders, is of no Service to the Patient."

Much *Spit* of a bad kind portends a great deal of Danger, especially if it appears on a critical Day, and no way relieves the Patient; for it is to be esteemed one of the critical Signs which determine nothing.

Spit little in Quantity is no less condemned, as being insufficient to purge off the Humour which is the Cause of the Inflammation; but most of all is it to be dreaded, when it is not only scanty but crude, and excreted with much Difficulty. Of Patients under this Circumstance we find *Hippocrates* speaking, 1 *Epid.* Sect. 1. "They expectorated, he says, by Coughing, a dense, concocted Matter, little in Quantity, which they brought up by Degrees, and with much Difficulty; but in those who laboured under the most violent Symptoms, the *Spit* had no Signs of Concoction, but was perpetually crude."

Under a Pleurisy not to spit at all is of no less fatal Signification, as indicating the Disease to be in a highly crude State: See the Quotations from *Galen* to this Purpose before, under the Causes of no *Spit*. This Absence of *Spit*, then, must of Necessity shew the Matter of the Disorder to be difficult of Concoction, and consequently portend the long Continuance of the Inflammation, as we are told by *Galen*, *Com. 1. in Aph.* 10. For the same Reason the Author of the *Coac.* 381. says, "That dry Pleurifies, in which nothing is evacuated by Spitting, are very dangerous."

Bilious *Spit*, in the same Disorders, suppressed without Reason, after it had at first appeared, portends a Delirium, according to the Author of 1 *Proorrh.* 97. and is said by *Galen*, *Lib. de Const. Art. Med. Cap.* 16. to be a Sign of approaching Death; consumptive People, also, live as long as they can bring up their *Spit*, but when that is retained they die. 7 *Aph.* 26.

Frequent *Spit*, but not discharged by Coughing, if attended with any other phrenetical Sign, indicates a Phrensy, according to the Author of 1 *Proorrh.* 6. And a little after the same Author, *T.* 12. utterly condemns frequent Spitting in Fevers; and indeed justly, because, as *Galen* expresses it, it

is a Sign of a disordered Brain, which suffers under a Repletion. Again, 1 *Proorrh.* 31. this frequent Spitting, attended with a Perfrigeration, is said to be the Forerunner of black Vomiting, which is a most pernicious Symptom.

White, pituitous *Spit*, in bilious Diseases, is of no Service to the Patient, according to *Hippocrates in Prognostic.* where it said, "That white, glutinous and round *Spit*, is of no Benefit;" and for a good Reason, as indicating that nothing of the Humour, which is the Cause of the Inflammation, is discharged, which in Inflammations from Bile is none of the least pernicious Signs. Some Years ago there raged at *Bassano* and *Morostica* a pestilential Pleurisy, which proved mortal in four, or at the most in seven Days. Under this Disorder whatever was excreted by Spitting, was of a white pituitous Substance, which a certain Physician not well versed in *Galen's* Doctrine, took for a good Sign, and always had good Hopes of the Patient. But he still found himself deceived, as not knowing that those white pituitous Spittings were an Indication that the morbid Matter of the Inflammation was not thereby evacuated, and consequently that the Disease was highly crude and pernicious. This is confirmed by an Instance in *Hippocrates*, 7 *Epid.* *T.* 58. of the Wife of *Euxenus*, who had a Cough, and spit up a white, thinnish Matter, and but little at a Time, and dy'd at last of a Pleurisy.

Yellow and pale *Spit*, also what is bloody, not well mixed, if they are first discharged after the Beginning, or first State of the Disorder, indicate the same to be difficult of Concoction, of long Continuance, and therefore by no means void of Danger. On the contrary, if they appear in the Beginning, they shew that the Disease will have an easy Solution, as we observed before. Of the yellow and ruflet kinds of *Spit* it is observed in the *Prognostics*, that if they happen a considerable Time after the Beginning of the Disease, they are very bad; or, as it is expressed a little after, if they appear not till the seventh Day, or later, they are less secure.

Pale, ruflet, green, deep red, livid and black *Spit*, are of the same Prognostication; green and æruginous *Spit* indicate much Heat and Aduftion, with Plenty of æruginous Bile. *Hippocrates*, in the *Prognostics*, utterly condemns the deep green *Spit*, as *Galen*, *Lib. de tot. Morb. Temp.* does the deep red, as highly pernicious.

Livid *Spit* is still more dangerous, as proceeding from a Redundance of black Bile, or Extinction of the natural Heat, and is therefore justly condemned by the Author of the *Coac.* 390, if appearing in the Beginning of a Disease.

Spit of a black Colour is the most pernicious and fatal of all the Kinds, because it proceeds, as we have already observed from *Galen*, *Lib. 1. de Crisibus*, from a vehement Affection, or an universal Refrigeration, on account of the Extinction of the natural Heat. Justly, therefore, does he make it an Indication of a most formidable Disease, and *Lib. 1. de Cris.* a Prognostic of Death. The Author of the *Coac.* 390, 407. tells us, that they who throw up a black Matter by Vomiting are in a dangerous State. *Hippocrates*, *Lib. 3. de Morb.* says, that those who cast up black Clots of Blood by Coughing, die on the seventh Day.

Spit of various Colours seems to be no less destructive, as it indicates a Multiplicity of Disorders; for which Reason *Hippocrates* pronounces this kind of *Spit*, attending an acute Pain, mortal.

Spit simple or unmixed is always condemned, for good *Spit* ought to be of a mixed kind; and the contrary to this is bad, but especially the pure and undiluted, as proceeding from a Consumption of all the ferous Humidity by the Heat.

We conclude, then, that in Pleurifies and Peripneumonies, *Spit* of a yellow Colour, simple or unmixed, ruflet, æruginous; *Spit* of a deep red, or livid, but most of all black, and pure or undiluted, are of bad Prognostication, and are condemned as such by *Hippocrates*, in his Book of *Prognostics*; for they are too sure Indications of a desperate Disease.

Fetid *Spit* is, also, constantly condemned in acute Diseases, because it is an Indication of an extraordinary Putrefaction. *Hippocrates*, 5 *Aph.* 11. makes the ill Smell of the *Spit* a distinguishing Character of Persons in a Consumption, and also a mortal Symptom.

Spit discharged with much Difficulty by Secrecion has been censured as bad, agreeably to the Observation of *Hippocrates*, 1 *Epid.* Sect. 1. before quoted.

Spit which rattles in the Throat, and induces a *Cerchnos* or Stertor, is no less to be condemned; of such we find *Hippocrates*, in *Prognost.* thus pronouncing: "Bad, also, says he, is the *Spit* which cannot be worked off, or ejected by the Lungs, but fills and rattles, or bubbles in the Throat."

In the same List of the bad Kinds of *Spit* are to be reckoned those which are so far from mitigating, that they increase

and exasperate the Cough, according to the Book of *Prognostics*, which passes the same Censure on those which mitigate not a Pain. These, however, are not sufficient for a Prediction, unless accompanied with other Signs, which, as *Galen* says, are accurately to be considered.

Other Kinds of bad Spit are such as (tho' frequent and troublesome) neither remove a Difficulty of Respiration, nor a Cough, nor a Fever.

Lastly, a Discharge of Spit on a critical Day, after which the Patient finds himself in a worse State than before, if accompanied with some other bad Sign, is succeeded by inevitable Death.

And these are the kinds of Spit which are to be condemned in a Pleurisy and Peripneumony. See PHTHISIS. *Prosper Alpinus de Presag. Vit. & Mort.*

SPYRAS, or SPYRATHOS. σπυράς, or σπυράθος. The Dung of Goats in small round Balls. Goats Tricklings. *Hippocrates* advises to use these by way of Suffumigation in Disorders of the Uterus.

SQUALOR. See AUCHMOS.

SQUALUS. The Name of a Fish mentioned by *Aldrovandus*.

SQUAMA AERIS. See AEs.

SQUAMARIA, & SQUAMATA. Offic. *Orobanch radice dentata major*, C. B. P. 88. *Raii Hist.* 2. 1220. *Orobanch radice dentata*, sive *Dentaria Major Matthioli*, Park. Theat. 1363. *Dentaria major Matthioli*, Ger. 1387. Emac. 1585. *Anablatum Cordi*, sive *Aphyllon*, J. B. 2. 783. *Raii Synop.* 3. 288. TOOTH-WORT.

It grows on the shady Banks of Hedges, and flowers in April.

Tooth-wort is consolidating, conglutinating, and good in Hernias, Wounds, and various Affections proceeding from Fluxions.

SQUAMOSA SUTURA. The squamose Suture of the Skull.

SQUATINA. Offic. *Aldrov. de Pisc.* 471. *Salv. de Aquat.* 152. *Rondel. de Pisc.* 1. 367. *Bellon. de Aquat.* 78. *Raii Ichth.* 79. *Ejuld. Synop. Pisc.* 26. *Charlt. Pisc.* 12. *Gefn. de Aquat.* 809. *Jonf. de Pisc.* 23. *Mer. Pin.* 186. THE KING-STONE, OR MONK-FISH.

It is taken in the *British* and other Seas. The Eggs, Skin and Ashes, are used. The dried Eggs are found to be very serviceable in stopping a Looseness, by the Experience of the Fishermen, who use it for all manner of Fluxes of the Belly. *Rondel.* Of the Skin is prepared an excellent Smegma for the Psora and Scabies, and the Ashes are effectual against the Alopecia and Achors. *Aldrovand.*

The Skin of this Fish is recommended, by *Galen*, for rubbing Parts affected with an Alopecia.

SQUILLA, in Botany, is the same as SCILLA; which see.

SQUILLA, Offic. *Squilla gibba*, Schonef. Ichth. 72. *Rondel. de Pisc.* 1. 549. *Squilla parva*, Mer. Pin. 192. *Squilla gibba Rondeletii*, *Aldrov. de Exang.* 150. THE SHRIMP.

It is taken in the Sea, and agrees in Virtues with the *Asacus*, Lobster.

SQUILLINUM, AZIZA. Horse-Dung. *Rulandus*.

SQUINANATHIA. A barbarous Word importing a Quinsey.

SQUINANTHUM. The same as SCHÆNANTHUM.

SRINT. The Hungarian Name for any inflammatory Tumor in the Mouth, Throat, or Anus.

STAC. Coagulation, or Congelation. *Rulandus*.

STACHYS.

The Characters are;

The Leaves, Stalks and Branches are hairy, hoary, and covered with a very soft Down. The Galea is fornicated, or arched, erect, and somewhat bifid; the Beard trifid, the middle Segment large and pendulous. The Flowers are disposed of at first in thick Whorles, but towards the Top in Spikes.

Boerhaave mentions thirteen Sorts of *Stachys*, which are;

1. *Stachys*; major; Germanica. C. B. P. 236. *Sideritis*, *Heraclea Discoloridis*, Col. Phytob. 1. 31.

2. *Stachys*; major; Germanica; folio angustiore, Flor. 2. 66.

3. *Stachys*; Cretica; pro Pseudo-Stachyde L. in Prodromo describitur. C. B. P. 236. Prodr. 113.

4. *Stachys*; Alpina; magna; flore ex albo rufescente. Pseudo-Stachys Alpina, C. B. P. 236. Prodr. 113.

5. *Stachys*; Creticæ similis; flore purpureo triplo majore.

6. *Stachys*; minor; Italica. C. B. P. 236. *Tourn. Inst.* 186. *Boerb. Ind. A.* 154. *Stachys*, Offic. Ger. 563. Emac.

695. *Raii Hist.* 1. 554. *Stachys Discoloridis*, Park. Theat. 47. BASE HORE-HOUND.

The *Stachys* is a shrubby Plant, resembling *Marrubium*, but somewhat longer, and producing numerous rare, hard, and somewhat hairy Leaves, white, and of a pleasant Smell, with several Stalks, which shoot up from one Root, and are whiter than those of *Marrubium*; it grows in mountainous and rugged Places. *Stachys* is of an acrimonious and heating Quality; for which reason a Decoction of the Leaves being drank, provokes the Menfes, and expels the Secundines. *Discoloridis*, Lib. 3. Cap. 120.

It is cultivated with us in Gardens, and flowers in June.

7. *Stachys*; verticillata; odora; *Betonice foliis pallidis*. H. C. 2.

8. *Stachys*; Canariensis; frutescens; Verbaci folio. T. 186. *Salvia sylvestris*; amplissimis *Verbascifoliis*; groveolens, flore albo, parvo, Canariensis, Pluk. Almag. & Phytogr. T. 322.

9. *Stachys*; hormini folio obscure virenti; flore ferrugineo; M. H. Bloef. 198.

10. *Stachys*; spinosa; Cretica. C. B. P. 236. *Gaidarothymum*. Alpin. Exot. 86.

11. *Stachys*; orientalis; altissima; foetidissima. T. Cor. 12.

12. *Stachys*; alba; latifolia; major.

13. *Stachys*; Cretica; latifolia; T. 186. *Boerb. Ind. Alt. Plant.*

All these Species of *Stachys* have a very strong and rank Smell; whence they are good in hysteric, apoplectic, and epileptic Disorders. *Hist. Plant. ascript. Boerb.*

STACTE. See MYRRHA. In another sense it imports a Lixivium distilling from Ashes; or it signifies Brine.

STACTICON. στακτικόν. The Name of a Collyrium in *Scribonius Largus*, N° 34. and in *Paulus Aegineta*, L. 7. C. 16.

STADIEUS. σταδίων. A Person who walks a Stadium. *Galen. Exegef.*

STAIS. σάις. Meal moistened with Water, and kneaded with the Hands; or it signifies Fat or Suet.

STAGIUM. The same as Sextula, the sixth Part of an Ounce, that is, four Scruples.

STAGMA. A Liquor exposed to Distillation. *Blancard.*

STAGNEA VASA. Vessels tinned on the Inside; or incrufted, or lined, in order the better to preserve their Contents. *Scribonius Largus.*

STAGONIAS. σταγίαι, from σταῖς, to distil. An Epithet for that Species of Male Frankincense which is in small round Lumps, like Drops.

STALAGMA. A distilled Liquor. *Blancard.*

STALAGMOS. σταλαγμός. A Distillation from the Head.

STALTICA. σάλτικα, from σάλαι, to contract. Repellents; or Medicines which render the Lips of Wounds even.

STAMINA. See the Explication of Terms under the Article BOTANY.

STAMNOS. στάμνος. An Urn, or Basin for holding Water.

STANNAR. The Mother of Metals, or the occult Fume of which Metals are generated. *Rulandus.*

STANNUM. Tin. See JUPITER.

STAPES. The Name of a Bone in the internal Ear. See AURIS.

STAPHIS. A Raisin.

STAPHISAGRIA. Staves-acre. A Name for the *Delphinium*; *Platani folio*; *Staphisagria dicta*.

STAPHYLE. σταφύλη. A Grape. Or a Disorder of the Uvula, which consists in an Extenuation of its superior Part, and a Tumor of the inferior; whence it depends in the shape of a Grape. The Uvula, or Gargareon, is, also, thus called.

STAPHYLEPARTES. σταφύλεπαρτες. A Chirurgical Instrument for elevating the Uvula, mentioned by *Paulus Aegineta*, L. 3. C. 16.

STAPHYLINUS. A Name for the *Daucus Vulgaris*.

STAPHYLIS. σταφύλις. In *Moschion, de Morbis Mulierum*, C. 116. this is a sort of Cup for feeding Children, contrived with an Orifice resembling a Nipple, or a Grape.

STAPHYLODENDRON.

The Characters are;

The Calyx is pentaphylloidal, caducous and expanded; the Flower rosaceous, pentapetalous, erect, as it were, in the Figure of a Bell, and furnished with five Stamina. The Ovary, in the Bottom of the Calyx, is furnished with two Tubes, and becomes a membranaceous Fruit inflated like a Bladder, and divided into Capsules full of stony Seeds.

Boerhaave mentions four Sorts of *Staphylodendron*, which are;

1. *Staphylo dendron*, *Offic. J. B. 1. 247. Raii Hist. 2. 1681. Synop. 3. 468. Tourn. Inst. 616. Boerb. Ind. A. 2. 235. Pistacia sylvestris*, C. B. P. 401. *Nux Vescaria*, Ger. 1249. Emac. 1437. Park. Theat. 1417. THE BLADDER NUT-TREE.

It is sometimes found in Hedges, flowers in May, and the Nuts are ripe in Autumn. The Nuts are by some supposed to have the same Virtues with Pistachios.

Ray says, that he knows no Use of them in Medicine, but that they serve the poorer sort of People in many Places instead of Beads, to number their Prayers. *Raii Hist. Plant.*

2. *Staphylo dendron*; *Virginianum*; *trifoliatum*. H. L. *Pistacia sylvestris*, *trifolia*, *Virginianensis*. H. R. Par.

3. *Staphylo dendron*; *Africanum*; *folio singulari*, *lucido*, *Par. Bat.*

4. *Staphylo dendron*; *Africanum*; *folio lanuginoso Rosmarini lationi*. *Boerb. Ind. Alt. Plant.*

It has its Name from *σταφύλη*, (*Staphyle*) a Grape, and *δένδρον*, (*Dendron*) a Tree; because its Fruit grows in Clusters.

Scaliger says that the Nuts are eatable, and that he has often eat them instead of Pistachios. From the Seeds is expressed an Oil of a resolvent Virtue. *Hist. Plant. ascript. Boerb.*

STAPHYLOMA. A Disorder of the Eye. See OCULUS.

STARAPHAXAT. A restraining Medicine, or one which restrains Fluxions. *Rulandus.*

STASIS. *στάσις*. A Stagnation.

STATER. *στατήρ*. A Weight equal to four Drams.

STATHEUSIS. *σταθεύσις*, or *σταθυσίς*, from *σταίω*, to roast by a slow Fire. A gentle or imperfect roasting, or toasting.

STATICA. The same as STALTICA.

STATICE.

The Characters are ;

The Root is fibrous and perennial, the Leaves grassy, and the Stalk naked. The Calyx being squamous, membranaceous, and consisting of a Multiplicity of Series of Squamæ, is common. The Floscules are polypetalous, resembling Clove-Gilly Flowers, each seated in its proper Calycle, which is shaped like a Funnel, monophyllous, and deeply cut into Segments. These Floscules are collected in great Numbers together into one floriferous globular Head, surrounded by that one common squamous Calyx before described. The Ovary proceeding from the Center of the Calycle consists of five Eggs, which grow together in a Circle round the Basis of the Placenta, and are each furnished with a long Tube.

Boerhaave mentions four Sorts of *Statice*, which are ;

Statice, *Lugdun.* 1190. *Scabiosa montana*, *globoso flore*, *gramineis foliis*, *latioribus*. *Caryophyllus montanus*, *major*, *flore globoso*, C. B. P. 211. *Græmen Polyanthemum*, *majus*. *Dod. p. 564. Armeria*, *montanus*, *tenuifolius*, *major*. *Clus. H. 287. Limonium majus*, *flore globoso*. M. H. 3. 600.

2. *Statice*; *foliis angustioribus*; *flore rubro*. *Scabiosa montana*, *globoso flore*, *gramineis foliis angustioribus*, *flore rubro*. H. L.

3. *Statice*; *foliis angustioribus*; *flore albo*, *Scabiosa montana*, *globoso flore*, *gramineis foliis angustioribus*, *flore albo*. H. L.

4. *Statice*; *montana*; *minima*. T. 341. *Scabiosa montana*, *globoso flore*, *gramineis foliis angustissimis*, *minima*. H. L. *Caryophyllus montanus*, *minimus*, *flore globoso*. H. R. Par. *Armeria montanus*, *tenuifolius*, *minor*. *Clus. H. 287. Limonium minimum*, *vulgatius*, *flore globoso*, M. H. 3. 601. *Boerb. Ind. Alt. Plant.*

Dodonæus pretends that the *Statice* is of no Use in Medicine, but that the Flowers are beautiful enough in Garlands. But *Dalechampius* assures us, that the whole Plant is of an astringent Taste, and is of surprising Virtue in drying up and repressing the Eruptions of Humors, being either bruised and applied, or the Juice of it drank; that it cures the Dysentery, an excessive Flux of the Menfes, Bleeding at the Nose, and spitting of Blood; that it is also a Vulnerary, and cicatrises malignant Ulcers.

It is astringent, whence it is of Use in immoderate Fluxes, and may be of service in Disorders proceeding from a Laxness of Fibres, and where the Humors are too fluid, and disposed to Eruptions. *Hist. Plant. ascript. Boerhaave.*

STATIONARIÆ FEBRES. Stationary Fevers.

There are certain general Constitutions of Years, which owe their Origin neither to Heat, Cold, Dryness, nor Moisture, but rather depend upon a certain secret and inexplicable Alteration in the Bowels of the Earth, whence the Air becomes impregnated with such Kinds of Effluvia as subject the human Body to particular Distempers, so long as that Kind of Constitution prevails, which, after a certain Course of Years, declines, and gives way to another. Each of these general Constitutions is attended with its own proper and peculiar Kind of Fever, which never appears in any other; and

therefore I call this Kind of Fevers Stationary. *Sydenham.*

STATIVA. The same as STALTICA.

STATUS. The Constitution, or State of any thing, and in this sense it is the same as CATASTASIS. It, also, imports the same as ACME.

STAXIS. *στάσις*, or *ἀπὸστάσις*, from *στάω*, to distil. A Discharge of Blood from the Nose by Drops. This is the general signification of the Word *στάσις*, in *Hippocrates*, tho' sometimes he adds *ἐκ τῆς ἰνῆς*, or *ἀπὸ τῆς ἰνῆς*, "from the Nostrils."

A *Staxis*, in the Doctrine of *Crises*, is justly condemned as indicating a Weakness and Decay of Strength in Nature. Thus, 1 *Prorrh.* it is said, *ἐνδεκαήμεροι στάσις δύσκολος*, "Distillations of Blood from the Nose on the eleventh Day are bad," where *Galen* on the Place condemns all such Distillations. The same is repeated, *Coac. 336.* And *Coac. 57.* we are told that *στάσις ἰσχυρὰ κακὰ*, "small Distillations of Blood from the Nose are bad;" particularly in Pleurisy and Phrenzies. Such Distillations are condemned as very bad Signs, *Coac. 405. 227. 1 Prorrh.* 1. On the contrary, free and copious Discharges of Blood from the Nose are, in the Doctrine of Signs and Crises, esteemed a Solution of the Disease, according to that in 1 *Epid. Sect. 1.* where we read that *ἀμφοτέρωθεν ἰσχυρὰ, &c.* "copious Hæmorrhages from the Nose for the most part relieved the Patients." And not only small and sparing Eruptions of Blood from the Nostrils, which stop within their due Measure, but all weak, small and imperfect Excretions, whether by Urine, Vomit or Stool, are condemned as bad Prognostics, *Coac. 400.* and the Judgment there passed upon them is confirmed by Matter of Fact in many Cases recorded in the *Epidemics.*

STEAR. *στάγ*, in *Hippocrates*, sometimes signifies simply Fat, as in many Places of the Books *de Morbis Mulieb.* Sometimes it signifies not only Fat, but Leaven or Dough, or Paste, in the same sense as *στάς*, *Stais*. Thus (*Lib. 1. περὶ γυναικ.*) *ταῖς ἐπὶ ὡς ὅτι στάγ γαστρίαι*, "Boil them till they become like a Lump of Dough;" which is repeated in Words to the same Effect, *Lib. περὶ γυναικ. φύς.* And *Dioscorides*, *Lib. 2. Cap. 202.* *στάς δὲ ἡ πηλὴ πεινυλάσσεται*, "It is wrapped up in Paste or Clay," where tho' the printed Editions read the Word *σταίσι*, yet that the ancient Reading ought not to be changed, appears from *Pliny*, *L. 20. C. 9.* who seems to have read *στάσι*, and to have mistranslated it *Adeps*, where he says, *Coquitur plurimis modis; in olla quæ conjiciatur in Clibanum aut Furnum, vel Adipe aut Luto illita.* "It is prepared many Ways, either by baking it in a Pot, or dawbing it over with Fat or Clay." Again, *Dioscorides*, *Lib. 5. Cap. 99.* says of *Stibium*, *στάσις δὲ στάσις πεινυλάσσεται, &c.* "It is wrapped up in Paste, and so roasted under the Coals." Where *Pliny* again, *Lib. 33. Cap. 6.* translates the Word by *Adeps*. *Galen*, *Lib. 2. & 5. de C. M. S. L.* uses the Words *στάσις* and *στασίον* in the same sense; I mean, as signifying Paste or Dough, or some such Composition; and *Hesychius* expounds *στάγ* by *λίπος*, *ζύμη*, "Fat, Leaven." *Fœsius.*

STEATOCELE. From *στάγ*, Suet, and *κῆλη*, a Hernia. A Species of Hernia, caused by a Collection of a Substance in the Scrotum, resembling Suet.

STEATOMA. *στάτωμα*, from *στάγ*, Suet. A Species of Tumor, containing in a Cystis, or Bag, a Substance resembling Suet. In the *Definitiones* ascribed to *Galen*, *Steatoma* is described, a preternatural Increase of Fat.

STEGNOSIS. Confipation, Condensation or Obstruction.

STEGNOTICA. *στεγνωτικά*. Astringents, from *στεγνίω*, to brace up.

STELÆUS. *στελαεύς*. The Handle of an Instrument. *Hippocrates.*

STELECHIEA. *στελεχίαια*, from the preceding Word. An Epithet for the *Vena Portæ*. *Galen.*

STELECHITES. The Name of a Stone found in some Parts of Germany, about the Size of a Finger, of the same Nature as the BELEMNITES. It is esteemed desiccative, and good to clean the Teeth, as a Dentifrice.

STELENCHIS, or STLENCHIS. *στελεγχίς*, or *στελεγγίς*. A Strigil, an Instrument used in the ancient Baths to rub off Sweat.

STELLA. A Star. See ASTRONOMIA.

STELLA MARINA. The Star-Fish, a Sort of Sea Insect, of which there are many Species. They are esteemed opening, if taken by way of Decoction; and their Smoke when burned, is said to cure the Epilepsy.

STELLA OCCIDENS, is *Sal Ammoniac.*

STELLA TERRÆ, is Talc.

STELLARIA AQUATICA. Water Star-Wort, or star-headed Water Chickweed. *Raii Hist. Plant.*

STELLARIS LAPIS. See ASTROITES.

STELLIO. A small Species of Lizard, or Eft, marked upon the Back with Spots resembling Stars. The Bite of this Animal is said to inspissate the Humours, and stupify the Senses; to remedy which, Venice Treacle and volatile Salts

are recommended. The Flesh is said to excite Sweat, and resist Poison. *Lemery des Drogues.*

STELLIO ADUSTA, is Cinnabar. *Rulandus.*

STEMA. *στέμα.* The Penis. *Ruffus Ephesus.*

STEMPHYLA. *στέφυλα.* The Husks of Vines; or the Mass remaining after the Wine is pressed out of the Grapes. Sometimes this Word is applied to the Recrements of Olives, after the Oil is pressed out.

STEMPHYLITES. *στέφυλιτες.* A Sort of Wine; the same as LORA.

STENYGROCHORIE. *στυγροχόρις*, so *Galen* reads the Word, *Lib. de Artic.* whereas all the Copies have it *στυγροχόρις*, (*Stenschorie.*) The Word seems derived from the Verb *στυγροχόρις* (*Stenygrochōsai*), which *Galen*, in his *Exegesis*, expounds by *στυγροχόρις* (*Stenosai*), to straiten; and adds that some will have it to import a straitening, obstructing the Passages of the Humours, and drying them up. This Sense agrees with *Erotian*, who makes *στυγροχόρις* to mean the same as *ἀντοστερωσάιν* *ἢ* *πυκνῶσαι* *τοὺς* *τῶν* *ἰσθμῶν* *ἢ* *ἢ* *ὄγκους* *ἔστι*, "To straiten and block up a Place in which is some Humidity." Those Expositions have certainly a Relation to the first Aphorism of the second Section of the sixth of the Epidemics, and prove the Word *στυγροχόρις* to be compounded of *στυγροχόρις*, narrow, and *ὄγκος*, moist. *Galen*, however, in his Comment on this Aphorism, denies this, and asserts that the second Syllable is attenuated and not aspirated, because the Word *ὄγκος* is not contained in it; and that the Word *στυγροχόρις*, with the *Ionians*, signifies no more nor less than *στυγροχόρις*, which he proves by the Authority of *Simonides*, who has *μῆνός* *στυγροχόρις* *συμπυκνῶν* *ἢ* *ἀντοστερωσῶν*, "Meeting alone in a narrow Path," which Quotation is very corruptly read, *Com. 1. in Lib. de Artic.* where, on the Word *στυγροχόρις*, *Galen* approves of the same Etymology, as not deriving from *στυγροχόρις*, and *ὄγκος*, and *χώρα* (*Chora*, a Place) but from *στυγροχόρις*, which signifies no more than *στυγροχόρις*; so that *στυγροχόρις* is no more than *στυγροχόρις*, and this no more than *στυγροχόρις*, Narrowness. Hence it appears, as was observed in the Beginning, that for *στυγροχόρις*, as it is generally read, *Galen* reads *στυγροχόρις*. The Verb *στυγροχόρις* is by the same Author, *Com. 1. in 6 Epid.* expounded by *πυκνῶσαι*, to condense, and *στυγροχόρις*, to straiten; since it is opposed to *εὐρύναι*, to dilate. And by the Doctrine of *Hippocrates*, Things dilated are to be closed by Astriction and Refrigeration.

STEPHANILÆUS. *στέφανιλος*, Coronary. See CORONARIA, and CORONALIS.

STERA. A barbarous Word, signifying the Uterus, by Corruption for *στέρας*.

STERCUMEZEFF, or STERCORUMECEFF. Litharge. *Rulandus. Johnson.*

STERCUS. Dung. See FIMUS.

STERGETHRON. A Name for the larger Aizoon, Houfleeck.

STERILITAS. See BALSAMICA.

STERIPHNOS. The same as STRUPHNOS.

STERNO-COSTALES, *vulgo Triangulares Sterni.*

These are five Pairs of fleshy Planes disposed more or less obliquely on each Side the Sternum, on the Inside of the Cartilages of the second, third, fourth, fifth and sixth true Ribs.

They are inserted by one Extremity in the Edges of the Inside of all the lower half of the Sternum. From thence the first Muscle on each Side runs up obliquely, and is fixed in the Cartilages of the second Rib. The second runs less obliquely to its Insertion in the Cartilage of the third Rib. The rest are inserted, in the same manner, in the Cartilages of the following Ribs; their Obliquity decreasing, and their Length increasing in Proportion as they are situated lower down; so that the lowest is almost transverse.

This last Muscle, which is fixed by one Extremity in the Cartilage of the sixth true Rib near the Bone, and seems to pass the *Appendix Ensisformis*, immediately above the Insertion of the Diaphragm in that Appendix, and to join the Muscle on the other Side. The superior Portions of the transverse Muscles of the Abdomen, united with the lowest *Sterno Costales* have nearly the same Appearance, so that these might be reckoned to belong to the *Transversales*, did not the Insertion of the Diaphragm come between them.

The Insertions and Direction of the *Sterno Costales* being carefully examined, it will be found that their Use is to depress the cartilaginous Portions, and anterior Extremities of the Ribs, especially the superior Ribs, except the first; and at the same time to draw the Cartilages of the inferior Ribs near the Sternum, by Reason of the Curvature. They may therefore very well be called *Depressores Costarum* as the *Supra Costales* are named *Levatores*. *Winslow's Anatomy.*

STERNO-HYOIDEÆUS, *frve Sterno-Cleido-Hyoideus.*

This is a long, thin, flat Muscle, broader at the lower than at the upper Part, and sinuated, together with its Fellow, on

the Foreside of the Throat, from whence some have very improperly termed it *Sterno Mastoidæus*.

It is fixed by its lower Extremity in the superior and lateral Part of the inner posterior Side of the Sternum, in the posterior Part of the sternal Extremity of the Clavicula, in the transverse Ligament which connects these two Bones, and in the inner or back-side of the Cartilage of the first Rib. All these other Insertions are more considerable than that in the Sternum, which is sometimes scarce perceivable.

From thence it runs upon the Foreside of the *Aspera Arteria*, joined to its Fellow by a Membrane, which forms a sort of *Linea alba*, and is inserted laterally in the lower Edge of the Basis of the *Os Hyoides*.

There is sometimes a transverse tendinous Line, about the Middle of the Backside of this Muscle.

The *Sterno-Hyoidei* draw the *Os Hyoides* directly downward, and serve to counterbalance the different Motions of the *Stylo-Hyoidei*, *Omo-Hyoidei*, and *Genio-Hyoidei*. They may in some Cases be assisted by the *Sterno-Thyroidæi* and *Thyro-Hyoidei*. *Winslow's Anat.*

STERNO-MASTOIDÆUS. See MASTOIDÆUS ANTERIOR.

STERNO-THYROIDÆI. See LARYNX.

STERNUM. See THORAX.

STERNUTAMENTUM, signifies the same as STERNUTATIO; or as STERNUTATORIUM.

STERNUTATIO. Sternutation, or Sneezing. A Branch of the fifth Pair of Nerves united with those of the sixth Pair, is distributed in the Cavities of the Head, lined by the pituitary Membrane; and when any Part of this Nerve is irritated to a certain Degree, the Intercostal Nerve, and the *Par Vagus*, are drawn into consent, in such a Manner, that the Muscles subservient to Respiration, suffer a Kind of Convulsion, and the Air is expelled the Lungs with Violence, and acting upon all the Parts of the pituitary Membrane, absterges, and brings away the Mucus there secreted; and besides, this excites all the Actions which depends upon the Brain, sometimes to such a Degree as to become fatal, tho' often salutary when the Faculties are languid, or the Mucus indurated upon the pituitary Membrane, as it frequently happens after a Night's Rest. See CAPUT.

STERNUTATORIUM. A Sternutatory, or Medicine which excites Sneezing. Snuff is the most common Sternutatory; but any Thing which will stimulate the Nerves mentioned under STERNUTATIO, to a sufficient Degree, will excite Sneezing.

STERNUTATORIUM CUM EUPHORBIO.

A Sternutatory with Euphorbium.

Take Powder of Euphorbium, half a Scruple; white Wine an Ounce; Spirit of Scurvy-grass, two Drams; Oil of Marjoram, two Drops; shake all together.

This with the Euphorbium is too sharp and violent to be trusted therein to snuff up; and therefore 'tis best to dip a little Cotton, and just thrust it into the Nostrils. *Ludovici* is so timorous, as to order but half a Dram in half a Pint of Water, to be boiled and strained, and even then to be used but very sparingly.

STERNUTATORIUM CUM MARJORANA.

A Sternutatory with Marjoram.

Take of an Infusion of Marjoram made like Tea, one Ounce; dissolve in it Salt of Vitriol ten Grains, and put it in a Glass for Use.

This is directed and much recommended by *Ettmuller*, and it may be made stronger or weaker, by a greater or lesser Quantity of Water, as is found needful. But of all the Medicines to this Purpose the following is preferable.

STERNUTATORIUM CUM SALE VOLATILE OLEOSO.

A Sternutatory with Sal Volatile.

Take *Sal Volatile Oleosum*, two Drams; Spirit of Lavender, twenty Drops; Damask Rose-Water, or Orange Flower-Water, half an Ounce; mix.

This is both mild and grateful, and very refreshing to the Head, as well as a gentle Provoker of what is secreted by the Nose.

STER-

STERNUTATORIUM CUM SUCCIS.

A Sternutatory with Juices.

Take Leaves of Honeyfuckle, four Handfuls; Primrose, three Handfuls; Betony, two Handfuls; Marjoram, one Handful; bruise them all together, and press out their Juice.

This is much milder than either that with Euphorbium or Turpeth Mineral, and may be used in any Disorders and Stoppages of the Head, either by snuffing a little out of the Hollow of the Hand, or blowing it up the Nostrils with a Quill, and these liquid Snuffs have this Advantage over Powder, that they do not clog up and heat the Nose.

STERNUTATORIUM CUM TURPETHO MINERALI.

A Sternutatory with Turpeth Mineral.

Take Turpeth Mineral, half a Scruple; Powder of Liquorice, half a Dram; Nutmeg, one Scruple; Oil of Rosemary, two Drops; mix together.

This is very powerful in all such Illnesses of the Head as proceed from tough viscid Matter sticking upon the Glands and Sinuses, and have been of long Continuance, and obstinate; for it brings it away in such Plenty, that 'tis almost like a Salivation; but it is subject to make the Nose sore, and therefore the Nostrils should be rubbed sometimes with a little Oil of Almonds, or warm Milk.

STERTOR. A Snoring; or what the Vulgar call a Rattling in the Throat; a fatal Symptom in Apoplexies, and many other Distempers. See RHENCHOS.

STILÆ. *σταλα*. SEA PEBBLES. *Galen. Exeges.*

STIBI. *στιβι*. The same as STIBIUM.

STIBIALIA. Antimonial Medicines.

STIBIUM. Antimony. See ANTIMONIUM.

STICA, according to *Blancard*, are external Astringents, as Bole, and Dragons Blood.

STICHOS. *συχος*. The Name of an Arteriacal, or pectoral Confection, the principal Ingredient in which is *Marrubium Horehound*, described by *Galen, Lib. 7. de Comp. M. S. Loc. C. 2.*

STICTICUM EMPLASTRUM. An Adhesive Plaister.

STIGMATA. The Marks of Blows, Bruises, Wounds, or Burns.

STILBOMA. *στίλβωμα*, from *στίλβω*, to shine, a general Term for any Cosmetic used to procure a shining Countenance. *Castellus.*

STILBUS. Antimony. *Rulandus.*

STILISCUS, the same as *Scalmus*, or *Priapiscus*. *Oribas. de Machin.* See PRIAPISCUS.

STILLA. A Drop.

STILLATICUS, the same as DISTILLATUS, distilled, an Epithet of Liquors passed through an Alembic. *Castellus.*

STILLICIDIUM has two Significations, one *pathologic*, in which Sense it is the same as STRANGURIA, which see; the other *pharmaceutic*, in which it signifies an Instillation of Liquor upon some Part of the Body, being much the same as Embrocation. *Castellus.*

STIMMI. *στίμμι*. Antimony. *Dioscorides.*

STIMULANS. *στίμμι*, stimulating, the same as *pungens*, pungent, is an Epithet applied to a Kind of Pain, *Galen in 6 Aph. 5.* The Words *stimulans* and *stimulus*, are, also, applied to some of the more active Kinds of Medicines, which are added to those which are slower, in order to quicken their Operation. *Castellus.*

STINCUS, as *Fuchs* observes, *Not. in Myreps. Antid. 69.* is a corrupt Word for *Scincus*, taken from a Manuscript Copy which has *σίνγα*, *Stinga*, for *σύνγα*, *Scinga*, which Corruption, he says, is still retained in the Shops to this very Day, where instead of *Scincus*, they say *Stincus*.

STIPATIO. The same as *Constipatio*, or STREGNOSIS; which see.

STIPES. That Part of a Plant which is between the Root and the Branches, the Trunk, Stem or Stalk. *Blancard.*

STIPHROS. *στίφρος*. The same as STRYPHNOS; which see.

STIPTE, *Stipteria*, are corruptly read for *Stypte*, *Stypteria*. *Alum.* We meet also with *Striptica* for *Styptica*. *Castellus.*

STIPULÆ, according to *Blancard*, are the Leaves which surround the Stalk in Corn.

STLENGIS. *στίλγης*. The same as STRIGIL or STRIGILIS, which see.

STOEBE. A Name for several Sorts of JACEA.

STOEBE *Plantaginis Folio.* See CATANANCE.
STOECHAS.

The Characters are;

The Galea is erect and bifid, the Beard trifid, and the Flower appears quinquefid. The Spikes of the Flowers are thick, squamated, and crowned at Top with small, coloured Leaves.

Boerhaave mentions three Sorts of *Stæchas*, which are;

1. *Stæchas*; *purpurea*. *C. B. P. 216. Tourn. Inst. 201. Boerb. Ind. A. 153. Stæchas Arabica*, *Offic. Stæchas Arabica vulgo dicta*, *J. B. 3. 277. Raii Hist. 1. 514. Stæchas vulgaris*, *Park. 67. Stæchas sive Spica Hertulana*, *Ger. 469. Emac. 585. FRENCH LAVENDER.*

This beautiful Shrub grows three or four Foot high, clothed with long hoary Leaves less than those of common Lavender, two at a Joint, with smaller coming forth among them, the Stalks are square, bare of Leaves to the Top, on which grow thick, round scaly Spikes, or Heads of Purple, galeated Flowers; set in hairy Calyces. On the Top of the Spikes grow two or three slender Purple Leaves, the Seed is small and round, four succeeding each Flower; the Root is thick and woody, and much branched; the Leaves and Flowers have a strong aromatic Scent. It grows naturally in the southern Parts of *France* and in *Spain*. It took its Name, according to *Dioscorides*, from the *Stæchades* Island in the *Mediterranean* Sea, not far from *Marjeilles*. It is planted with us in Gardens, where it is easily increased, and bears our severest Winters with moderate Shelter; and pity it is not more propagated, the fresh Heads being certainly of greater Virtue and Efficacy than those which comes from abroad, there being not fresh Importations in many Years. It flowers in *June*, and its Heads ought to be gathered when they are firm and hard, which is about the latter End of *July*. The Flowers are only used.

They are cordial and cephalic, strengthening the *Genus Nervosum*, and are useful for Apoplexies, Palsies, and all Kinds of Convulsions; they are opening and attenuating, promote the *Catamenia*, resist Poisons, and the Bites of venomous Creatures. They are an Ingredient in the *Theriaca* and *Mithridate*. *Miller's Bot. Off.*

Stæchas is absterging, attenuant and aperitive; its principal Uses are in Affections of the Head and Nerves, as the *Vertigo*, *Apoplexy*, *Palsy* and *Lethargy*. In Diseases of the Breast it has the same Effects as *Hyssop*; it also provokes Urine and the *Menses*, resists Poisons, and gives Relief under hypochondriac Disorders. Outwardly it is used in Lotions of the Head, Suffumigations, and other Ways. *Mesue* is very prolix in describing its Virtues; there are three Preparations of its Syrup in Use, the Simple, and Compound, and that of *Fernelius*. They are all esteemed cephalic, and used with good Success in cold Affections of the nervous Parts. *Mesue* writes that *Stæchas* purges Phlegm and Melancholy; but because it is slow and weak in Operation, he orders an Addition of a sixth Part of common Salt, *Sal Gemmæ*, black *Myrobalans*, or *Cepula*. He also advises Persons of a bilious Constitution to abstain from it, for which Reason, perhaps, says *C. Hoffman*, it is grown out of Use. *Raii Hist. Plant. p. 514.*

2. *Stæchas*; *folio verrato*. *C. B. P. 216. Lavandula, foliis crenatis*. *T. 198.*

3. *Stæchas*; *cauliculus non foliatis*, *C. B. P. 216. Boerb. Ind. Alt. Plant. Vol. 1. p. 153.*

The first Species is called *Stæchas Arabica*, not because it grows in *Arabia*, but because of the high Commendations given it by the *Arabian* Physicians. *Stæchas* is somewhat of a ranker Quality than *Lavender*; in other respects it has the same Virtues, and is recommended for the same Diseases; hence a Syrup of *Stæchas* is so much commended by the *Arabian* Physicians, that they prescribe no cephalic Medicine in which this is not an Ingredient. But the common Preparations of this Syrup is good for nothing, because the Virtue is lost in the Boiling. The Conserve therefore, or the distilled Water, or only a simple Decoction, taken inwardly, are of excellent Virtue. Bruised, and the Juice expressed without Exhalation, there is no better Medicine for strengthening the Brain. The Plant has a very pleasant and fragrant Smell, and is anti-hysterical, attenuant, diaphoretic, detergent and inciding. Hence it is of Service in Obstructions of the *Menses*, Retention of Urine, Head ach and Melancholy, resolves coagulated Blood, but excites Catarrhs. It is reckoned of excellent Use for freeing the Lungs of acrimonious Humours, and kills Worms. Outwardly it is a very good Emollient in a Hardness of the Uterus, and to strengthen the Head in an Apoplexy. *Hist. Plant. ascript. Boerhaave.*

STOECHAS CITRINA. A Name for several Sorts of *HELICHRYSUM*.

Besides the foregoing Species of *Stæchas*, *Dale* mentions the following.

[* M m m]

STOECHAS

STOECHAS CITRINA GERMANICA, Offic. *Stoechas citrina Germanica latifolia*. J. B. 3. 153. Raii Hist. 1. 281. *Elichrysium seu Stoechas citrina latifolia*, C. B. P. 264. Tourn. Inst. 453. *Amaranthus luteus latifolius*, Ger. Emac. 646. *Gnophalium luteum*, Volck. 193. GERMAN GOLD-LOCKS.

It is cultivated in Gardens, and flowers in May. The Flowers, which are the Part used in Medicine, are of Service in Obstructions of the Liver and Spleen, and provoke Urine and the Menes; they resolve coagulated Blood, dry up Rheums, and expel Worms.

Tragus says, that the Flowers of *Amarantus* (so he calls this Plant) are of a hot Nature, which is known by their Taste and Smell. Boiled in Wine and taken they expel Worms of the Belly, which *Tragus* says is verified by his own Experience. Taken in the same Manner, they provoke Sweat, and therefore he esteems them effectual in Obstructions of the Liver, Spleen, Kidneys and Bladder. A Lye made of the Flowers cures scald Heads, and kills Lice, and put among Clothes preserves them from Moths. The Decoction thereof in Water being used by Way of Vaporation or Fomentation, mollifies the Hardness and Swelling of the Matrix. Some use the Flowers, as *Breynius* says, with good Success in the Jaundice. Raii Hist. Plant.

STOIBES, *στίβος καρπός*, "the Fruit of the Stoebe," in *Galen*, *Exegesis*, is expounded by *τὸ ὑπὸ τοῦ στίβου*, "the Seed of the Hippophaes." But *Foessius* thinks we should read *στίβος* and *ὑπὸ τοῦ στίβου*, and that they have a Relation to that Passage, *Lib. 2. περὶ γυναικ.* where a Cataplasm of the Seed of the *Stybe*, or the Bramble boiled in Water and Oil, is directed to be applied to the Breasts, in order to mollify their Asperities. But there we read *στίβος*, as *Galen* also in his *Exegesis* says, that the *Hippophaes* is called also *στίβος*, *Stybus*. Now the *στίβος*, *Stoebe*, is an Herb fit for making green Beds or Banks on which to sit or repose, and may serve instead of Flocks to stuff Beds or Couches, and is called by some *Phleas*, according to *Pliny*, *Lib. 21. Cap. 15.* from *Theophrast. Hist. Plant. Lib. 6. Cap. 1.* *Hesychius* writes *στίβος*, and expounds it by *ἵδρος χόρτο*, "a Kind of Stubble." Some read in *Galen* *στίβος* for *στίβος*, and *στίβος* for *στίβος*. It is also written, *στίβος*, *Lib. περὶ γυν. φύσ.*

STOLIDES, *στίλιδες*. Wrinkles in the Forehead.

STOLONES. The Suckers of Plants.

STOMACACE, from *στόμα*, the Mouth, and *κακός*, Evil. A Symptom of the Scurvy, consisting in a Fœtor of the Mouth, and an Erosion and spontaneous Hæmorrhage of the Gums.

STOMACHICA.

The Stomach has the leading Part both in Pleasure and Pain, for by its commodious Vicinity to the Heart it has the principal Share in contributing to the Strength of the Body, and by its sympathizing with the Soul, has a mighty Influence towards the Exaltation or Depression of the Spirits. From Pleasure proceed a good Concoction, a lively Colour, and fleshy Habit of the Body; from Pain or Uneasiness the contrary to these, and sometimes a Dejection of Mind, the Stomach receiving no Aliment, or Melancholy, with an Aversion to all Food.

A Disorder of this Part [the *Stomachica Passio*] is attended with a Hatred and Aversion to all Food, not only when it is offered, but when out of Sight; for the Patient recalls the Idea of it to Mind, accompanied with a Nausea, Anxiety, Redundance of Humidities, Cardialgia, an Effusion of the Saliva, and sometimes Vomiting: And tho' the Body suffers, and the Belly be empty, he bears the Pain of Fasting better than that of Eating; and if he finds it necessary to eat, he is forced to endure a Pain much worse than that of Hunger. It is very troublesome to him to chew his Meat, and much more irksome to swallow it; besides, he has an Aversion to common and wholesome Food, and longs for what is absurd and contrary to common Use. Nature with him is perverted, he is tired with every Thing, and hates and shuns his very Food. He is molested with a Pain between the Shoulders, which is increased after Eating and Deglutition, Restlessness, Anxiety, Dimness of Sight, Noise in the Ears, Heaviness of the Head, Numbness and Palsy of the Limbs, a Palpitation of the Hypochondria, and fancies that the Spine of his Back moves towards his Legs. Whether standing or lying, he seems to be agitated and moved this Way and that Way, like a Reed or a Tree by the Blasts of Winds. He spits a cold watery Phlegm, and if abounding with Bile in a bilious Constitution [*χολὰ ὑπερβαίνει*] is subject to a Scotomia. He is free from a Thirst, tho' after Eating he seems to desire Drink, continues waking tho' sluggish and drowsy, like those who labour under a Coma, is lean, pale, feeble, faint, spiritless, timid, silent, yet soon angry, very much molested with black Bile, and sometimes falls into Fits of Melancholy.

The Influence of these Symptoms being communicated by the Stomach to the Soul, a Disease must necessarily arise, but Men, through Ignorance of the sympathizing Parts, from whose Consent proceed the most severe and dangerous Disorders, ascribe the Cause of the Disease (merely) to the Stomach. What confirms my Assertion is the Contiguity of the Heart, the Original of all the Faculties; for the Heart is seated in the Midst between the Lungs, to the Middle of these is the Stomach connected, and this with the others to the Spine of the Back. From this Vicinity of the Heart proceed the Cardialgia, Fainting, and melancholy Disorders.

The Cause of this Disease, among a thousand others, is more especially a Discharge of Pus from the Belly upon the Stomach. This Disorder is also incident to those who through Necessity are forced to live on thin and hard Diet, and to such, also, as spend their Time in Study, and learned and laborious Researches, who are smitten with the Charms of divine Knowledge, and deprive themselves of due Rest and Food, neglecting the Care of themselves, and thinking nothing worthy of their Regard but a wise Saying, or a wise Action. These hard Students and Contemplators despise a Fulness and Variety of Meats, abstaining from Food and Sleep, and satisfying their Thirst with Water. Instead of a soft Bed, they lie on the Ground, without any Covering but the common Canopy of the Sky, and go muffled up in a thin and Threadbare Cloak, coveting no Riches nor Possessions but the invaluable Acquisition of divine Wisdom and Knowledge, which comprehends all that deserves to be called good in their Esteem. When they find it necessary to eat, they are contented with what is cheap and common, and use it not for the sake of satiating an Appetite, but for the Sustainment of Life. They indulge not themselves in drinking of Wine, or cheerful Conversation, in Tours or Promenades, but neglect the due Exercise as well as Clothing of the Body. Whither will not a Love of Learning divert a Person, and draw him aside? It seduces him from his Country, Parents, Brothers, and Sisters, and even from himself, and his own Life. Thus the poor Student becomes extenuated, looks ill-coloured, and old while young, is silent, thoughtful, never laughs, but is constantly severe and stern in his Behaviour. The Stomach is affected with Loathing, or is soon satiated with such cheap and ordinary Food as comes first to hand, being unaccustomed to Varieties, and of a dull Appetite to all Manner of Meats, and offended by any unusual Food, the taking of which is immediately succeeded by a general Loathing.

This Disorder of the Stomach is a chronic Affection, and different from a Phlegmon, Fluxes, Cardiogmus, and Pain of the Stomach.

The Stomachic Passion is most common in Summer, at which Season there is a Weakness of Digestion, Appetite, and all the Faculties. The Time of Life most subject to it is old Age, which, on account of its Vicinity to Death, is but too liable to a Failure of Appetite, even without a Disease. *Arætaus de Caus. & Sign. diutin. Morb. Lib. 2. Cap. 6.*

The Stomachic Passion takes its Name from the Part affected, the Stomach; but not every Disorder complained of in that Part is without further Consideration to be called the Passion of the Stomach, unless it be attended with the Concurrency and Continuance of many Symptoms together, and becomes of the Nature of chronic Distempers with repeated Exacerbations and Remissions. A Number of Physicians have prescribed singly for the Cure of this and that particular Symptom of the Disease, sometimes treating of the Hardness of the Stomach, sometimes of its Ventosity, of the Rheumatism in particular of the Stomach, and so of its Weakness, its Loathing and Aversion to Food, and the rest. *Themison*, in his first *Book of chronical Diseases*, calls a Solution of the Parts about the Stomach by the Name of Rheumatism. In his second Book he gives it the Appellation of Ventosity. *Thessalus* in his second *Book of Diætics* treats distinctly of the Cure of a Solution, and of an Inflation of the Stomach. Our Design is to speak of them all under one general Head, in which we shall reduce Ventosity or Hardness from an Inflammation, under Diseases of Stricture, and a Loathing or Abhorrence of Food, and a Corruption of the same, a Disorder of an ambiguous Nature under the two principal Diseases.

The antecedent Causes of the Stomachic Passion, besides those which it has in common with other Distempers, are, more particularly a continual Indigestion or Vomiting after Eating, a taking Cold, Sorrow, also, and taking a strange and nauseous Draught of Physic.

The Symptoms attending this Disease in the Time of the Fit are, a Fainting, a cold Numbness of the Joints, or a Heat more piercing than the natural, diffusing itself through all the Members, and most sensible in the Palms of the Hands, with a dewy Sweat, a Restlessness, Jactation, and Anxiety, a Lowness of Spirits, and Dependancy of Mind, a Change of Colour,

Colour, a small, swift, and weak Pulse, a Wasting of the Body, or, on the contrary, an immoderate Appetite, with a Corruption of the Food, which acquires an acid, unfavoury or nidorous Quality. Sometimes the Patient lies speechless, and grinds or clenches his Teeth; there is always a Cold in the Head, with a Ringing in the Ears. Sometimes, also, there is an insatiable Thirst, and when the Inflammation is at the Height in the Time of the Fit, a Dryness of the Mouth, and a leaping under the Region of the Præcordia; there is, also, a Pain in the same Parts, or between the Scapulæ, which extends itself further, if the Inflammation happens to be more diffused, with a Difficulty of Deglutition, and a Strangulation, which has induced some leading Men of our Sentiments, in their Books of Epistles, to call this Kind of Symptom a *Stomachic Quinsy*.

A *Hardness* of the Stomach, without Heat or Pain, is attended with other common Symptoms, and besides with a ligneous Sensation of the same Parts, and especially between the Shoulders, if the Stomach be wholly dry'd. If there be only a Dryness of its upper Part, there will be a Difficulty of Deglutition till what is received arrives at the Bottom of the Stomach; or if the Dryness or Hardness affect its Bottom, which the *Greeks* call *Basis* (*Basis*) Deglutition will be easy; but when it is perfected, will be succeeded by a Sense of Weight, with a Hardness, and a visible Tumor in the interior Parts of the Præcordia.

A *Ventosity* of the Stomach is attended by a Tension together with an Inflation. There is a Repletion of the Head, from a Retention of Flatuosities, with continual Eructations, which manifests itself by a Sense of Heaviness of that Part, which is increased after taking Food, at which Time there is a Sound, also, of the Liquids in the interior Parts, as of a Bladder half full, the Wind rushing through the empty Spaces, till the Parts are relieved from this Tension, and relaxed by the Benefit of Eructations. If the Intestines be, also, inflated, there follows a Rumbling of their interior Parts, which the *Greeks* call *Βορβορυγμὸς* (*Borborygmus*.) A *Solution* of the Stomach, which they call *Rheumatismus*, [a Rheumatism] is succeeded by a Flux of the Saliva, and sometimes by a continual Spitting, and a nauseous Humectation of the Mouth, with a biting Sensation in the inward Parts. Some, in this Circumstance, vomit up vast Quantities of a gross, tenacious, or a bilious and porraceous Humor, or some other Substance of the same Colours. If the *Solution* be *occuli*, which the *Greeks* call *ἀδνος* (*Adelos*) or the Signs are not apparent, which the *Greeks* call *λογοθεορέτα* (*Logothœreta*) there follows a Weakness of the Pulse, with a Sense of Trembling and Pendulousness of the Stomach, a Faintness and Swooning, which the *Greeks* call *λιποθυμία* (*Lipothymia*). This Symptom is removed for the present by taking some Food, and the Patient finds himself refreshed, though but for a while, for he relapses into his former Fainting-Fit, and is in the same Circumstances as in the last Paroxysm; so that unless he receives speedy Recruits of Aliment he falls away as dead. Hence we are told by the Antients, that Numbers under this Disorder have continued eating and drinking for a whole Day and Night without ceasing. And *Aesclepiades* relates, that a Servant of *Praxagoras* eat every Day three Loaves, each of two Pounds in Weight, and after he had eaten them was no otherwise affected than if he had taken nothing. And this last Character distinguishes the fore-mentioned Disorder from a *Phagedæna*; for in this latter the Food received is not digested, nor continues in the Stomach, but is expelled thence by Vomiting. *Cælius Aurelianus* *Morb. Chron. Lib. 3. Cap. 2.*

THE CURE.

In other Diseases, after the Cure, there remains nothing to confirm the Health and strengthen the Body, but a proper Regimen with a good Concoction. To *Stomachic* Patients alone a Regimen proves of no Service, or prejudicial, for want of rightly digesting his Aliments. I shall, therefore, briefly give Directions in using proper Means for promoting a due Concoction in such Subjects. For Gestation, Walking, with other Exercises of the Body and of the Voice, may procure an Appetite, and subdue a Loathing or Inappetence of the Stomach, but prove insufficient to remove a long and habitual Indigestion, and to render a lean and extenuated Body carnosous, and of a good Habit. The Sick in such Cases are more to be indulg'd than other Patients, and to be managed in the nicest Manner: The Physician, also, is to comply with their Desires, provided they extend not to something which would prove very prejudicial to them; for this is the best Way you can take, if they cannot be

persuaded into a Liking of what would be most proper and beneficial.

Medicines to be taken inwardly are the Juice of Worm-wood, Unguentum Nardinum, Theriaca, the Seeds of Parsley, Ginger, Pepper, and Sefeli; these promote Concoction. Outwardly, to the Sternum may be apply'd an astrigent Epithem, compos'd of Nard, Mastich, Aloes, Acacia, and Juice of Quinces. Another of the like Nature may be prepared of the Pulp of Apples bruised with Dates. Besides these Remedies, others may be used, which I have prescribed for the Cure of a Thirst in a Diabetes. The same Remedies, indeed, which are proper in this Disorder, would excite a Thirst in a Diabetes; but in Stomachics, the Tone of the Stomach is not at all disposed to render the Patient thirsty. *Aræteus de Curat. Chron. Morb. Lib. 2. Cap. 6.*

STOMACHICA:

Stomachic Corroboratives, or such as strengthen the Tone of the Stomach and Intestines, among which are *Carminatives*, as the Roots of Galangals, red Gentian, Zedoary, Pimpinella, Calamus Aromaticus, and Arum; Of Barks and Rinds, those of Canella Alba, Sassafras, Citrons, *Seville* and *China* Oranges, the Cortex Africanus, the Cortex Winteranus, Cascarilla; Of Spices, Pepper, Ginger, Cloves, Cinnamon, Cardamums and Mace. Other Things of this Nature are, among Simples, as *Roman* and common Chamomile, Wormwood, Mint, Carduus Benedictus, and the four Carminative Seeds; Of Preparations, the Oil of Cedar, Oil of Oranges by Expression, Oils of common Chamomile, Daucus Cre-ticus, Anisum Stellatum, Cumin, Caraway, Mint and Wormwood, with the Spirit of Salt and sweet Nitre. Among Compounds are the Sal Volatile *Sylvii*, our stomachic Elixir, and that of *Michaeli*, the carminative Essence of *Wedelius*, the stomachic Powder of *Birkmannus*, the Essence of Orange-Peel, with sweet Spirit of Nitre, Tincture of Tartar, Oils of Oranges prepared by Expression, the compound Essence of Wormwood of *Conordingius*, the carminative Water of *Dornerellius*, and the Spiritus de Tribus.

Though many cephalic and nervine Remedies are, also, of excellent Service in Diseases of the Stomach and Intestines, especially such as proceed from a Weakness or Decay of their Tone, there are yet other Medicines which, with Regard to the particular Kind of Disorder, are accommodated, as it were, by a specific Virtue to the Distempers of those Parts. Thus, for Example, under a Weakness of Appetite, from a Congestion of viscid and acid Crudities in the Stomach, besides Bitters, such as the Root of red Gentian, the Herbs Wormwood, and Carduus Benedictus, and the several Sorts of Spices; the Roots, also, of Galangal and Pimpinella, the Canella Alba, Pepper, Ginger, and Arum, are of especial Service. For a Nausea, Vomiting and Inversion of the Stomach, the most present and effectual Remedies are Mint, its spirituous Water, and Oil carefully distilled; Mastich, and its Spirit, with what is prepared of *Peruvian* Balsam, and Salt of Tartar, and our mineral anodyne Liquor. Against the Cardialgia, Colic, and Gripes, the speediest and best adapted Remedies are fresh Orange Peel, and the Essence of the same duly extracted, the Water and Oil of *Ethiopian* Cumin, the genuine Oil of the Flower of common Chamomile, with the sweet Spirit of Nitre. To correct an excessive Lubricity of the Intestines, and restrain a Looseness, the Cascarilla is endu'd with a peculiar Virtue. Under Inflation of the Intestines, the most effectual Medicines to expel the Flatules are the carminative Water of *Dornerellius*, the carminative Essence of *Wedelius*, the Spiritus de Tribus incorporated with the sweet Spirit of Nitre, the Essence and Water of Zedoary, and Cardamoms, with the genuine Oils of Caraway and Cumin. *Frederic Hoffman.*

STOMACHOTROTOS, from *σῆμαχος*, the Stomach, and *τρυπαχον*, to wound, wounded in the Stomach.

STOMACHUS, *σῆμαχος*, has many and various Significations with the ancient Physicians. Properly, it signifies a narrow Neck like an Isthmus placed before any considerable Cavity resembling a Belly; and this was what the Antients meant by the Word. The Name was afterwards translated to signify the *Oesophagus*, or *Gula*, the Gullet; and since that, to denote the Mouth of the Stomach, which the Antients call *καρδία* (*Cardia*). This last Sense was impos'd upon the Word in *Galen's* Time, as he informs us in the Beginning of his fourth Book *de Usu Partium*. The same Author, *Lib. 5. de Loc. Affect. Cap. 5.* tells us, that Writers since the Time of *Aristotle* usually give the Name of *Stomachus* to the Part between the Fauces and the Mouth of the Stomach, which the Antients called *Oesophagus*, and those in his Time, *Gula*, "the Gullet;" but that *Aristotle* always called this Part by its ancient Name: Thus

Tully

Tull. Lib. 1. *de Nat. Deorum*, makes the *Stomachus* adhere to the Roots of the Tongue, whither the Food is first transmitted from the Mouth, with the Assistance of the Motion and Agitation of the Tongue, and through which it is impelled downwards. *Celsus*, also, Lib. 4. Cap. 1. et 3. takes the *Stomachus* for the *Gula*, when he says, that it is situated under the Fauces, and receives the Food; though the same Author seems to use the Word improperly for the lower Part of the Stomach, when he makes the *Stomachus* the Beginning of the Intestines, and describes it as a nervous Part beginning from the seventh Vertebra of the Spine, and join'd to the Stomach about the *Præcordia*. Lib. 4. Cap. 1. And *Pliny* Lib. 11. Cap. 37. calls the upper Part of the *Gula*, or Gullet, the *Fauces*, and the other Part the *Stomachus*, which Appellation, also, was not unknown to the Antients, as appears from *Homer*. Il. 7. vers. 292. *καὶ ἀπὸ στομάχου ἀπὸν τὰ μὲν ἰδίῃ χάρμῃ*. "And cut the Throats (*Stomachi*) of the "Lambs, &c." To proceed, *Galen* in many Places writes, that *Stomachus* was a Name for the Mouth of the Stomach; and Lib. 4. Cap. 5. *de Loc. Affect.* he says, that the Antients call'd the Mouth of the *Stomachus* *καρδία*; the Appellation being given it from some Symptoms which it seemed to induce; but in his Time it was call'd *Stomachus*, by a wrong Use of the Word, as he writes, *Com. ad 7 Aph.* 56. where he says, that in his Time not only the common People but the most eminent Physicians call the Mouth of the Stomach, by an Abuse of the Word, *Stomachus*. To the same Purpose he writes in many other Places, and particularly Lib. 2. *τὴν καλὰ τὴν*. he says, that *Stomachus* is the Name by which *Archigenes* calls the Mouth of the Stomach, and is the usual Appellation bestow'd on it by the Physicians, who use the Phrase *Stomachica Syncopa* (to signify a Syncope proceeding from an Affection of that Part) and call some *Stomachici* from a Disorder in that Part, and particularly those who have an Oppression at the Mouth of the Stomach, as he writes in the Beginning of Lib. 8. *καλὰ τὴν*.

Hippocrates, Lib. *περὶ ἀεισπύου*, and Lib. *περὶ καρδίας*, calls the *Oesophagus*, or *Gula*, *στόμαχος*, which was the usual Name the Antients had for it. *Stomachus* was, also, us'd among the *Latins* to signify the same as *Gula*, or the Canal subjacent to the *Fauces* at the Root of the Tongue, which transmitted the Meat and Drink to the Stomach, as we are assured by *Gellius*, Lib. 17. Cap. 11. Thus, according to the Opinion of *Erasistratus*, *στόμαχος καρδίας*, in *Hippocrates*, will signify that narrow Pipe, or Neck of the Stomach prefix'd to its Cavity, from that antient and proper Signification of *στόμαχος*, observ'd in the Beginning, in which Sense it is very often used by *Hippocrates*. For Instance, *στόμαχος κιστῆρος*, is expounded in *Erotian* to be the Neck of the Bladder, and *τῆς μήτρας στόμαχος*, the Neck of the Womb.

STOMARGUS. *στόμαργος*. *Galen*, in his *Exegesis*, writes, that *Dioscorides* reads *στόμαργος* in the second of the *Epidemics*, and understands it *τὸ λαλῶντος μανικῶς*, of one who talks madly. Others, he says, read *στόμαργος*, and make it a proper Name.

STOMATICA. *στοματικά*, from *στόμα*, the Mouth. Remedies for Disorders of the Mouth, and *Fauces*.

STOMOMA. *στόμαμα*. Purified Iron, that is, Steel.

STOMOMANICON. *στομομανικόν*. A Name for the Muscle call'd otherwise *Platysma Myoides*.

STOPAROLA. The Name of a small Bird mention'd by *Aldrovandus*.

STORAN. See **STYRAX**.

STORYNE. *στορύν*. An Instrument us'd by the Antients for drawing Blood from the Nose, as we learn from *Aretæus*, *de Curat. Diuturn. Morb. L. 1. C. 1.* As this Author but just mentions it, and I don't know that it is taken Notice of by any other, I cannot describe it.

STRABISMUS, STRABILISMUS, or STRABOSITAS. A Distortion of the Eye, or squinting. See **Oculus**.

STRAMONIUM.

The Characters are;

The Root is annual; the Leaves are alternate, and sinuated at the Edges; the Calyx is pentagonal, and tubulated. The Flower is monopetalous, Funnel-shaped, quinquefid, and open. The Ovary in the Bottom of the Calyx becomes a prickly, roundish Fruit, divided by a decussated, or cruciform Partition, into four Cells, containing many Kidney-shaped Seeds.

Beerhaave mentions six Sorts of *Stramonium*, which are;
1. *Stramonium*; fructu spinoso, rotundo; flore albo simpliciter. T. 118. *Solanum*, *Pomo-spinoso, rotundo, longo flore*. C. B. P. 168. *Datura Turcanum*. H. Eyft. Aut. O. 2. F. 12. F. 1.

2. *Stramonium*; fructu spinoso, oblongo; caule, & flore, violaceo. *Boerb. Ind. A.* 261. *Stramonium*, Offic. *Stramonium majus album*, Park. Parad. 360. *Raii Hist.* 1. 748. *Stramonium spinosum*, Ger. 277. *Emac.* 348. *Stramenica fructu spinoso oblongo flore albo*. Tourn. Inst. 119. *Stramonium altera major, sive Datura quibusdam*, J. B. 3. 624. *Solanum foetidum pmo spinoso, oblongo*, C. B. P. 168. **THORN APPLE.**

The common Thorn-Apple has a white, thick, woody Root, pretty much branched, and full of Fibres, from which arises a thick, round, hollow Stalk, two or three Foot high, divided at the Top into several Branches, and clothed with large Leaves, waved and sinuated about the Edges, in Shape like the common Night-shade, but much larger, of an ugly foetid Smell. The Flowers are long, white, hollow Tubes, dilated at the Ends into large pentangular Brims, each Angle ending in a long *Ligula*: They stand in loose, green, five-cornered Calyces, and are succeeded by large Seed-Vessels, near as big as a Walnut, covered all over with long, thick, upright Thorns; and as they ripen, they separate into four Parts, shewing the flat, black, and somewhat rough Seed. It is sown in Gardens, and is sometimes found wild among Rubbish, and flowers in July.

The Leaves are accounted cooling, and good for Burns, Scalds, and Inflammations in any Part. The Seed is narcotic and soporiferous, and rarely used. *Miller's Bot. Off.*

3. *Stramonium ferox*. *Boerb. Ind.* 261. *Tourn. Inst.* 119. *Datura*, Offic. *Solanum foetidum Pomo grandiore, Aculeis donato*, *Raii Hist.* 1. 748. **DUTROY.**

The Seed of *Stramonium* pulveriz'd and drank disorders the Senses, and induces a Delirium, which lasts twenty-four Hours, whence, as we are told by *Garcias*, it is us'd by Thieves to mix with the Food of those whom they design to rob. And *Acosta* tells us, that it is customary with lewd Women to give half an Ounce of the Powder to their Gallants, in Wine, or any other Liquor they like best. He who is so unfortunate as to take it remains for a long Time like one without Reason, either laughing, weeping, or sleeping, and sometimes talking, and giving rational Answers as if he were in his right Senses, though the contrary be true, for he neither knows whom he talks with, nor remembers a Word of what has been said after he comes to himself. Some of these Women are so experienc'd in administering this Medicine, and know how to temper it in such a Manner, that its Effects shall last for a certain Time, or for as many Hours as they please. There are some Physicians among the Pagans, who use the Seed to provoke Urine; their Method is first to exhibit some Emetic, then inject an acrimonious Clyster, and apply strong Ligatures to the Arms and Legs, and rub them very well, and sometimes to apply Cupping-Glasses to them: If these have no Effect, they find it necessary to open a Vein in the great Toe.

As the Pagan Physicians, as well as the Christian Natives, abhor the Use of Venesection and Cupping-Glasses, they do nothing but provoke Vomiting, and apply strong Ligatures and Frictions. If these will not answer the Intention, they prescribe a Bath of warm Water to provoke Sweat. After vomiting they exhibit a Draught of Wine mixed with Pepper and Cinnamon. A Dram of the Root taken in Wine induces a profound Sleep and strange Dreams full of surprizing and extravagant Images. The Seeds macerated a Night in Vinegar, then carefully powder'd, are good to anoint a miliary Herpes, and spreading Erysipelas. An Ointment prepared of the Juice of the Leaves with Swines Fat is a most approved Remedy for a Burn by Fire or scalding Water. *Raii Hist. Plant.*

4. *Stramonium*; fructu spinoso, rotundo; flore violaceo, duplici, triplicive. T. 119.

5. *Stramonium*; *Americanum*; minus; *Alkekengifolio*.

6. *Stramonium*; folio *Hyoscyami*; flore toto candido; fructu propendente, rotundo, spinis innoxiiis ornato. *Datura, folio Hyoscyami latissimo, flore toto candido, fructu propendente, rotundo, copiosissimis, & longissimis, spinis, fere innoxiiis, munito, semine pallido*. H. Mauroc. *Boerb. Ind. Alt. Plant.*

The Leaves, Roots, Flowers, and Seeds of *Stramonium* taken inwardly, induce a Sapor, if used in great Quantity. The very Smell thereof causes Ebriety. A large Dose destroys the Memory of all things past. The Whores in *Java* use it when they are hir'd by People of Quality; the Women, also, give it to their Husbands, who become delirious afterwards; they will, also, take it themselves in the Presence of their Husbands out of Wantonness. Too large a Dose induces Stupidity, Faintness, and at last Death. The Plant induces a strange Kind of Madness, or Drunkenness: They who take it, make Answers with their Eyes open, but remember nothing, nor concern themselves in the least about any

any thing. For this Reason the *Indian Princes* make use of it to render their Rivals stupid, and consequently incapable of Government, in which Condition they suffer them to live and shew themselves to the People. These Effects are caused by the Drink called *Datyra*, which is composed of Opium, Stramonium, and Hyoscyamus. This Drink has no Taste nor Smell, yet the Diseases proceeding from it are incurable. *Garcias*, indeed, speaks of a Remedy, which is immediately to take a Vomit with a large Quantity of Salt and Vinegar; this in some measure cures, but they never recover their Strength of Brain. See *Bernier's Travels thro' the Dominions of the Great Mogul*. This Plant taken in a small Quantity causes Sleepiness, in a large Dose Madness, Convulsions, cold Sweats, and at last Death. Outwardly, in the Form of a Cataplasm, it is of Service in an Erysipelas, Convulsions, inveterate Ulcers, and all kinds of Inflammations, but is never to be used internally. *Hist. Plant. Ascript. Boerhaave.*

STRANGALIDES. στρεγγαλίδες. Hard Tumors in the Breasts from concremented Milk.

STRANGULATIO. Strangulation; a Sensation of Suffocation in hysteric Disorders.

STRANGURIA. στρεγγυρία, from στρέω, a Drop, and βουρα, Urine. A Strangury; that is, a Discharge of Urine by Drops, attended with Pain. See **CALCULUS**, **CATHETER**, **CATHETERISMUS**, **GONORRHEA**, and **RENES**.

STRATIFICATIO. Stratification; that is, the laying different Substances upon each other; *Stratum super stratum*; Layer upon Layer.

STRATIOTES. Offic. *Stratiotes Egyptia*, J. B. 3. 787. Raii *Hist.* 2. 1384. *Stratiotes aquatica vera Dioscoridis & Egyptiaca*, Park. Theat. 1249. *Lenticula palustris Egyptiaca*, five *Stratiotes aquatica folii sedo majore latioribus*, C. B. P. 362. *Hay alem el masvi*, id est, *Stratiotes*, Alpin. *Egypt.* 2. 51. **WATER SEA-GREEN.**

It grows in the Canals derived from the Nile near *Damiata* in *Egypt*, and swims on the Water like the *Lenticula Palustris*; has no Stalk, but has Leaves resembling those of the *Cynoglossum*, somewhat short, broad, thick, hard, hairy and whitish; to these Leaves, instead of Roots, hangs a little thin Sort of Down. From its Resemblance to the greater *Sedum* or *Sea-green*, they call it *Hay alem el masvi*, that is, *Water-Sea-green*. It has no Smell but what it has from the Water, but has a dry and astringent Taste like *Acacia*, and is found by Experience to be good for the same Diseases as *Plantain*. Hence the Countrywomen, whom they call *Bedovi*, use the Decoction or Juice, or take a Dram of the Powder every Day, to stop an Hemorrhage of the Uterus; and the Peasants apply the bruised Leaves to Wounds, with surprising Success. I suppose this to be the true *Stratiotes* of the Ancients, of which *Dioscorides* gives the following Description: "The *Stratiotes*, which grows upon the Water, and which some call the *River Stratiotes*, the *Egyptians* *Tibus*, the *Magi* the Blood of *Ælarus*, swims upon the Waters, and lives without a Root, whence it has its Name. It is like the *Sempervivum*, only has a larger Leaf." That Author ascribes to it the same Virtues for which the *Egyptians* now use it; so that there can be no doubt but this is the true *Stratiotes*. The same is more clearly demonstrated by *Pliny*, in the following Words: "The *Stratiotes* is a Plant in much Esteem among the *Greeks*, but it grows only in *Egypt* among the Inundations, being like the *Aizoon*, only its Leaves larger." *Prosper Alpinus, de Plant. Egypt.*

STRATIOTICON. στρεπτιον, or **STRATIOTÆ COLLYRIUM**. The Name of a Collyrium described by *Scribonius Largus*, No. 33. and *Paulus Ægineta*. L. 3. C. 22.

STRATUM SUPER STRATUM. See **STRATIFICATIO**.

STREMMMA. στρέμμα, from στρέφω, to turn. A Strain, or, as it is usually called, a Sprain, of the nervous and membranous Parts about a Joint.

STREPITOSUS. The Name of a flatulent Disorder common in those Parts of the Alps which belong to the House of *Austria*, in which the Face, Neck, and Arms, are so distended with Flatulences, as to make a Noise, when struck, like a dry Bladder half distended with Wind. *Castellus* from *P. de Serbait. Med. Septentr.*

STRIATA CORPORA. Two Protuberances of the Brain, upon the Crura of the *Medulla Oblongata*. See **CEREBRUM**.

STRIBILIGO. A cutaneous Efflorescence. *Helmont. Tumul. Pestis.*

STRICTOR. The same as *Sphincter*.

STRICTUM, in *Scribonius Largus*, No. 45. is Dense.

STRICTURA. Stricture, Rigidity. I have made several References to this Article in the Course of this Work, at that Time intending to explain the Doctrine of Disease

from Stricture or Rigidity here; but as I afterwards judged it more proper to be inserted under the Article **FIBRA**, the Reader must have the Trouble of consulting that. See, also, in the Preface, the Methodic System.

STRSDOR DENTSUM. A Grinding of the Teeth.

Prosper Alpinus, in his *Treatise de Præfag. Vit. et Mort. Ægrot.* tells us, that a *Stridor Dentium*, which he calls a Convulsion of the Teeth, has been frequently observed by him to be a mortal Symptom; and he confirms his Observation by the Authority of *Hippocrates*, 1 *Prorrhet.* 48. and in the Book of the *Prognostics*, where it is said, that "the Grinding of the Teeth in Fevers, where a Person has not been accustomed to do the same from his Childhood, portend Madness and Death; and if it be attended with a Delirium, is so much the more dangerous and fatal." And *Galen* commenting thereon says, "That a Grinding of the Teeth, when the Patient has not been used to it from the Beginning, indicates an approaching Delirium; but if you perceive the Patient to labour under both Symptoms, that is, to grind his Teeth, and to be under a Delirium, you may conclude him to be near Death." We read the same Prognostics from a *Stridor Dentium*, 1 *Prorrhet.* 48. And we have it confirmed by an Instance which *Hippocrates* gives us, 7 *Epid.* T. 20. in the Person who lay sick in the House of *Metron*, who, the Day before he died, was affected with this Contrition or Grinding of the Teeth, among other mortal Symptoms. We may conclude, therefore, that a *Stridor Dentium*, in acute Diseases, portends nothing but Death. *Prosper Alpinus.*

STRIGENSIS TERRA. See **TERRA SILESIACA**.

STRIGIL, STRIGILIS, was an Instrument in Use among the Ancients in their Baths and some gymnastic Exercises, and served to absterge Sweat and Sordes from the Body. Persons who intended to bathe or use some Exercise, when they came into the Gymnasium, put off their Clothes in the Apodyterium [see the Article]; after which some of them, especially such as designed to box or wrestle, went into the *Alipterium*, where they were anointed, and thence proceeded to the Place where the Dust was, with which they were sprinkled as they passed along, and then entered on their several Exercises; which being finished, they returned to the *Alipterium*, and had the Strigments and Sordes absterged from their Bodies by the *Alipta* [see the Article] with Iron *Strigil*; and as they consisted of a Mixture of Oil, Dust and Sweat, they were preserved for medicinal Uses, and called by the *Attics* *Conisalus*, *κοισαλεις*, and by others *Patos*, *πάτος*, as appears from *Dioscorides*, *Pliny*, *Galen*, and *Aetius*; tho' *Avicenna*, in his second Book, mentions the dry Sweat of Wrestlers, which I suppose to be such as had no Mixture of Oil or Dust. And tho' *Strigils* were used in Bathing in *Galen's* Time, they were generally Sponges, or made of Linnen, and not always common, but every one carried with him his own *Strigil*, especially those who had an Aversion to Instruments which were of common Use. *Strigils* were of Iron, Gold, Silver, Horn, Ivory or Brass, and were of a crooked Shape, like a Gardiner's Pruning Knife, as appears from ancient Monuments, and that Verse of *Martial*.

Pergamus hoc mist curvo distringere Ferro.

STRIGMENTUM, στρίγμα, *στρίγμα*, the Strigments, Filth, or Sordes, absterged from the Skin in Baths, and Places of public Exercises, or from the Walls or Statues belonging to those public Places. Hence *Strigments* are of three Kinds, first of the Baths, consisting of the Sweat, Oil, and Sordes collected in those Places; secondly, of the *Palastra*, consisting of the same Things, with an Addition of Dust, collected partly by Insersion after anointing with Oil, and partly in the Colluctation of the Combatants offensively, and insidiously throwing Dust upon each other, besides what was raised by conflicting. The third Kind was obtained by Abrasion from the Walls and Statues belonging to the *Gymnasium*; and these Strigments, or Sordes, consisted in a great measure of Oil, (the same with which the Combatants were anointed) with a Mixture of Particles of that particular Substance to which it adhered, and consequently some Communication of its Virtues; as, for instance, what was scraped off from Copper Statues had a Mixture of the Substance and Virtues of *Ærugo*.

Archigenes in *Galen*, Lib. 3. κατὰ τὸν, uses Strigments with Lime for discussing the Parotides; and uses, also, for the same Purpose an Application of Nitre, with a third Part of *Rubrica Sinopica*, and with *Unguentum Cyprinum*, reduced to a strigmentitious Consistence.

Strigments absterged in the Baths are of a heating, mollifying, and discutient Quality; and therefore proper to anoint the *Rhagades* and *Condylomata* affecting the Anus.

The strigmentitious Sordes of the *Palæstra*, which have a Mixture of Dust, discuss Collections of Matter about the Joints; and, being applied hot by way of Fomentation, or in a Malagma, give Relief under the Pain of the Sciatica.

The Strigments which are scraped off from the Walls and Statues belonging to the *Gymnasia* [public Places of Exercise] are heating, and discuss Tumors which are difficult of Maturation, and are proper for Abrasions, and Ulcers in old Persons. *Dioscorides, Lib. 2. Cap. 34, 35, 36.*

STRINGENS. Astringent.

STRIX. The Screech-Owl, a Bird described by *Aldrovand.*

This nocturnal Bird is a Species of Owl, and as large as an ordinary Hen. It lives in mountainous and maritime Places, near the Folds in which the Goats are kept, because it is fond of their Milk, and sucks them when it can have any Opportunity of doing so. It contains a large Quantity of volatile Salt and Oil. Its Flesh, when dried and reduced to a Powder, is proper for the Cure of Palsies and Quinsies. The Dose is from half a Dram to one Dram. Its Fat, when externally applied, is emollient, resolvent, and proper for corroborating the Nerves. Its Gall is detensive, and proper for removing Specks of the Eyes. *Lemery des Drogues.*

STRÖBILE. στρεβλῖν, from στρέβω, to turn. An intort-ed Pledget of Linnen.

STROBILITES. στρεβλῖτης. An Epithet for Wine impregnated with Pine-Cones. *Dioscorides, L. 5. C. 44.*

STROBILUS. στρόβιλος. An Artichoke. But *Strobilus*, also, signifies a Pine-Cone; and in *Dioscorides*, as *Marcellus Virgil* renders him, a Pine-Kernel.

Pine-Kernels cleaned and eaten; or taken in *Passum* with Cucumber-Seeds, provoke Urine, and correct the Acrimony of Humours infecting the Kidneys and Bladder. They, also, give Relief under the gnawing Pains of the Stomach, being taken in the Juice of Purslain; they strengthen a weak Body, and correct the corrupted Humours. The whole *Strobili*, or Pine-Cones, gathered fresh from the Tree, then bruised and boiled in *Passum*, are three Cyathi of the Liquor, if taken every Day, are good for inveterate Coughs, and *Phthisis*. *Dioscorides, Lib. 1. Cap. 88.*

STROMBITES. A Stone in Form of that sort of Shell-Fish, called *Strombos*.

STROMBOS. στρόμβος. A Periwinkle, or any Species of turbinated Shell-fish, from στρέβω, to turn.

STROPHOI. στρόφοι. Gripes of the Intestines.

STRUMA. See *SCROPHULA*.

STRUTHIO. Offic. *Schrod. 5. 323. Charlt. Exer. 79. Struthio-Camelus*, Will. Ornith. 100. Raii Ornith. 144. E. juss. Synop. A. 36. Schw. A. 350. Aldrov. Ornith. 1. 587. Gesn. de Avib. 670. Jonf. de Avib. 35. Bellon. des Oyse, 232. **THE OSTRICH.**

The Parts of this Animal used in Medicine are the Coat of the *Craw*, the Fat, and the Eggs. The inner Coat of the *Craw* corroborates the Stomach, and dissolves Stones in a surprising manner. The Fat is agreeable to the nervous Parts, mollifies the Hardness of the Spleen, and mitigates nephritic Pains, the Parts being anointed therewith. The Eggs burnt and triturated in Vinegar cure the Impetigo.

STRUTHIO-CAMELUS. The same with the preceding. It is also called *AFRA*.

STRUTHIOFERA. A Species of *Filix*, so called because its Leaves resemble the *STRUTHIO*.

STRUTHIOMELA, STRUTHIA. A small Species of Quinces, more odoriferous, and of a sweeter and less astringent Juice than the common sort. *Plin. Lib. 15. Cap. 11. Oribaf. Med. Col. Lib. 2. Cap. 50.*

STRYCHNODENDRON. Raii. A Name for the *Solanum fruticosum bacciferum*.

STRYCHNOS, STRYCHNON, στρυχνος, στρυχνον, in *Dioscorides*, is the *Solanum*.

STRYPHNOS. στρυφνος. The same as *ACERBUS*, which see.

STULTITIA. μωρία. See *MOROSIS*.

STUPEFACIENS. See *NARCOTICA*.

STUPHA. The same as *Balneum Laconicum*, or a Vapor-Bath. See *BALNEUM*.

STUPIO. Stannum, or Tin. *Rulandus*.

STUPOR. νύκνη, νύκνησις. A Stupor, or Numbness.

STUPOR DENTIUM. An Affection of the Teeth; for which see *DENS*.

STUPPA, STUPA. A Stupe, in Surgery, is a Piece of Cloth dipt in some proper Liquor, and applied to an affected Part. *Blancard.* Or, as *Castellus* describes it, it is a Linnen or Hempen Bag used by the Surgeons in stopping a Cavity, and, also, in Epithems to the Forehead, Nucha, and other Parts, and in Fractures.

STURIO. Offic. *Schrod. 5. 333. Aldrov. de Pisc. 517. Bellon. de Aquat. 101. Gesn. de Aquat. 931. Jonf. de Pisc. 75. Raii Ichth. 239. E. juss. Synop. Pisc. 112. Acipenser, Rondel. de Pisc. 1. 410. Charlt. de Pisc. 34. Acipenser, sive*

Sturia, *Schonf. Ichth. 9. Acipenser, Sturio*, Mer. Pin. 188. *Sturio, sive S. latus*, Sale de Aquat. 113. **THE STURGEON.**

It is a Native of the Sea, but for the most part an Inhabitant of Rivers. The Parts in Use are the Bones and the *Caviar*, which is a Mass resembling green *Hamburg Soap*, both in Colour and Substance, and is exported in great Quantities from *Russia* to *Italy* and other Countries. The Way of preparing it is thus related by *Gesner*: They take the Eggs of the Sturgeon, and first cleansing them from the Nerves which are therein, wash them in Vinegar or White Wine, and spread them upon a Table to dry. This done, they put them into a Vessel, and cover them with Salt, then break them abroad with the Hand, not using an Instrument, and afterwards put them into a Bag of a rare Texture, that the Humor may run through. When this is done they put it into a Pot with a Hole in the Bottom, by which the remaining Humor, if any, may be evacuated, and after well pressing and covering it close, set it aside for Use.

The Bones are commended in the wandering Gout, and are exhibited in the Pain of the Colic. The *Caviar* is nourishing, increases the Semen, and excites Lust. *Dale.*

Sturgeon is a large Fish that lives both in the Sea and fresh Water; it has an excellent Taste, and grows fat in the Rivers, and more delicious than if it had continued always in the Sea; it usually weighs a hundred Pounds, but sometimes double. This Fish is able to strike a Man down with its Tail, and it will frequently break the Nets in which it is taken. In Ponds they cannot live long; and as it has no Teeth, it cannot feed upon Fish, but subsists upon the Filth and Froth of the Sea.

Sturgeon was much esteemed by the antient Romans, and the Belly is reckoned best. It contains much Oil and volatile Salt, and yields a nourishing and solid Food, because of its thick and gross Juices. It is, also, hard, toughish, fat, and difficult of Digestion; and therefore it is injurious to weak and tender Persons, and those who are sick or recovering from Illnesses. As Sturgeon is fat, it relaxes the Fibres of the Stomach and Bowels, and renders the Body a little soluble. The Bones of this Fish, taken to the Quantity of a Dram, are looked upon to be opening, good for Rheumatisms and the Gravel; they extract what is called Mouth or Water-Glue from it, which is not so soon dissolved as the common sort, but produces the same Effects. *Lemery on Foods.*

STURNUS. Offic. *Bellon. des Oyse, 321. Gesn. de Avib. 677. Charlt. Exer. 90. Jonf. de Avib. 96. Schw. A. 351. Will. Ornith. 144. Raii Ornith. 196. E. juss. Synop. A. 67. Sturnus vulgaris*, Aldrov. Ornith. 2. 632. Mer. Pin. 177. **THE STARE, OR STARLING.**

It makes its Nest about Towers, and the Tops of Houses. Its Dung is esteemed a Cosmetic, and is said by *Galen* to cure the *Alphi*, *Pani*, *Impetigo*, and *Morphew*.

STYGIA. An Epithet of caustic or corrosive Waters, and particularly *Aqua Regia. Castellus.*

STYLISCUS. στυλίσκος. See *PRIAPISCUS*.

STYLOCERATOHYOIDÆUS See *STYLOHYOIDÆUS*.

STYLO-CHONDRO-HYOIDÆUS. So *Douglas* names one of the Muscles called *Stylohyoidæus*, because it is inserted into the cartilaginous Appendix of the *Os Hyoides*.

STYLO-GLOSSI. See *LINGUA*.

STYLO-HYOIDÆUS. This is a small Muscle lying obliquely between the *Apophysis Styloides* and *Os Hyoides*.

It is fixed laterally by one Extremity to the Root or Basis of the *Apophysis Styloides*, and by the other to the *Os Hyoides*, at the Place where the Basis and Cornu unite; and also to the Cornu itself, from whence it has been called *Stylo-Cerato Hyoidæus*.

The fleshy Fibres of this Extremity, are often parted, and inclose the middle Tendon of the *Digastricus. Winslow.*

The *Stylo-Hyoidæi* move the *Os Hyoides* upward and backward in a middle Direction between those in which they lie; and they draw it more upward and backward when they act freely, that is, without being checked or confined by other Muscles. When one acts more than the other, the Bone is moved obliquely. *Winslow's Anatomy, Sect. 3. No. 1145.*

STYLOIDES Processus, sive Apophysis. See *CAPUT*.

STYLO-PHARYNGÆUS. The Name of a Muscle belonging to the *PHARYNX*; which see.

STYLOS. στυλός. A Probe, of which various Sorts are used in Surgery.

STYMMATA, στυμματα, from στυψω, to astringe or inspissate, in Latin *Spissamenta*, Spissaments, are the Name which the Antients had for their most solid and substantial Ointments, and, also, for such Things as gave a Spissitude and Solidity to their Ointments. These latter *Stymmata* were some sweet-scented Simples, such as *Costus*, *Nardus*, *Amara-cus*, *Amomum*, and *Mint*; which being mixed in the Com-position

position of Ointments, communicated to them a Fragrance, and preserved them from Corruption, as *Galen* says, *de C. M. S. L. Lib. 3. Cap. 1. Stymmata* differ from *Hedysmata*, in that these latter are liquid. *Stymmata*, then, seem to be properly such Things as not only communicate a Fragrance, but exercise their astringent Quality in such a manner as to preserve the Ointment, with which they are mixed, from Corruption. Thus *Ætius*, *Tetrab. 3. Serm. 1. Cap. 49.* in the Composition of a Troche, directs *Stymmata*, or Spissaments of a Decoction of the Bramble, Myrtle, Pomegranate Flowers, the Root of the Capparis, with the Leaves of the Willow, and other Things of that Nature. A little after, in the same Chapter, he directs dry Spissaments pulverized; also Pomegranate Flowers, Galli, Malicorium, Myrtle, Lentisk, and other things of the like astringent Quality. For the same Purposes, the *Stymmata*, in the Oil of Roses, are Lentisk, Calamus, and Aspalathus, as we are informed by *Dioscorides*.

STYPTERIA, *στυπτήρια*, from *σῑψω*, to astringe, Alum. See ALUMEN.

STYPTICA, from *σῑψω*, to astringe. Styptics, or Medicines, which stop Hæmorrhages. When a considerable Hæmorrhage is stoppt by Absorbents or Styptics, it is always produced by means of a Clot of Blood secured by Compression, so that the Orifice of the Vessel is stoppt. This Clot generally consists of two Parts, the one without and the other within the Vessel; that without is formed by the last flowing Blood, which, in coagulating, incorporates itself with the Lint, Moss or Powders, used for stopping the Blood. The other Part of the Clot within the Vessel, is only that Portion of the Blood which was ready to be discharged when the Vessel was stoppt. These two Parts are often but one continued Clot; that without the Vessel performs the Office of a Covering, whilst that within it serves as a kind of Stopper. Both contribute to the stopping of the Blood by the Solidity they acquire in Coagulation, and their future Adherence the one with the internal Part of the Vessels, and the other with its external Orifice.

When Styptics or Escarotics are used, the Clot is sooner formed, than when Absorbents or simple Astringents are only employed. The Clot in the former Case possesses a larger Space in the Cavity of the Vessel, which makes the Stopper more deep. The Covering or external Portion of the Clot is also thicker, because at the same time the Styptics and Escarotics coagulate the Blood, they also burn a Portion of the Vessel and adjacent Flesh, which incorporating with the coagulated Blood, form together a thicker and more extensive Covering. *Mem. de l'Acad. Royale, An. 1731. Mr. Petit.*

Alcohol, or pure Spirit of Wine, is the most usual, and, perhaps, the best Styptic; and is the Basis of most of the celebrated *Arcana* for stopping Hæmorrhages. *Boerhaave* says, it becomes an immediate Styptic, as it prevents Putrefaction, and occasions a thin but very solid Eschar. For if Pledgits be dipp'd in pure Alcohol made hot, and applied to a bleeding Wound, if it be closely compressed upon the Part, and covered with a Piece of Bladder, lightly besmeared with Oil, and kept on with a proper Bandage, the Hæmorrhage presently ceases, and the whole Dressing may continue unremoved for three Days, in which Time the Vessels are usually closed, and strangely contracted and consolidated by means of the Alcohol. So far *Boerhaave*.

HELVETIUS'S STYPTIC.

The Method of curing fresh Wounds in a few Days without Suppuration, where neither Nerves, large Vessels, Bones, or any of the Viscera were concerned, has been long ago observed. *Purman*, a famous Surgeon of *Breslaw*, in his *Chirurgia Curiosa*, tells us of a Mountebank, who gave himself thirteen Wounds, by Incision, in the upper Part of his Left-arm, and thereupon applied his Nastrum, and with the Help of a good Roller was cured in two Days Time.

Next he mentions a martial Styptic, which stopped Bleeding incomparably, and healed fresh Wounds (as he says) in two Days, especially if the Patient took withal a few Drops inwardly. This has, also, been mentioned by *Blegny* near thirty Years ago.

When I came into *France*, I found that many little Trials were made there, also, with a Styptic Ball, mixed with *French Brandy*, by striking a Cock through the Head, opening the Crural Artery of a Dog; or chopping off a Dog's Leg, &c. But I found that it did not amount to any Thing of Consequence; yet I have still a Ball, made above twenty Years ago of Filings of Iron and an equal Quantity of Tartar, mixed well with *French Brandy* upon a Marble; this, with some Alteration, was afterwards published by the famous *Helvetius*, Physician to *Levis XIV.* of *France*, in a Book called, *Recueil des Methodes pour le Guérison de diverses Ma-*

ladies; which was reprinted in *Holland* in the Year 1710. This Preparation was then sold by *Pierre Rottermund*, Apothecary at the *Hague* in *Holland*.

The Recipe for his Medicinal Ball I have translated, and it is as follows:

Take four Pounds of the Filings of Steel, and eight Pounds of Tartar, well powdered; mix these well together, and put them in a new earthen Pot, and pour thereon as much *French Brandy* as will make it into a Poultefs. Let this stand fermenting in a Cellar for four Days, and stir it between whiles. Then put it in *Balneo Mariae*, and distil it according to Art with a moderate Fire, to draw off the Brandy. When you find that nothing but the Phlegm comes off, take it from the Fire, and take out the Mass, stamp it very fine that not the least Lump may remain; then mix it again, as before, with a sufficient Quantity of Brandy, and put it into the Cellar to ferment, as before, and then distil it a second Time. This Operation may be reiterated seven or eight Times, but the last Time mix your Mass well upon a Marble, and form it into two Ounce Balls. One of these Balls is steeped in a Pint of good *French Brandy*, a little warmed, and hung only in it by a Wire, till the Brandy has received the Colour of the Ball. But if you are in great Haste, then grate a sufficient Quantity of the Ball in some Brandy, stir it well, and you may use it that very Instant.

No doubt but the Author thought, by often grinding, fermenting and distilling this Mass, to communicate and subtilize its Particles, so as to make it more fit to contract the Fibres and Vessels of a Wound, and to prevent Stagnations of the Fluids, both within and without, upon Contusions; but the Success did not answer, and therefore it was laid aside. Neither did *Helvetius* ever recommend it as an universal Styptic, astringent, or consolidating Medicine, but merely in fresh Wounds, and that only for a first Dressing, and where People lived at a Distance, and could not get immediately Assistance from a Surgeon. Besides, he makes several Exceptions where it should not be used, and in general advises where Chalybeate Medicines may be made Use of according to Experiments.

But last Year a Balsamic Styptic was published by one *Dr. Eaton*, good to stop all Manner of Bleeding without or within, and that without any Manner of Exceptions. This made me desirous to see it, and soon after I had an Opportunity to examine it: I found presently that this was the same old Medicine, which was got hither also, after other Countries had discarded it. But I neglected it that Time as not worth my Notice, till I saw lately a Treatise of Consumptions published by *Sir Richard Blackmore*, giving it the greatest Encomium that ever was given to any Invention whatsoever. For, says he, *Dr. Eaton's Balsamic Styptic bids fair for the Credit of a certain Remedy in stopping of Blood outwardly or inwardly, where the Crasis of the Blood is not entirely ruined, and will be of more Service to Mankind than all the Discoveries made by Galenical Compounders of Drugs, and systematical Methodists.*

Finding this Remedy recommended in so extraordinary a manner by so eminent a Physician, I began now to think that possibly I might have been mistaken, and therefore desired *Mr. Winterbottom*, an Apothecary in *Bow-Lane*, immediately to prepare the Recipe, as described by *Helvetius*. When this was ready, I sent for a Bottle of *Dr. Eaton's Styptic*, and tried them both with Galls before several Gentlemen; the Tincture was the same, a deep Purple. I then precipitated the Contents with Old Hock, and found the precipitated Matter to be the same in both. Not contented with my own Enquiry, I sent several small Quantities to others, and went myself to *Mr. Godfrey* the Chymist. They all told me, that there was no Difference betwixt them. I tried several ways to find out its balsamic Quality, from whence it has its Name, but found none. Then I confessed it surprized me, that a Man who had a Mind to vend a Thing as a Secret, had not done so much as to alter it either in Taste, Smell, or Colour, and yet this might very well have been done, without robbing it of its Virtue in the least.

My next Business was to try these two upon the crural Artery. Having got a good middle-sized Dog, *Mr. Ranby* laid the Artery bare, and opened it with a Lancet the lengthwise of the Artery, for near half an Inch. The old Trick used to be to cut the Artery crossways, and there was no Necessity of a Styptic at all, nor indeed here neither. But at first *Helvetius's* Tincture was applied, and stopped the Bleeding; then we opened the Artery again, and tried *Dr. Eaton's* with the same Success. I then had the Artery open-

ed in the other Thigh, and tried it only with *French Brandy*, which I found did as the other two. I opened the Artery again, and had dissolved in *French Brandy* a little *Sal Martis* and *Saccharum Saturni*, and applied that, and it answered in the same manner. This made me immediately conjecture, that there was but little Virtue in either of them, but only that the Brandy by its great Heat did merely contract the Fibres of the Artery, which, no doubt, might be a little assisted by the Chalybs; but this could not be much. I then reflected upon the Smallness of the Crural Artery in a Dog, and that it was no more to be compared to the crural Artery of a Man, than a Cock's Head to a Man's Head, and that a little Pledgit of Lint might have stopped the Blood without more to do, as well as the Temporal Artery, when opened with a Lancet, which we did, and the Pledgit of Lint stopped it. We then untied the Dog, and sent him going, who ran directly home. The Mistress of the House tore off the Pledgits, and had the Dog well washed with Butter and Beer warmed, she not knowing what had been done to him; upon which the Dog fell a bleeding again, tho' not much, and the Blood stopped of itself. Thus far as to its outward Use, and I could wish it were as harmless within. If only, according to *Helvetius*, it had been ordered to have been taken inwardly in fresh Wounds and Contusions, one might have let it pass; but when, without Exception, Dr. *Eaton* recommends it, as also even Sir *Richard*, in all outward Bleedings, I then thought it high time to make some Animadversions upon it. For Sir *Richard* himself says, in his Treatise of Consumptions, p. 99 and 101, that in spitting of Blood there is an Orgasm or stimulating Ferment: What is this but a Feverish Indisposition? And is there any Hæmorrhage without it? Now if so, will not Brandy and Chalybeats heighten this? which by their Heat and Stimuli brace and irritate the Fibres, and accelerate the Blood's Motion. And will not then the Blood take up more Room, and press harder against the Sides of the Vessels, and whatsoever opposes it? Is not this the Way to make an Orgasm, and cause an Hæmorrhage?

Dr. *Eaton* tells us himself, in his Book, p. 57, That it did very much overheat a Gentlewoman, and that her Bleeding still continued after the taking of it, and she might have perished, if a Surgeon had not given her a cooling and astringent Apozeme. And but just before, p. 47, he complains of a Physician, that was not willing that his Patient should take it, who had a hectic Fever upon her, because he was afraid that it was too hot.

Since the former Trials, on the 10th of June last, I desired Mr. *Ranby* to open the carotide Artery of a Dog, thinking that this Artery might give me more Satisfaction than the crural Arteries had done, to try the styptic Quality of the Tinctures of *Helvetius* and *Eaton*. Having laid bare the Jugular Vein, divided, and tied it, that its Bleeding might not hinder us from finding the carotide Artery, we were obliged to cut some of the Muscles through likewise, till, with some Difficulty, we found the Artery, which being opened with a Lancet, the Blood spouting forth, I applied to it *Helvetius's* Tincture, upon which the Blood stopped. I took it off in less than a Minute, and made it bleed again, but it bled but little, and then I applied Dr. *Eaton's* Styptic; we filled up the Wound with Lint, and stitched up the Integuments, then untied the Dog, and let him run down Stairs; where, after some Time I saw him again, and found he had bled a good deal, and was still bleeding. I was very well satisfied, that he would not bleed to Death, the Artery being so very small; and if he had had nothing but Lint upon it, it would have done as well. It must be observed, that the carotide Arteries are largest in Proportion in human Bodies, and that this Artery of the Dog was but little bigger than the crural Arteries of the former Dog. This shews that the styptic Quality of these Tinctures is very inconsiderable; and that *Helvetius's* Tincture is rather better than Dr. *Eaton's*, if there is any Difference, tho' I believe it proceeded from the Brandy, for my Brandy was stronger than Dr. *Eaton's*. I enquired for the Dog next Morning, and found him alive and well, only hanging his Head on one Side, which proceeded from the cutting through of the Muscles. Dr. *Sprengel*, *Philosophical Transactions abridged*, Vol. 8.

A RESTRINGENT PREPARATION OF IRON, SOLD BY THE NAME OF COLBATCH'S STYPTIC POWDER.

Take any Quantity of Filings of Iron, and pour upon them Spirit of Salt to the Height of three or four Fingers above them; let them stand in a gentle Digestion till the Fermentation is over, and the Spirit of Salt is become sweet; then pour off that Liquid, and evaporate it in an Iron Glass Vessel until half is consumed; at which time put to it an equal Quantity of *Saccharum*

Saturni, and evaporate to a dry Powder. If upon its first becoming dry, the Operation be stopt, it has exactly the Appearance of *Colbatch's Powder*; but if it be continued longer, and the Heat raised, it will turn red. It must be kept close stopt from Air.

If this is not kept close stopt, it will imbibe the Air, and flow so as to lose its Efficacy. I have been informed from very good Hands, that this is the Styptic with which there was so much Noise made some time ago, by the Author of *Novum Lumen Chirurgicum*, and for the Sale of which a Patent was procured; only in that was used Oil of Vitriol, instead of the Spirit of Salt in this: but that Difference is insignificant. This is a Preparation of *Maet's*, once Professor at *Leyden*, and is in the *Collectanea Chymica Leydensis*; how much soever some have pretended to make a Secret of it since. It is commended as a Restringent in most Kinds of Fluxes inwardly, and particularly Hæmorrhages. The Dose is from four to twelve Grains, and is conveniently given in any Forms, but Powders or Pills.

EXPERIMENTS MADE WITH MR. COL- BATCH'S STYPTIC, BY MR. WILLIAM COUPER.

I. A large Dog being provided, an Aperture was made through the common Integuments of his Abdomen, whence the small Guts were extruded. After an Incision made in one of them according to its Length, they were again reduced; the Wound in the Abdomen being stitched up, a Solution of this Powder was applied; the Dog continued without any ill Symptoms, and became perfectly well in a few Days after. The like Experiments I have made on another Dog, who in like manner recovered without the Appearance of any Medicine.

II. The Leg of a Dog was amputated three Inches above the Patella; the Expence of Blood from the Arteries was great, which did partly proceed from Unaptness of the Applications which were prepared; but after two or three Attempts, the Flux of Blood was stopped, and such a Bandage made use of, as was necessary only to keep on the Dressings. The Dog continued without any considerable Flux of Blood, and the next Day he was found on his three Legs.

III. The diseased Arm of a Man in St. *Bartholemew's* Hospital, was amputated above the Elbow; but for a Quarter of an Hour's Time many successful Applications of this Styptic were made, and at length a small Tent, dipped in the Powder itself, inserted into the Extremity of the bleeding Artery, before the Flux of Blood would admit the Application of Bandage. Five Hours after, a fresh Flux of Blood appeared, and strict Bandage was applied. The same Morning the abovementioned Amputation was made, a Boy about twelve or fourteen Years of Age, had his Leg also taken off below the Knee, to whose Stump divers successful Applications of this Styptic were also made, before it was bound up; and in less than an Hour after, a fresh Flux of Blood happened, and strict Bandage was added. Some Hours after these Operations, both these Patients suffered extravagant Pains. Three Days after, the Applications were taken off; and had any Person, a Stranger to what had been done, seen the Stumps, he would have supposed nothing less than an actual Caustery had been applied, as could have occasioned such large Eschars, and so horrid an Appearance; which did sufficiently denote this vulnerary Powder to be a violent Caustic.

Trials of Styptics on the Bodies of Quadrupedes have been commonly practised, to commend them to the Public; but it is not without Cause that Pretenders to such Remedies have made choice of younger Animals, as Dogs, Calves, and the like, for that purpose. But since the only Standard of their Use is their Success on the Human Body, we ought to make our Experiments on those Animals, whose Magnitude and Age bear a Proportion to it. For nothing is more obvious in wounding the Arteries of living Animals, than that the Protrusion of their Blood bears a Proportion to their Bulk; and in Dissection, the Arteries of the Fœtus are remarkably thinner than those of an Adult; and those of aged Bodies grow still thicker, and frequently become cartilaginous, and at length entirely bony. Mr. *Cowper*, *Philosophical Transactions abridged*, Vol. 3.

STYPTICUM REGALE.

The Royal Styptic.

Upon the sympathetic Powder four Ounces, infuse of good Oil of Vitriol half an Ounce; stir them well in a Glass-Mortar,

Mortar, with a Pestle of the same, and let them stand twenty four Hours on warm Sand, in a wide mouth'd Glas; grind this Mixture again with a little Spirit of Wine, and put it into a Matrafs; pour upon it more Spirit of Wine, to make that already used a Pint. Lute it well, and let it stand forty eight Hours in Digestion, often shaking it: Then let it stand to cool and settle, and decant the Spirit of Wine, which keep well stopp'd. Remove the Cucurbit or Matrafs into a Sand Furnace; lute on its Head and Receiver, and drive over the Helm all that will rise by the third Degree of Fire, which also keep by itself: Let all cool, and take out what is left at the Bottom; powder it, and put it into a Cucurbit, and pour upon it distill'd Rain-water, one Pint; set it on warm Sand for forty eight Hours, and shake it often; then let it settle, decant and keep it for Use.

The impregnated Spirit and Water may be used apart or mixed; and if the Mixture be desired stronger, there may be put to it some of the acid Spirit drawn off, after the Spirit of Wine was decanted: But equal Parts of the impregnated Spirit of Wine and Water, evaporated to a Dryness, make the best Styptic of all. This is commended for a very powerful Styptic, and to be one of the best Vulneraries in the World, in curing all fresh Wounds by the first Intention (as is boasted so much of by *Colbatch's* Grand Styptic) that is, without Suppuration and Digestion.

STYRACINUM OLEUM. Oil of STYRAX, made by boiling a Sextans of Styra in a Sextary of the best Olive Oil. *Actius Tetrabib. l. Serm. i.*

STYRAX.

The Characters are;

The Leaves are roundish, the Calyx is dentated and am-pullous. The Flower is monopetalous, tubulated in the lower Part, and multifid in the upper, with its Lobes expanded in Form of a Star. The Ovary in the Centre of the dentated, multifid Calyx, becomes a roundish, fleshy Fruit, generally inclosing one or two Stones, which contain a Kernel.

Boerhaave mentions but one Sort of *Styrax*, which is, *Styrax*; folio Mali Cotonei, *C. B. P. 452. Tourn. Inst. 598. Boerh. Ind. A. 2. 218. Styrax*, Offic. *Styrax Arbor*, Ger. 1342. *Emac. 1526. J. B. l. 341. Raii Hist. 2. 1680. Styrax arbor vulgaris*, Park. Theat. 1530. THE STORAX TREE.

It grows in *Italy* and other Countries. The Part used in Medicine is the Refin, of which there are two Sorts to be had at the Shops, the dry and the liquid. The dry *Storax* of the Shops, *Styrax Calamita*, *Rand. Ind. 87. Mont. Exot. 11.* is a fat resinous Substance, of a yellow Colour, inclining to red, concreted into Grains of various Bignesses, of a resinous, and somewhat acrid Taste, a very fragrant Smell, and flowing spontaneously from the Trunk of the Tree.

Observe, here, first, that our Apothecaries and Druggists sell in their Shops a most impure *Magma*, mixed with various heterogeneous Bodies, as Chaff, Hairs, Bran and Saw-dust (which perhaps gave Occasion for the *Styrax rubra nonnullis*) for *Styrax Calamita*. Secondly, we meet with Prescriptions in which the *Storax Calamita* and *rubra* are ordered distinctly. Now what is the Meaning of *Nicolaus* in making such a Distinction, there are different Opinions. Some by the *Styrax rubra* understand the *Thymiana*, others the best Sort of *Styrax*, which runs into Grains; and others again will have it to be nothing but the *Styrax* grown red with Age. The learned *Commelin* writes, that there are two Sorts of *Refin*, the dry and the liquid; the dry is sold in the Shops under two different Names, the *Styrax Calamita* and the *Styrax rubra*, which differ only in Purity. And *Hoffman*, (with whose Opinion we agree) tells us they are the same Gum, but different in Purity; for the *Calamita* also participates something of a Redness. But when we find in Medicinal Prescriptions the *Styrax Calamita*, we are to understand it of the *Styrax* in Grains; or of what is cleansed from Impurities; but by the *Styrax rubra* that most impure *Magma* of *Styrax* which is commonly sold in our Shops. Chuse what is fat, viscous, consisting of pale reddish Fragments, of a lasting Smell, and which yields a mel-leous Liquor when it is worked.

The *Storax liquida*, Offic. **LIQUID STORAX**, is a pinguious Liquor, of a melleous and tenacious Substance, of a brown Colour, or brown inclining to red, of a strong Smell, and flows from the Bark of the Tree. It heats, dries, mol-lifies and digests, and is very serviceable in Disorders of the Brain and Nerves, and cures Coughs, Catarrhs, Hoarseness, and the like.

There are also great Disputes among Authors about the *Styrax Liquida*. Some will have it to be the same as *Stacte*, that is, stillatitious Myrrh, which appears to be a Mistake in that the Tears of Myrrh, on account of the Similitude of

Substance, will dissolve in any aqueous Liquor, whereas the *Styrax Liquida*, like other Refins, will dissolve in none but fat and oleous Liquors. Others affirm it to be a factitious Substance, prepared of a Solution of *Styrax Calamita*, in Oil and Wine, boiled with a Mixture of *Venice Turpentine*. When this Decoction is grown thoroughly cold, the *Styrax Liquida* is said to separate, and fall to the Bottom, sending up a more liquid and oleous Substance to the Superficies. Some will have it made by Expression, and others assert it an Oil expressed from the Kernels of a Tree whence the *Storax* flows; some, again will have it made by a Decoction of the Bark or Wood of the *Styrax*, others of liquid Amber. *Hoffman* asserts, that the *Styrax Calamita* and *Liquida* are the same Gum, and different only in Purity, so that the *Liquid* is the best. But what is sold for *Liquid Styrax* in our Shops is a Substance merely factitious, as I am assured by several Apothecaries in *London*. The *Storax liquida vera* is a Kind of Bird-lime prepared of the Bark of the *Rosa Mallos*, boiled in Sea-water, as I am assured by *M. Petiver*, in the *Philosoph. Transact. N^o. 313*. What Sort of a Tree the *Rosa Mallos* is, and to what Genus to be reduced, is quite unknown to me, and therefore I can only add, that it grows in *Cebro* an Island in the upper *Red-Sea*, not far from *Cadesch*, which is three Days Journey from the Port of *Suet*. Whether *Cattar-mija* be a Name given by the *Turks* and *Arabians* to the Tree, or the Birdlime made of its Bark, is a Thing uncertain. This Birdlime is brought to *Judda*, and from thence in the Months of *June* or *July* to *Mocha*, where in Proportion to its Goodness it is sold from sixty to one hundred and twenty Dollars a Vessel, which weighs one hundred and twenty Pounds. The best is what has the least Mixture of Dirt or Dust, with which it is very often soiled, but very easily purified from them by the Help of Sea-water. *Dale*.

The *Storax-tree* has a Trunk like that of a Quince-tree, but has a whiter Bark; the Leaf, also, resembles the Leaf of that Tree, only is less and roundish, or ending in a blunt Point, covered with a hoary Down underneath, but green and smooth above. The Flowers on the young Sprays are like those of the Orange-tree, white, and several joined together, consisting of several Petals, and sweet-scented. The Fruit is of the Size of a Filberd, hoary, callous, of a brown Colour and bitterish Taste, opening into three or four carinated Figures, and discovering a ligneous Stone, of the Colour of Box, which contains sometimes but one Kernel, channel'd with four Furrows, sometimes a double angulous Kernel, and sometimes a third. I suppose this, says *Ray*, to be accidental, for naturally one Stone includes only one Kernel. The internal Substance of this Kernel is unpleasant to the Taste. It grows plentifully in the Hedges and Woods in the Country about *Rome*.

The dry *Styrax*, called the *Styrax Calamita* of the Shops, has its Name from the *Calami*, or Canes, in which, as we are told by *Galen*, it was formerly brought from *Pamphylia*: It is a gummy and resinous Juice of the Tree before describ'd, concreted, dry, and of a very sweet Smell.

It was for a very good Reason that the *Styrax* was imported in Canes, since *Parkinson* found by his own Experience, that the pure Gum of *Styrax*, after he had by Art and the Help of a Press alone, rendered it depurated and fluid, did not only penetrate the Joints and Commissures of the Vessels, but the very Wood itself in the Summer Time, and flowed out, so that he was obliged to keep it in a Glas Vessel well stopp'd; but the Spaces between the Joints of Canes have no Chinks nor Commissures, and therefore are the better adapted for containing so scented and subtle a Gum. It may be observed, that the *Styrax-Tree* in *Italy* produces but a small Quantity of Tear, which is the Case of many other Trees in that Country, which in a very hot Climate abound with Plenty of Juice. *Raii Hist. Plant.*

There are several gummy Substances, which are the Produces of this Tree: The first is the *Styrax Rubra*, "red *Styrax*," or, as some call it, *Thus Judæorum*, "the Jews Frankincense," because they suppose it to be the Resin which the wise Men offer'd to our Saviour. This is a reddish, or yellowish Substance, extracted from the Tree by Incision. A second Sort is the *Styrax Calamita*, so called because it was transported in *Calami*, or Canes of Reeds, to preserve its Odour: This *Styrax* is reddish on the Outside, and white within, and of a very pleasant, aromatic Smell. The third Kind is the *Styrax Liquida*, "liquid *Styrax*," which is an oily, viscous Matter, of the Consistence of an Ointment, of a greyish Colour, and aromatic Smell. Some extract an Oil from the Nuts, which is called *Styrax Liquida*.

The Virtues are the same as in *Turpentine*, only a little more effectual, as it is more fragrant: It is of Service in raising the Spirits, as, also, against Coughs, and Colds in the

Head, being used by Way of Suffumigation: It is, also, useful in mollifying the Nerves and Tendons, and dissolving scirrhus Tumors. *Hist. Plant. ascript. Boerhaave.*

SUBACTIO. The working of any medicinal Ingredients, either with the Hands, as in making Plaisters, or with a Pestle in a Mortar.

SUBALARIS VENA. The Auxiliary Vein.

SUBBUTEO. The Name of a Bird, resembling the Bittern, but less.

SUBCARTILAGINEUM. The same as **HYPOCHONDRIUM.**

SUBCLAVIA VASA. The subclavian Vessels; that is, the Arteries and Veins which are situated under the Clavicles.

SUBCLAVIUS MUSCULUS. The subclavian Muscle. This is a small oblong Muscle lying between the Clavicle and first Rib. It is fixed by one End in all the middle lower Portion of the Clavicle, at the Distance of about an Inch from each Extremity; and by the other, in the Cartilage and a small Part of the Bone of the first Rib. It seems, also, to adhere to the Extremity of the Clavicle next the Sternum, by a Kind of broad, thin Ligament.

The *Subclavius* can have no other ordinary Use, but to bring down the Clavicle, after it has been raised together with the *Acromion*, by the Action of the *Trapezius* and *Serratus Major*. It may, also, hinder not only the *Clavicle* in which it is inserted, but, also, the *Acromion* from rising, especially when assisted by the *Pectoralis minor*, *Rhomboides*, and *Angularis*.

When we stand, or sit, the Weight of the Arm alone seems to be sufficient to bring down the *Clavicle*, when raised; and therefore in this Case there would be no Occasion for the *Subclavius* to act upon the Clavicle, nor for the *Pectoralis minor*, *Rhomboides*, and *Angularis* to act upon the *Acromion*. But when we lie, or are situated in any other Manner, the Weight of the Arm has no such Effect; and in these Cases, these four Muscles become more or less necessary.

The *Subclavius* therefore is a proper Depressor of the *Clavicle*; and an Assistant Depressor of the *Acromion*, or of the Shoulder in general, together with the *Pectoralis minor*, *Rhomboides*, and *Angularis*, all which in their Turns assist the *Subclavius* in its Action on the *Clavicle*.

I cannot conceive what has led several great Anatomists to rank this among the Muscles of Respiration, since it is inserted not only in the Bone, but in the Cartilage of the first Rib; since this Cartilage is not articulated with the Sternum, but joined to it as immovably as to the Bone of the Rib by its other Extremity; and lastly, since this Cartilage is much shorter, much broader, and much less pliable than the Cartilages of all the other Ribs of equal Thickness. *Winslow's Anatomy.*

SUB-COSTALES.

These are fleshy Planes, of different Breadths and every thin, situated more or less obliquely on the Insides of the Ribs near their bony Angles, and running in the same Direction with the external Intercostals.

They are fixed by both Extremities in the Ribs; the inferior Extremity being always at a greater Distance from the Vertebrae, than the superior and several Ribs lying between the two Insertions.

These Muscles are more sensible in the lower Ribs than in the upper, and they adhere closely to the Ribs that lie between their Insertions.

The *Sub-Costales* having the superior Extremities of their Fibres much more distant from the vertebral Articulations of the Ribs, than the lower Extremities, it follows, that they can more easily move the upper than the lower Ribs, and consequently that they are Assistants to the *Sterno-Costales*. *Winslow's Anatomy.*

SUBDITA, or SUBDITITIA. Medicines which are introduc'd into any of the natural Orifices, as Pessaries, and Suppositories.

SUBDUCTIO ALVI, is purging the Belly, or procuring Stools.

SUBER.

The Characters are;

It is in all Respects like the *Nex*, except in its Bark, which thick, spongy, and light.

Boerhaave mentions but one Sort of *Suber*, which is,

Suber; latifolium; perpetuo virens. C. B. P. 424.

Tourn. Inst. 584. Boerb. Ind. A. 2. 178. Sußer, Offic.

Suber latifolium, J. B. 1. 2. 103. Raii Hist. 2. 1393.

Ger. 1163. Emac. 1347. Park. Theat. 1397. THE

CORK TREE.

The Cork-tree is a Kind of ever-green Oak, of a thicker and firmer Texture, green above, and whitish underneath, not cut into so many Segments; in some Leaves smooth, and

in others only a little indented about the Edges; the Acorns are smaller than those which grow on the common Oak, for generally two together upon one short firm Stalk; the Bark of the Trunk is rough, and of a great Thickness, which, if not taken off in its stated Time, will burst of itself, and come off, the young Bark appearing of a reddish Colour; they separate it by making a long incision from the Head to the Root of the Tree, which they take Care to do in dry settled Weather, for the young, tender Bark is liable to be destroyed, and the Trees killed by Rain. The Cork-tree grows in the southern Parts of *France*, and *Spain*, and *Italy*.

Cork is said to be restraining, and good for all Kinds of Fluxes; the same is said of its Ashes, or burnt Cork. *Mil-ler's Bot. Off.*

The Bark bruised and drank in warm Water, stops an Hæmorrhage; the Ashes of it burnt have the same Effect. *Raii Hist. Plant.*

The Fruit is astringent, and serviceable in the flatulent Colic; the Bark is detergent and astringent, and useful in Hæmorrhages, and a Diarrhæa; and burnt to Ashes, is resolvent and demulcent in the Hæmorrhoids. *Hist. Plant. ascript. Boerhaave.*

SUBETH. The Arabic Name for a CARUS.

SUBETH SAHARA. The Arabic Name for a COMA VIGIL.

SUBFASCIATIO. The same as **HYPODESMIS.** See **HYPODESMIS**, and **EPIDESMOS.**

SUBFRONTALIS SUTURA. The Suture by which the *Os Frontis* is connected with the Bones of the superior Jaw.

SUBHUMERATIO. The same as **CATOMISMUS.**

SUBINTRANTES FEBRES, are Fevers in which one Paroxysm begins, before the preceding ends.

SUBLIGAMEN. The same as **HYPODESMIS.**

SUBLIGAMENTUM. The same as **ENÆOREMA.**

SUBLIMATIO. Sublimation.

Sublimation differs little from Distillation, excepting that in Distillation the fluid Parts of Bodies only are raised, and in Sublimation the solid and dry Parts. The Matter to be distilled may be either solid or fluid; but Sublimation is concerned only in solid Substances.

Another Difference is, that Rarefaction, which is of great Use in Distillation, has little or no Efficacy in Sublimation; for the Substances which are to be sublimed, being solid, are incapable of Rarefaction, and can only be raised by Impulse. It may not, however, be improper to inquire into the Reason of such a Diversity in the Elevation of Bodies; why some ascend with a gentle Heat, and others are not to be raised with the most vehement Degree of Fire.

Fixed Bodies are such as abide the Fire; volatile, such as not being able to endure the Fire, are raised by the Force of its Heat. We will therefore begin with the first, and explain the Manner how in volatile Substances, which seem to be of the same Nature, there happens so great a Variety and Difference in their Elevation.

The Cause of this Elevation and Ascent in the Particles of Bodies, is to be ascribed to the Fire, not only on Account of its Impulse, but of another Property. The Fire insinuates itself into all the Interstices of these Bodies, and thus breaks the Cohesion of their Parts, so that they are at last divided into very small Particles, if not the most minute to which Art can reduce them. Particles thus separated lose much of their Gravity, for the Gravity of the same Particle decreases in the same Proportion as the Cube of its Diameter is lessened. Suppose, therefore, a Body whose Diameter is 12, and its Gravity 12: If then its Diameter be made less by 1, the Gravity of that Body will be only $9\frac{1}{4}$ or thereabouts. For 1331, which is the Cube of the last Diameter, bears the same Proportion to $9\frac{1}{4}$, which 1728, the Cube of the first Diameter, does to 12, the Gravity of the Body. But if the Diameter be reduced to 10, the Gravity will but just exceed 6; and if it be diminish'd half, that is to 6, then the Gravity will be less than 2; so that very minute Corpuscles, when their Diameter is lessen'd in the utmost Degree, have scarce any Gravity at all. Therefore, when once they are thus divided, they are very easily sublimed.

But besides the Decrease of Gravity, there is another Result from this Division of the Particles of Bodies, which conduces very much to hasten the Ascent, and that is, the Variety of their Surfaces. For, the Surface of a Body decreases, in a very different Manner from its Gravity, only as the Square of the Diameter is lessened. Now, the Gravity decreases in such a Series as is expressed by the Numbers 1728, 1331, 1000, but the Diminution of the Surface will observe this Proportion, 144, 121, 100. And when upon reducing the Diameter to 6, the Gravity will be less than 2, and the Surface will still amount to 36. So that though the Gravity of a Particle be so lessen'd, as to be reduc'd almost to nothing,

thing, yet there will be Surface enough left, which will serve to raise it. This Argument, which has been explained by Calculation, may be demonstrated, as it were, to Sense, by the following Experiment. If Water be poured upon the Filings of Iron, and a little Oil of Vitriol dropped upon it, a Fermentation will presently arise, and the Globules of the Air, in striving to disengage and extricate themselves, will carry up with them some of the Particles of Iron to the Surface of the Water. This can happen upon no other Account, but that the Proportion of Gravity in the Filings of Iron is very small in respect to the Largeness of their Surface; and therefore Iron is forced upwards by a Body, which is a great deal specifically lighter than itself. But how much this must contribute to a more quick Ascent, will be much more evident to the Senses from the Sublimation of Camphire, Benjamin, and Arsenic; whose Particles, as they cohere but loosely, are for that Reason diffused into a larger Surface; upon which Account they are more easily sublimed than any other Substance; and, upon Account of their Surface, will even ascend sooner than some Fluids. So Flower of Sulphur rises sooner than the lightest Oil. By this Contrivance of Nature, that the Gravity of Bodies decreases in a triplicate, but their Surface in a duplicate Proportion of their Diameters, it happens that Bodies, which have a very different Gravity, may be raised with the same Force. Thus the Salts of animal Substances, as of Hartshorn, human Blood, Vipers, and the like, being composed of very minute Corpuscles, as is found by Experience in distilling them, easily ascend, because the Surface in them is not lessened so much as the Gravity. And the Salts of Vegetables, though of a more close Texture, are, by reason of their large Surfaces, without much Difficulty raised. The Corpuscles, also, of Minerals and Metals, though very compact and heavy, in some Measure yield to the Fire, and are capable of being sublimed. In all these Instances, the Breadth of the Surface, which exposes the Particles more to the Impetus of the Fire, is the Reason why they are raised with as much Ease as if their Gravity had been lessened by diminishing their Surface. So that Particles, though ever so different in Weight, may be equally raised by the same Degree of Heat, if the Proportion of their Gravity be reciprocal to that of their Surfaces. From what has been thus explained, may easily be deduced the Reason of all that Variety observed in the Volatility of Bodies. With regard to Fixation, as it proceeds from contrary Causes, it wants little Explanation; for he that thoroughly understands why some Substances can be sublimed, must, at the same Time, apprehend why others cannot. *Quincy.*

SUBLIMATORIUM. A subliming Vessel.

SUBLIMIS MUSCULUS. A Name for the *PERFORATUS Dignitorum*.

SUBLIMITORIUM. The same as *HYPALIPTRON*. *Coffellus.*

SUBLINGUALES GLANDULÆ. The sublingual Glands.

SUBLINGUALIA. Medicines lay'd under the Tongue, in order to dissolve there, and cure a Cough, or *Branchocelle*, or mend a fetid Breath.

SUBLUXATIO. An incompleat Luxation.

SUBMERSIO. Drowning. See the Operation of *Bronchotomy* under the Article *ANGINA*.

That in populous Towns, and even in less considerable Places situated on the Banks of Rivers, some Persons have almost every Year the Misfortune to be drown'd, is a Truth not to be call'd in Question; but it is not equally known and believ'd, that many Persons taken out of the Water without any Appearance of Life, would be rescu'd from approaching Death, if, for a sufficient Time, the proper Means of Relief were afforded.

After some short Attempts, we continue to esteem as dead, those in whom all Appearance of Life seems to be extinguish'd, especially if they have remained for a considerable Time, a few Hours for Instance, in the Water, in which Case no Measures are taken for their Recovery. Histories, however, related by Authors worthy of Credit, sufficiently evince, that the Lives of Men, who for several Hours have been not only in, but under Water, have been preserv'd, and that sometimes two Hours have elaps'd before there appeared any Sign that they were not really dead. The steep and dangerous Banks of some deep Lakes of *Switzerland* frequently occasion dismal Accidents of this Nature. The good Success of the Measures us'd for restoring such Persons, sometimes sooner, and sometimes later, have been publish'd in the *Swiss Mercury*, and these Measures we shall here enumerate, since it is to be wish'd that they were universally known, that they could be put in Practice on all Occasions that require them, and that in putting them in

Practice, the World might discover Measures still more efficacious and infallible.

Formerly it was thought the best and most expedient thing that could be done for the Recovery of the drown'd Person, to hang him up by the Heels: But since, from the Dissections made by skilful Anatomists, 'tis certain, that drown'd Persons have generally less Water in their Stomachs, than if they had voluntarily drank a considerable Quantity, it does not seem expedient to put the drown'd Person in a Position which would prove uneasy as soon as the Humours of the Body should resume their ordinary Motion. It may however happen, that the Person may have swallowed too much Water, and in order to know whether he has or not, and to make him vomit it up if he has, 'tis proper to put him into a Tun, open at both Ends, and which for some Time is to be roll'd backwards and forwards in different Directions. He may, also, be excited to vomit the Water by frequently introducing into the Oesophagus the bearded End of a Feather.

After taking off the Cloths of the drown'd Person, instead of letting him lie stretch'd and naked on the Shore, which is too often the Practice, we ought, with the utmost Expedition, to shelter him from the Impressions of the cold Air, and begin to warm him by wrapping him up with Cloths and Coverings.

In order to warm him the more effectually, he is afterwards to be put into a Bed, the Cloths of which are pretty warm, applying, also, frequently to his Body hot Napkins and Cloths.

There are Instances of drown'd Persons, on whom the Influences of a hot and scorching Sun, to which they have been expos'd, have produc'd the same happy Effects which the warm Cloths have upon others. Some have been warm'd in hot Baths, but these are not on all Occasions to be had.

The great Intention to be pursued is, to put the solid Parts of the Machine in Action, that thus they may restore the Motion of the Fluids. In order to answer this Intention, the drown'd Person is not to be left in Bed in a State of Rest, but agitated in an hundred different Manners, turn'd from one Position to another, lifted up and let fall, and shak'd in various Directions in the Arms of Persons of Strength sufficient for that Purpose.

Spirituos Liquors ought, also, to be poured into his Mouth, and where these cannot be had, 'tis customary to pour warm Urine into it, which has been observ'd to produce happy Effects. Some prescribe a Decoction of Pepper and Vinegar, to be us'd as a Gargarism.

We must, also, attempt to irritate the internal Fibres of the Nose, either by volatile Spirits, and the Liquors us'd in apoplectic Cases, or, by tickling the Nerves distributed to the Nostrils by the bearded Part of a Feather, or by blowing into the Nostrils through a Quill, Snuff, or some more powerful Sternutatory.

One of the Measures taken with such drown'd Persons as have been restored to Life, has been by Means of a Quill, or small Pipe, to blow warm Air into their Mouths, that thus it might be convey'd into their Intestines, into which it has, also, been successfully introduc'd by Means of a pair of Bellows. For this Purpose we may, also, use a Syringe, which might perhaps be still employ'd to better Purpose, in injecting warm Clysters capable of irritating the Intestines, and producing more considerable Effects than the Air generally convey'd to them.

But, perhaps, the most efficacious Method that can be taken with a drowned Person, is, by Means of a proper Pipe, to blow the Smoke of Tobacco into his Intestines. There have been several Instances at once of the speedy and happy Effects of this Smoke on drowned Persons.

None of all these Measures specified ought to be neglected, since they may possibly concur to produce an happy and salutary Effect; but they will prove most successful, when taken under the Management and Inspection of a judicious Physician. If a Surgeon can be had, Venesection is by no Means to be neglected, and perhaps it is most commodiously instituted in the Jugular Vein; for in drown'd Persons, as well as in those that are hang'd or seiz'd with an apoplectic Fit, the Veins of the Neck are too much distended and choak'd with Blood. Now if these Veins can happily be in some Measure emptied, they will be in a more proper Condition to act upon the Fluid they contain, and which, in order to restore the Patient, they ought to put in Motion.

When these Measures prove unsuccessful, the Surgeon's last Recourse is to *Bronchotomy*, or opening the *Arteria Trachea*; for perhaps the Air entering freely into the Lungs, through the Aperture made in the Canal through which they receiv'd it in their natural State, and the warm Air which

may be blown through this Aperture, will restore the Playing of the Lungs, and all the Motions of the Breast.

But we must carefully advise all those who shall employ themselves in the humane and beneficent Office of restoring drown'd Persons, not to be discourag'd if the first Appearances do not answer their Expectations; for 'tis certain from Experience, that some drown'd Persons have not begun to discover any Signs of Life, till they have been tossed about and tormented for more than two Hours. Besides, the Man who has succeeded in restoring to Life a Person whose Death, without his Assistance, was certain, is sufficiently rewarded for his Pains by the Success; and if his Pains and Diligence should fail of their desired Effects, he will still receive an exalted Pleasure from a Reflection on his having acted with the most noble and generous Views. *Brubier.*

SUBMISSIO, sometimes signifies a Remission; sometimes it imports the same as *Systole*, with respect to the Arteries, that is, their Contraction.

SUBOPLITEUS MUSCULUS. The same as *POP-LITEUS*.

SUBPURGATIO. A slight, or gentle Purgation.

SUBSCAPULARIS MUSCULUS.

This Muscle is of the same Breadth and Length with the *Scapula* of which it occupies all the inner or concave Side, and from this Situation it has its Name. It is thick, and made up of several penniform Portions, nearly in the same Manner with the *Deltoides*.

It is fixed in the internal Labium of the whole Basis, and in almost the whole internal Surface of the *Scapula*, its fleshy Portions lying in the Intervals between the bony Lines when these are found. Near the Neck they leave the Bone, and form a very broad Tendon, which is inserted in the Surface of the small Tuberosity of the Head of the *Os Humeri*, close by the bony Channel. The lower Edge of this Tendon, probably sends off the ligamentary *Frænum* mentioned in the Description of the *Latissimus Dorsi*, *Teres Major*, and *Coraco Brachialis*.

This Muscle covers immediately the *Serratus Major*, being in a Manner inclosed between it and the *Scapula*. The upper Edge of its Tendon is joined to the lower Edge of that of the *Supra-Spinatus*, except at the upper Part of the bony Channel, where they give Passage to one Tendon of the *Biceps*. It likewise adheres to the capsular Ligament. The Tendons of the *Supra-Spinatus*, *Infra-Spinatus*, *Teres Minor*, and *Subscapularis*, being all joined by their Edges, form a Sort of Cap, which covers the upper Part of the Head of the *Os Humeri*.

The Use commonly ascribed to the *Subscapularis*, of pressing the Arm against the Ribs, from which it has the Name of *Porte-feuille* in French, is without Foundation. When the Arm hangs down in its natural Situation, this Muscle may turn it round its Axis, from without forward, as it happens when in this Situation we beat the Breast with the Fore-arm bent; and it likewise strongly assists the *Latissimus Dorsi*, when we turn the Hand behind the Back.

When the Arm being raised, we move it backward, as in giving a back Stroke with the Elbow or Fist, the *Subscapularis* hinders the Head of the *Os Humeri* from being luxated forward; for which Purpose it is well fitted both by its Structure and Number of its Fibres, this Motion being sometimes performed with great Violence.

It may likewise, by Means of the Nearness and lateral Union of its Tendon with that of the *Supra-Spinatus*, assist that Muscle in keeping the Head of the *Os Humeri* in the Glenoid Cavity, when the other Extremity of the Bone is raised. *Winslow's Anatomy.*

SUBSIDENTIA. The Sediment, or *Hypostasis* in Urine.

SUBSTILLUM SANGUINIS. A dropping of Blood from the Nose.

SUBSULTIO. A Palpitation.

SUBSULTUS. An involuntary twitching, or spasmodic Contraction of the muscular Parts.

SUBVERSIO STOMACHI. A Subversion of the Stomach is a violent Vomiting, when what should pass into, or through the Intestines, is discharged by the Mouth.

SUBVOLA. The Part of the Hand otherwise called *HYPOTHENAR*, which see.

SUCCAGO. The inspissated Juice of any Plant. A *Rob* or Jelly.

SUCCEDANEUM. Any Drug, or Medicine, substituted for another.

SUCCENTURIATI RENES. Two glandulous Bodies situated near the Kidneys, called also, *Glandula Renales*, or *Capsula Atrabiliaræ*.

SUCCENTURIATUS MUSCULUS. A Name for the *Pyramidalis*. See *ABDOMEN*.

SUCCIDA LANA. Greasy Wool, that is, Wool impregnated with the Sweat of the Sheep.

SUCCINGENS MEMBRANA. The Diaphragm.

SUCCINUM. Amber. See *AMBERA*.

SUCCISA. A Name for several Species of *SCABIOSA*.

SUCCOLATA. Chocolate.

SUCCOTRINA ALOES. Aloes of *Succotra*, esteem'd the best Species. See *ALOES*.

SUCCUBUS. A Species of Night Mare. See *EPHIALTES*.

SUCU. The Name of a Chinese Species of Apple.

SUDAMINA. The same as *HIDROA*.

SUDOR. Sweat.

Under the Skin, above the Fat, are disposed all over the Body what we call the *Miliary Glands*, which are closely united, each Gland furnished with an Artery, Vein and Nerve, and produce an excretory Duct or Vessel, which passes through a Perforation in the *Reticular Body*, and discharges through a wide Orifice, the Sweat under the Epidermis. These Ducts are cover'd with a hollow, and raised Valve, of a round Figure, and seated under the Skin; its Use is to transmit or restrain the Humour. This excretory Duct is the principal Organ of *Sweat*, in Conjunction with the *VASCULA Ruycheiana*.

The *Sweat*, thus secreted, varies according to the Differences of Air, Soil, Sex, Age, Temperament, Emunctories, Diet, Way of Living, and Time of Concoction, almost in the same Manner as does the Urine.

Sweat is seldom or never observ'd in a sound Body, unless from an Error in the Non-naturals; in its primary Effects it is always hurtful; by Accident it sometimes proves beneficial.

Perpiration according to SANCTORIUS.

There are, besides the excretory Vessels above described, under the Scales of the Epidermis, exhaling Vessels, which open obliquely, and are of such exquisite Subtlety, that *Leeuwenhoek* computes that a hundred twenty-five Thousand of them will take up no more Space than a common Grain of Sand. Through these Vessels perpetually transpires a very subtle Humour, from all Points of the Body, which has the Name of *Sanctoriana Perspiratio*, from *Sanctorius*, who has the Glory of being the Discoverer and Perfector of this important Doctrine in Medicine.

The Exhalation of this Humor is from the whole external Epidermis, and also from the Cuticula of the Mouth, Nostrils, Fauces, Larynx, Lungs, Oesophagus, Stomach, Intestines, Bladder and Uterus. Hence in Quantity it exceeds the Sum of all other Excretions; for in the Air of *Italy*, the Vigour of Age, easy Circumstances of Life, and moderate Eating and Drinking, the Quantity exhaled through the external Skin, and by the Mouth and Nostrils, amounts to five Eights of the Aliments received.

When this *Exhalation* or *Perpiration* is highly subtle, equable and undisturbed, in Quantity copious, and is augmented after Sleep, it is at once a Sign and a principal Means of perfect Health.

A Deviation, or Alteration, in any Manner, from the Qualification just required in *Perpiration*, is the first and most certain Forerunner of some Disorder, and perhaps the Cause of it.

Perpiration is effected, preserved, increased and restored by a robust State of the Viscera, Vessels and Fibres, by Exercise and Motion to the Degree of an incipient, gentle Sweat, by the moderate Exercise of Venery, excited by the Health and Strength of the Body, and not by the Advice and Instigation of the Mind, by a Sleep of seven or eight Hours, with the Body well cover'd, but not oppressed under a Load of Clothes; by moderate Cheerfulness, Youth, solid but light Aliments, fermented, not fat, and season'd very slightly with Spices, and by pure, serene, dry, weighty and cold Air.

The Contraries to all these Requisites beforemention'd, as well as an Augmentation of all the other Excretions, diminish, obstruct and deprave the Action of *Perpiration*.

Hence we learn the Matter, Cause, Effects, Necessity and Uses of this *Perpiration*; that it is especially serviceable to Flexibility, Softness, and Restoration of lost Substance, and principally that the humid and quick nervous Papillæ might be fit for the Impression of Objects, and transmitting the Effects of that Impression.

It appears also that when Sweat is increased, and its Vessels enlarged, that *Perpiration* is of Necessity diminished, and its Vessels compressed.

And that with violent Motion, and excessive Heat, this *Perpiration* is turned into Sweating; but that with gentle Motion and a moderate Degree of Heat, it is very much promoted.

That nothing more conduces to a free *Perpiration* than gentle and long continued Friction.

That

That long and copious Sweats highly check and weaken it, and that such Sweats are constantly and necessarily Attendant on weak, wasting, consumptive, fainting and dying Persons.

Questions to be solved on this Head are;

Why immediately after Eating, and also a long Time after the same, *Perspiration* in a healthy Person is diminished?

Why *Perspiration* is greatest in the fifth and the twelfth Hours after Eating?

Whence it comes to pass that riding on Horse-back, or Gestation in a Coach, or Ship, but especially violent Motion on the Ice, or in the Snow, so highly promote *Perspiration*?

SUDOR ANGLICUS. The Sweating Sickness.

This Disorder is so call'd from the Island in which it first appeared, in 1483. among the Soldiers of *Henry VII.* when he landed at *Milford Haven* in *Wales*, whence it spread itself and rag'd in *London*, from the 21st of *September* till the End of *October*. In the same City it returned five Times, and always in the Summer: First in 1485; then in 1506. Afterwards in 1517, when it was so violent as to take off the Patient in three Hours, and so universal as to attack People of all Ages and Conditions; so that half of the Inhabitants of several Towns in *England* fell Victims to its irresistible Fury. It appear'd the fourth Time in 1548, when it generally prov'd mortal in six Hours; and then it appear'd in 1529, at which Time alone it spread itself to the *Netherlands* and *Germany*; in the latter of which it prov'd very fatal. The last Return of it in *London*, was in 1551, when it rag'd with such Fury, as in one Day to take off 120 of the Inhabitants of *Westminster*. At *Shrewsbury*, the Residence of the celebrated *Caius* or *Kaye*, from whom this Account of the Disorder is taken, it rag'd with such Inclemency as almost to depopulate that whole Quarter of the Country, cutting off some when travelling on the Road, and others when at home minding the Concerns of their Families. Some when awake, and others when fast asleep; so that in large Families few remained free from the Disorder; in such as were less numerous generally none; and among those, who were seiz'd with it, some died in a Moment, and others one, two, three, four, or more Hours after they began to sweat. So that those who were brisk and healthy at Dinner, were often dead before Supper; but none who surviv'd the Disease were ever out of Danger, till 24 Hours after its first Attack. From such Beginnings it increased so much, and spread so far, as to strike Terror into the Inhabitants of all *England*; and had this unlucky Circumstance, peculiar to itself, that Flight, which in other contagious Disorders is the best Method of Prevention, was of no Use; for not only such of the Natives of *England* as left the Towns, and betook themselves to the Fields, but, also, those who retir'd to *France*, *Holland* and *Scotland*, were equally subjected to it as if they had taken no Precaution; whilst, what is equally, or still more surprizing, Foreigners residing in *England* were not attack'd by it.

It seiz'd different Patients in different Manners; for in some it first appeared with a Pain in the Neck, Scapulae, Legs or Arms; whilst others perceived only a Kind of warm Vapour or Flatulence running through these Parts. And these Symptoms were suddenly succeeded by a profuse Sweat, which the Patients could not account for. The internal Parts became first warm, and were soon after seiz'd with an incredible Heat, which thence diffus'd itself to the Extremities of the Body. An intolerable Thirst, Restlessness and Indisposition of the Heart, Liver and Stomach, were the next Symptoms, which were succeeded by an excessive Head-ach, a Delirium, in which the Patient was very trifling and talkative, and after these a Kind of Extenuation of the Body, and an irresistible Necessity of Sleeping.

In some the Sweat stopp'd in the Beginning, and their Limbs became moderately cool. But this Evacuation being afterwards promoted, the Matter of it was of a disagreeable Smell, of different Colours, according to the Nature of the Patients Humours; sometimes more and sometimes less in Quantity, and of a pretty thick Consistence. Some were seiz'd with a *Nausea*, and others with a Vomiting; but these Symptoms happen'd almost only to such as had overloaded their Stomachs with Aliments. All without Exception were afflicted with a difficult and frequent Respiration. The Urine had nothing preternatural, except that it was of a thicker Consistence, and ting'd with a fainter Colour than usual. The Pulse was also more quick and frequent than in a natural State. In those, however, who breath'd the least corrupted Air, and of the best Constitutions, the Disease was more mild and temperate, being generally accompanied with no worse Symptoms than a preternatural Heat and Sweat.

From the Symptoms now enumerated, *Kaye* defines this Disorder to be a diary Fever of the pestilential and contagi-

ous Kind, and to support his Definition reasons in the following Manner.

The profuse Sweat is, in this as well as in other Fevers, produc'd as a Symptom by the excessive Agony and Heat of the Patient; for as they who work hard have the Whole of their Bodies cover'd with Sweat, so those who labour under violent internal Disorders are subject to copious Sweats, which are the Instruments Nature uses, in order to carry off the Cause of the Disease. If she is vigorous enough to produce this Effect, the Patient is preserv'd; but if she is too faint and languid, he falls a Victim to the superior Force of his Disease; for if this Sweat flows spontaneously, and is duly carried on, it is of the salutary and beneficial Kind; but if it is totally check'd, or too much diminished, it is either mortal, or highly dangerous; for the Truth of which the Author appeals to the Experience of his Countrymen.

The learned and ingenious Author next proceeds to shew;

1. Why this Fever is of diary Kind.

2. From what Causes it proceeds, &c.

3. Why the Inhabitants of *Britain* alone are subject to it.

The First he accounts for from the particular Nature of the Poison which, he says, is of the putrid Kind. The Second he explains from the Situation and Air of *Britain*; which last is subject to be impregnated with noxious Exhalations, proper to produce Diseases of the putrid Kind. And the Third he Accounts for from a particular Fitness and Disposition in *English* Constitutions, to receive and be acted upon by this Poison. But as the learned Disquisitions of the Author, on these Points, would swell the Article too much, and are not very satisfactory, we shall proceed to give the Method he prescribes, both for the Prevention and Cure of this Disorder.

For preventing this Disease, then, he orders Temperance, and the Choice of salutary Aliments, and Drinks. No crude Pot-herbs nor Sallads are to be used, because they may have received a noxious Quality from the Air; or if they are us'd, they are to be previously wash'd with warm Water. The following Powder is to be sprinkled on the Aliments.

Take of Mace and Cloves each two Parts, of Zedoary and Dittany Root each one Part; of all the Sanders each half a Part, of red Coral and red Roses each one Part; of Cinnamon three Parts, of Pearles one Part, and of Sugar a sufficient Quantity. Beat all and reduce to a fine Powder.

The Air is, also, to be render'd as pure as possible, by removing those Things which can corrupt it; such as Carcases of Animals, stagnant Waters, and other Things of a like Nature, and by correcting and altering its peccant Quality, by Means of constant Fires, especially in the Morning and Evening; and by burning in the Room fragrant Substances. When we go abroad, which should be as rarely as possible, we should carry in our Hand a Preparation to smell to, which he orders be made in the following Manner.

Take of the *Nux Unguentaria*, Mace, Cloves, Saffron, Cinnamon, and Chian Mastick well triturated, each one Part and an half, of Storax two Parts and an half, of Ladanum four Parts, with a few Grains of Amber and Musk, dissolve in aromatic Wine, and make into a proper Consistence for a Paste, to be smell'd to.

The Steam of Scordium or Vervain, receiv'd into the Mouth before going abroad, is an excellent Preservative against this Disease; as also holding continually in the Mouth a Piece of Zedoary or Elicampane Root, macerated for a Night in Vinegar of Roses.

No one must go abroad fasting, for at that Time the Body is more subject to Infection than at others. 'Tis, therefore, proper to take, before going out of the House, a proper Quantity of *Theriaca*, either by itself, or in a Glass of distill'd Water of Sorrel, or Scabious. The Troches of Vipers, and several other Things of a like Nature, are, also, proper for the same Purpose; but the most efficacious Preservative is by the Author said to be the following.

Take of Sorrel, red Roses, yellow Sanders, Spikenard, Cinnamon, Saffron, and Citron Seeds each one Part, of *Armenian* Bole one Part and an half, of seal'd Earth half a Part, of prepar'd Pearles half a Part, with the Addition of some Leaf-Gold, all which are to be triturated, and taken in a small Quantity of Vinegar.

In plethoric Persons the Quantity of Humours are to be diminish'd by Abstinence, or by Venesection, and other Evacuations, as the State of the Person shall require.

After the Sweating Sickness has seiz'd a Patient, the best Method to be pursued is to promote the Sweating for a due Time; for by this Means alone the Disorder is remov'd. For this Purpose the Patient is to be kept warm, and due Care is to be taken, that he does not, thro' Ignorance or Restlessness, expose any Part of his Body to the open Air. The Patient must be attended, and have his Sweat continued for twenty-four Hours, because at that Time the Disease generally terminates in an happy Manner. During all this Time, the Patient must abstain from all Aliments, and from Drink of every Kind for at least five Hours, unless the Patient's Strength is so exhausted, as to call for a supply of them, which, however, can hardly happen in so short a Time. If the Sweat does not flow spontaneously, Frictions with moderately warm Cloths may be us'd, taking Care to prevent the Access of the Cold; and if by this Means he sweats, we are to abstain from other Methods; but if none of these will do, sudorific Potions are to be us'd. Sleep is to be prevented, by calling on the Patient with a shrill Voice, and pulling him till both the Desire and Necessity of sleeping are remov'd. After the Patient is recovered, he is not too soon to go abroad, nor expose himself to the open Air, by doing which many have been taken off by an incurable Flux. *Caius de Ephemer. Britannica.*

SUDORIFERA. The same as **SUDORIFICA.**

SUDORIFICA. Sudorifics; Medicines which excite Sweat. See **DIAPHORETICA.**

SUFFERSURÆ. Pustulous Eruptions, which break out upon Children, on Account of Heat. *Forestus.*

SUFFIMENTUM. A Suffumigation. This differs from odoriferous Substances, because the latter diffuse their Odour without the Assistance of Fire; whereas the former does not exert its Influence without the mediate or immediate Action of Fire.

There are two Kinds of Suffumigations, one subservient to Pleasure, and another contributing to Health; both of them are either dry or moist. The Suffumigation for Pleasure is, also, call'd *θυμίαμα* ; whereas that for Health is more properly call'd a Vapour or Steam.

That subservient to Pleasure, and the Purposes of Luxury, is made up of fragrant and sweet-scented Substances, and may be us'd either in the Form of a Powder, Troches, or medicated Candles. The first of which may be prepared of Storax, Benjamin, the Root Acorus, Zylaloes, Marjoram Leaves, Orange and Lemon Peel, Mace, Cloves, Cinnamon, Camphire, Amber, Musk, and Civet, in due Quantities, reduc'd to a Powder. The second may consist of the said Powder put in melted Gum Tragacanth, and made up with some proper Water: And the third may be prepared of the odoriferous Gum melted, with an Addition of the above-mention'd Powder, Gum Tragacanth, or Ladanum melted, and a proper Quantity of Musk, or Amber. Though this Species of Suffumigation is principally intended for Pleasure, yet as it consists of cephalic and cordial Ingredients, it must necessarily contribute to corroborate the Brain, recruit the Spirits, and prevent their assuming a malignant Quality. The moist Suffumigation for Pleasure consists of Storax and Benjamin; or if you please, a small Quantity of the above-mention'd Powder dissolv'd in some odorous Water, such as that of Roses.

The Suffumigation contributing to Health, is either corroborative, and consists almost of the same Ingredients with that for Pleasure, or it is alterative, dries the Brain, purges the Lungs, provokes the Menfes, and prevents a Suffocation. The dry Species of this Suffumigation is prepared of sweet-scented Substances, such as Ladanum, Storax, and Benjamin, and sometimes of Galbanum, Asa-Fœtida, and Castor, which are highly beneficial in several Disorders of the Uterus. This, also, may be exhibited either in the Form of a Powder, consisting of the above-mention'd Ingredients, or in the Form of Troches, prepared as above. A Suffumigation of this Kind is, also, sometimes made by throwing Tobacco alone on the Coals, and collecting the Steam in a Funnel, or some proper Instrument; this powerfully purges the Brain, and frees the Breast from pituitous and bilious Excrements. This Species of Suffumigation is us'd either for corroborating or altering, for drying the Brain, removing Catarrhs, and Phlegm generated in the Breast in various Disorders. Suffumigations of Tobacco, Colt's-Foot, and Sulphur are beneficial for drying Ulcers of the Lungs, and for several other Disorders of the same Kind. The moist Suffumigation for Health, consists either of some simple Liquor, such as Vinegar, Wine, Aqua Vitæ, or Rose-water; but in hard, oedematous Tumors to be discuss'd, the Fire-Stone, or a Brick ignited, are to be put into the Vinegar, and the Steam received; this is, also, frequently done in

the Plague: Or the moist Suffumigation for Health may consist of a Decoction of proper Ingredients. This Preparation is principally us'd in Disorders of the Uterus, in stopping or promoting the Menfes, in Dysenteries, Disorders of the Anus, Ears and Eyes. This Species of Suffumigation is us'd for drying, constricting, relaxing, softening, discussing and opening. *Morelli de Formul. Remedior.*

SUFFIMENTUM CATARRHALE.

A Fume for a Catarrh.

Take Olibanum, Amber, Benjamin, Storax, Gum Guaiacum, and Balsam of Tolu, of each two Scruples; make all into a gross Powder to burn.

Where the Desfluxion is very thin, and has much of its Cause in the Laxity of the Glands, such Means may do Service by constringing the Parts, and repelling the Flux, inasmuch that it may be thrown off by other more proper Outlets; but where there is an Asthma, and very weak Lungs, there is great Reason to fear Mischief; because checking the Rheum will thicken it, and make it pass with greater Difficulty through the pulmonary Vessels, when, in the Course of Circulation, it comes thither. The following, therefore, may be less inconvenient, though this may, also, be used in the same Manner, to burn upon Coals, only receiving the Steams with a Cap before it is put on, especially at Night going to Bed.

Take of Gum Guaiacum, Gum Juniper, Mastich, Myrrh, each a Dram; Cloves, two Drams; Balsam of Peru, sixteen Drops: Make them into a coarse Powder.

Filling a thick Cap frequently with the Steam of this burnt upon Coals, may, with sometime using, strengthen the Fibres, and particularly the Glands about the Head; whereby they will not be subject to those Suffusions of Lymph, which ought to be remanded by other Secretions, and principally by Urine.

SUFFIMENTUM HYSTERICUM.

An Hysteric Fume.

Take of Asa-Fœtida, one Ounce; best White-Wine-Vinegar, a Pound; boil them in a Pot with a narrow Mouth, and let the Patient hold her Head over it, with her Mouth open.

This is an untoward Application, and seems justifiable only in Cases where other Means cannot be used; though in some Kind of hysteric Convulsions, Steams this way received up the Nose have very sudden and remarkable Effects.

SUFFIMENTUM ODORIFERUM.

A sweet-scented Fume.

Take of Benjamin, one Ounce; Storax, half an Ounce; Labdanum, two Drams; Musk and Amber-grease, each five Grains: Make them into a fine Powder, to mix with Wax for Candles.

The Scent of this burnt in Places suspected of Contagion, or infected with any noisome Steams, is not only pleasant but beneficial. They are likewise very agreeable to light Pipes with.

ANOTHER.

Take of Cypress Roots, and Calamus Aromaticus, each one Ounce; Rosemary, one Handful; Storax, and Benjamin, each two Drams; Frankincense, two Ounces: Make all together into gross Powder to burn.

This is useful to take away the ill Scent of a Room, from what Cause soever it be; and in a Time of pestilential Contagion, would be beneficial to burn for an Hour or two every Morning in all the Rooms of an House, or some convenient Place, where the Whole may be filled with its Steams. And, by this Caution, many Families who lived in London during the last great Plague, escaped being hurt by it.

SUFFIMEN-

SUFFIMENTUM AD PROBIDENTIAM ANI.

A Fume against the falling down of the Fundament.

Take of Frankincense, Mastich, Amber, and Cloves, each a Dram; Red-Rose Leaves, and Balaustines, each two Drams: Make them into a gross Powder.

This is to be burnt upon a Chaffindish of Coals under a Chair, with a Hole in it, over which the Patient is to sit with the Part bare, after the Gut is thrust up; and by such Means continued, will the Sphincter at last get Strength enough to keep it up without any such Help. In a Tenesmus it is, also, of Use.

SUFFIMENTUM AD PROCIDENTIAM UTERI.

A Fume against the falling down of the Womb.

Take of Myrrh, Mastich, Cinnamon, and Spikenard, each a Dram; Mint, and red Roses, each two Drams; Cloves, Zedoary, and Pimento, each half a Dram: Make them into a gross Powder to burn.

This is to be used as the preceding, and in the same Weakness it is, also, good; as that is of Service in this. These are very easy Remedies, and might be beneficial in many uterine Weaknesses, where Persons are too squeamish or Prejudiced to take necessary Medicines another Way. Fumes from hot, aromatic Liquors, which are sometimes directed to the same Purposes, are hardly so efficacious as those which arise from the burning, dry Ingredients; because their Moisture prevents their being so immediately restraining.

SUFFITUS. The same as SUFFIMENTUM.

SUFFO. This is explain'd by *Rulandus* and *Johnson*, *Paris Porcinus*.

SUFFOCATIO UTERINA. A Strangulation of the Uterus, an hysterical Symptom. See HYSTERICA.

SUFFRUTICES, in Botany, are Under-Shrubs, or small Shrubs, with ligneous Branches, and small Leaves.

SUFFUMIGATIO. The same as SUFFIMENTUM.

SUFFUSIO. A Cataract. See CATARACTA.

SUFFUSIO AURIGINOSA. A Jaundice.

SUFUFF. Compound Powders, in the Shops call'd *Species*. *Castellus*, from *Libanius*.

SUGILLATIO. Sugillation. See the Article CONTUSIO, for the Difference betwixt a Sugillation and *Ecchymosis*.

SUGITIVA. Medicines which consume the Serofities of hydropical Persons. *Castellus*.

SULPHUR.

The Sulphur of the Shops, called *Sais* in *Greek*, because used in all expiatory and other sacred Rites, is a mineral, concreted Juice, solid, dry, friable, fusible by Fire, and very easily inflammable. The Flame it emits is blue, and the Smell of burning Sulphur is strong, subtle, acid, and very prejudicial to the Lungs.

Sulphur is of various Kinds; it is, in the first Place, divided into *εστωπος*, or native Sulphur, which has never been exposed to the Fire; and *πυροπυρετος*, or factitious Sulphur, prepared by Fire. It is either of a yellow, yellowish, Ash, or light Colour, and either pure or impure in Substance.

Native Sulphur, termed *Sulphur Vivum* in *Latin*, is of two Kinds; one pellucid, and shining like Gold, and either of a citrine or greenish Colour. This is found about the gold Mines in *Peru*, *Switzerland*, and many other Places. The other is opaque, found either in hard, solid, shining, greenish, or yellow Lumps, or in form of a clayish Glebe, of a light Ash Colour, or yellow. This Kind is dug near all the burning Mountains; near some sulphureous Springs, and in several other Places of *Europe* and *America*.

Factitious Sulphur is prepared in different Manners: In some Places it is obtained by boiling of Water; and at *Buda* in *Hungary*, according to *Agricola*, it is evaporated along with the Water of the mineral Springs, and concretes in the Covering, or Dome of these Fountains, like Flower of Brimstone, and is gathered from thence, once every Year, with great Care. It is, also, extracted from a Sort of Ash-coloured, argillaceous Earth. Thus in some Places of *Italy* there are Mines, out of which a fat, white, argillaceous Earth is dug, mixed with some blackish Veins; and this Earth being put into very capacious earthen Vessels, and distill'd, the melted Sulphur runs out at the Rostrum of the Alembic into a Receiver, where it soon concretes into large Lumps. After the Distillation is over, a red Earth remains, which is thrown away as useless. Sulphur is, also, often ex-

tracted from a Kind of *Pyrites*, especially near *Liege*, where there is a Kind of *Pyrites* like Lead Ore, which being dug up, is broken into small Pieces, and then thrown into very large Crucibles, or rather earthen Cucurbits of a quadrilateral Figure, with a narrow Orifice: These Vessels are placed in proper Furnaces, in an inclined Position, where by the Sulphur contained in these Stones, being melted by the Fire, runs into Leaden Vessels filled to a certain Height with Water, where it concretes immediately; the Substance which remains in the Cucurbit containing a large Portion of Vitriol. If by this first Operation, the Sulphur be not sufficiently pure and clean, it is melted a second Time in Iron Vessels, and boiled with the Addition of a certain Quantity of Linseed Oil; afterwards it is made up, either in large Lumps, or is thrown into hollow Cylinders of Iron, rubbed over with Oil on the Inside, and so is formed into Rolls.

Sulphur so prepared is called common Brimstone, or common Sulphur, and is of two Kinds, yellow, or greenish; which last is preferred for the Extraction of Oils or Sulphurs from other Bodies, as containing the greatest Quantity of vitriolic Salt. Common Sulphur melts by Fire, is easily inflammable, emitting a fine blue Flame, with acid Effluvia, which affecting the Nostrils and Lungs, excite Coughing: An electrical Quality is likewise observed in it. It is not soluble by Acids, but very readily by alkaline or oily Substances. When fired in the open Air, it flies almost all away, a small Portion of a Kind of metallic Earth only remaining: But if the Vapours that ascend from burning Sulphur be collected with Care, it becomes an acid Liquor, of the same Nature with Spirit of Vitriol, without any apparent Mixture of oily or bituminous Parts: But if Sulphur be distilled in an Alembic, or any other close Vessel, the Vapour does not then turn to a Substance of a different Kind, but concretes in form of a yellow, sooty Dust, called Flowers of Sulphur, which is of the same Nature as it was before Distillation. *Geoffroy*.

THE EXAMINATION OF SULPHUR.

Perfect Sulphur is found in the Mines, under very different Forms; sometimes smooth and yellow; sometimes yellow and almost transparent, like Amber; sometimes red, and almost transparent, like a Ruby; but more frequently of an opaque, grey Colour. Any of these Sorts being put into a Crucible, easily melt in the Fire, and so long appear transparently red; but when cold, they again become opaque. Sulphur, as soon as melted, readily takes Flame upon the Admission of the external Air, and burns blue; the Vapour whereof, being received with the Breath into the Lungs, proves suffocating to all Animals. It entirely burns away, or scarce leaves any Faeces behind: If kept melting in the Fire without burning, it discharges a strong-smelling Acid, but not suffocating Vapour. As soon as melted, some Part of it goes into the Air; and if long kept fused, without burning it, it all gradually becomes volatile, and vanishes. When cold, it is extremely brittle; and when melted by Heat, it seems viscous, like Pitch; and in neither Form will mix with Water. It will never dissolve in Alcohol alone; if its Powder be mixed with any Acids or Alkali, it gives not the least Signs of Ebullition, or Effervescence; so that it has not thus the Effect of an Acid or an Alkali. If taken crude into the Body, by small Doses frequently repeated, it wonderfully cleanses the first Passages, at length purges strongly, and then effectually cures certain cutaneous Diseases, and such as proceed from Worms or mercurial Fumes.

REMARKS.

Hence the Nature of Sulphur may be in some Measure understood, as found naturally in the Earth. And hence it appears, why the Chymists have called it the Rosin of the Earth; for, excepting that it does not dissolve in Spirit of Wine and Alcohol, in other Respects it approaches to Rosin.

THE FLOWERS OF SULPHUR.

I. Take six Ounces of common Sulphur, put it into a Body of *Hessian* Earth, apply a capacious Glass-head, close the Juncures with a Mixture of equal Parts of Clay and Ashes, wrought up with Water; set it in a Sand-Furnace, so that the same may almost touch the lower Rim of the Glass-head; let the Pipe of the Head, and, also, the Body itself incline a little downwards, that the Moisture may run into the Receiver fixed for that Purpose; make a gradual Fire, and continue it till the Head begins to grow dark

dark with the ascending Flowers; a little Water will rise and come into the Receiver; cautiously keep up the Fire, that the Heat may not melt the Flowers in the Head, and yet be sufficient to sublime the Sulphur; continue thus for eight Hours, and at length increase the Fire, till the lower Rim of the Head grows almost so hot as to melt the Sulphur; the Sulphur will now be sublimed into a yellow, light, rarified, soft powdery Substance, called Flowers of Sulphur.

2. This Experiment is sufficient for our present Purpose; but those who make Flower of Brimstone for Sale, have entire Furnaces built for the Purpose; with two Chambers or Partitions, one containing the Sulphur to be sublimed, where the Fire is placed, and the other adjoining to it, communicating therewith, and kept cold. Both of them are exactly stopped up, to exclude the Air; and thus the Sulphur being urged in one Chamber, by the Heat of the Furnace, and render'd volatile, flies into the other which is cold, and there collects together. When the Operation is ended, and all grown cold, the Furnaces are opened, and the Flowers swept out; and thus they repeat the Operation with fresh Sulphur. And as they thus prepare the Flower of Sulphur in large Quantities, with little Labour and small Expence, hence it is usually sold but little dearer than rough Brimstone.

REMARKS.

The Sulphur by these Means is attenuated and purified; in other Respects it is not chang'd; but thus it becomes very fit for internal, medicinal Use. For when thus divided, it exerts its Virtues to greater Advantage in the Body; and thus, also, it proves fitter for external chirurgical Uses, principally when it comes to be mixed with Balsams, Liniments, and Ointments. Hence we understand its wonderful Nature; for though ever so often sublimed, it always remains the same, without being changed or mixed: It therefore can never become a Metal, or enter the Composition of Metals. This therefore is not the Sulphur of the Philosophers, nor can never be made to afford it, as being no more than an Oil mixed with an Acid. So long as the Air is excluded from this Sulphur, heated even to the Degree of Fusion, it remains unchanged by the Fire; but as soon as the free Air is admitted, it presently takes Flame, and then soon changes, and divides into separate Parts. *Paracelsus* directs these Flowers to be sublimed from the red Calx of Vitriol, and recommends them for the Cure of exulcerated Lungs. I made the Experiment, but without finding that these Flowers, which he so much commends, had greater Virtues than the common Flower of Brimstone.

THE ACID SPIRIT OF SULPHUR.

1. Chuse a cool, moist, still Day, and melt pure Flower of Brimstone, in an earthen, cylindrical Pan, three Inches deep, and as many over. When the Sulphur is thoroughly melted, but not fired, put the Vessel under a Chimney that does not smoke, but discharges all Fumes made upon the Hearth. Now light up the melted Brimstone, and immediately cover it with a glass Bell, the Center whereof is over the Center of the Flame. The Bell should first be suspended in the Vapour of hot Water, to moisten its internal Surface, and let it be so supported by Bricks, set triangularly, as not entirely to extinguish the Flame of the burning Brimstone; otherwise, the nearer it is to the Flame the better. As soon as the Flame begins to go out, let there be at hand another similar Vessel full of melted Brimstone, to be fired and applied as the former, and continue thus for a whole Day. A strong-smelling, acid Vapour, will begin to collect in the Bell, especially during the Coldness of the Night; apply a little Glass Receiver to the Bell, which is to be set so inclining, as that the Liquor may gently run out of it into the Receiver. Thus, by continuing the Operation, and increasing the Number of the Bells, there will be obtain'd a gratefully acid, ponderous, yellow, and sometimes red Liquor, that is wonderfully fixed at the Fire, so as to require almost the same Heat to raise it as Oil of Vitriol. It, also, strongly attracts Water; and therefore gradually increases its Weight in an open Glass. If all these Directions be well observed, the Operation will always succeed. The Vapour here must be carefully avoided.

2. Mr. *Homburg* finding this Method too tedious, has invented a much easier and better, whereby five Ounces may be obtain'd in twenty-four Hours. He took the most capacious Glass Receiver he could get, and cut a round Hole in the Bottom of it, eight or ten Inches wide. This is done by first finding the Centre of the Basis, by letting a Plumb-Line fall down through the Mouth of the Glass till

it touch the Bottom, and remain every way equidistant from the Sides; the Point of Contact is mark'd with a Diamond; then setting the Foot of a Pair of Compasses on that Point, and opening them to the Distance of five Inches, the Periphery of a Circle is struck with Ink. When the Line is dry it is to be cut with a Diamond, the deeper the better. Then have at hand an Iron-ring of the exact Size with the Circle drawn. When the Iron is heated, apply it to the round Line, and the Piece will fly off, and leave the Basis open. When the Bell is thus procured, paste a Slip of strong Linnen about the Neck, with a Loop-hole for a String to run thro', in order to suspend the Bell; then have ready a cylindrical earthen Pan, six Inches wide, full of pure melted Sulphur; light it, and set this Vessel upon a glazed earthen Foot, plac'd upon the rising Part in the middle of a large glazed Dish; suspend the Bell exactly over the middle of the Flame, at such a Distance as not to extinguish it. Make the Sulphur always burn equably, by adding fresh Supplies of it, and taking off the Crust with an Iron Rod, when it grows hard; so that the Distillation may thus proceed uninterrupted. The other Particulars abovementioned, of moistning the Inside of the Bell with a warm aqueous Vapour, of taking the Opportunity of a cold, moist, still Air, and of a Chimney that does not smoke, are here also to be regarded.

REMARKS.

The Sulphur sublimed into Flowers is freed from its Earth and metallic Part. When lighted after being melted, it burns only on its Surface contiguous to the Air; its blue Flame consists of Fire, or the inflammable oily Part of the Sulphur, agitated by the Fire, and a mineral Acid, which is the other constituent Part of the Sulphur, now agitated, attenuated, made caustic and volatile, by the Flame. Thus the unctuous combustible Matter is consumed by the Fire, and the ponderous Acid dissipated, which soon after condenses by its own Weight, when it gets clear of the Flame that throws it off. Hence this Vapour becomes so mortal, because the violently caustic Acid, thus strongly agitated, comes in Contact with the Nerves, which move the Muscles, that join the Interstices of the cartilaginous Rings of the Larynx, Bronchia, and Vesiculæ of the Lungs, whence it contracts them spasmodically, so as to stimulate the Lungs into a panting Endeavour to cough, while they are entirely contracted, and not suffer'd to expand by the Weight of the Air; altho' the Breast be dilated with a laborious but fruitless Endeavour. The same Vapour, shut up with fermentable Liquors, stops Fermentation; and if strongly repeated, prevents Putrefaction, in all Bodies that otherwise easily putrefy. Hence this Fume is a proper Preservative against pestilential Poison, and the Contagion that flies abroad, or remains fixed in Goods, so as to infect them.

And hence we understand why the Flame of Nitre and Sulphur put together, but principally of Gunpowder, afford a very healthy Fume in the Height of the Plague; for the explosive acid Vapour of Nitre and Sulphur corrects the Air; and the same Vapour, if received in a small close pent-up Place, kills Insects. This Spirit of Sulphur, called by the Name of *Oleum Sulphuris per Campanam*, or Oil of Sulphur by the Bell, is no other than the Oil of Vitriol, which was lodg'd in the vitriolic Pyrites; and afterwards joining with the Oil of Coals, constitutes Sulphur. This appears from all kinds of Trials, preffion, which is wanting in the Spirit of Sulphur prepared from the Flowers of Sulphur. The great *Homburg* has, with much Labour and Subtilty, computed the Quantity of this Acid contained in Sulphur, and found it to be nearly a tenth Part. And thence, perhaps, we have the Reason why Alcohol will not touch Sulphur; that is, because its Oil is saturated with Acid: And again, why a tenth Part of Alkali, mix'd with it by the Fire, occasions Alcohol to dissolve only Oil of Vitriol is suspected to contain some metallic Impolve it; because thus having Alkali to absorb the fix'd Acid, it leaves the Oil free to dissolve in the Alcohol: And again, why Sulphur resists Acids, and is not resolved thereby: Why when once dissolved with its own Acid, it admits no more: Why Metals melted or calcined with Sulphur, are corroded by it; that is, because the Acid of the Sulphur forsaking its own Oil, is strongly attracted into the Metals, and thus corrodes them into a kind of Vitriol. Hence let those less skilful Chymists grow more prudent, who endeavour to fix Sulphur; which is only a fossil Acid united with an inflammable Oil, and no longer attempt to fix metallic Mercury with it, for such heterogeneous Things cannot enter each other; nor can they give the Gravity and Solidity here so requisite, nor indeed the Simplicity or Malleability. This Spirit of Sulphur, being purified, barely by standing, then mix'd with Juleps, gives them an agreeable Acidity, and renders them a wholesome Drink in all Inflammations, and hot Diseases, attended with

with thirst and Corruption. *Helmont* says it is conducive to the Prolongation of Life.

SULPHUR DISSOLVED IN FIXED ALCALI.

Take nine Drams of pure Flower of Sulphur, melt it in a Crucible, and add two Drams of dry fixed Alkali in Powder; the Sulphur will presently begin to change of a new and particular Odour, and of a high red Colour; stir the Mixture over the Fire with a Tobacco-pipe, then, when thoroughly melted and united, pour it out upon a cold Marble. It will be a red brittle Mass, soluble in Water, and soon re-igniting in the Air; whereas the Sulphur before would neither resolve by the Action of the Air or the Water.

REMARKS.

The fixed Alkali being here actuated by the Fire, intimately unites with the melted Sulphur, attracts its Acid, and joins therewith, so that the Sulphur resolves into its two separate Principles; yet the Oil does not here remain separate, but is intimately united with the Alkali, and acid Salt, so as immediately to produce a wonderful Soap, consisting of Acid, Alkali and Oil; and therefore the Combination of the fossil Acid, Alkali and Oil, in the Composition of Sulphur, changes the Oil to another Nature; but the Acid remaining almost unchanged, comes out the same upon the Resolution: And hence we may understand the Power of fixed Alkali in Metallurgy. Sulphur is often mixed with Metals, and makes them brittle; but, if fix'd Alkali be added to them in Fusion, it takes the Sulphur into itself, from the Metal; and floating upon the Surface, as a lighter Soap, leaves the heavier Metal, now freed from its Sulphur, to fall to the Bottom, in the Form of a Regulus, whilst the Alkali has no Entrance into, or Power upon the Metal. Hence, therefore, if there be any Doubt, whether any fossil Glebe or Ore contains Sulphur, the Way is to grind and melt it with fixed Alkali, for thus the Alkali will manifest the Sulphur by the Colour and Smell produced.

SULPHUR DISSOLVED IN VOLATILE ALCALI.

Mix any strong alkaline Spirit, whether prepared from Sal Ammoniac, Harts-horn, Blood, or the like, with pure Flowers of Sulphur; distil and cohobate, by which means the Sulphur will be dissolved; or if the Mixture be long kept in a close Vessel, and frequently shook, by this Method, also, a golden Tincture may be obtain'd.

REMARKS.

This Process serves to shew the Power which volatile Alkali has upon the acid of Sulphur, and the consequent Change thereof. But whether the Tincture possesses such great medicinal Virtues, especially in Diseases of the Breast, as an eminent Chymist imagined, may be justly questioned.

THE SOLUTION OF SULPHUR IN ALCOHOL.

Take Sulphur first opened by fixed Alkali, as in the last Process but one, and whilst it remains still hot from the Fire, and consequently dry, grind it fine in a hot and dry Mortar; put it into a dry Glass, and pour pure Alcohol thereon, so as to float five Inches above it. The Alcohol thus perfectly dissolves the Sulphur, as soon as it comes in Contact with it, into a rich, gold-colour'd, unctuous Liquor, which by shaking, becomes still richer. Let the Tincture be decanted clear from its Fæces, pour fresh Alcohol upon the Remainder, and this being again tinged, separate it, and repeat the Operation, till the Alcohol becomes tinged no longer. Keep all the Tinctures mixed together; they make a Liquor that has a very particular Smell, though not ungrateful, but with some Fragrance. It is of an exceeding aromatic heating Taste, and of a corresponding medicinal Virtue; the Fæces left behind are grey-coloured, saline and earthy.

REMARKS.

Alcohol will not touch native Sulphur, though ever so long digested therewith; but as soon as the Sulphur is opened by Alkali, it is then eagerly taken up by Alcohol; so that I scarce know any quicker Solution. Hence we learn the Power that Alkalies have upon Sulphur; for procuring Entrance to Alcohol. Sure, therefore, Sulphur frequently lies concealed in many fossil Glebes, but especially in Ores; whence it happens, that a simple Tincture of Sulphur has often been sold for the most secret and valuable metallic Tincture, even to Princes; and I remember a boasted Tincture

of Gold thus put off for *Aurum potable* at a high Price. This Tincture was made by mixing Gold with crude Antimony, and the Alkali of Tartar, or *Glauber's* Alcahest, melted and stirred together; then the whole being afterwards bruised, and brought to Powder, it afforded a golden Tincture with Alcohol; but this, I say, was a mere Tincture of Sulphur; for the Gold here remains unchanged: But Antimony abounds with Sulphur, and in melting, the Alkali attracts this Sulphur, separates it from the metalline Mass, and opens it; then the Alcohol being added to the whole ground Mass, extracts only the sulphureous Part opened by the Alkali, and leaves the Gold, or metallic Part of the Antimony, perfectly untouched. This Observation is of infinite Use in examining numerous other than Tinctures; for as soon as a skilful Artist knows that fixed Alkali is employed in making them, he knows they must proceed from Sulphur; because the metallic, or as the Chymists call it, the mercurial Part, is never touch'd by vegetable Alkali. In the mean time, our Tincture of Sulphur affords a wonderful warming Medicine, that causes Eruetation, resists Acids, and cuts Phlegm; a few Drops of it being taken upon an empty Stomach, in Mead, Spanish Wine, or any proper Syrup, which it thus turns white, so as to be called the Milk of Sulphur. But I could never discover its antiphthical Virtue, as a last Refuge in ulcerated Lungs, though I have diligently sought for it; notwithstanding the great Doctor *Willis* has wonderfully recommended it in this Distemper; but I judge such Preparations should be more sparingly praised by Physicians.

THE SYRUP OF SULPHUR.

Take a Dram of Sulphur opened with Alkali; dilute it with thrice its Weight of Water, wherein it almost wholly dissolves; add to the Solution twice or thrice its Weight of Sugar, a little boiled; mix them together, and thus a kind of Syrup of Sulphur is prepared, containing the Virtue of the opened Sulphur, and may thus be conveniently employed for medicinal Uses. It is made more expeditiously by mixing the Tincture with six Times its Weight of the Syrup of Liquorish, or the like Syrup.

REMARKS.

What Opinion Physicians should have of this Composition we hinted above, in considering the Tincture of Sulphur. The Syrup is heating, drying, and stimulating, which are Properties that do not suit Coughs and Consumptions; especially where the Body is worn down, and attended with constant Sweats. But hence we advantageously learn, how wonderfully the Powers of Fossils may be concealed in almost every Thing; for if any fossil Glebe, rich in Metals and Sulphur, be first gently washed, ground to Powder, calcined with fixed Alkali; and afterwards dissolved in Water, Syrup, Wine, Alcohol, or other Liquors, the alkaline sulphureous Part easily dissolves, and lies concealed. Whence the Liquor receives some particular Virtue, which should be carefully examined before the Liquor is used internally.

SULPHUR PRODUCED FROM OIL AND ACID.

Take four Ounces of pure rectified Oil of Turpentine, put it into a Retort, and let fall thereon by a Drop at a Time, an Ounce of highly rectified Oil of Vitriol; shake the Retort, after the Addition of each Drop, that it may be thoroughly mixed. The Liquor will now heat, smoke, grow red, and exhale a variable Odour. After the whole is thoroughly mix'd, digest it for eight Days; then apply a capacious Receiver, and distil in a Sand-furnace, the Junction being well luted; a new and particular oily Liquor will come over. The Matter at the Bottom appears first like a Fluid Bitumen, but gradually thickens, and at length becomes pitchy, and bituminous; the Liquor that comes over is fetid, sulphureous and suffocating, if received into the Lungs. If the Distillation be carefully carried through with successive Degrees of Fire, there will at length arise a true Sulphur into the Neck of the Retort, as may appear from its Form and manner of burning.

REMARKS.

Hence we learn the artificial Method of preparing Bitumen and Sulphur; and that the fix'd Acid of Vitriol, Alum, and burnt Sulphur, is the incombustible Basis of Sulphur, while the other Part is the combustible pure Oil; which two, by their intimate Union, compose Sulphur. If this factitious Sulphur be burnt, its oily Part affords a Flame without Smoke; and the other Part, in the burning, affords an acid, caustic, suffocating Vapour, which is preservative and ponderous, so

as not to rise high, and if condensed by a Glass Bell, it drops down into Oil of Vitriol, exactly like that of the natural Sulphur. A pure inflammable Oil seems to be collected in Sulphur, such as can scarce be otherwise obtained; whilst the gross, unflammable, terrestrious, or other saline Matter is excluded in this Combination; no other Acid, produced by Nature or Art, will make Sulphur by mixing with Oil. The Acid of Vitriol, wherever it be, or wherever subtly concealed, joins with any inflammable Oil so as to make Sulphur. Tartar of Vitriol, *Glauber's* Sal Mirabile of Sea-Salt, and of Nitre, the Salt of Vitriol, burnt Alum, and other Bodies containing this Acid, as often as they are, by Means of it, joined with an inflammable Oil, always afford true Sulphur. Hence this Acid alone has the Property of producing Sulphur, whilst all inflammable Oils serve therewith for the same Purpose; and hence Sulphur can never be produced where this Acid did not pre-exist; whence numerous obscure Particulars may be understood in the chymical History of Fossils and Metals; and, therefore, whoever would explain them, should remember what is here delivered. To give an Example from *Becher*; Melt *Glauber's* Sal Mirabile in the Fire, throw powdered Wood-Coals thereon, a sulphureous Flame arises, and a brown Mass is left at the Bottom, which being dissolved in Water, and precipitated, a true sulphureous Matter is obtained. Here it is plain, that the Oil of Vitriol in the Sal Mirabile lays hold of the inflammable Matter in the Coal, and becomes Sulphur; therefore, in determining the Effect of any chymical Operation before hand, we must carefully examine whether any of the Matters employed, either manifestly, or secretly, contain the Oil of Vitriol, Alum, or Sulphur, and whether any inflammable Matter is, also, applied; for in this Case, the Action of Sulphur is immediately produced.

SULPHUR OBTAINED FROM ALCOHOL AND ACID.

Into a tall Glass Body put eight Ounces of Alcohol, prepared without Alkali; let fall to it, by a Drop at a Time, highly rectify'd Oil of Vitriol; shake the Glass well after each Drop, and rest a little, otherwise a great Heat, and suffocating Vapour would arise; continue thus, by Degrees, till an Ounce of the Oil of Vitriol is added. The Mixture will have the sweet Fragrance of Southern-Wood, which will spread over the whole Place, but ought to be avoided, as being suffocating; if received in a small Quantity into the Lungs, it causes a violent Cough; and if received in a large Quantity, at once, I judge it might prove mortal: The Liquor will become reddish. Let it now be gently digested, in a close Vessel, for five Days; then distil it gently in Glasses close luted; a wonderful, subtle Spirit will come over, which proves incredibly suffocating, and is so much the more dangerous, as, by its grateful Smell, it treacherously leads one to take it in freely. Continue this gentle Distillation for some Time, till the mixed Matter grows black; then the Spirit which last came over will be exceeding sweet and fragrant; and now there will begin something acid to arise, which was not in the former Liquor; then change the Receiver, still keeping a gentle, but constant Fire, that the Liquor may rise slowly; for if the Fire was to be urged too strongly, but for a Moment, the Matter would immediately swell and rarify, so as to come over at once into the Vessels, and disturb the Operation. If the Distillation be thus gently continued, there arises an aqueous, fetid Liquor, and along with it another that is ponderous, pure, limpid, and keeping separate and unmixed with the Phlegm. After all this is come over, and about one Half of the Whole, again change the Receiver, and distil by Degrees of Fire, up to the highest; a fetid Liquor will arise, that does not mix with the former ponderous Kind; at the Bottom of the Vessel remains a black, brittle and unflammable Matter, though otherwise in some Degree approaching to Sulphur; so that by these Means we have three distinct Liquors arising from this Mixture, as, also, a suffocating Vapour, and a fixed *Caput Mortuum*, of a very particular Nature, remaining behind.

REMARKS.

The strongest Fossil Acid, by thus barely mixing with the most subtle vegetable Oil, or Alcohol, causes such a violent Heat, as, if imprudently mixed, almost to take Flame, and produce a considerable Effervescence. At the Instant of mixing, there arises a sweet Odour, which diffuses itself widely; but by a long Digestion, the disagreeable Odour of Garlick is produced. The sweet suffocating Odour is attended with an Acid. Here, 1. a spirituous, fragrant, suffocating, inflammable, and tartish Liquor is separated; whereas the Oil of Vitriol was a little before so fixed, and no way fragrant. 2. There comes over a fetid, sulphureous, aqueous, uninflam-

mable, acid Liquor, though neither the Alcohol nor Oil of Vitriol contain much Water. 3. There comes over a limpid, ponderous Liquor, that smells and tastes gratefully aromatic, but will not mix with the two former, yet dissolves in Alcohol, and then extracts somewhat of a Tincture from calcined Gold, and hence is esteem'd the philosophical Oil of Vitriol. It is certainly a dulcified Oil of Vitriol, concerning which *Isaac Hollandus*, *Gesner*, *Mr. Boyle*, but particularly *Dr. Hoffman*, may be consulted. The black Fæces being diluted with Water, return almost into acid Oil of Vitriol. We have here a great many unexpected Phenomena from a simple Combination; perhaps this may be the philosophical Spirit of Wine, which, by its Fragrance, calls in the Neighbours while it is made, according to *Lilly's* Account of it. Perhaps it is the dulcified, fragrant Spirit of Vitriol of *Paracelsus*, which he esteemed powerful in the Falling Sickness; and possibly the Tincture prepared with it from Gold is a Species of *Paracelsus's* *Aurum Potabile*, digested in the Stomach of the Ostrich. Certainly this Operation may excite the truly Curious to examine with Care, whether there be any thing of these great Secrets concealed therein. We find it does not produce true Sulphur, but only certain Properties of it. *Boerhaave's* *Chymistry*.

As Sulphur cannot be resolved into its different Principles in close Vessels, the Distillation of it remained very imperfect, till *M. Homberg* completed it. His Method, as explained in the Memoirs of the Royal Academy of Sciences for the Year 1703, is this:

Take Flower of Brimstone, four Ounces; Oil of Turpentine, a Pound; digest them in a Matrafs over a Sand-heat for eight Days, till the Sulphur is dissolved, the Liquor appearing of a dark red Colour. Then, if the Solution be set in a cool Place, in a Vessel cooled by Art, about three Fourths will turn to yellowish Crystals, the other fourth Part remaining dissolved in the Liquor. The Crystals being separated from the Tincture, let a Pound of fresh Oil of Turpentine be poured upon them, and thus continue to repeat all the Parts of the Operation till the Flower of Sulphur be quite dissolved; mix all the Tinctures together, and distil them in a large Glass Retort over a gentle Fire; the greatest Part of the Oil of Turpentine will come over limpid, together with a small Portion of a whitish and very acid Liquor; but as soon as the Drops from the Neck of the Retort appear red, change the Receiver, and increase the Fire by Degrees, till nothing more will come over. Near the End of the Operation, a thick, brownish Oil will appear, mixed with a small Portion of a whitish, acid Liquor. In the Bottom of the Retort is found a black, rare, spongy Earth, or *Caput Mortuum*, in some Measure foliaceous, shining, insipid, and remaining fixed in the most vehement Degree of Fire. Let the thick, dark-coloured, and bituminous Oil be put into another Glass Retort, and when the Remains of the Oil of Turpentine, and of the white acid Liquor, are all drawn off by a very gentle Heat, red Drops will begin to rise; then immediately remove the Fire, and upon the bituminous Matter in the Retort pour rectify'd Spirit of Wine, which being drawn off again, in a gentle Heat, will have a very fetid Smell; pour fresh Spirit on the Remainder, and continue this Process till the Spirit that comes off has lost all its unpleasant Smell; and the black Matter which then remains in the Retort will Smell agreeably enough, and is the true bituminous and inflammable Part of Sulphur.

It is here to be observed, that only a certain Portion of this bituminous Substance is dissolvable in Spirit of Wine, another Part remaining which is soluble neither by that Spirit, nor by any lixivial Liquor, but only by essential distilled vegetable Oils. This indissoluble Substance is a strong Cathartic given in the Quantity of two or three Grains; but that Portion which yields to the Spirit of Wine is an excellent Balsam for the Lungs.

By this Analysis, three very different Substances are obtained from Sulphur, almost in equal Quantities, one acid, the second bituminous, and the third earthy and fixed. The acid Liquor is not different from Spirit of Vitriol, and when saturated with Salt of Tartar, is formed into Crystals like those of vitriolated Tartar. This Similitude of those two Liquors is farther confirmed by the artificial Production of Sulphur.

Dielschides informs us, that Sulphur is good in Coughs, when mixed with an Egg; and *Hippocrates* used it in hysterical Affections accompanied with Coughing, by way of Fumigation, sometimes alone, and sometimes mixed with other Substances. The internal Use of Sulphur is recommended by Physicians in Diseases of the Lungs, of which it is, by way of Eminence, termed the Balsam; because it promotes Expectoration, and clears and strengthens that Organ, and is therefore very beneficial in a Phthisis, Asthma, and Catarrh. It has in all Ages been a famous Medicine in cutaneous

neous Diseases, Scabs, and Pforæ, used inwardly or outwardly. Externally applied, it discharges hard Tumors, ripens and digests Buboes; but no Medicine prepared with Sulphur is thought to be agreeable to Women with Child, because it is ready to cause Abortion. Inwardly taken, it is laxative, and promotes insensible Perspiration, as may be perceived by the sulphureous Smell of such Persons as have taken it, and by the brownish or black Colour which it gives to the Gold or Silver they carry about them. It is therefore very quickly and readily diffused through the whole Body, and, by its balsamic Parts, it blunts and entangles the acrid Salts, with which the Fluids abound in these Diseases; and thus resolves their native, mild, soft, and oily Qualities; by which Means it readily cures small Ulcers in the Lungs and Skin.

Though Sulphur may be given inwardly, even in a gross Powder, yet it is seldom ordered without some Preparation. It may be purified different Ways; some put it into Water with melted Wax, which swims at the Top while the Sulphur falls to the Bottom; and by repeating this Mixture till the Sulphur begins to acquire a red Colour, it is then thought to be more defecated. Some boil it in Water for several Days, changing the Water every now and then, and afterwards they set it for two Hours in hot Smoke, that some Fumes may exhale, and the remaining pale yellowish Sulphur they judge to be very pure. Others make Milks and Magisteries of Sulphur, which they think much preferable to common Sulphur; but all these Preparations either change the true Nature of Sulphur, or else are of no Effect at all. The best Way to purify it, is by Sublimation, or the Reduction of it to Flowers, by which common Method it is freed from the earthy or metallic Parts that may have been mixed with it. Sulphur thus prepared may be ordered in the Diseases already mentioned, in the following Manner:

Take Flower of Brimstone, four Ounces; Sugar of Roses, one Ounce; Syrup of Maiden-Hair, a sufficient Quantity to make a soft Opiate; of which three Drams, or half an Ounce, are to be taken every Morning fasting, and every Evening, at the greatest Distance between Meals, for a long Continuance of Time, in the Scabies and Asthma.

Take Flower of Brimstone, an Ounce; white Sugar, four Ounces; Rose-Water, a sufficient Quantity: Boil them according to Art, and make them into Tablets, or Lozenges; to be taken at a great Distance from Meals, in Coughs, Consumptions, and Astmas.

Take Flower of Brimstone, two Drams; mix it well in a poched Egg, and swallow it early in the Morning fasting, and repeat it again in the Evening, for the Itch, rubbing the Body with the following Ointment:

Take the Roots of wild, sharp-pointed Dock, and Elecampane, of each two Ounces; fresh Butter, four Ounces; Flower of Brimstone, an Ounce and half: Mix them together, and make them into an Ointment.

As the powerful Acid contained in Sulphur is very prejudicial to the Lungs, Chymists, in order to make it a more safe, and equally efficacious Medicine, have endeavoured to mitigate or inviscate that acid Salt; by the Preparation called Balsam of Sulphur, for which, on any Quantity of Flower of Brimstone, they pour as much Oil of any Kind as will swim three or four Fingers Breadth above it, and then digest them in a gentle Sand-heat, till the Oil begins to look red or brown. This Liquor, when cold, is separated from the Fæces, and kept for Use. In this Manner are the different Balsams of Sulphur prepared; such as the *Balsamum Anisatum*, *Faniculatum*, *Terebinthinatum*, *Juniperisatum*, *Succinatum*, so called from the different Oils used. The Dose is from ten Drops to thirty in Astmas, immoderate Coughs, Ulcers in the Lungs, nephritic Pains, and Ulcers in the Kidneys, and Bladder. From this Balsam are prepared the balsamic Pills of *Morton*, which in flow, scorbutic, or scrophulous Phthisis, are attended with a very small Fever, if any at all; and where the expectorated Matter is glutinous, as in an Asthma, are very beneficial, both in the Beginnings and subsequent Stages of the Disease.

Take of Powder of Millepedes, three Drams; Gum Ammoniac, well purified, a Dram and an half; Benjamin Flowers, two Scruples; Extract of Saffron, and Balsam of Peru, each ten Grains; Terebinthinate Balsam of Sulphur, a sufficient Quantity: Mix and make them into Pills, which must either be gilt or rolled in

Powder of Liquorish. The Dose is fifteen or eighteen Grains, to be repeated three Times a Day, at medicinal Hours.

But the best Balsam of Sulphur that has ever been prepared, is undoubtedly that of the great *Homburg*, made by extracting a Tincture, with Spirit of Wine, from the bituminous Part of Sulphur, freed from all its acid and earthy Parts. This Tincture, evaporated over a gentle Fire to the Consistence of a Syrup, is the genuine Balsam of Sulphur; and of excellent Use, not only in Diseases of the Lungs, but in all Disorders in which the animal Functions are disturbed by acrid Salts in the Fluids. It is taken a few Drops at a Time, in any Syrup, or licked from the Palm of the Hand.

The Spirit of Sulphur is proper in burning, malignant, and pestilential Fevers. It quenches Thirst, prevents the Putrefaction of the Fluids, and calms the Effervescence of the Blood and Bile, not by coagulating the whole Mass of Fluids, as the other mineral, acid Liquors, but only by entangling the sulphureous Parts: For, according to *Borelli's* Observation, a Dram or two of Spirit of Sulphur, injected into the Jugular Vein of a Dog, did not kill the Animal; but the same Quantity of Aqua-fortis, even diluted with Water, throws a Dog into terrible Convulsions, of which he soon dies; and upon opening his Body, the whole Blood contained in the Veins and Heart is found in grumous Clots. Moreover, Spirit of Sulphur attenuates gross, viscid Humours, and thereby often removes Obstructions; whence it is recommended by some in Astmas: However, I do not think it proper in phthisical Cases, because, like other acid Liquors, it excites Coughing. It is given only in a few Drops at a Time, sufficient to give a grateful Acidity to any proper Vehicle; and by repeating this Dose at the Beginning of every Paroxysm, intermitting Fevers are often cured by it.

Spirit of Sulphur, either by itself, or mixed with Honey of Roses, cures simple Aphthæ in a very small Time, provided there be no Inflammation, by only touching these little Ulcers with the Spirit or Mixture, imbibed by a Bit of Cotton, or Linnen Rag. *Riverius* is of Opinion, that it is an excellent Remedy in putrid Fevers; and that it is found by Experience to cool, open, resist Putrefaction, prevent the Inflammability of the Fluids, and quench Thirst. But it is never to be given in Pleuritis, Peripneumonies, Spitting of Blood, Phthisis, and other Diseases of the Lungs, except the Obstruction arises from a thick, pituitous Matter, in Inflammations of the Stomach, Dysentery, bloody Urine, and Ulcers of the Kidneys and Bladder. *Geoffroy*.

SUPERCILIA. The Eye-brows.

SUPERCILIUM ACETABULI. The Margin of the ACETABULUM, which see.

SUPERCOMPOSITIVA SECTA. The Episynthetic Sect of Physicians among the Antients. See the Preface.

SUPEREXCRETIO. The same as HYPERCRISIS.

SUPERFICIES, in *Rulandus*, is the White of an Egg.

SUPERFŒTATIO. Superfœtation. See EPICYESIS.

SUPERGEMINALIS. The *Epididymis* is sometimes thus call'd.

SUPERGENUALIS. The PATELLA.

SUPERHUMERALIS. The same as EPOMIS.

SUPERIMPRÆGNATIO. The same as EPICYESIS.

SUPERLIGULA. The EPIGLOTTIS.

SUPERMONICUM. This is explain'd by *Dorneus*, *Ænigmatical*.

SUPERPURGATIO. The same as HYPERCATHARSIS, which see.

SUPERSCAPULARIS SUPERIOR. A Name for the *Musculus SUPRASPINATUS*.

SUPERSCAPULARIS INFERIOR. A Name for the *Musculus INFRASPINATUS*.

SUPERVACUATIO. The same as HYPERCRISIS.

SUPIM. The Name of a *Chinese* pomiferous Tree, of no Use in Medicine, that I know of.

SUPINATOR LONGUS, SIVE MAJOR.

This is a long, flat Muscle, lying on the external Condyle of the Os Humeri, and on the convex Side of the Radius, from one End to the other.

It is fix'd by fleshy Fibres to the external inter-muscular Ligament, and to the Crista of the external Condyle of the *Os Humeri*, for five or six Fingers Breadth above the Condyle, between the *Brachialis* and *Anconæus Externus*; from thence it runs along the whole convex Side of the Radius, and is inserted by a flat, narrow Tendon, a little above the Styloide-Apophysis in the Angle between the concave and flat Sides of the Extremity of this Bone.

The *Supinator Longus* was believed to be concerned only in the Motion of Supination, till *Heister* very justly observed that it was, also, a Flexor of the Fore-arm: And indeed, a very small Degree of Attention to its Insertions and Situation, must convince us, that it is much better fitted for this last Use than for the first; for before it can act as a Supinator, the Hand must be in the greatest Degree of Pronation; and even then, it can do little more than bring the Radius back to its natural Situation, without compleating the Supination, excepting it be by Jerks. It would, therefore, be much more properly named *Radialis Longus*, than *Supinator Longus*.

This Muscle may bend the Fore-arm, by Means of the Connexion the Radius with the Ulna, in several different Situations; that is, when the Fore-arm is fully extended, the Radius being either in a Motion of Pronation or Supination, or in a middle Situation between both.

On this Occasion it is proper to observe, that the Method of examining the Uses of the Muscles on dead Bodies, by pulling them in order to move the Bones in which they are inserted, is very uncertain, except particular Care be taken to pull them in their true natural Direction, which is often different from what it appears to be when they are dissected, by reason of the lateral Connections, and *Frena*.

Supination performed when the Fore-arm is fully extended, is commonly attributed, in part, to the Rotation of the *Os Humeri*, by Means of its Articulation with the Scapula, as if this Supination, when the Fore-arm is extended, were greater than when it is bent; whereas the Difference in Supination is really but very small, though it be very considerable in the Motions of Pronation.

SUPINATOR BREVIS, SIVE MINOR.

This is a small, thin, fleshy Muscle, surrounding a great Portion of the upper third Part of the Radius.

It is fixed by one End to the lower Part of the external Condyle of the *Os Humeri*, to the external lateral Ligament of the Joint, to the annular Ligament of the Radius, and to Part of the lateral Eminence in the Head of the Ulna.

From thence it passes obliquely over the Head of the Radius, covering some Part of it, and running down upon, and in some Measure surrounding the Neck, it turns in under the bicipital Tuberosity, and is inserted by the Side of the inter-osseous Ligament in the Inside of the superior Quarter of the Bone, and even a little lower. In some Subjects we may observe the Marks of the Passage of this Muscle over the Outside of the Bone. It makes an Angle with the *Pronator Teres*, resembling the *Roman V*.

The *Supinator Brevis* seems to have no other Use than what is expressed by its Name; and as it is a short, small Muscle, it must be very weak. Its Use is principally owing to the Obliquity of its Fibres; but still neither this nor the former Muscle would be able to perform Supination, where a great Force is required, without the Assistance of the Biceps, which is the most powerful of all the Supinators, and the principal Actor in this Motion. *Winslow's Anat.*

SUPPEDANEA, or SUPPLANTALIA. Topical Medicines apply'd to the Feet.

SUPPOSITORIUM.

A Suppository, is a Kind of medicated Cone, or Ball, which is introduced into the Anus for opening the Belly. Suppositories are usually made of Soap, Sugar, Allum, or a Piece of Tallow-Candle, about the Length of a Thumb, and the Breadth of a Finger; though they may be made smaller for Children, and sometimes a little thicker for Adults. Suppositories are sometimes compounded of Ingredients adapted to the Disease, and Circumstances of the Patient, as of Honey, Salt, Powder of Aloes, Colocynthis, and the like. If one Suppository does not occasion a Stool, it must be supplied by a stronger; and if that does not succeed, the Repetition must be continued till the Effect required is produced. They are sometimes lubricated with Oil or Butter, that they may be introduced with greater Ease. Some use a Lozenge of Sugar, or a small Piece of thin Linnen Cloth rolled up, with a little hard, salt Butter, which greatly loosens the Belly. For Ulcers of the Rectum, the best Suppositories are made of Honey of Roses, Powder of Mastich and Myrrh, or of Colophony. The stronger Suppositories, which are composed of acrid and stimulating

Ingredients, are advantageously used in promoting a difficult Birth, if the Infant be in a natural Position, and, also, for expelling the Secundines, when they are tenaciously retained in the Uterus. In exhibiting them, the Patient should be put in the same Posture as in giving a Clyster, and the Suppository must be gently thrust up the Anus with the Finger.

SUPPRESSIO. A Suppression, or Retention; it is generally us'd relative to Urine, or the *Menses*.

SUPPRESSIONIS IGNIS. A Fire of Suppression, in Chymistry, is, when the Vessel containing the Ingredients to be acted upon is covered with Sand, upon which live Coals are laid, so that the Matter contain'd in the Vessel may be acted upon both from below and above.

SUPPURANTIA. Suppurative Medicines.

SUPPURATIO.

If an Inflammation, by Neglect, too late Use, or ill Success of the Methods, directed under the Article **INFLAMMATIO**, tends to a Suppuration, and it appears so to do by the Signs there given, the Indications will be,

1. To mature the crude Humour, as soon as may be, into one similar Substance.
2. To mollify the same, with the adjacent Parts.
3. To attract it outwards.
4. To procure a Vent for the concocted Pus.
5. To mundify the Place.
6. To manage the rest of the Cure as a Wound.

An Abscess, *ἀπὸσσωσις, ἀπὸσσωμα, Abscessus*, with the ancient Physicians, had various Significations. *Hippocrates, Epidem.*

1. gives that Name to the Change of one Disease into another, when he says, *ἡ δὲ ἀλλαν πυρὶς καὶ νεκρῶσιν ἀποσώσῃ ἐκ τῆς πύλῃς ἐν τῷ σπλῆνι*; "Of other Fevers and Diseases there was a Mutation into Quartans". The Name *Abscess* was, also, given to those Efforts of human Nature, by which some noxious Matter was separated from the Blood, and either discharged from the Body, or deposited on some Part. The Antients, therefore, divided these Kinds of *Abscesses* into such as were form'd, καὶ ἐκέρχον, "by Efflux", [See *ΕΚΡΟΕ*] and those which were form'd, καὶ ἀποθήκον, "by Deposition." *Galen. 1. Com. 2. in 1 Epid.* Thus, for Example, in a Peripneumony, the Matter of the Disease is observed to find a Vent by Spitting, by a bilious Flux of the Belly, or by Plenty of thick Urine with much Sediment, and in these Circumstances there is an *Abscess* by an *Efflux*. But where there is no such Excretion, and yet from the salutary Signs which appear, we can predict the Recovery of the Patient, we are directed by *Hippocrates, Lib. Prognost.* to expect an *Abscess*, either at the Ears, or towards the inferior Parts of the Body, the Matter of the Disease being deposited in those Parts. But at present we understand by an *Abscess*, according to the common and received Sense of the Word, the Transition of an Inflammation into a Suppuration, and a Collection of Pus thence generated in some Part of the Body. In this Sense is an *Abscess* defined by *Galen, M. M. ad Glauc. Lib. 2. Cap. 21*, "An Affection in which Bodies that were before in mutual Contact, secede from one another. Hence it is necessary that some void Space should be left in the Middle, which will contain some flatulent or humid Matter, or a Mixture of both. Some Inflammations, and many erysipelatous and phlegmonoide Tumors are changed into an Abscess." For while the obstructed Extremities of the inflamed Vessels are separated by the Force of the vital Fluid, which presses on them behind, they become intermingled with the effused Humours, and being cherished by the Heat of the Place, pass into Pus, which by removing at a Distance from one another the Parts which were before contiguous, makes Room for itself. But since a true Phlegmon almost constantly resides in the Panniculus Adiposus, this Membrane, which easily gives Way, may by a Collection of Pus be sometimes distended into a very great Tumor. Now, that such a preternatural Cavity is formed by a Collection of Pus, after the Phlegmon has been suppurated, which did not exist before, is demonstrated, in that if you make an Incision with a Lancet into the inflamed Part, before the Pus be generated, there will be an Eruption either of Blood, or some thinner, Ichorous Fluid, and the whole Tumor appears solid: But if the Incision be made after Suppuration, there appears a manifest Cavity after the Effusion of the Pus, occasion'd by a Seccession of the Parts which were before contiguous.

The best Cure of an Inflammation, is undoubtedly by Resolution; but when this is out of the Power of the Physician or Surgeon to effect, as is frequently the Case, there remains nothing but Suppuration, since other Mutations or Consequences of an Inflammation, which are either a Gangrene or Scirrhus, are much worse. If, therefore, from the Signs enumerated under the Article **INFLAMMATIO**, it appears that

that the Inflammation is of such a Nature, that a Resolution cannot reasonably be expected; or though perhaps there were some Hopes in the Beginning, that the same might be effected; yet through unsuccessful Application, or Neglect, or too late Use of proper Remedies, (after the Impetus of the vital Liquid, by a continued Pressure for several Days together, has consolidated the obstructing Molecules, and rendered them quite irresoluble by expressing the most fluid Parts) all Expectations of a Resolution are absolutely vain and fruitless; the curative Indications are to be directed in such a Manner, that by forming a Suppuration as soon as possible, all the Parts, both in the Fluids and Solids, which are corrupted by the Inflammation to such a Degree that they can no longer be subservient to the Laws of Health, may be removed out of the Way; and this being effected, that afterwards the lost Substance may be restored, and the separated Particles be reunited and restored to their natural Cohesions.

1. The material Cause of the Disease, as long as it continues in such a Disposition as qualifies it for causing or increasing the Disorder, is called *crude*; but when by the vital Forces, its own Nature, or proper Medicines, it becomes changed in such a Manner as to be more conformable to the Laws of Health, and less injurious to the natural Functions, it is termed *concocted*; and that State of the Disease, in which this material Cause is so alter'd as to be less pernicious, is called *Maturation*, or *Concoction*. Now this *Crudeness* may take Place as well in the Fluids as Solids, and consequently the same may be said of *Maturation*. In a Phlegmon we bestow the Epithet *crude* on all Matter which so obstructs as to be incapable of Resolution, and every Vessel so obstructed that it cannot be open'd, comes under the same Denomination. In order, therefore, to the Restitution of Health, this obstructed Vessel, together with its contained stagnant Matter, must be separated from the other quick and pervious Vessels, and with the effused Liquids be changed into one homogeneous Humour called *Pus*. As long, therefore, as the Cohesion of the obstructed Extremity, with the other Parts of the Vessel which are pervious, remains undissolved, the vital Force acting upon the Place obstructed, causes an Increase of all the Symptoms of the Inflammation; but when a Separation is effected, and a free Passage is opened for the Humours through the dilacerated Extremity of the Vessels, it is very reasonable to conclude, that all these bad Symptoms must be very much diminished. A *Crudeness*, therefore, is known by the Increase or Height of all the Symptoms; and *Maturation*, on the contrary, by their Remission. We have an elegant Description of the whole Affair in *Celsus*, *Lib. 5. Cap. 28.* where treating of Abscesses, he says, "*Crude* is what has in it, as it were, a great Motion of the Veins, attended with a Weight, Heat, Distention, Pain, Redness and Hardness; and if the Abscess be considerably large, there is a Horror, with a slight continual Fever; but if the Suppuration be deeply seated, instead of those Symptoms which otherwise appear on the Skin, the Patient is molested with pungent Sensations. When there is a Remission of the beforemention'd Symptoms, and the Place itches, and becomes whitish, or somewhat livid, the Suppuration is matured."

2. The Hardness and Resistance of the inflamed Part proceeds from the close Compactness of the Liquids and Solids. [See INFLAMMATIO] and while these continue, the Disease is justly said to be *crude*. But *Maturation* requires a Separation of the obstructed Extremities from the other Parts of the Vessels. The more, therefore, the Parts are soften'd, and, as it were, withered, the sooner, and with the less Pain, may this Separation be effected. But if the Part be affected with a violent Phlegmon, it is generally observed, that though the Middle of the diseased Place begins to soften, all the circumjacent Parts retain their Hardness, for which Reason they are to be treated with the like Emollients, as *Celsus* advises us in the Chapter before quoted, where he says, "If the Parts about the Phlegmon are harder than ordinary, they are to be mollify'd with Fomentations of bruised Mallows, or Seed of Fenugreek, or Linseed, boiled in *Passum*."

3. If the Pus generated from the Suppuration of the inflamed Part settles about the Superficies of the Body under the Skin, there is generally a spontaneous Elevation of the Skin into a Tumor, especially if the Place be treated with mollifying and relaxing Medicines: But if the Pus should have a deeper Seat, the Danger is the greater, lest it should have Sinuses in the Panniculus Adiposus; or if it be latent in the interior Parts, it is to be feared that it will communicate a purulent Contagion to the Viscera. As soon therefore, as by the Signs described under the Article INFLAMMATIO, it appears that the Inflammation tends to a Suppu-

ration, we are to try all Methods for deriving the Pus to the exterior Parts. *Celsus*, *Lib. 4. Cap. 6.* treating of the Cure of a Pleurisy, for a violent and recent Pain commends Bleeding; but if that proves useless, or is administer'd too late, he bids us have "Recourse to Cupping or Scarification: A Sinapism, also, prepared with Vinegar, may properly be applied to the Breast, till it raises a Blister, to which a proper Medicine is to be afterwards apply'd, in order to attract the Humours to the Place." And speaking of a Peripneumony, *ibid. Cap. 7.* when arriv'd at its Height, he says, "It may be of Service to apply to the Breast Salt, pounded very small, and mix'd with Cerate, because it slightly corrodes the Skin, and diverts the Impetus of the Matter, which infects the Lungs to the exterior Parts. It may be of good Use, also, to apply a Malagma, of that Kind, which operates by Drawing." If the Pus now totally formed can be conveniently attracted to the exterior Parts, the Event of the Inflammation is not so much to be dreaded: For even in a suppurated Pleurisy, for Instance, the Patient dies either of a Suffocation from a Compression of the Lungs by the Ulcer turgid with Pus, and prominent towards the interior Parts, or of a Rupture of the same Ulcer discharging its Pus into the Cavity of the Thorax, the Consequences of which are an Empyema, Phthisis, and Death. But if the Impostume generated in the intercostal Parts tends towards the superficial Parts, and there rises into a Tumor, an Incision being made therein, and the Pus evacuated, the Patient generally recovers. With this View the ancient Physicians irritated the external Parts with stimulating Medicines, or treated them with highly mollifying Cataplasms or Fomentations, in order to divert the Impetus of the Disease towards the exterior Parts.

4. When the Extremities of the obstructed Vessels, with the stagnant Blood contained in them, by Means of Heat, a Mixture of Humours, and long Settlement in a close Place, are chang'd into a pinguious, white, and homogeneous Liquor, a matured Pus is then said to be form'd. By what Signs we may know the Presence of such a Pus, shall be declared hereafter: But when the Pus is too long confined within this close and hot Place, it grows by Degrees thinner, and at the same Time more acrimonious; and as the small resorbent Veins expand their open Orifices in all the Superficies of the Cavity in which the Pus is contained, they will absorb the same, and, by transmitting it to be mixed with the Mass of Blood, induce a purulent Cachexy, the Consequence of which may be a hectic Fever and Phthisis. Besides, the Pus being render'd more acrimonious, will much injure the whole Superficies of the Place in which it is contained; and being at the same Time attenuated, will very easily find Ways for itself into the Panniculus Adiposus, the Consequences of which are often very bad Sinuses and Fistulas, which are all owing to a Neglect of procuring in Season a proper Outlet for the concocted Pus. Hence, also, we clearly understand the Difference between the Resolution of an Inflammation, and the Cure of it by a Suppuration: For in the Resolution of the Inflammation, the Matter of the Disease is, by Means of the vital Forces and proper Remedies, alter'd in such a Manner, as to become very like what is of a laudable and wholesome Substance, and qualified for Circulation through the Vessels with the other Humours, without injuring the Functions; so that in this Case no Evacuation is required. But when by Means of Suppuration there happens a Separation of those Fluids and Solids which were corrupted by the Inflammation, they are converted into a mild Pus, though quite different from the Nature of our Humours; for which Reason, when mixed with them, it creates Disorders every where, and excites Fevers, until it be evacuated from the Body, or secreted from the Blood by a Translocation, and deposited in some Part of the Body, whence it must again be expelled before a Cure can be effected. If appears, then, that an Evacuation of the concocted Pus is required, and that in a speedy Manner, since the longer it stays, the more acrimonious it becomes. What great Mischiefs and Disorders arise from too long a Detention of Pus in an Abscess; we learn from the Observations of Physicians. A Virgin, forty Years old, had her left parotid Gland suppurated; and on the fourteenth Day of the Disease, the Abscess there generated was elevated to the Bigness of one's Fist. And though in the Beginning of the Disorder the Patient was free from a Fever, and took Care of domestic Affairs, yet at last, for want of a due and seasonable Discharge of the Pus, she was seized with a Fever, attended with very bad Symptoms, as Fainting, Nausea, Watchings, and other pernicious Concomitants, which in a few Days put an End to her Life. The Abscess, indeed, broke of itself a few Days before her Death, but little or no Pus flow'd out of it. *Hilden. Obs. Chirurg.*

Chirurg. Cent. 1. Obs. 39. A Child of three Months old had an Abscess upon its right Shoulder, and the Parents not suffering an Incision to be made in the Place, the Tumor began to subside of itself; but the Pus being reformed, was translated to the Pudenda, where it caused a mortal Gangrene of these Parts. *Ibid. Obs. 81.* Numbers of the like Observations occur in Authors, which shew how dangerous it is to suffer maturated Pus to continue long inclosed in a Vomica.

5. As long as the suppurated Place remains closed, it is called a *Closed Vomica*; but after an Outlet, whether spontaneously or by Art, is procured for the Pus, it is called an *Open Vomica*. But the whole Superficies of the Cavity which contained the Pus, was macerated in the same; whence it must of Necessity have been more or less injur'd by it, especially if the Pus were by Delay and Heat rendered considerably acrimonious. An Union, therefore, and Consolidation of the separated Parts, or a Restitution of these which are destroy'd, can never be accomplished before all that Superficies be reduced to the Condition of a pure Wound; and therefore, the half-mortify'd Extremities of the Vessels, with the half-corrupted Parts of the Panniculus Adiposus, must be separated, and every Thing else be done which is requir'd in Wounds. [See the Article VULNUS.] "Ulcers, says *Hippocrates, Lib. de Ulcer.* before they are cleansed will not unite, though their Lips are brought together; nor will they admit of a spontaneous Coalition. Ulcers, also, whose circumjacent Parts are inflamed, can never unite as long as the Inflammation continues. Or if the Parts surrounding the Ulcers appear black, or if there be any putrify'd Blood, or a *Varix* supplying an Influx of Blood into the Place, in such Cases there can be no Coalition before the circumjacent Parts of the Ulcer are made whole and sound."

6. After Depuration, the Ulcer passes into the Nature of a pure Wound, but with Loss of Substance; and therefore a Regeneration of what is lost, and a Re-union of what is separated, are next to be procured.

Maturation is effected by the Application of such Medicines as,

- I. Increase Motion in the Part affected, by cherishing, stimulating, heating, communicating Heat actually or virtually; they have the like Effect on the whole Body, exciting a slight Fever.

All Maturation of an inflammatory Crude Matter into concocted Pus, must be effected by Means of the vital Forces; for soon as these fail or languish, the Formation of Pus is observ'd to cease. And therefore *Hippocrates, Lib. de Ulcer.* enumerates among the Signs of Death the Exsiccation or Drying up an Ulcer, whether generated before, or during the Time of Sickness: And in the last Stage of a Pthisis, the Spit is diminished, and frequently even ceases, for the like Reason. Now, the vital Force is estimated by the Circulation of the Fluids through the Vessels. Since then the Extremities of the obstructed Vessels are to be separated, together with their stagnant Contents, by the Force of the Fluid pressing upon them forward, the speediest Way of effecting this must be by augmenting the Strength and Celerity of the Motion of the Fluids through the Vessels in the Part which requires Suppuration; for in that Case, the Fluid projected through the Vessels will, within a given Time, act upon the obstructed Extremities with stronger and oftener repeated Strokes, and by that Means destroy their Cohesion. Hence an increased Motion is mention'd under the Article INFLAMMATIO as one Condition requir'd to cause a Tendency in a Phlegmon to Suppuration. It is, however, to be observed, that too swift a Motion of the Liquids through the Vessels causes a sudden Rupture of the Capillaries, instead of a gradual Separation; the Consequence of which is a Gangrene, instead of a laudable Suppuration. A just Moderation, therefore, is requir'd, so as that the Motion in the Part be greater indeed than in a State of Health, and yet not excessive. Now, the Heat of the inflamed Part, if it be on the Superficies of the Body, or the Fever, in a greater or lesser Degree, if the Disease have a deeper Seat, will discover whether the Motion ought to be increased or diminished. If the Motion be too slow or languid, it is to be quicken'd and increased, either by the Application of Topics to the Parts affected, or by internal Remedies.

We have observed under INFLAMMATIO, that a Phlegmon is attended with a Fever, either universal or partial, and therefore the Motion is to be increased in the inflamed Part alone, if it be possible, or in the whole System by exciting a slight kind of Fever. Thus we see in a Pthisis, where Pus

is generated every Day, that the Patient is never free from a slow hectic Fever, which is exasperated while the Pus is generating; but diminished during the Expectoration of the same when generated; and therefore it is said by *Hippocrates*, in the Place quoted under INFLAMMATIO, "That Pains and Fevers are more incident about the Time of the Generation of Pus, than after it is generated." Things qualify'd for answering the aforesaid Intention, are the aromatic Gums, Ammoniac, Galbanum, Opopanax, and the rest; in all which there is a moderate Stimulus, and at the same time a good measure of Tenacity, by which they adhere to the Part to which they are applied. And thus by confining their very subtle Exhalations, they cherish the Part as it were in a Vapour-Bath of their own Creation; and, at the same time, by relaxing the Vessels, insinuate their stimulating Aromatic Principle; which is the Reason why such Remedies are of extraordinary Efficacy in all Inflammations, where, on account of too languid a Motion, we are apprehensive of a Scirrhus. All these Medicines, also, which thus by a gentle Stimulus excite a greater Motion in the affected Part, are at the same time virtually or potentially heating, because a greater Heat is the Consequence of an increased Motion of the Fluids through the Vessels, as is demonstrated under the Article INFLAMMATIO. Those Medicines, also, are very serviceable, which are actually hot, provided their Heat be not so intense, as by dissipating the most fluid Part, to convert the rest into a scirrhous Hardness. The best Heat then, in this Case, is of a humid kind, as when Fomentations and Cataplasms are applied wrapt up in heated woollen Cloths, or the like, by which means the affected Part is fomented and cherished with a continual tho' gentle Heat. For, "A hot Suppuratory, tho' not in all Ulcers, is a very good Sign of a safe State, for it softens the Skin, attenuates, and mitigates Pain." *Hippocrat. 5. Aph. 22.* with other good Effects. Why he says, "Not in all Ulcers," is explain'd by *Galen* in his Comment on this Aphorism, where he says that Heat is prejudicial to putrid and rheumatic Ulcers, by increasing the Putrefaction, and attracting Defluxions.

2. Maturation is promoted by the Application of such Remedies as restrain the excited Motion and Heat to the Place affected, by glutinous emplastick Substances, which prevent too great an Exhalation and Dissipation, and by Lenitives correcting an Excess of Acrimony.

The inflamed Place is always hotter than it is usually in a State of Health; and since all the Symptoms of an Inflammation are increased, when it tends to a Suppuration, the Heat must be so too before the Abscess be formed. But by an Increase of Heat the most liquid Part of our Humours is dissipated, whence it must be highly beneficial to apply such Things as cherish the Part affected by a continual Humectation, and restore what is dissipated by the increased Heat. Hence those Remedies must be of extraordinary Service, which are able to retain a large Quantity of Water, and will not easily part with it. But such is the Nature of all glutinous Things, which with Water will form themselves into a ductile Paste, as will all farinaceous Substances, and particularly the Meal of Linseed, which will absorb a vast Quantity of Water. Of Things of the like Nature are formed highly emollient Cataplasms, of which there are various *Formulae*. And if the Place which requires Suppuration be kept Night and Day well wrapt up in them after the Manner prescribed, especially if Care be taken that they may be always warm, all Inflammations which will not admit of Resolution, are generally speedily enough maturated, and converted into good Pus. And since all these Remedies have, besides their moistening Quality, an emollient Virtue, and relax the solid Parts of the Body, they must in an extraordinary measure mitigate the Pain which attends the Suppuration, and is generally pretty sharp; and besides exert their lenient Virtue, by inviscating and obtunding all manner of Acrimony; in which last respect they are of Service, because a mild Disposition of the Humours is requir'd in order to a Suppuration, as we have observ'd under INFLAMMATIO. And since there is great Danger here of a Degeneracy into a Putrefaction, on account of a Stagnation of the Fluids in the obstructed Vessels contiguous to the others, and the increased Heat, for this Reason we take care to select such Topics, as by the Heat of the Part to which they are applied are in a short time so alter'd, as to become of a Nature quite opposite to Putrefaction, or to acquire an acescent Quality. With this View our Surgeons add to their maturating Cataplasms the Meal of Rye, which very soon becomes acescent, Vinegar itself, Sorrel and the like. They, also, use to add fresh Butter, Oil of Linseed, or the like remarkably

markably soft and pinguious Substances; partly because by obstructing the Pores of the Skin, they prevent the Diffipation of the Humid; and partly, because, by these Additions, they take care that those Cataplasms shall not become too soon dry.

Suppuratives, or Remedies effecting a Maturation into Pus, are,

1. Simple aromatic Gums, such as Gum Ammoniac, Bdellium, Elemi, Galbanum, Opopanax, Sagapenum.
2. Emollients, Relaxers, Moisteners.

Formulae to these Purposes occur under the Article ABSCESSUS.

3. A third Means of promoting Maturation is, by moderating the Motion and Temperament of the whole vital Fluid, in such a manner, as that it may neither be too sluggish, nor too much exalted.

This Rule is of the greatest Importance in the Practice of Medicine, with respect to the Cure of internal as well as external Diseases. The accelerated Motion of the Humours causes a Tendency of the Phlegmon to a Suppuration; but too great a Degree of Acceleration, by suddenly destroying the very tender Texture of the capillary Vessels, produces a Gangrene; as, on the contrary, a sedate and moderate Motion is what takes place in the Resolution of an Inflammation. While there are Hopes, then, of a Resolution, the Physician makes no Scruple of checking the Impetus of the vital Liquid, by such Remedies as have been mentioned under the Article INFLAMMATIO, in order to prevent any farther Injury of the inflamed Vessels. But when he perceives by undoubted Signs that a Resolution is impracticable, he knows that a greater Degree of Motion is always requir'd than is natural in a State of Health, for separating the obstructed Extremities of the Vessels, and converting them, with the extravasated Humours, into good and laudable Pus; and is therefore sensible, that such Methods as give too great a Check to the Impetus of the Circulation may oftentimes be prejudicial. In this Case, therefore, either by means of internal Remedies; or the Application of Topics, we are to endeavour such a Regulation of the Circulation of the Humours through the Vessels, as will produce in the Place which is to be suppured a greater Heat and quicker Motion than is consistent with a State of Health, but not in so intense a Degree as by a sudden Destruction of the minute Vessels, wholly to deprive the Part of the Influx of the vital Humours, and by that means induce a Gangrene. And such a Regulation is known to be made, if the Heat in the Part inflamed exceeds that in Health, but not much; if there be a Pain, but not intense; if a moderate Pulsation may be perceived; and if the Tumor, Redness, and other Symptoms of an Inflammation increase indeed, tho' but slowly and by due Degrees. The Signs, then, which are afforded by the very Part affected, indicate whether the Motion of the vital Fluid is to be augmented or diminished. But when the Inflammation is so very considerable as to disorder the whole Body, in such a Case the Greatness of the Fever, the Thirst, with the Dryness of the Tongue, are plain Indications of what ought to be done, in order to obtain that just Regulation which is requir'd. Now there is no universal Suppurative; but different Remedies are necessary, in proportion as the Motion of the Humours is to be increased or diminished. For a hot and juvenile Constitution, a Cataplasma composed of Oatmeal, Milk and fresh Butter, will be proper to be applied to the Place which is to be suppured; for the Melancholic, Aged, and Persons of a cold Temperament, Bulbs of Onions roasted under the Ashes, Galbanum, Gum Ammoniac, and the like Stimulants are added, that by quickning, in some measure, the Motion of the Fluids, the Suppuration may succeed the better, and a Scirrhus be avoided, which otherwise often happens in such a Circumstance, if the Inflammation seizes the glandulous Parts of the Body. The same Regulations are to be observed in internal Inflammations. Thus in the Beginning of a Pleurisy, Bleeding boldly administer'd, even to Fainting, often removes the Disease; but when, for want of timely Assistance, the Physician perceives that the Cure cannot be effected by a Resolution, he knows that the only Way left for a Recovery is, by a Concoction of the morbid Matter, and an Evacuation of the same when concocted by Spitting, Urine, or other Ways, or a Conversion of it into an Abscess. But to attempt a Cure, in such a Circumstance, by Venesection, or other Evacuants, which must of Necessity highly weaken the vital Force, cannot but prove to the Detriment of the Patient, since the Case requires a moderate Fever for the Maturation of the crude inflammatory Matter.

The Use of the Decoction under the Title of *A thin aromatic Liquor to be drank warm*, found under the Article INFLAMMATIO, will answer the Intention of exciting a sufficient Motion.

4. The Intention of Maturation is answered by keeping the Place closed, till all the inflamed irrefoluble Matter be suppured; and this is a fourth Method, which, with those before prescribed, will not fail of procuring good and laudable Pus in the Part affected.

It often happens in a large Abscess, that the Middle becomes soft and yielding to the Touch, when the greatest Part of the inflamed Tumor, which lies more remote from the Center, continues hard. But because many Disorders are consequent on keeping the Place too long closed, after the Generation of the Pus, the Surgeon is therefore often intent on opening such Tumors as soon as he perceives the least Fluctuation. But all the pernicious Consequences observed to proceed from a delayed Evacuation of the Pus depend on the Putrefaction and Acrimony which it acquires by long Continuance, whence, as it increases in Quantity, it works out Passages for itself into the *Panniculus Adiposus*, and produces Sinuses and Fistulas; or being attenuated, is absorb'd by the bibulous venous Vessels, and by this means infects the Blood with a purulent Cacochymy; or, lastly, having its thinner Part diffipated, the rest is condensed, and forms scirrhus Tumors, especially about the glandulous Parts. But as long as the Place remains closed, and the Air has no Access to it, there can be no sudden Degeneracy into a Putrefaction; and while the Pus is contain'd in a Cavity whose circumambient Parts are all hard, it will not easily insinuate itself into the *Panniculus Adiposus*; nor will there be any great Fear of a Resorption of the attenuated Pus, since the arterial Vessels, which are distended by the inflammatory irrefoluble Matter, compress the adjacent Veins. Besides the very Pus itself, which is lodg'd in this half-ripen'd Abscess, affords a very good Remedy for the Resolution of the crude and hard adjacent Parts; while, by its Heat and long Residence, it induces in them a Colliquation, which Manner of Expression is used by *Hippocrates, Lib. de Cap. Vuln.* where he says, ἀνέστη γὰρ τὰς σαρκὰς τὰς φρασθείσας καὶ κοπίσας πῦρ ἡνιμενὲς ἐλάττωται, "for the contused and lacerated Flesh must of necessity be converted into Pus and consumed." For Pus generated in a Wound resolves the semilacerated Parts, and the inflamed Extremities of the Vessels, together with the contained Liquids. It appears, then, of how great Benefit it is to leave the suppuring Place close or unopened, till all the inflamed crude Matter be matured; for in so doing we imitate Nature, which best performs her Work of Suppuration, when the Place to be suppured is closed up. Thus in a recent Wound, where the Parts are divided, after the Flux of Blood is ceased, a bloody Crust is formed upon the Cavity of the Wound, and under this Covert, by a gentle Suppuration, is the Surface of the Wound depurated. Hence *Hippocrates*, who always follows Nature, has established it as a Maxim in Medicine, 6 *Epid.* "Whatever requires Concoction is to be closed up; but the contrary to this is to be kept open and dry'd."

When the Methods prescribed under these four Heads are observed, the Consequence is the Generation of a good Pus; the Qualities of a good and laudable Pus may be found under INFLAMMATIO.

Unless the Matter of the Inflammation be thus changed as is above described, the opening of the Abscess is both useless and dangerous.

If the inflammatory Tumor be opened before it comes to perfect Maturity, no Pus, but pure Blood, is discharged, as is observed under INFLAMMATIO; or if any Part of it be changed into Pus, when that is evacuated, the rest is indurated, and is with more Difficulty, and after a larger Space of Time, brought to Maturation. And besides, when an Incision is made in such Tumors while they are crude, the Pain is much sharper, and the greater the Danger of injuring the subjacent Parts. For in a mature Abscess, the collected Pus elevates the Skin above the Parts which lie under it; and therefore it may be safely opened, since the Point of the Lancet, after perforating the Skin, enters a hollow Place full of Pus; whence there can be no Danger of hurting the Vessels or muscular Fibres. For this reason, *Celsus, Lib. 7. Cap. 2.* treating of Abscesses in nervous Parts, says, "That Abscesses in other Places may be opened somewhat crude, but with respect to those among Nerves, the last Degree of Maturity is to be expected, till the Skin be extenuated, and the Pus brought near to it, that it may be the more easily come at." The same Regard is to be had of these Places where the large Blood-Vessels have their Course; as for instance, the Groin, and under the Arm-pits, where such inflammatory Tumors often occur, and require

quire Suppuration. For no prudent Artift will venture to open fuch Abfcelfes before they are perfectly ripe, fince the great Veffels, or fome confiderable Branches of them, may very eafily be injured, to the vaft Detriment of the Patient, upon fuch Incifion; and how much the Cure is retarded, and the Pain augmented, by opening a crude Abfcels, the Observations of the beft Surgeons will inform us. A Man of Quality, after a Fever, had an inflammatory Tumor under his Arm-pit, which was very painful. The Surgeon, who had the Care of it, defpifing the Advice of wifer Perfons, as foon as he perceived a flight Fluctuation in the Tumor, made a deep Incifion in it with his Lancet, which was very painful to the Patient, who received no Relief from the Difcharge of a very fmall Quantity of Pus on that Occafion, but, on the contrary, had his Fever and Inflammation increased. After long Application of the moft emollient Cataplafms, the Place was at laft healed; the Cure of which might have been accomplished in a few Days, if the Tumor had not been opened in a rash manner before perfect Maturation. *M. de la Motte*, in his *Traité Complet de Chirurgie*, Tom. I. gives feveral Inftances which confirm the Truth of this Observation. So I have fometimes feen venereal Buboës too foon lanced, for fear of a Lues, on account of the long Retention of the Pus; produce very troublefome Confequences; by which means the Cure has been protracted many Months, while the Surgeon was obliged to ufe Corroſives, to confume what the Pus, if left alone in its clofed Cavity, would moft certainly have refolved in a few Days. It is to be obſerved, however, that in Abfcelfes there often happens to be fomewhat of a Hardnefs in their outer Margin, when their other Parts are perfectly maturated. But when fuch Tumors break spontaneously, and the Pus is by that means all evacuated, thefe hard Reliques uſually waſte away and vaniſh; and therefore the Opening of fuch Tumors as thefe would have produced no bad Effects, becauſe they were already fuppurated in almoſt every Part.

A Softnefs of the Part, a Fluctuation of the Tumor when preſſed, its Whitenefs, a Remiſſion of the Pain, Heat, Rednefs, Tenſion, Pulſation and Fever, the Head or Top of the Tumor mucronated, and a Weight ſucceeding the Pain, are Indications that the Pus is maturated, and diſpoſed for Evacuation.

As it is dangerous to open the fuppurated Place before perfect Maturity; and, on the other hand, the Confequences of too long a Retention of the Pus in a cloſed Place, are many and pernicious, the greateſt Attention is due to thoſe Signs, which ſhew, that the Pus which is now formed and collected in the Abfcels, may be diſcharged with Advantage. Now theſe Signs are deduced from an Alteration of the Phænomena, in the fuppurated Part, while the irrefoluble inflammatory Matter is changing to perfect Maturity.

A Softnefs of the Part. It has been demonſtrated under the Article INFLAMMATIO, that in a Phlegmon there is great Hardnefs proceeding from a cloſe Compactnefs of the Solids and Liquids together, becauſe the condenſed Blood ſettles in the Veſſels, which remain as yet entire, tho' obſtructed. But when the diſtended Veſſels, while the Phlegmon is under Suppuration, are broken, the Liquids extravafated, and the tenderſt of the ſolid Parts ſuffer an Attrition, Reſolution and Change into Pus; the Hardnefs muſt of neceſſity be ſucceeded by a Softnefs, ſince we have now a fluid and not a hard and crude inflammatory Matter under the Skin. Bodies may; alſo, be vaſtly hard, tho' conſiſting for the moſt part of Fluids, provided they are contained in diſtinct Veſſels, and are not confluent into one Place; as we find by Apples, Pears, Turneps, and ſome other Fruits, which, tho' they contain an extraordinary Quantity of Juice, are yet oftentimes very hard; but when they are bruifed, they become a very ſoft Pulp, as they do, alſo, when placed pretty near the Fire; for then the elastic Air, latent in theſe Fruits, being rarified with the Heat, breaks the Veſſels, which cauſes an Effuſion of the Humors, by which a very hard Apple may within a Quarter of an Hour become ſo ſoft as to be almoſt fluid; and the ſame happens, if the Continuity of the Veſſels in theſe Fruits be diſſolved by means of Putrefaction.

A Fluctuation of the Tumor when preſſed. The Surgeon, in order to aſſure himſelf that the inflamed Place is equally fuppurated, uſes to apply his Fingers to the Tumor, and gently preſſes it, now on this, now on that ſide; and if while he preſſes it on one ſide, he perceives an Undulation of the contained Humour on the Side oppoſite, he ſatiſfies himſelf that the Tumor is ſufficiently maturated in all its Parts. But where ſuch a Fluctuation is not perceived, tho' it appears to be ſoft on both ſides, there may be ſtill ſome crude inflammatory Matter in the middle of the Tumor, which may prevent the Impreſſion made on one ſide from being commu-

nicated to the oppoſite Part. That there are ſuch Abfcelfes, which are in a manner divided into two, by remaining crude in the middle, while the outer Parts are maturated, we learn from ſurgical Obſervations. And the ſame was obſerved by *Hippocrates*, *Epid.* 6. where he ſays, that "Tubercles externally protuberant, elevated to a Head and ſtagnated, equally maturated, neither hard in the Extremities, bending downward, nor biſid, are of the better ſort; but the contrary to theſe are bad, and the moſt contrary worſt of all." And *Galen*, in his Comment on the Place, ſays, that "in biſid Abfcelfes, the middle is never without Fault, as being crude [*ἀνενόητος*]" "unſuppurable and hard." It is true indeed, that a mature Abfcels has this Fluctuation in common with Aneurifms, and ſome ampullous Swellings containing Humours; but an Abfcels is very well diſtinguiſhed from them, in that it is preceded by an Inflammation. It is plain enough, that the Fluctuation of a preſſed Tumor cannot well be perceived, unleſs the Tumor be eminent; for while the Abfcels is latent in the *Panniculus Adipoſus*, deeply ſituated among the Muſcles, it is not eaſily diſcovered by this Mark of Fluctuation.

Whitenefs. It has been demonſtrated under the Article INFLAMMATIO, that a Rednefs ought to accompany an Inflammation, becauſe the obſtructed and dilated Veſſels are replete with a red thick Blood. But when all that thick inflammatory Matter, together with the obſtructed Extremities, are changed into a white and equal Pus, the Cauſe of a Rednefs no longer exiſts. Beſides, while the Pus from within, and the moſt emollient Fomentations or Cataplafms from without, are macerating the Skin, it decays in a manner, and acquires a white Colour; for when a Plaſter of any ſort is applied, the Skin being under a continual Fomentation from the reflected Vapour of the exhaling Liquid, becomes thoroughly white in a few Days, and being inſenſibly waſted and extenuated, appears at length of the Colour of the ſubjacent Pus. We ſee then the Reaſons why a white Colour is juſtly reckoned a Sign of the Maturity of an Abfcels. *Celfus*, *Lib.* 5. *Cap.* 28. treating of Abfcelfes, ſays, "that ſuch as become ſofter on a ſudden, are of the moſt favourable Sort; as are thoſe which have their red Colour fading into a white; and theſe are Signs that Pus is actually forming; for a Tumor and Rednefs were long pre-exiſtent."

A Remiſſion of the Pain, Heat, Rednefs, Tenſion, Pulſation and Fever. All theſe Symptoms of an Inflammation are produced by the Blood impelled by the vital Force, and with an increased Impetus and Celerity preſſing upon the obſtructed Extremities of the Veſſels, an Account of which is found under the Article INFLAMMATIO. When, therefore, the Extremities of the Arteries, which were obſtructed are by the Suppuration, ſeparated, the Cauſe of theſe Symptoms ceases, and conſequently the Symptoms themſelves diſappear, or at leaſt are very much diminished. Hence *Hippocrates*, 2 *Aph.* 47. already quoted, juſtly obſerves that "the Pain and Fever are more intense at the Time when the Pus is generating, than when it is generated." It is, however, to be obſerved, that the Pain is ſometimes very acute, tho' the fuppurated Part be perfectly maturated, becauſe the Collection of Pus, which is every Day augmented, diſtends the incumbent Skin, and more and more dilacerates it; but this Pain has its Original, it is plain, from another Cauſe; and when the Abfcels breaks ſpontaneously, or when perforated by the Lancet, it ceases immediately. *Celfus*, therefore, in the Place before quoted, after enumerating the Symptoms by which an Abfcels is known to be crude, preſently ſubjoins, "But when theſe are remitted, and the Place itches, and appears whitith or ſomewhat livid, the Suppuration is mature." But we muſt here obſerve, that tho' the Skin, when the Abfcels is mature, be generally whitith, yet the cutaneous Veſſels are ſometimes compreſſed by the diſtending Pus to ſuch a Degree, that all vital Influx and Efflux of the Humours being quite ſuppreſſed, the Skin begins to gangrene, and acquires a ſomewhat livid Colour. The like Signs of a mature Abfcels we have in *Ægineta*, *Lib.* 4. *Cap.* 18. where, after enumerating the Signs of an inflamed Part tending to Suppuration, he tells us that "After the Abfcels is come to its Height, many of theſe Signs are mitigated, the Part is affected with a prickling kind of Itching, a Numbnefs is felt, and the Tumor riſes into a ſharp Head, which is ſoft, and yielding to the Touch, and has its Surface near the Head abraded [*ἀνενόητος*]." Here he remarks that the Skin on the mucronated Top of a mature Abfcels ſecedes *per Strata*, by a ſort of Excoriation.

The Top of the Tumor is mucronated. When the Phlegmon begins to mature by Suppuration, there is almoſt conſtantly perceived a Softnefs and Fluctuation in the Middle, tho' the exterior Parts remain ſtill hard. For ſince the moſt emollient Cataplafms are uſually applied to promote the Suppuration

ration, the relaxed Integuments in this Place will give way to the Pus as it gradually increases, and be extended beyond the equable Superficies of the Tumor, because the greater Hardness of the rest of the Parts prevents their easy Extension. For this Reason the mucronated Top of the Tumor will be eminent above the other Parts; and in this Place, the Integuments being gradually distracted and weaken'd, the Abscess will break spontaneously, or may be very safely open'd with the Lancet.

A Weight succeeding the Pain. We have already observed, that the Pain increased as long as the inflamed Part was under Suppuration; for the Extremities of the obstructed Vessels must be separated by Degrees, and, consequently, when the nervous Fibres, dispersed through the Coats of the Vessels, are just about to break, the Pain must be sharpest, but will cease after an intire Rupture. But when the Abscess is broken, there will appear a Collection of Pus without the Vessels, lodged either in a Cavity preternaturally produced, or in a natural Cavity enlarged, and this Pus with its Weight presses upon the Parts on which it settles. For a Person in Health, tho' he feels not the Weight of his own Body, yet, as soon as there is a Collection of extravasated Humours, he will immediately be sensible of their Weight. When the Vessels are broken by a violent Contusion, and there is a Collection of Blood in the *Panniculus Adiposus* under the entire Skin, the Patient presently complains of an unusual Heaviness of the Part. When the Legs are distended with an Accumulation of Serum in the Anasarca, the miserable Patients move their Limbs as if they were oppressed with Weights of Lead. But this Sense of Weight takes place only where there is a considerable Suppuration, as is easy to imagine; and in internal Diseases the principal Sign of a latent Abscess is the Sense of a dead Weight, succeeding an acute Pain in the affected Part; as it happens in a Pleurisy, Peripneumony, and the like Diseases.

If the Pus be then suffer'd to remain long in a close Place, it becomes thin and acrimonious, putrefies, increases, corrodes and consumes the neighbouring Parts; and by its Bulk, Weight and Motion, creates various kinds of Sinuses and Fistulas in different Parts, particularly very pernicious ones in the *Intestinum Rectum*; or else, the thinner Part being dissipated, the rest becomes indurated, and forms hard Tumors, especially about the Glands; or lastly, being absorbed by the lymphatic Veins, or Blood-Vessels, through their corroded Orifices, it is mix'd with the Blood, which it contaminates, and forming Collections in the Viscera, corrupts those Parts, disorders their Functions, and produces numerous Diseases, and those very severe and dangerous.

When it appears, by the Signs before enumerated, that all the inflammatory crude Matter is matured, and converted into good Pus, that Pus is as soon as possible to be evacuated; since after it is arrived at its ultimate Perfection of Whiteness, Thickness, Smoothness, Equability, and Want of Smell, it begins to degenerate, and alters every Day for the worse. For it settles without the Vessels, and is no longer subject to the Laws of Circulation, but stagnates; and through the Heat of the Place, undergoes a spontaneous Change, by which it tends to Putrefaction. For tho' in a close Place, where no Air is admitted, all animal Parts are slower of Corruption, yet they putrefy. Besides, a greater Thinness is observed to be produced in our Humours, by means of Putrefaction; for Blood discharged from the Veins immediately concretes, but when afterwards it becomes putrefy'd, it is entirely dissolved. The Bile in the Gall-bladder in sound Animals, which are at rest, is of a thick Consistence, but in putrefying dissolves into a thin Substance. For the same Reason Pus, if too long retained in a mature Abscess, loses that Unctuousity, and balsamic Viscidity, in which Respect it pretty well resembles Cream, and is changed into a thin, ichorous Fluid; and this Thinness, which increases in putrefying, is always attended with a greater Acrimony. The whole Superficies, then, of that hollow Place in which the Pus render'd thus thin and acrimonious, is contain'd, being continually soaked in a thin and corroding Ichor, the tender Extremities of the Vessels which have their open Orifices disposed on the Surface will be destroyed, and the extravasated Humours corrupted, whence the Sides of the containing Cavity being corroded, the Extent of the Abscess will be enlarged, and the Quantity of the Pus increased by the Conflux of the Humours through the corroded Vessels. Now we have numberless Instances from the most approved Authors which prove, that the solid Parts of the Body have been corroded by Pus too long suffer'd to settle, and become putrefied. We read in *Schenkius, Obs. Medic. Lib. 2.* that after an Empyema the Lungs have been consumed to such a Degree, that there have been scarce any Remains left of that noble Bowel. The same Author gives us another Example, where not only the Pericardium, but

the very Substance of the Heart itself, tho' of so solid a Contexture was corroded by the Pus. And it is a general Complaint and Observation among Surgeons, that solid Bones have been corroded, and converted into a Caries in deep Suppurations. Hence we see the Reason why *Hippoc. 7 Aph. 47.* says, that those who are affected with an Empyema, and from an Operation of Cutting or Burning have a Discharge of white and pure Pus, recover; but if the Pus be bloody, feculent, or fetid, the Patient dies. And in the next Aphorism he tells us, that those who labour under a Suppuration of the Liver, and being burnt for the same, have an Efflux of Pus resembling Amurca, or Lees of Oil, die of the Disease; for such a Pus indicates a Corrosion of the very Substance of the Viscera, the Effects of which must, of Necessity, be fatal.

Besides, since an Inflammation is generally seated in the *Panniculus Adiposus* [See INFLAMMATIO.] the Suppuration of it must have the same Situation. But the extraordinary tender Contexture of this Membrane makes it very easy to be corroded by the Pus, when grown acrimonious; and even the very Weight and Bulk of the Pus, by long Settlement, in so easily dilatable a Substance, will distend it, and work out for itself new Ways and Sinuses of a very dangerous Nature. It has been demonstrated under the Articles *CAPUT* and *THORAX*, that the Ingress of the Air into the *Panniculus Adiposus* has caused such an Inflation of it, as to distend the whole Body, whence it appears that there is a Passage from every Part of this Membrane, through almost all its Circumference. And I have observed, that when the Parotid Gland has been suppurated, for want of procuring a Vent for the collected Pus, the same has made a Passage for itself in the *Panniculus Adiposus*, descending by the Neck, Shoulder, and Arm to the Flexure of the Cubit, where it corrupted the Ligaments to such a Degree, as to cause an incurable Ankylosis. A deep Inflammation near the Joint of the Thigh was succeeded by an Abscess, and when the Pus, which lay latent under the large Muscles, could not be discharged, it made its Way downwards, and formed a sinuous Ulcer, which extended itself through the whole Length of the Thigh and Leg; and, in the End, by inducing a purulent Cacochymy, after trying in vain all manner of Remedies, proved mortal to a very hopeful young Gentleman. If it be, also, consider'd, that the Pus, which is thus collected in the *Tunica Cellulosa*, being attenuated by Heat and long Settlement, is frequently incumbent on some of the strongest Muscles, we shall easily be convinced, that when it is pressed by the Motion of these Muscles, it may be propelled through all the neighbouring Places, and by that means be the Cause of deep Sinuses, and very bad Fistulas, especially when in creeping through the *Panniculus Adiposus*, it insinuates itself into the Interstices of the Muscles. And the greater the Thickness of the *Panniculus Adiposus*, and the more numerous the Strata, or Lays, of the Muscles, incumbent on one another, the worse are the Sinuses formed by the Retention of the Pus; for which reason, in the Abdomen, because of its extraordinary Fatness, intermixed with the various Strata of the abdominal Muscles, we meet with such troublesome Sinuses and Fistulas.

But there are no worse Sinuses and Fistulas, from too long a Retention of Pus, in any Part of the Body, than about the *Intestinum Rectum*. For since that Part is appointed as a Passage for the very grossest of the Fæces, it was necessary that it should be easily distended all around its whole Compass, for which End it is surrounded with a very soft and copious Fat, whence it is that Pus, if long retained in an Abscess form'd in this Place, will be capable of producing very deep Sinuses. "For the putrid Matter [omitted] corrodes the soft Parts, says *Hippocrates, de Fistulis Cap. 1.* and as the *Intestinum Rectum* is humid, and of a soft Flesh, it feeds in it till the Tubercle be broken, and the Parts beneath towards the Anus appear putrefy'd." And if the *Intestinum Rectum* itself should happen, also, to be corroded, the Pus will be capable of diffusing itself through the cellular Membrane and mucilaginous Cavities of the *Intestinum Rectum*, and produce very tedious and troublesome Disorders, which are much increased by the Fæces defiling every thing in their Passage this Way with their Impurities. *Hippocrates*, in the Book before quoted, being apprehensive of such bad Consequences, directs us not to wait till the Tubercles in those Places be quite mature, but speedily to open them while they are yet crude.

Or else the thinner Part being dissipated, the rest becomes indurated, and forms hard Tumors, especially about the Glands.

This is sometimes, tho' not often, the Consequence of too long a Retention of Pus, especially when the Abscess is treated with very hot Remedies, without a Mixture of Emollients and Moisteners. Thus it is usual for Women to expose their suppurated Breasts to the Heat of burning Coals, to avoid the Opening of a mature Abscess by the Surgeon's Lancet. The thinnest Part of the Matter is by this means evaporated, and

the inspissated Remainder hardens into a Scirrhus, and the Patient lives for the future in continual Fear of a Cancer, which is often the Consequence. The like Hardness often remains after opening venereal Buboës before their due Maturation, or when they have been treated with too heating Remedies. Very good in such Cases is the Advice of *Galen, M. M. Lib. 14. Cap. 4.* where treating of the Cure of an Erysipelas and Phlegmon, when there was Reason to apprehend a Scirrhus consequent upon these Disorders, he says, "Whoever should attempt to evacuate them by violent drawing and discurfve Remedies, instead of endeavouring to soften and dissolve them by moistening and heating Medicines, will flatter himself for the first Days, that the Patient is in a very fair Way of Cure; but the Disease will leave Reliques which are incurable, since the thinner Parts of the morbid Matter being dissolved, what remains turns to a kind of stony Concretion." *2. Lib. 1. Cap. 1.*

Or, lastly, being absorbed by the lymphatic Veins and Blood-Vessels, through their corroded Orifices, it is mixed with the Blood, &c. It is observed under the Article VULNUS, that Pus in Wounds is generated from an Effusion of the Humours through the Extremities of the Vessels, their inspissation by their Settlement, and the Resorption or Diffipation of their most fluid Parts. For if the Wound be deterged every Hour, you will find no Pus, but only a thin Humour, which in the Space of twelve Hours will be converted into Pus. The most fluid Part of the extravasated Humours seem indeed to be rather reformed by the Mouths of the Veins, than diffipated outwards, because good Pus is seldom generated, unless the Wound be well covered with Plaisters or Ointments; and over all the Surface of the Wound are dispersed the gaping Orifices of Veins, as well as Arteries, which absorb the contiguous Humours with the same Force as the smallest Glass Tubes attract Liquors, convey them to the larger Veins, and so mix them with the Blood. By the like Method of Reasoning, Pus long retained in an Abscess will be spontaneously attenuated, and being deprived of its mild and gentle Nature, will become acrimonious; and being reformed by the contiguous Orifices of the Veins, will infect the Blood with a purulent Cacochymy, productive of a hectic Fever and Phthisis. That Pus collected in a Cavity of the Body is capable of a Resorption by the Orifices of the Veins, and by that Means of being mixed with the Blood, we are convinced by Multitudes of Instances. A Person of Quality, in a Battle, was shot through the Elbow with a leaden Bullet, by which the Bone of the Elbow was fractured, and the Consequence of the Wound was a continual Fever, attended with many very bad Symptoms, and a considerable Abscess, which occupied the Place of the Wound and the adjacent Parts. When it was agreed among the Surgeons to open the Abscess, which was now grown mature, the Patient was seized with a violent Diarrhœa, and immediately the Tumour of the wounded Part quite vanished, and a vast Quantity of Pus was observed to be evacuated by Stool. And whenever afterwards the Wound happened to swell with an Accession of new Pus, it was in like manner evacuated by a supervening Diarrhœa; and by this Means, the Wound, tho' dangerous enough, was cured. *Belleste, Chirurg. d'Hôpital.*

• A Man who had received a Wound which perforated the Abdomen, was observed by *Scultetus, Armament. Chirurg. Observ. 61.* to have his Urine mixed with a great Quantity of Pus, the Excretion of which was succeeded by a Mitigation of all the Symptoms. *Galen, de loc. affect. lib. 6. cap. 4.* observed an Imposthume of the Lungs cleansed and purged off by Urine, and another in the Thorax which had its Expurgation through the Intestines by Way of Stool. A Vomica of the Lungs, with a Distortion of the Spine, was cured by a purulent Dysentery, which lasted several Days, tho' the great Weakness of the Patient, and a Multitude of other very ill Symptoms, had defeated all Hopes of Recovery, in the Opinion of the most experienced Physicians; and, what is more surprising, the Patient, who was a young Woman, was by this Means not only rescued from imminent Danger of Death, but had the Distortion of her Spine spontaneously removed. *Memoires de l'Acad. des Sciences, An. 1731.* In the Small Pox, a Resorption of the Pus is usually observed to excite very bad Fevers; after which there is frequently a Congestion of that Pus in some Part or other of the Body, where it rises into Tumours, which opened, discharge true Pus, and sometimes degenerate into very bad Ulcers. We meet with a vast Number of Instances, in the most credible Authors, which assure us that Pus too long retained in a close Place may be absorb'd by the Veins, and mixed with the Blood, and afterwards be deposited in various Places of the Body; and at the same time it appears that the Event is very doubtful in these Cases, depending on an Uncertainty, whether this Congestion of Pus secreted from the Blood, happens to fall on this or that Part of the Body. For tho' in the Ex-

amples just related, the Pus was, very fortunately for the Patients, discharged by Stool and Urine, yet the Viscera are always in great Danger of being corrupted by some pernicious Collection of the purulent Matter, or it is to be feared that the whole Mass of Blood with which it is mixed, should be so depraved by it, as to give Occasion for the Production of incurable Diseases. For the Collection of Pus in the closed Abscess will scarce be reformed, unless it be first reduced to a considerable Degree of Thinness and Acrimony; and after it is mixed with the Blood, and flows through the Vessels, it acquires a still greater Acrimony, the Consequences of which may be very bad Fevers, Corruption of the Blood, and other Disorders without Number. From this Cause it so often happens in the Small Pox, that when the Patient is judged to be out of Danger, a high Phrenzy is on a sudden excited, and succeeded in a short time by Death, the Pus being reformed into the Blood, and its Course turned upon the Brain. We have an Instance to this Purpose in *Hippocrates, 7 Epid. Ægr. 30.* where he describes the Case of one who laboured under an internal Suppuration, and by the Signs, which were a Stertor of the Breast, and a Difficulty of Respiration, seemed to have a great Collection of Pus within. "About the sixtieth Day, he tells us, the Left Eye was blinded by a Tumour, without Pain, and not long after the Right Eye, also, was in the same Condition, and the Pupils of the Eyes became very white and dry, and in a short Time after this Blindness, not more than seven Days, the Patient died in a Stertor, and a high Delirium." In this Case it seems very likely that the reformed Pus had by an unhappy Metastasis, its Course first diverted upon the Eyes, and from thence upon the Brain, where it proved fatal. The Diseases proceeding from these purulent Collections are various, according to the different Viscera where they settle themselves, while by pressing on the Parts, and corroding them by a greater or lesser Degree of Acrimony, they either disturb, or wholly destroy their Functions. It appears, also, from the Premises, that the highest Prudence is necessary in such Cases; for an Abscess opened too soon, before all Things have acquired their due Maturity, may be very detrimental to the Patient, as has been shewn before; and again, if a Vent be not given to the mature Pus, very dangerous Disorders may possibly be the Consequence. The Signs of perfect Maturation are already given under this Article.

It is this Resorption of Pus, which proves so often fatal to those, who by the Amputation of a Limb, or Exsection of an Ancurysm, have received a large Wound, which generates every Day a great Quantity of Pus. For if the Pus, which is collected on the Surface of the Wound, be frequently deterged, the Body is deprived of almost all its Nutriment, which passes off this Way, and so the Patient wastes away in a Marasmus. On the other hand, if the Pus be left too long on the Surface of so large a Wound, it is reformed, and induces a purulent Cacochymy, with all the Mischiefs which may proceed from it, unless by drinking Decoctions of detergent Vulneraries, great Part of the Pus mixed with the Blood be evacuated. Sometimes the Patient is too weak to bear the drinking a sufficient Quantity of these Decoctions, but becomes hydropic from their Use, in which Circumstance he very seldom recovers.

By the same Methods with which Maturation is procured, are the Integuments of the suppurated Place, both above and beneath, together with the adjacent Parts, mollified, attenuated, and relaxed.

When an Inflammation cannot be cured by a kindly Resolution, Suppuration only is to be chosen, for obtaining which the six curatory Indications mentioned in the Beginning of this Article are required. For, in the first Place, the inflammatory crude Matter is to be reduced to perfect Maturation. Of this we have already treated, as also of the Signs by which we are assured that the Maturation is accomplished; and we have just now enumerated the bad Consequences which are to be dreaded, when a mature Abscess, full of good Pus, is left too long closed. The second curatory Indication was, that the Place which required Suppuration, together with the adjacent Parts, may be mollified.

An Inflammation generally affects the Membrane called *Panniculus Adiposus*, or *Tunica Cellulosa*. [See INFLAMMATIO.] The thick Skin, with the Epidermis, are incumbent on this Membrane, almost throughout the whole Surface of the Body; and they must either be perforated, or break of themselves, to give a Vent to the mature Pus; hence it appears to be highly requisite that these Integuments should be relaxed and mollified. But the same Remedies which have been already recommended for the Maturation of an inflammatory crude Matter will at the same time have the Effect here required. For all those emplastick and glutinous Substances, whose

whose Use is directed, above for Maturation, have also the Virtue of relaxing and mollifying the solid Parts of the Body. By the Application therefore of such Cataplasms or Fomentations to the suppurating Place, the Integuments are macerated, and as it were wasted away, and the Pus which acts on the internal Superficies of the Skin, at the same time soaks and macerates it on that Side, in which Effect it is also much assisted by that maturing Heat which resides in the Part under Suppuration. There seems to be nothing, then, further required, in order to answer the second curatory Indication.

The Resistance of the Integuments being diminished by the Remedies just now prescribed, the formed Pus is expelled or attracted forth by maturing Remedies.

The Pus now supposed to be formed, and lodged in a close Place, where it increases daily, and is pressed by the contiguous Parts, will, according to the common Law of all Fluids, tend to the Parts where is the least Resistance. If the Integuments then, by Application of emollient Medicines, are so debilitated, as easily to give Way to the distending Pus, this latter will elevate the Integuments, and bend its Force outwards, instead of working out for itself sinuous Ways in the Panniculus Adiposus. All those Remedies, therefore, which are employed in the Maturation of the inflammatory crude Matter, at the same time attract forth the formed Pus; for it is demonstrated under the Article OBSTRUCTION, that the Nature of Drawers, or attractive Remedies, is to diminish the Resistance in the Place, whither the Derivation is designed to be made.

Then moderately acrimonious, emollient and subpinguious Medicines, mixed together, are to be applied, that the dead and wither'd Integuments may the more easily, and without Pain, be opened,

A Passage must be procured for the Discharge of the Pus collected under the Integuments, while they are entire. A Division, therefore, must be effected of these Parts, either spontaneously and by a gradual Dilaceration from the distending Pus, or by the Surgeon's Lancet. That this Division may be performed either way with as little Pain as possible, highly emollient and subpinguious Topics are to be applied, by which the Integuments are wasted and withered to such a degree, as to be in a manner dead and insensible. When, therefore, the mature Abscess begins to gather to a Head, or becomes mucronated, it is customary with the Surgeon to anoint the Top with a Feather dipt in Basilicon, or some other very emollient Ointment, by which the Integuments in this Place may be mollified to an extraordinary Degree, and the Fibres being by this means relaxed, the Pain is diminished, [See VULNUS.] which in this prominent Part is usually pretty sharp. And sometimes these Emollients are mixed with moderately acrimonious Medicines, such as Leaven of Bread, Venice Soap, Honey, and the like, which will produce a sort of Deadness in the macerated Integuments, and facilitate their Rupture. Thus Women employed in Washing, whose Hands are all the Day long macerated in soapy Lye, have the Skin of their Fingers white and almost dead, and very subject to Excoriation. Formulæ for this purpose, of rendering the Integuments thin and less sensible, occur under the Article ABSCESSUS; which see.

The Remedies before proposed having had their due Effect, in the next Place, the Surgeon, after dexterously pressing up the Pus into the most elevated Part of the Tumor, is to enter his Incision-knife into the inferior Part of the whitest, softest, and most eminent Place, till the Pus appearing, assures him, that he has penetrated far enough; then let him enlarge the Wound upwards, by elevating the Knife, or passing the Point thereof to the opposite Side, divide the intermediate Integuments, avoiding the Fibres and Vessels; this done, let the redundant Pus be gently and successively expressed, and the Place kept guarded from the Air, and unmolested with Tents.

When the whole Compass of the suppurated Part is found to be perfectly mollified, and we are assured by all the proper Signs, that Maturation is completed; in this Circumstance, if the Integuments will not break spontaneously, a Discharge for the Pus is to be procured by Art, in order to avert those mischievous Consequences which have been mentioned. In glandulous Places, Abscesses are suffered to remain longer than in other Parts, because they are more in Danger of a Scirrhus, if any thing should perhaps remain unmaturing. Celsus, therefore, speaking of opening Abscesses, gives the following Directions, *Lib. 7. Cap. 2.* "If the Pus

"be mature, and in the Groin, or under the Arm-pits, a Section is seldom to be attempted; nor in any Place, where the Abscess is but moderate; nor where it is but superficial, or even seated in the Flesh, unless the Weakness of the Patient obliges us to hasten the Cure. In these Cases, it is sufficient to procure a spontaneous Discharge of the Pus by means of Cataplasms, for the Place which has not felt the Surgeon's Instrument, may commonly be healed without an Eschar." Here Celsus prefers a spontaneous to an artificial Opening of an Abscess, not only in glandulous, but also in other Parts, principally on account, it seems, of the Danger of Defecation by a Cicatrix. But a Wound inflicted by a Lancet, will, however, admit of a more decent Consolidation than a larger Opening and Secession of the Skin effected by a Corrosion of the contained Pus. And the Reason why Celsus often observed a deforming Cicatrix resulting from the Operation of the Lancet, plainly appears from what we read in the same Place. For where the Pus happen'd to be deeply seated, he directs the Abscess to be open'd with a red-hot Iron; and in another Case, where the Skin is extenuated to a very great Degree, he orders it to be all cut off above the Pus; and he would have the same done, if the Skin be pale, for then, he says, it is dead, and will never be of any Service, and therefore is fitter to be cut off.

In giving vent to the Collection of Pus, in a mature Abscess, Regard is to be had, as much as may be, to the Ease of the Patient, and the Security of the subjacent Parts; for no more than the common Integuments, under which the Pus is lodged, and which are elevated and distended by it, are to be divided. It is usual for the Surgeon, in this Case, very gently to press the suppurated Tumor all around, to cause the Integuments to recede as much as possible from the subjacent Parts; and since it generally happens for some Part of the Tumor to be prominent, or gather'd to a Head, as was before observ'd, the same is especially to be enter'd by the Incision-Knife, for in this Place the Integuments being much extenuated, and in a manner mortify'd, may very easily, and almost without any Pain to the Patient, be divided; especially if the Head or mucronated Top be macerated before-hand, by the Application of subpinguious and acrid Medicines, as before prescribed. The Incision is to be made, as much as conveniently may be, in the lower Part of the Tumor, that the Pus may find a Vent through the Opening, by Virtue of its own Gravity, but yet so as to consider the Situation which the affected Part will have after the Aperture. "We are to endeavour, says Celsus, in the Place before quoted, that the very Bottom of the Sinus may discharge itself, that no Humour may remain and settle within, and so corrode and create Sinuses in the sound and neighbouring Parts." But if the Apex of the mature Abscess be in a superior Place, and the Integuments appear softest and whitest, in the same part, it is better to make the Incision there than in another, tho' inferior Place, where the highly sensible and inflamed Skin cannot be divided without extreme Pain, and oftentimes very troublesome Consequences. For after the Aperture is made, the Pus which is left in the Abscess may, by changing the Situation of the Part, or by a gentle Compression with Bolsters and a proper Bandage, be prevented from working out to itself, by its own Weight, sinuous and fistulous Passages in the Panniculus Adiposus.

As soon as the Knife has penetrated the Integuments, it plunges in the Midst of the Pus, which will immediately begin to vent itself by the Sides of the Instrument, especially if the Integuments are stretched by the subjacent Pus from a gentle Compression of the contiguous Parts. Where there is a considerable Quantity of Pus, it is best to plunge the Knife to a good Depth, that afterwards with elevating its Point by a neat and equable Section, the Wound may be enlarged. And for the same Reason, if it may be done with Safety, the Instrument is pass'd through the Middle of the mucronated Head of the Abscess to the opposite Side, and then, by elevating it, the incumbent Integuments are at once divided, and a very large Opening made, which can never be the worse for the Patient: For unless the Orifice be thus made very wide, it often happens that considerable Parts of the Membrana Cellulosa, almost gangrenous, will be protruded together with the Pus, and obstruct the Opening, so as to render a new Section necessary: Besides, when the Pus is evacuated, the Integuments, which were before in a State of Tenseness, become contracted by their own proper contractile Force, and very much diminish the Aperture. It may pass for a general Rule, therefore, when an Abscess is to be opened, to make the Wound as wide as may be done without danger of hurting the subjacent Parts. But when the Pus is lodged just under the Skin, every one sees that there is no Necessity of plunging the Knife to any considerable Depth.

Sometimes

Sometimes the Pus happens to lie pretty deep, and then more Caution is required; for it would be a Disgrace to make a fruitless Incision into an Abscess, and it is often dangerous to thrust the Point of the Knife to a considerable Depth: On such Occasions, the Surgeon has a fair Opportunity of shewing his Skill and Dexterity; for unless he be well acquainted with the Situation of the Parts from Anatomy, he will always be either foolishly timorous, or rashly venture on Danger through Ignorance: For since an Inflammation has its Seat almost constantly in the *Panniculus Adiposus*, as was before observed, and there insinuates itself among the Muscles on every Side, it appears that the Pus may be very deeply lodged, though not the least Defect be observed in the Integuments. The antecedent Signs of an Inflammation, with the succeeding Indications of a Suppuration, the Fluctuation of the Pus, perceptible when the Part is pressed, will afford some Light in such obscure Cases. That celebrated Surgeon *De la Motte*, *Traité complet de Chirurgie*, Tom. I. has a remarkable Instance to this Purpose: A Woman, after the Suppression of the Lochia, had for nine Months been confin'd to her Bed, and was forced to lie with her Body incurvated in a most miserable Manner, in order to alleviate, in some Measure, her racking Pains; for she lay with her Face to her Knees, and her Heels went back towards her Buttocks, and in that Posture she continued Night and Day. As the Pain lay chiefly in the Hypogastrium, half Way between the Navel and the Pubes, the Place was very carefully examined by this excellent Surgeon, who perceived some Kind of Undulation, tho' there were no Hardness nor Tumor, nor the least Change in the Colour of the Integuments. Confirmed by long Practice in the Diagnosis of the like Disorders, he concluded that a profoundly latent Abscess was the Cause of all this Disorder, and resolved, contrary to the Opinion of four other Surgeons who before had this miserable Patient under their Care, to make an Opening in the Part, and performed the Operation with the greatest Caution, penetrating into the very Cavity of the Abdomen: Not the least Quantity of Pus, however, was discharged, though the Abdomen was compressed, the Patient held her Breath, and the Posture of the Body was changed, in order to promote an Evacuation. The honest Operator being confounded at this unfortunate Event, took his Leave, being laugh'd at by the other Surgeons, and ingeniously confesses, that he passed that Night without Sleep. The next Morning, when he came to renew the Dressing, he observed, to his great Joy, a vast Quantity of Pus discharged in the Bandage, though he knew not whence it came. The Discharge of Pus continued every Day for the Space of about six Weeks, at the End of which the Woman was perfectly recovered from so desperate a Disease, and continued to bear Children, and could walk with Ease, only a little inclining to the right Side, where the Seat of the Disorder lay. The like Case has fallen under my own Observation, where a Surgeon open'd a deep Abscess in a Woman's Breast, without the immediate Discharge of a Drop of Pus, though he entered his Incision-Knife to the Depth of an Inch, and more; but in a few Hours there was a vast spontaneous Discharge of Pus through the Wound. This is enough to convince us, that we are not to alter our Judgment with respect to the Diagnosis in such Cases on a sudden, if after just Deliberation and weighing all Things, we should at last resolve upon an Operation, and to open the affected Part; for though the Point of the Knife might not, perhaps, penetrate to the Seat of the Pus, yet the Pus may soon after, as it frequently happens, be derived, of its own Accord, to the Wound, as the Place of least Resistance.

Avoiding the Fibres and Vessels. If the Collection of Pus be lodged immediately under the Integuments, and, as *Celsus*, *Lib. 7. Cap. 2.* expresses it, be contiguous to the Skin, it is plain that there can be no Fear of hurting the Vessels or Fibres, because the Pus elevates the Skin from the subjacent Parts; nor has it hitherto appeared that a true Suppuration ever affected the Substance of the Muscles, but took up its Seat only in the *Panniculus Adiposus*. For tho' *Paulus Aegineta*, *Lib. 4. Cap. 18.* defines an "Abscess to be a Corruption and Alteration of the Flesh, or fleshy Parts, as the Muscles, Veins, and Arteries;" yet we know by daily Experience, that after the greatest Suppurations, and even Gangrenes, in which the *Panniculus Adiposus* has been consumed, the Muscles have been found very clean and entire. It is true, indeed, that surprizing Degeneracies and Alterations have been observed not only in the *Panniculus Adiposus*, but in the very Substance of the Muscles: But when the Tumors in such Cases have been open'd, there has been no Discharge of Pus, but of quite another Liquor, whence such Affections seem not properly to belong to the Class of Suppuration. We have a memorable Instance of

such a Disorder in the *Medical Essays*, Tom. 1. A Woman had a Swelling, for some Months, on the Outside of her Leg; the Tumor was prominent in the Middle, and soft, with a manifest Fluctuation, when pressed with the Fingers. When the Skin came to grow red in the Part, the Patient was in violent Pain, and had a hectic Fever, attended with nocturnal Sweats, and a Diarrhæa, which returned every third Day, with other Symptoms. It was at last resolved to open the Place, and after the Application of maturing Cataplasms for two Days, when the Integuments were much attenuated, and the Fluctuation was very plainly perceptible, the Tumor was open'd; a pretty deep Incision being made, no less than an Inch and half, not a Drop of Pus flow'd, but two or three Ounces of Mucus; and the next Day a Fungus appeared in the Wound, which being remov'd, the like grew up again; and after vast Quantities of the like Substance had been thus removed, a Probe introduced into the Place penetrated through the whole Substance of the Leg, till it touched the Skin on the opposite Part. The Woman dy'd a few Days after, and the Skin of the affected Leg was found whole; but the *Panniculus Adiposus*, together with the Muscles, was degenerated into a fungous Substance, in such a Manner, that after diligent Examination, the Muscles could not be so much as distinguish'd; and the Periosteum had every where separated itself from the affected Bones. From this Case it appears indeed, that the Muscles may by the Force of a Disease be transformed into such a deformed Mass as before related, but there was no Pus here discover'd, which is the Thing principally to be regarded. It is a Question whether *Hippocrates*, *Lib. de Articulis*, is to be understood of such Abscesses, where he says, "But, in short, all the other [Tumors] which are mucous, and discharge Mucus, as being glutinous, when touched, slip away under the Fingers to this or that Side; for which Reason the Surgeons find them deeper than they expected." He was here treating of a Fracture of the Ear, and of a Suppuration succeeding it, and advises, if an Incision be necessary, not to cut superficially, because the Pus is more deeply lodged than is commonly imagined. He had told us a little before, that Cataplasms are hurtful in Fractures of the Ears, because they excite Abscesses, with Plenty of Mucosities, and troublesome Suppurations; and then subjoins the Words quoted.

There seems, then, not to be so much Danger of injuring the Fibres in opening mature Abscesses, and consequently no Necessity of all that Care and Circumspection, so much insisted on by *Fabricius ab Aquapendente*, *de Chirurg. Operat. Cap. 107.* as necessary to be used in almost all Parts of the Body, that there may be no Incision but according to the Course of the subjacent muscular Fibres. And the same Author himself, afterwards, in the same Chapter, confesses that Persons ignorant of Anatomy are every where found, who yet are successful enough in opening Abscesses, "on Account of the Redundance of Pus, which elevates the Place, and renders the subjacent Parts safe from the cutting Instrument."

This done, let the redundant Pus be gently and successively expressed. In very large Abscesses, which contain a vast Quantity of Pus, it seems not always safe to evacuate the Pus all at one Time; for all the Parts which surround so large a Bag full of Pus, and were very much pressed before, being thus in a Moment freed from the Pressure, become very flaccid, and admit vast Quantities of Blood into their Vessels, whence less Remittances of the same are made to the Brain and Cerebellum, and Faintings, and perhaps Death itself are thence occasion'd. The same Danger attends a sudden Relief or Relaxation of the Parts from the Pressure of any other Collection of Humours. And this made *Hippocrates* say, 6 *Aph. 27.* "That Persons labouring under an Emphysema, or Dropsy, and burnt or cut for the same, die away and expire under the copious and violent Effusion of the Pus or Water." But if the Abscess be seated in such a Part of the Body, that when a proper Aperture is made for discharging the Pus, the Parts may be supported and compressed by swathing them with a Roller, the greatest Evacuations may safely be performed, as appears from the Success of that Method in evacuating the Waters of an Ascites, after the Operation of the *Paracentesis*. [See HYDROPS.] Nor will it injure the Patient to leave some part of the Pus undischarged; for the Sides or Inclosure of this hollow Bag are cherished and depurated by a good Pus, and covered with the same, as with a natural Balm, the best certainly that can be accommodated to it, the half-mortified Ends of the Vessels are separated, and all Things are disposed for an happy Consolidation, as appears more at large under the Article VULNUS, which see. It is only required, that so great a Quantity of Pus should not be left as might injure the Parts by not distending them, and create Sinules in the *Panniculus Adiposus*,

pus, which Inconveniences are well enough avoided by leaving the Aperture over, and in such a Situation that the redundant Pus may find a Vent from its own Gravity. We are, therefore, to use due Care and Caution, that the open Abscess be

Kept guarded from the Air, and unmolested with Tents. When the Abscess is open'd, though all the Pus be evacuated, yet in the Space of twenty-four Hours, and sometimes sooner, will there be a new Collection of Pus, which must in like Manner be discharged. And this was the Reason why the Surgeons, being apprehensive that the Aperture would close too soon, used to introduce Tents into it, by way of Prevention: But such Tents, being made of dry Lint, absorb the contiguous Humours, which causes them to swell; and being of a conic Figure, they are soon after squeezed out; or, if retained by the Application of Plaisters or Bandages, are dilated, and stop up the Orifice like a Cork, so preventing all Discharge of the collected Pus, and leaving it to work out for itself sinuous Ways and Cavities in the *Panniculus Adiposus*, a Membrane very capable of Dilatation. Besides, these Tents, while swelling with the absorbed Humours, insensibly widen and dilacerate the Sides of the Orifice, whence a new Pain and Inflammation are often occasion'd. It is plain, then, that the Use of Tents in these Cases is either useless or prejudicial; and even while the Dressing is renewing, and the Tent extracted, after the Pus is discharged, a very free Access is admitted for the Air into the now empty Cavity, which cannot but be very prejudicial by its Appulse to the gaping Orifices of the extremely thin and tender Vessels, as is observed under the Articles *VULNUS* and *CAPUT*.

The best Way, therefore, will be to cover the Aperture with a simple Pledget only, that the Pus may have free Liberty to discharge itself, taking due Care, also, that neither the Bandage nor Plaisters press hard upon the Orifice; on the contrary, it will be rather advisable to compress, though gently, the adjacent Parts, by a dextrous Application of Bolsters or Bandage, that the Pus may be derived towards the Orifice, which is to be kept open, and free from all Manner of Pressure. The Usefulness of Tents in open Abscesses, seems long ago called in Question by *Celsus*, *Lib. 5. Cap. 28.* where he says, "Then [after opening] if they be seated in the Groins or Armpits, they are to be dressed without Tents. In other Parts, also, if the Bottom of the Wound be but small, the Suppuration but moderate, and has not penetrated to a considerable Depth, if there be no Fever, and the Body be strong, the Use of Tents is equally superfluous. In other Cases they are to be used, though sparingly, and not unless the Ulcer be large." See more concerning the noxious Use of Tents under the Article *THORAX*.

Then let it be treated with Cleaners, Suppuratives, Digestives, Balsamics, Deterfives, and Dryers, vary'd as the present Exigence shall require, according to our Instructions under the Article *VULNUS*.

We are now to treat of those curatory Indications comprehended under the two last Numbers of the first Head of this Article, which are, to mundify the Ulcer, and reduce it to the State of a simple Wound: For the whole internal Superficies of the hollow Abscess having been macerated in the contained Pus, is generally, as was before observed, much injur'd by it. It ought, therefore, to be mundify'd, and a Separation to be made of all those Particles, both fluid and solid, which are corrupted to such a Degree as to prevent an Union of the separated Parts. But the Superficies of an Abscess is render'd most impure, when the Pus, by long Retention, has degenerated from its mild and friendly Quality; for in such a Case it frets and wastes both the incumbent Skin, and the adjacent Parts of the *Panniculus Adiposus*; and certainly, Cavities with so foul a Superficies can never be consolidated, unless they be first cleansed. This appears to be the Opinion of *Galen*, *M. M. ad Glaucom. Lib. 2. Cap. 9.* "When the Skin, he says, is so wasted by the Suppuration as to resemble Cloth worn to Rags [*ὡς παλαιὸς γυνήθας, τοῦ λυγροῦ*]; it is with Difficulty brought to a Coalition with the subjacent Bodies, and therefore the Ulcer must of Necessity be cleansed by enlarging the Vent for that Purpose." The Methods and Remedies for depurating a fœtid Ulcer, and reducing it to the Condition of a pure fresh Wound, are largely describ'd under *VULNUS*.

If the Patient be shock'd at the Sight of the Instrument, and refuses the Operation, apply a Caustic to the Part; let the Eschar be separated, by mollifying it with Butter; and let the Cure be managed as directed under the two preceding Heads.

The safest Way of opening an Abscess, is by the Incision-knife; but sometimes the Surgeon has to do with Persons of

so pusillanimous a Temper, that they are ready to faint away at the bare Mention of the Operation. In such a Circumstance, it is best to use Deceit, and dextrously to perforate the Abscess while the Patient has not the least Apprehension of it. Various Kinds of Instruments have been contrived for this Purpose: Some have concealed a small Lancet in a Ring which they wore on their Forefinger, or have cover'd the Top of a Lancet affix'd to a Plate of Metal, under a Cataplasim, or Ointment, which they have apply'd to the Part, and by gently pressing it, have effected what they design'd. More Artifices of this Kind are to be met with in *Paré, Livre 7. Chap. 10.* and others. If the necessary Aperture of a mature Abscess cannot be accomplish'd by any of these Contrivances, there remains no other Way than to apply to the mucronated Top of the Abscess what the Surgeons call a potential Caustic, of which there are several Sorts prepared in the Shops, and describ'd with their Use under the Article *CAUSTICA*. The *Lapis Infernalis*, or the common Corrosive of the Surgeons, prepared of Quick-lime and Potash, are mostly in Use. A Plaister is apply'd, which has a Perforation in the Middle answering to the Place on which the Caustic is to be laid; to this Perforation they apply the Caustic, and cover it with another Plaister, and let the Dressing remain for an Hour or two, till an Eschar of a sufficient Thickness be raised. This done, they attempt a Separation of the dead Eschar from the quick Parts, by Means of Basilicon, fresh Butter, or the like mollifying Topics; which being effected, the Pus is evacuated by the Aperture thus procured, and the Cure is performed by the Methods before prescribed. It is certain, however, that such pusillanimous Patients as require this Method of laying open an Abscess suffer much greater Pain; for the Division of a mature Abscess by the Incision-knife is performed in a Moment, but the Action of a Caustic requires an Hour, and often more; and when that is done, the Patient endures a good deal of Pain while the Eschar gradually separates from the quick Parts; and, besides, a greater Defecation, and more unsightly Cicatrix, generally result from the Application of a Caustic. *Vanfweiten, Comment. in Boerhaavii Aphorism.*

PREDICTIONS FROM A SUPPURATION OF THE LUNGS.

"Those who have a Collection of Pus, says *Galen*, *Com. 2. in Prognost.* whether within the Body, or in any Part affected with an Inflammation, and even after an Eruption, we may properly enough call *Empyi*," that is, purulent or suppurated; "but Physicians usually give that Name to those who have the Thorax or Lungs thus affected." In this Case, the Pus, after Eruption, is contained between the Thorax and Lungs; and if it be not speedily expectorated, the Patient dies of a Consumption, labouring all the Time he lives under a slow Fever, and a constant Exacerbation of the Heat and other Symptoms at Night.

The Ancients called a Collection of Pus in any Part of the Body *Empyema*; and hence suppurating Medicines were by some called *Empyemata*, by others *Diapyemata*. Some give the Name of *Empyi* to those who have Pus collected in any one of the Viscera: And others, as was said, will have that Name appropriated to such as have a Collection of Pus between the Thorax and Lungs; that is, in the Part affected with an Inflammation, and from an Effusion of the Pus within the Thorax, arises this Affection.

Pus of this Kind is generated when the Matter of the Phlegmon is not absterged, in which Case the Contents are, by the Heat, converted into Pus. And this we find expressed by *Hippocrates*, *7 Aph. 38.* where he says, that Distillations "upon the upper Belly [*ἐπὶ τῇ ἄνω κοιλίᾳ*] come to a Suppuration in twenty Days;" and more clearly to the purpose, *5 Aph. 8.* "They who labour under a Pleurisy, if there be no Repurgation of the Matter in fourteen Days, become affected with an *Empyema*." For where the Matter which causeth the Pain is not discharged by Expectoration, nor by Stool, nor Venesection, nor Diet, nor Medicine, it either turns to a Suppuration, or suffocates the Patient. And this is well expressed by *Galen* on the *Prognostics*, in the following Words: "Whoever, he says, are affected with Pains in the Thorax near the Seat of the Lungs, which will not yield to Remedies, and have no other Disorder, nor any mortal Symptom, may expect a Suppuration." When an Inflammation, therefore, becomes suppurated, and the Humors are converted into Pus, these, if not evacuated by Spitale, are, by a Rupture of the Impostume, discharged into the Cavity of the Thorax and Lungs, in which Case the Patient may truly be said to be *Empyos*; and by this Pus is he suffocated, or thrown into a Consumption; or freed from it in the Space of forty Days, by the Help of a Cough, according to *Hippocrates*, *5 Aph. 5.* where we read, "that whoever are affected with an *Empyema* after a Pleurisy, and are cleansed by Expectoration in forty Days after the Rup-

"ture, are freed from the Disease." But as *Galen* says in his Comment, "If all the Pus be not discharged by spitting in that Space of Time, it putrifies, and being putrified, corrodes the Lungs, and induces a Tabes;" which is an Extenuation of the whole Body, occasioned by those incurable Ulcers of the Lungs, in Conjunction with a slow Fever, which the *Greeks*, and particularly the *Athenians*, as *Galen* says, call by the proper Name of *Phthisis*, and *Hippocrates* *Phthisis*. When the Patient in this Case is reduced to Extremities, and the Case desperate, the Hair falls off by reason of Dryness, there is a Looseness of the Belly, occasioned by the Imbecility of the retentive Faculty, as *Galen* expresses it, and the Spit is retained; for the Patients, however extenuated, live as long as they can clear their Lungs, by Coughing and Spitting; but when these cease, and the Matter which should be expectorated remains within, the Passages for Respiration are obstructed, and the Patient is suffocated.

For the better understanding the Prognosis to be formed from a Suppuration, we are to consider, first, whether the Patient be subject to it from a Pleurisy, Peripneumony, or Quinsy; then, from what Signs we suspect a Suppuration; thirdly, when the Eruption is like to be made; and lastly, of the Signs from which we may predict the Death or Recovery of the Patient.

From what Signs we may reasonably expect a Suppuration, we are taught by *Hippocrates* in his *Prognostics*, where he says, "that Pains in those Parts (about the Region of the Lungs) which yield not to Expectoration, Purging, Phlebotomy, Diet nor Medicines, terminate, you may be certain, in a Suppuration." But because the Pain and Fever are more urgent about the Time of the Generation of Pus, than when it is actually generated, according to *Hippocrates*, 2 *Aph.* 47. it is necessary that the Symptoms should be increased in the Progress of the Suppuration. On this Subject we are directed by *Hippocrates*, in the *Prognostics*, "to consider that the Beginning of the Suppuration commences from the Day in which the Patient began to be feverish, or was seized with a Rigor, or the Time when he first said that he had a Weight instead of a Pain in the Place affected; for from such Times are we to date the Suppuration." And *Galen*, in his Comment on the Place, says, that the Signs of a Suppuration are a Gravitation or Weight, instead of the Pain, a Rigor or Horror, and a Fever, which is more urgent on the Patient than before: He adds, that besides the Sense of a Weight, there is also a Pain in the Sides, or in one Side, if the Suppuration be only in one Side; which is agreeable to the Directions of *Hippocrates*, in the Book just quoted, where he says, "If the Suppuration be only in one Side, it will be proper to turn the Patient, and learn of him whether the Pain be in one Side, and whether it be hotter than the other; and whether when he lies on the sound Side, there seems to be a Weight lying on the other; for if this be the Case, the Suppuration is on that Side, which soever it be, where the Weight is." By these Signs, then, may we discover a Suppuration, which is indicated by a Rigor or Horror, proceeding, as *Galen* says, from the Acrimony of the Pus infecting the Parts affected with the Inflammation, from the great Increase of the Fever, and the Weight in the Sides, or in one Side only, if the Collection of Pus be only in one Side; to which we may add a Sense of Heat in both Sides, or only in one, if the Pus, as we said, be collected only in one Side. And if this Pus, after its due Increase and Concoction by Nature, makes an Eruption, and is expectorated by Coughing, the *Empyos*, or Person affected with the Pus, recovers; but if the Pus can by no means be discharged, as it happens in great Weakness of the Parts, the Patient is either suffocated, or dies at last of a Consumption. Hence it is observed by *Hippocrates*, in his *Prognostics*, that this Disease is "more fatal to the Aged than to young Persons." And the Reason is, as *Galen* says, "because old Persons are weaker, and great Strength is required in order to discharge the Pus, by Coughing and Spitting; and it is necessary for Recovery, that great Quantities of Pus should be expectorated by means of a Cough." *Galen*, *Lib. 5. de Loc. affect. Cap. 3.* speaks of some *Empyos*, who spit out no less than fifteen Heminae of Pus, and recovered. So that they who expectorate freely, and in large Quantities, escape, which is imported by what we read, 5 *Aph.* 15. before quoted. But when the Pus is not discharged, on account of the Grossness and Viscidity of its Substance, the Denseness of the Membrane in which the Lungs are contained, or the Weakness of the Faculty, which Defects are known by Respiration in which the whole Thorax is elevated, without any Sign of Expectoration by Spitting. Thus we are told by *Galen*, *Lib. 4. de Loc. affect. Cap. 3.* "That the Elevation of the whole Thorax in Respiration by those who are affected with a Suppuration, on account of a Collection of Pus between the Thorax and the Lungs, proceeds from the Im-

becility of the Patient, who is too weak to discharge himself from the offensive Matter. And if he escapes Suffocation, he dies of a Tabes, under all the Symptoms described in the Beginning of this Discourse."

The Case of an *Empyos* under a Tabes, or Consumption, is thus described by *Hippocrates*, *Lib. Prognost.* "All *Empyos*, he says, are known by the following Characters; first, if there be no Intermission of the Fever, which is more gentle by Day, and more violent by Night; if copious Sweats supervene, and the Patient has a Desire to cough, but expectorates nothing worth Notice; if there be a Howness of the Eyes, a Redness of the Cheeks, a Crookedness of the Nails, a Heat especially in the Tops of the Fingers, a Tumor of the Feet, a Loss of Appetite, and an Eruption of Pustules about the Body." *Galen*, in his Commentary on this Description, tells us, "that the Fever has no Intermission, because the very solid Parts of the Body are heated, and retain a Heat somewhat like that of a continual Fever, and, after the manner of Lime, gentle to the Touch. And this Heat, which is esteemed a proper Sign of a Hectic Disposition, is increased as often as the Patient eats or drinks, as it is in Lime, by an Affusion of Water; so that the Parts feel much hotter to the outward Touch. The constant Sweats are from Weakness, and a Corruption and Diffipation of the Aliment. There is a Desire of Coughing, but nothing expectorated that deserves Notice, on account, as we said before, of the Grossness and Viscidity of the Pus, the Tenseness of the Membranes of the Lungs, or the Weakness of the Faculty. Howness of the Eyes is from Dryness, and is common to all long Fevers; Redness of the Cheeks is from Heat in the Lungs, and also from the Cough, by which the Face is heated. The Nails are incurvated, because the Flesh which should support them is consumed, and the interior Parts of the Tops of the Fingers feel hotter than the rest, as being more fleshy, and because the hectic Heat, which possesses the solid Parts, is more sensible in these Parts which abound most with Moisture. The Feet swell, because the Extinction of the natural Heat begins in these Parts, as being at the farthest Distance from its Principle or Original. The Appetite is lost from an Extinction of the Faculty; and the Eruption of Pustules is occasioned by an Effusion of the corroding Sanies from the interior Parts on the Surface of the Skin." These, then, are the Signs by which the *Empyos* are known to be in a Consumption; and though their Case be desperate, they live as long as they can excrete Pus, as we have already observed from *Hippocrates*, 7 *Aph.* 16. One thing in relation to this Spit, worthy Observation, is what *Galen*, in 3 *Epid.* affirms, that in desperate Consumptions nothing of Concoction can be perceived in it; but Spitting at last ceases, and is suppressed, a Looseness comes on, with a Swelling of the Feet, and other Symptoms, which shew the Case to be desperate.

As to the Time of Rupture of the Impostume, or Vomica, it is to be considered, first, that the Humor, which is the Cause of the Pleurisy or Peripneumony, not being evacuated or removed, putrifies, and is converted into Pus; in a short time after, that makes an Eruption, and is expectorated by Coughing; but as to the determinate Time when this Pus is effused between the Thorax and the Lungs, it happens generally in the Space of twenty Days, sometimes sooner, sometimes latter. The Thing itself, and the Signs by which it is known, are thus expressed by *Hippocrates*, *Lib. Progn.* "As to the quicker or slower Rupture of the Vomica, they are known by the following Signs: If there be a Pain from the Beginning, and the Difficulty of Respiration, together with the Cough and Screation, continue, the Rupture may be expected on the twentieth Day, or even sooner; but if the Pain be more remiss, and the other Symptoms in proportion, the Rupture will happen later; but it is necessary that a Pain, Difficulty of Respiration, and Spitting, should precede the Eruption of the Pus." From these Words *Galen* infers, that the Signs of a future Rupture, are a Pain, Difficulty of Respiration, Cough and Spitting, which, if they are continual and violent, preface a quick Eruption; if they are not so violent nor continued, the Eruption will be the slower. There is necessarily a Pain from the Pus obvolving and corroding the Part by its Acrimony, and the Cough and Screation are necessary from the thinner part of the Sanies, a corrupt Matter which lies upon and penetrates into the Part affected; there must, also, of necessity, be a Difficulty of Respiration, on account of the Condition of the whole Body, but principally from the acceding Pain.

The Cause of the Eruption is referred to the moving Force of Nature, and to the Redundance of Pus, or its depraved Quality irritating the expulsive Quality to Excretion.

The Eruption happens before the Time, that is, before the Concoction of the Pus, from a Corrosion of the Bag which contains the Pus, by a pure Bile, which is unmix'd with the Spit, and not arrived at that Mediocrity of Temperament, which is due and convenient for Nature; hence a Pain, Cough, Difficulty of Respiration, and Spitting, precede an Eruption, either from the Plenty of Pus, or the Offensiveness of the Putrefaction irritating the expulsive Faculty. Such an Eruption before Maturity, is symptomatical, and not good, but that which is made by Nature, or when the Pus is concocted, is critical and good; and the Pus discharg'd appears white, pure, equal and smooth; whereas, in an Eruption which happens before due Time, and is symptomatical, the Pus is crude, parti-colour'd, fetid and yellow, or mix'd with Bile. Of such an Eruption the Author of the *Coac.* 392. speaks, where he says, "They who expectorate purulent and bilious Spit, either separately, or mixed together, generally die on the 14th Day."

These Things being premised concerning Suppurations, we are now to enquire into the Prognostics they will afford. And, first, as to the salutary Signs in those who recover, after the Eruption of the Pus, we are directed in our Judgment by Hippocrates in the *Prognostics*, where he describes the Symptoms which promise a good Event to the Disorder. "Good Signs, he there says, are, to bear up well under the Distemper, to breathe freely, to be free from Pain, to cough up the Spit with Ease, for the Body to be soft and warm in all Places alike; not to be afflicted with a Thirst; for the Urine, Stools, Sleep, Sweat, to be regular, and all in due Order as requir'd; in such Circumstances we may venture to pronounce the Patient will not die." And a little after he says, "They who recover are generally those who get rid of the Fever the same Day that the Eruption is made; who soon recover their Appetite; and are freed from their Thirst; whose Stools are small in Quantity, and compacted; and when the Pus is white, smooth, of one Colour, free from Phlegm, and expectorated without Labour or violent Coughing. The Patient in such Circumstances is very happily and speedily freed from his Malady; and the nearer he comes up to this Character, the more likely he is to recover." The Symptoms portending Death in a Suppuration, are enumerated by the same Author in the Book before quoted, as follows: "On the contrary, (with respect to the good Signs before described) to bear up ill under the Disease; to breathe short and thick; to have no Remission of the Pain; to expectorate with Difficulty; to be very thirsty; for the Body to labour under an anomalous Fever; to have an extraordinary Heat in the Belly and Sides; for the Forehead, Hands and Feet to be cold; for the Urine, Stools, Sleep and Sweat, to be all bad and disorderly; the Patient will die under Expectoration, before the fourteenth Day, either on the ninth, or eleventh Day." And a little after the foregoing Passage, he says; "The Disease proves mortal, meaning after the Eruption, when the Fever ceases not, or if it soon recurs after a seeming Cessation; if the Patient be afflicted with a Thirst, Loss of Appetite, or a Looseness; if the Pus expectorated be of a greenish [χλωρός] Colour, a palish Green, livid, or pituitous and spumous; if these concur, the Patient will not recover." For all these kinds of Spit are condemned, *Coac.* 390. And we have Instances of their Fatality, 4 *Epid.* T. 4. in the Wife of Meander the blind Man, who immediately expectorated a greenish and purulent Matter; and in the Son of Amphiphrades, 7 *Epid.* T. 24. who discharged first a purulent and pale, and soon after a greenish Spit; and in Euryptolemus, *ibid.* T. 16. whose Spit was of a pale Colour. To the same Purpose may be apply'd that of Hippocrates, 7 *Aph.* 44. "If those who are affected with an Empyema, and suffer Burning or Cutting for the same, discharge a pure and white Pus, they escape; but if the same be bloody, feculent and fetid, they die." And so much shall suffice concerning Predictions from an Empyema, the Perusal of which may be of Service to the Student in Medicine. *Prosper Alpinus de Præfag. Vit. et Mort. Egrot.*

SUPRA COSTALES.

These Muscles are commonly called *Levatores Costarum*, which Name was first given them by Steno; but he did not pretend to have discovered them. They are irregularly triangular, and situated on the back Part of the Ribs near the Vertebrae.

Each of these Muscles is fix'd by one tendinous Extremity in the transverse Apophysis, which lies above the Articulation of each Rib, and to the neighbouring Ligament; the first being inserted in the transverse Apophysis of the last Vertebra of the Neck, and the last, in that of the eleventh Vertebra of the Back.

From thence the fleshy Fibres run down obliquely, increasing in Breadth as they descend, and are inserted in the back

Part of the Outside of the following Rib. Some of the Fibres often pass beyond that Rib, and are fixed in one or more of the Ribs below it, by several Digitations, which lie at a greater Distance from the Vertebrae, in proportion as they run lower. In the inferior Ribs these Digitations are more considerable, than in the superior. *Winslow's Anat.*

For the Uses of these Muscles, see the Article INTERCOSTALES.

SUPRASCAPULARIS MUSCULUS. The same as SUPRASPINATUS.

SUPRASPINATUS MUSCULUS.

This is a thick narrow Muscle, in some measure pennisiform, filling all the supra-spinal Cavity of the Scapula.

It is fix'd to all the posterior half of the supra-spinal Fossa, and sometimes its Insertion reaches near the Neck of the Bone. There the Fibres leave the Surface of the Bone, and being as it were supported by the fat or cellulous Substance, pass between the Acromium and Neck of the Scapula, under the Arch formed by the Acromium and Extremity of the Clavicle, and under the Ligament between the Acromium and Apophysis Coracoides; being afterwards inserted in the superior Surface of the great Tuberosity of the Head of the Os Humeri, very near the bony Channel. This Muscle is cover'd by the *Trapezius*.

The *Supra-spinatus* is commonly supposed to join with the *Deltoides*, in lifting up the Arm; this Muscle beginning that Action, and the *Deltoides* continuing it. But besides that this Muscle is very small, it seems to be too near the Articulation of the Head of the Os Humeri, to be able to raise the whole upper Extremity, which is of a considerable Weight and Length. It has, however, two other very remarkable Uses, when the Arm is raised from the Thorax to the Head by the Action of the *Deltoides*.

To understand these Uses it must be remember'd, 1. That the cartilaginous convex Part of the Head of the Os Humeri is much larger than the glenoid Cavity of the Scapula. 2. That the most superior Part of this Convexity lies out of the Cavity, when the Arm is depressed or near the Ribs. 3. That the orbicular Ligament of the Joint is very broad, being proportion'd to the Distance between the Edges of the convex Part of the Head of the Os Humeri, and of the glenoid Cavity of the Scapula; and that therefore it cannot check the Os Humeri in any of its Motions.

From thence it is plain, that the strong deltoide Muscle, in the first Instant of its Action to raise the Arm, would thrust the Head of the Os Humeri upwards out of the Cavity, if something did not supply the Place either of a bony Fulcrum or ligamentary Frænum. The Arch of the Acromium is of no Use in this Case; for the Bone must be first luxated, before it can reach so far; and the neighbouring Parts must suffer a Friction, and even a Contusion, which would be very prejudicial.

It is, also, plain, that the broad orbicular Ligament would be very subject to be entangled and bruised between the Edges of the two articulated Bones, were not this Inconveniency prevented by some means or other; because it is not elastic enough to contract of itself in proportion as these two Edges approach each other.

The *Supra-spinatus* answers both these Ends. When it contracts its Tendon, which runs over the convex Part of the Head of the Os Humeri, to be inserted in the upper Surface of the great Tuberosity, it presses very strongly on the Head of the Bone, thereby supplying the Place of a Fulcrum, and hindering the Head to rise, during the Beginning of the Action of the *Deltoides*.

I find, also, in this Muscle, a singular Contrivance to prevent the second Inconveniency. Its Tendon is a kind of Band, which adheres closely to the Outside of the orbicular Ligament; and when we examine it narrowly, we observe that several of its Fibres do not go so far as the Head of the Os Humeri, but are gradually inserted in the outer Surface of the Ligament. These tendinous Fibres are continuous with those which lie nearest the Bone or Bottom of the supra-spinal Cavity of the Scapula.

This Portion may, therefore, be reckoned a distinct Muscle belonging to the orbicular Ligament, notwithstanding of its close Union with the other Part, which is inserted in the Os Humeri. And indeed we might very justly establish a new Species of Muscles, by the Name of Articular Muscles, which belong principally to the capsular Ligaments of those Joints which have large Degrees of Motion. The Mechanism of this kind of Muscles consists in this: The Extremities of the Tendons are inserted very obliquely in the Surface of the Ligament, and the Fibres take up a great deal more Space there, than in the Body of the Tendon; and they are commonly the innermost, or deepest and shortest Portions of the ordinary Muscles inserted near the Articulations.

The Use of these Muscles, or Portions of Muscles, is to pull the orbicular Ligaments uniformly, and thereby to prevent their running into irregular Folds, and their being intangled between the two articulated Bones. *Winslow's Anat.*

SURIANA.

The Characters are;

It hath rose-shaped Flowers, consisting of several Petals, which are placed in a circular Order; from whose Empalement arises the Pointal, which afterwards becomes the Fruit, which generally consists of four Capsules, in which are included four roundish Seeds.

We know but one Species of this Plant, which is,

Suriana foliis portulacæ angustis, Plum. Nov. Gen.

This Plant was so named by Father Plumier, who discovered it in the French Settlements in America, in honour to Dr. Joseph Surian of Mâsseilles, who was a very curious Botanist.

The Seeds of this Plant were brought from Havana, by the late Dr. William Houssain, who found the Plants growing there in great Plenty on the Shore, in moist Places, where the Salt Water usually flows. It also grows plentifully in some Parts of the Island of Jamaica. *Miller's Dict.*

SURRECTORIUM. An Instrument, mention'd by Paré, for keeping the Arm, when injur'd, in an erect Situation.

SUSINUM. See **ÆGYPTIUM OLEUM**.

SUSPENDICULUM. A Name for the **CREMASTER MUSCLE**.

SUSPENSOR TESTICULI. The same as **CREMASTER**.

SUSPENSUM. The same as **ENÆOREMA**.

SUSPIRIUM. An **ASTHMA**.

SUTORIUM ATRAMENTUM. Vitriol.

SUTRATAR, in *Paracelsus*, is a splenic Medicine; or one prepared of a Spleen.

SUTURA. A Suture, in Anatomy, is a particular Articulation of the Bones of the Head. See **CAPUT**. But

SUTURA, Suture, in Surgery, is the uniting the Lips of a Wound by Sewing.

But there are two Methods of closing Wounds by Suture; one with a Needle, called the true or bloody Suture; the other with adhesive Plaisters, called the dry or false Suture. Sutures are not to be used in all Wounds indiscriminately; but, 1. Principally where the Lips of the Wound cannot be brought into Contact by the Dressing; such are transverse, oblique, and angular Wounds, when they are recent and carefully cleared of the Blood and any foreign Substance which may be lodged in them. 2. In those, also, where there is nothing contused, abraded, or cut away; unless perhaps the wounded Parts are greatly relaxed. Sutures are in such Wounds of great Advantage, not only making them soon heal, but also inducing a smaller and neater Cicatrix. The adhesive Plaister, or dry Suture, is beneficial in those Wounds which are neither very deep nor very broad, especially in the Face, tho' some prefer the Needle; but the Judgment of the Surgeon may, in this Particular, be best directed by the Nature of the Wound. For when the Lips of the Wound may be held together by a Plaister and Bandage, the Needle becomes unnecessary, which occasions more Trouble, and also new Wounds and Cicatrices. But on the other hand, when the Wound is wide and deep, so that its Lips cannot be closely retained by Plaisters and Bandages, or where the Part is nearly amputated, as in the Nose, Ears, Cheeks, Forehead, Chin, or Fingers, immediate Recourse must be had to the Needle.

It is proper to observe, 1. That when the Lips of the Wound are joined by adhesive Plaisters, the Hair must first be carefully shaved from the Part. 2. Where one Plaister is not sufficient, more may be used, or they may be applied crossways, (as in Tab. 25. Fig. 4, 5, 6.) 3. The true or bloody Suture is of two Sorts, simple or compound. The simple Sort is done with a Needle and Thread, comprehending the knotted, glovers and circumvolut Sutures, and the Suture of the Tendons. The knotted Suture is so called from the many Knots that are used in it; the Glovers Suture from its Resemblance to the Glover's Stitch; and the circumvolut Suture is so denominated, because the Lips of the Wound being transfixed by the Needle, the Thread is wound about for conjoining the Lips of the Wound more firmly; as is used in curing the Hare-lip. (See Tab. 25. Fig. 21, 22.) The Suture of the Tendons is used when the Tendons are divided. Besides, there are several other Sorts of Sutures used by ancient Surgeons, as the *Sutoria*, *Sartoria*, *Ciliana*, (See Tab. 25. Fig. 19.) and the *Clavata* made with Quills or small cylindrical Pieces of Wood; but these are long ago disused, except the *Cicatrix Clavata*, which was lately revived by Palfyn and Garengeot, with little Variation, only instead of Quills or Pieces of Wood, they recommend waxed silken Cylinders. 4. It must be remembered, that in Sutures of deep Wounds a small Tent must be left in the lower Part of the Wound, till it

be thoroughly cleansed, that the Healing may begin at the Bottom.

The Plaisters in the dry Suture must be of a sufficient Length, and shaped according to the wounded Part, so as to encompass great part of the Wound, though not entirely, lest they should retard the Circulation of the Blood, and induce Tumors and other Mischiefs. They must, also, adhere firmly, which Purpose is well answered by the Plaister of *Andreas a Cruce*, or the styptic Plaister of *Crollius*, or the Plaister of *Diachylon*, or of *Diapalma*, mixed with Turpentine, and spread on a Piece of strong Linen. The Discharge of Blood being stopp'd, and the Wound deterged, a vulnerary Balsam must be instilled into the Wound, such as the Essence of Mastich, Amber, of the Peruvian Balsam; or the *Balsamum Commendatoris*, or any balsamic Composition of the gummy kind, which soon form a kind of balsamic healing Crust, denying all Access to the Air, and promoting the Agglutination. Then apply the Plaister of a sufficient Length and Breadth, or two or more if necessary, either strait or crooked, leaving Spaces between them; first lay it warm upon one Side of the Wound, pressing it with the Palm of the Hand to make it adhere, and then press the disunited Lips of the Wound gently and equably together; and being thus joined, let them be kept firm by fixing the other End of the Plaister on the other Side of the Wound, then apply pieces of Linnen dipped in any of the Balsams above specify'd, and secure the whole with proper Compresses and Bandages.

According to *Petit's* Method the agglutinating Plaisters should have one Hole in the middle, or more, according to the Size or Figure of the Wound, (See Tab. 23. Fig. 11. and Tab. 25. Fig. 7.) that by these it may not only be discover'd, as in the former Method by the Interstices between the Plaisters, whether the Lips were properly joined, but the Wound may be daily supplied with proper Remedies. These Plaisters are applied in the same manner as the others, and must be continued on the Wound till the Part be near healed. The dry Suture may be also made in the following manner. Make two Plaisters of any of the Prescriptions abovementioned, on strong Linnen Cloth, answering to the Largeness, Depth and Width of the Wound; the deeper Wounds requiring longer, and the slighter shorter Plaisters; fasten to the Border or Edge of each piece of Linnen, three or four Tape-strings, according to the Length of the Wound, and after having warmed the Plaisters, lay one on each Side of the Wound, at the Distance of a Finger's Breadth from it, so that the Remedies may be conveniently applied, as represented in Tab. 25. Fig. 8. Then the Lips of the Wound are to be joined, and dressed as before directed; and while an Assistant carefully keeps the Lips in Contact, let the Surgeon tie the Strings of the Plaisters together, first in a single Knot; and then a slip Knot, and thus will the Lips of the Wound be kept properly united. Over each Plaister should be laid an oblong Compress, and over them a large square one, securing the whole with a proper Bandage. Next Day the Wound must be inspected; and if the Strings appear to be relaxed, they must be drawn tighter. But if they are not loosened, they ought to be left untouched; then apply a piece of Linnen, moisten'd with some Drops of a healing Balsam, and afterwards the Compresses and Bandage as before. Some, instead of Tape-strings, use Iron or Brass Hooks and Thongs, as is represented in Tab. 25. Fig. 9, 10. These Plaisters are fixed to the Lips of the Wound in the same manner as the former, and then with a Thread or Thong, passed through the opposite Hooks, they are drawn together, and the Lips of the Wound are brought into Contact. But as these latter kinds of dry Sutures require more Time and Trouble, they are, therefore, less used than the first Sort.

If the Wound be broad and deep, or transverse, as frequently happens in the Thigh, (See Tab. 24. Fig. 1. Let. H.) or in the Abdomen, in the Nates or Arms; or where a Piece hangs down from the wounded Part, as in the Forehead, Cheeks, Nose, Chin or Ears; or when the Wound is angular or crucial, as in Tab. 25. Fig. 12, 13, and 17. the true or bloody Suture is to be used. Sutures of this Kind, as we have already observed, are distinguished by simple and compound. Of the simple true Sutures, the convoluted or twisted Kind is seldom used, except in the Hare-lip; the Glovers Stitch is performed in Wounds of the Intestines; and the knotted Suture in all other Wounds, which require a true Suture. The compound Suture is so called because other Things become necessary besides a Needle and Thread.

The best Method of making the knotted or interrupted Suture (I think) is the following. Take a double Thread well waxed, or fix small Linnen Threads, and pass them through a strong crooked Needle. (See Tab. 22. Fig. T. 5.) With this Needle, pierce at once the two Lips of the Wound (which we now suppose two Inches long) about the Middle, pro-

proceeding from the exterior Part of the inferior Lip, towards the Bottom, to the interior Part of the superior Lip, so that the external Perforations, through which the Thread appears, may be about the Breadth of a Finger from the Lips of the Wound, or more or less according to the Size of the Wound. Then removing the Needle, and compressing the Lips of the Wound, tie the Ends of the Thread, first in a single Knot, and then in a slip Knot, so that the Lips of the Wound may be properly brought into Contact; then dress as in the dry Suture. If the Wound should be longer, and one Suture is not sufficient, two, three, or more may be made (See Tab. 25. Fig. 11, and 16.) in the same manner, but so as to be at the Distance of an Inch from one another. Besides, that the Wound may not be hurt by the Knots, the Threads are to be so tied, that after the first Knot, a small Compress (See Tab. 23. Fig. 22.) of Linnen or waxed Silk, may be laid on it, over which let the second Knot be tied, which must be made to slip, that it may more easily be untied and relaxed, should Pain or Inflammation happen.

In this Method we proceed, when the Wounds are oblique or transverse; but when the Wound has Angles, or is triangular, (see Tab. 25. Fig. 13.) the Suture must be first made in the Angle A. Like Sutures must, also, be made about the middle of the Sides of the Wound, as at B and C. If the Wound has two Angles, like the Greek Letter Π , as in Tab. 25. Fig. 14. which frequently happens in the Face, especially in the Forehead, then a Suture must be made at each of the Angles A A. If these are not sufficient, because of the Largeness of the Wound, two more will be necessary, about the middle of the Sides at B B, or perhaps more. When the Figure is crucial, or in the Form of the Let. X. as in Fig. 6. and 12. and its Lips cannot be brought into Contact by Plaisters, the Needle (as in Fig. 12.) must first be introduced at A, so as to come out at B; and it must again enter at C, and be brought out at D; then the Lips must be gently drawn together, and the Knot tied between A and D.

Instead of this simple Suture, some of the ancient Surgeons used the compound, or clavated Suture, called by the French *Suture enchevillée*, in large Wounds. This Suture they preferred to the others, because by them the Lips of the Wound were sometimes lacerated, which not only obstructed the Agglutination, but induced great Inconveniencies. But though the clavated Suture has been disused for several Years, and is expressly said by *Dionis* to be improper, yet some Moderns (especially *Palfyn*, in *Chirurg. Cap. 6. de Sutaris*, and *Garengot*, in *Chirurg. Cap. de Sutar. et Gastroraph.*) have again introduced it into Practice, and in various Cases preferred it to the knotted Suture; but with this Difference, that instead of two Pieces of Wood used by the Ancients, the Moderns take small Pieces of waxed Linnen or Silk rolled up like Cylinders, as long as the Wound, and about the Thickness of a Goose-quill. (See Tab. 25. Fig. 17.) By these means, the Lips of the Wound are prevented from being lacerated by the Threads; nor are they so rudely pressed as by the Pieces of Wood, which frequently excited Tumors, Pain and Inflammations. *Palfyn's* Method of performing this Operation, in deep Wounds of the muscular Parts, was thus: He took a large strong crooked Needle, in which was a strong double Thread well waxed, (as in Tab. 25. Fig. 15.) making a Noose; this Needle being passed through both Lips of the Wound, as before directed: And a second or third Needle being threaded and passed in the same manner, (see Fig. 17.) he introduc'd one Cylinder or waxed Roll, through the Nooses, as at B B; then having removed the Needles, he placed another Cylinder between the Ends of the Threads upon the other Side, and having brought the Lips of the Wound into Contact, drew the Ends of the Thread gently and equally, and tied them over the Cylinder, B B, first in a single and then in a slip Knot, as at C C C. If there be three Threads, tie the middle Thread first, and then the others.

Garengot perform'd this Suture nearly in the manner now described, but with this Difference, that instead of a double Thread, he used a peculiar Sort of Lace, made of six or eight clean white Threads, joined together and waxed, and more or less strong, according to the Largeness and Depth of the Wound; observing always so to proportion the Size of the Lace to the Needle, that it may readily follow the Needle, otherwise great Pain may be produced. When in this manner he has introduced as many Laces as may be necessary, he ties a Knot on the Extremity of each Lace, which hangs out from the upper Lip of the Wound; then he separates the Threads which compose the Lace, between the Knots and the Lip of the Wound, keeping an equal Number on each Side; and thus Nooses are made, through which the wax'd cylindrical Roll may be introduced. Then placing two Fingers on the inferior Lip of the Wound, near the Punctures of the Needle, with the other Hand he gently draws

the Laces, beginning with the Middle, if there are three, till the Lips of the Wound are exactly brought into Contact. Then separating in two Parts the Threads of each Lace, in the lower Lip of the Wound, which serve for tying the other Roll, he first made a single Knot on the middle Lace, after having carefully conjoined the Lips of the Wound; then having tied a single Knot on each of the other Laces, carefully observe that they be not made too tight, which might excite an Inflammation, and then secure all with a Slip-Knot made over each of the single Knots. Then let the Wound be treated with some vulnerary Balsam, especially the *Commanders Balsam*, applied with scraped Lint, which soon produces a kind of balsamic Crust, and by these means the Access of the Air to the Wound is prevented, and the Cure promoted. Apply also a Compress dipped in some warm, succulent, digestive Liquor, and a proper Bandage.

On the first Days, by whatever Method the Suture was performed, the Compress and Bandage must be removed with great Caution, and the State of the Wound examined. If all Circumstances appear favourable, if there be no Pain, or at least none violent, the Sutures are to be let alone for six or seven Days, or longer, and must be dressed as before, till the Wound appears to be conglutinated. If at the first Removal of the Dressings the Sutures appear too loose, the Knots must be untied, and the Threads straitened; but if the Sutures are too tight, they must be relaxed. When the Lips of the Wound appear swelled, and in some measure confused, a Suppuration must be excited with some digestive Ointment, or *Arcaus's* Balsam; and these Remedies must be continued for some Days; and thus these Disorders, or any other threatening Inconveniencies, are generally removed. But when the Inflammation appears violent, and a Fever is brought on, the Sutures should be a little relaxed, and the Wound dressed with a digestive Ointment, or *Arcaus's* Balsam; the Patient must also be blooded, the Body must be render'd soluble with Clysters, and thin aqueous Drinks are to be recommended, with other Remedies proper in an Inflammation and Fever. These Disorders being removed, the Sutures must again be gradually tightened, and the Wound dressed as above directed. But if these Remedies prove ineffectual, and the bad Symptoms not only continue, but daily increase, so as to appear dangerous, the Sutures must be cut, and the Wound treated in the same manner as if there were a Loss of Substance.

But if by these means the Wound is conglutinated, which may be known not only by the Concretion of the Lips, but also by the Laxity of the Threads, a grooved Probe must be introduced between the Lips of the Wound and the Sutures, if necessary; and the Sutures must be cut with Scissars near the Knots; then the inferior Lip of the Wound must be supported with one Hand, and taking hold of the Knot with the other, the Thread must be gently extracted. The small Wounds, occasioned by the Punctures of the Needle, may now be easily cured, by injecting into them some vulnerary Water, as the Aqua Sclopetaria, Lime-Water, or Spirit of Wine, and applying Compresses dipped in the like Liquors: But if the Wound be large, it is to be anointed with the Balsam of *Arcaus*, or another of the like Nature, and its Lips kept in Contact by an adhesive Plaister, till a firm Cicatrix be induced.

In large Wounds of the Abdomen, some Surgeons greatly prefer the quilled or clavated, to the knotted or interrupted Suture; because the Muscles of this Part are greatly agitated by Respiration, Rising, Sneezing, Coughing, and the like; by which violent Motions the small Threads have sometimes torn the Lips of the Wound, and great Mischiefs have ensued.

Garengot recommends this Suture even in Wounds that penetrate the Cavity of the Abdomen, and directs the following Method of performing it. Having threaded the Needle, delineated at Fig. 6. Tab. 27. the Surgeon takes hold of it about the Eye in his Right Hand, and introducing the Thumb of his Left Hand into the Wound, he claps the Fingers of the same Hand on the external Part of the superior Lip of the Wound, which he elevates; then he enters the Point of the Needle into the Abdomen, and passes it through the Peritonæum, Muscles, Fat and Skin, about two Finger-breadths from the Lip of the Wound. He then removes the Needle, and fixes it to the other End of the Thread. Then introducing his fore and middle Fingers into the Wound, below the inferior Lip, and keeping his Thumb on the external Part, he raises this inferior Lip, and pierces it with the Needle in the same manner as before directed. If the Wound is about four Fingers-breadth in Length, two Stitches are required, equally distant from one another, and from the Extremities of the Wound; and if the Wound be larger, more Stitches are necessary. The waxed cylindrical Rolls are to be introduced, as was already mentioned from the same Author, and the Wound dressed with *Arcaus's*

caus's Balm. The Abdomen must then be fomented with warm Oil of Roses, mixed with a little Spirit of Wine, especially about the Navel, and the Parts near the Wound; then a large Compress dipped in the same Medicine must be applied to the Part, over which may be laid another moisten'd with warm Oxycrate. These must be covered with a Piece of Flannel, soaked in an emollient Decoction, and the whole secured with the Bandage called the Napkin, which is to be hindered from slipping down by the scapular Bandage, represented in *Tab. 24. Fig. 1. C.* which ought also to descend lower than the Napkin.

When the Lips of the Wound appear to be well agglutinated, the Stitches may be cut, one after another, with Scissors, either at the same time, or on different Days, as the Circumstances indicate. Then the Threads being extracted, as we before directed, the Cure of the Wound may be completed by a vulnerary Balm and adhesive Plaisters. But particular Care must be taken not to extract the Stitches too soon, which might occasion the Lips of the Wound to burst again, and induce many Mischiefs.

See *Celsus's* Method of performing the Suture of the Abdomen, under the Article ABDOMEN.

For the Suture of the Intestines, see ABDOMEN.

For the Suture of the Hare-lip, see LABIA LEPORINA.

See the Suture for a Trichosis at the latter Part of the Article ALCALI.

THE METHOD OF PERFORMING THE SUTURE OF THE TENDONS.

This Operation is performed by modern Surgeons in the Tendons of the Hands, in order to join them when they are cut, by which the Fingers are prevented from becoming rigid or motionless. This Suture may be performed, if the Tendon be not deeply seated, but lies near the Skin; such are the Tendons of the Thumb, and Extensor-Tendons of the Fingers on the Back of the Hand; the Flexor-Tendons of the Fingers, and the Extensors and Flexors of the Hand, situated near the Carpus: Of this kind, also, in the Leg, are, the Extensors of the Tibia below the Knee, the Tendon of *Achilles* above the Heel, and the like. On the contrary, the Tendons of the Palm of the Hand are so deeply seated, and consequently the Suture is so difficult to be performed, that I never heard of one Instance of this Operation in that Part. The ancient Physicians were great Enemies to this Method of Cure, because *Hippocrates* says, "That a divided Nerve, by which he meant Tendon, can never again grow or coalesce." And indeed, the most violent Disorders are sometimes caused by a slight Puncture of a Tendon. We may conjecture that this Operation was performed in *Galen's* Time, because he advises against it; and his Opinion was followed by the Generality of Physicians; and particularly by *Ambrose Paré*. However, *Avicenna*, *Guido de Cauliaco*, *Salicetus*, *Rogierius*, *Lanfrancus*, *Brunus*, *Chalmetus*, *Andreas à Cruce*, and other ancient Surgeons, approved of this Operation; but their Successors seem either to have been ignorant of this Practice, or thought it too dangerous; till in the last Age, *Veslingius*, *Severinus*, *Felix Wurtzius*, and other celebrated Physicians, especially *Maynard* and *Bienaisius*, both of *Paris*, *Purman*, and others, revived, and successfully performed this Suture; which succeeds best when the Wound is recent; though it may be beneficially undertaken the second, third or fourth Day, or longer, after the Wound has been inflicted; and sometimes, but with greater Trouble, even after the Wound has been healed up.

Before the Operation be undertaken, let it first be considered, whether the wounded Tendon requires a Suture. Sometimes it happens that the Suture is impossible to be performed, and sometimes it is attended with great Danger. In some Cases it may be practicable, but is unnecessary, when the Cure may be completed by proper Dressings. If a considerable Part of the Tendon be cut off, and the Extremities be lost among the Muscles, so as that they cannot be brought into Contact, then it will be in vain to attempt the Suture. If the divided Extremities of the Tendon are violently contused, by which great Inflammation and Pain are induced, and the Parts be thereby hindered from uniting and healing, the Suture would rather irritate and increase these malignant Symptoms. In this Case, therefore, as *Garengot* well directs, it may be proper to promote a slight Suppuration, and the Inflammation being abated, the Suture, if necessary, may be attempted. The same Author, after *Solinguus*, observes, that the Tendons of the Extensors in the Back of the Hand, may generally be united without Suture; if the Hand be extended, and the Fingers turned backwards, that the divided Parts of the Tendon may be brought into Contact. This Method, says *Heister*, I have often successfully tried, particularly in a Youth who had all the Tendons of the Extensors of the

Fingers, upon the Metacarpus divided. In this Case therefore, as well as when the Flexors of the Fingers and Hands, or the Extensors of the Toes are wounded, the Suture appears to me superfluous, if the Parts are so bound and retained, by Splints, Compresses, and Bandage, that the divided Extremities may be kept in Contact: But when the Tendons are only punctured, or perforated by a small Instrument, or when they are not thoroughly cut, or are violently contused, if violent Symptoms, such as Convulsions, be occasioned, and if these Symptoms will not yield to proper Remedies, such as Oil of Turpentine, either alone, or mixed with a few Drops of the distilled Oil of Amber, or of Lavender, it will be necessary to divide the wounded Tendon entirely; and the Symptoms being mitigated, it may be again sew'd up.

The Suture of the Tendons may be performed in the following Manner: The Member being first bent, or extended, as the Circumstances require, the wounded Part must be carefully inspected. If the superior Part of the Tendon, as is often the Case, be drawn up by its Muscle, and concealed under the Skin, so that it cannot be brought down to be penetrated by the Needle, an Incision must be made into the Skin, and other Integuments, sufficient to discover the Tendon, which must be gently laid hold of with the Forceps, drawing it a little downwards, and then the Tendon may be united by Suture; or if the Tendon be discovered, *Garengot*, as he thinks the Treatment with the Forceps too rough, advises to draw the Tendon down, by passing a Needle and waxed Thread thro' it; but the Use of the Forceps, in this Case, occasions no bad Consequences.

There are two Methods of performing this Operation; the first with one Needle, and the second with two. With one Needle, the Operation may be thus performed: Thread a strait, small, common, round, or flat-pointed Needle, (see *Tab. 57. Fig. 2. A A*) with a slender double Silk or Linnen Thread, but strong enough, and waxed, as at *B B*; make a thick Knot at the Ends of the Thread, as at *C*, and draw the Needle with the Thread through the Middle of a Piece of Leather, as at *D*, or such as is particularly represented at *Fig. 3. A. and B*, so that the Knot may not easily slip thro' the Tendon; (see *Fig. 4. A*, or *Fig. 7. D E*) then the wounded Hand, the Back of which is in some Manner represented in *Fig. 4*, must be extended flat on a Table, or thin Board, or a Piece of thick Pasteboard, that the divided Parts of the Tendon may be more easily joined together; then opposing the Canula delineated in *Tab. 29. Fig. 6. Let. c*, or only the Point of the Forefinger to the Extremity of the Tendon which is divided, opposite to the Needle, we are to pass this Needle through the Middle of the superior Tendon about a Straw's Breadth, or two Lines, from the Extremity passing the Needle from the external to the internal Parts, as in *Tab. 57. Fig. 4. A*. After this, the Needle is, in like Manner, to be pass'd through the inferior Part of the Tendon, represented by *B*; but it must be directed from the internal to the external Parts: Then, as in the knotted Suture, applying either a small Compress, or Piece of Linnen Cloth, wrapt up, as in *Tab. 23. Fig. 22*, either with or without Wax, or a Piece of waxed Silk folded up in the same Manner, or a Piece of Leather, a simple Knot is exactly to be made above the small Compress, and then another, though a slipping and easily loos'd Knot; all the Parts of which Apparatus are in the Figure represented by the Letter *B*. Then the Wound being carefully cleansed, apply warm Oil of Turpentine, or Balm of Capivi, or some other vulnerary Balm, with Lint and Compresses, likewise using a Splint or Piece of stiff Pasteboard, shaped according to the Hand, (see *Tab. 57. Fig. 5*.) with Compresses for raising the Fingers backwards, and secure the whole with a proper Bandage. Instead of a straight Needle, the Surgeon may conveniently use a small crooked Needle, such as that represented at *Fig. 6*, which is flat about the Point *A*. If the Needle cannot be easily passed through with the naked Fingers, a Needle with a Handle may be used, as in *Tab. 27. Fig. 2, 3*. If the Wound has been inflicted some Days before, and the wounded Extremities of the Tendon appear to be indurated, which would render their Conglutination difficult, before the Ends are conjoined by the Suture, very thin Pieces should be cut off them with the Scissors; or if the Wound be mostly or entirely healed, it should again be opened by Incision, the Tendon must be carefully separated from the Parts to which it adheres, and then proceed as before directed.

Garengot imagined that he had greatly improved this Method; he strictly prohibits the laying of the Tendon bare, or bringing its Extremities into Contact with the Forceps, lest by both these Operations violent Symptoms should be excited; while, on the other Hand, the Patients are treated in a much milder and safer Manner, if the external Skin, together with the subjacent Tendon, be sew'd up, as we have already directed.

rested, and the Hand be kept extended with a proper Dressing. But that all these Measures may be the more commodiously taken, *Garengot* advises, that whilst others only use the Hands alone for this Purpose, we should employ the Instrument represented *Tab. 29. Fig. 6. L. c. thro'* which, after applying the Finger to the opposite Part of the Skin in order to secure it, we are to pass a Needle and Thread; and having passed the Needle through these Parts, we are to remove the Instrument: Then taking the Needle, we are to draw the Thread as far as is necessary, after which we are again to apply the Instrument, in order to perforate and bring into Contact the inferior Part of the Tendon in like Manner. For performing this Operation, crooked Needles are preferable to such as are strait; and plain Needles with an Edge on the interior Curve, as in *Fig. 6.* are preferable to Needles with Edges on both Sides, like the common ones represented in *Tab. 22.* by the Letters S T U; because, by the former, so many Fibres of the Tendon are not divided as by the latter. When the greatest Part of the double Thread is passed through the Integuments and Tendons, a Compress of Silk, spread with Wax, and wrapped up in a cylindrical Form, is to be fixed in this Thread as in a Loop, that it may secure the Ligature on the Lips of the Wound, as in *Tab. 57. Fig. 4. Let. C.* When the Thread is in like Manner pass'd through the inferior Part of the Tendon, and the two Parts are drawn so together as to have their Extremities laid one contiguous to the other, and a cylindrical Compress is placed between the Thread, as at D, the Whole is to be secured with two Knots, the one a single, and the other a slipping Knot. But it seems surprizing that *Vaugion, Verduc, Charriere*, and *Dionis* formerly, and, also, *Garengot*, should direct the Extremities of the Tendon to be laid one upon another, without offering any Reason for such Conduct, when it is evident, that the Agglutination must be impeded by this Method, as has been already remarked by the celebrated *Cowper*, who happily reunited the Tendon of *Achilles* without observing this Circumstance. But if the divided Parts of the Tendon are become callous by the Wound being received a considerable Time before, the above-mentioned eminent Surgeons advise the Tendon to be separated from the contiguous Parts, and the indurated Extremities to be cut off; then proceeding in the Suture as before. This Suture may, also, be conveniently performed, by applying a square Piece of Leather, as in *Fig. 3. A B*, both to the superior and inferior Part of the Wound, as is shewn in *Fig. 7.* making a Knot, with a Compress under it. The most simple Method of performing this Operation is proposed by *Dionis*: Pass a proper Needle, with a single waxed Thread, through one Extremity of the Tendon, from without inwards; then pass it through the other Extremity from within outwards; at one Stitch, and then removing the Needle, tie the Thread with a round Compress under the Knot, so that the Extremities of the wounded Tendon may be conjoined. But to this, the former Methods are generally preferred.

The Suture of the Tendons with two Needles, was, as far as I know, first described by *Nuck* thus: Thread two small common Needles with one waxed Silk Thread, sufficiently strong, but moderately thick; pass both the Needles through the upper Part of the Tendon, *Fig. 4. E.* inwardly, and through the lower Part of the other End of the Tendon, as at F, outwardly, so that both the Perforations on each Part of the Tendon should be made towards the Sides of the Tendon, and near to the divided Extremities; then, removing the Needles, tie the Ends of the Threads, putting a Piece of Leather or small cylindrical Compress under the Knot, which are to be so drawn together, that the divided Extremities may be brought into Contact. By this Method, says *Nuck*, the Extremities of the Tendon are not so liable to be lacerated as in the preceding Operations, where only one Perforation is made in each Extremity of the Tendon, and the divided Lips are more firmly kept in Contact. The Suture being thus finished, he sprinkles on the Part the Powder of boiled Turpentine, and dresses it with *Arcaus's* Balsam, or the common Digestive, taking Care so to dispose the Compresses and Splints, that the Tendon may be secured from Motion. Others prefer the former Method with one Needle, especially if the Suture is to be made in the Hand, because it may be done with more Readiness, and with less Pain and Trouble to the Patient: However, I think *Nuck's* Method is not to be entirely rejected. When there are several Tendons divided, the Suture is to be made upon each of the Tendons separately.

The Suture being finished, the Dressing must next be carefully performed. Lay in the Wound scraped Lint dipped in Oil of Turpentine, or *Peruvian* Balsam, or Balsam of Capivi, over which apply a Compress dipped in warm Spirit of Wine, and expressed. The Hand must be extended on a Piece of thick, stiff Pastebord, (see *Fig. 5.*) with Compresses placed under the Palm, to prevent the Hand or Fin-

gers from bending inwards: This Piece of Pastebord must be firmly fixed with a Bandage; the Arm must be wrapped up with Linnen Cloths moisten'd in Spirit of Wine, or warm Oxycrate. Some anoint the Arm with Oil of Earth-Worms, which is not improper. These Dressings must be repeated, till the divided Parts of the Tendon seem to coalesce, which may be known from the Laxity of the retaining Threads which must thereupon be cut, and carefully extracted: If the Pieces of Leather, Lint, or wax'd Silk, do not fall off spontaneously, they must be removed very gently. The Wound must be treated with a vulnerary Balsam, and scraped Lint, and the Hand must be kept extended on the Pastebord, by which Means the Agglutination will be promoted. *Garengot* describes a particular Machine for retaining the Hand and Arm in a convenient Posture, with the Fingers extended, and a little reflected: But though this Instrument may not be improper, the same Intention may be answer'd by the Method above directed. If any Rigidity or Distension affect the conglutinated Tendon, it will be proper to rub the Part carefully every Day with the Ointment of Marshmallows, the Oil of Worms, of *St. John's Wort*, or of Almonds, till it recovers its natural Motion. But it is surprizing, that not only the Antients, but even some of the Moderns, as *Arcaus, Marchetti, Genga, Peccatius*, and other eminent *Italians*, should reject this Method of Cure; and some scruple not to assert, that all Accounts of the Success of these Sutures ought to be reckon'd fabulous, although there are Instances of the contrary given by Authors of undoubted Credit, among whom may be consulted *Kisnerus's Dissertation de Tendinum Læsionibus, Valentini's Surgery, and Goelicke de Tendinum Affectionibus.*

The Tendons of the Legs are no less liable to be divided than those of the Arms, especially the *Tendo Achillis*, and the Tendon of the *Extensors* of the *Tibia*, immediately below the Patella. By the Tendon of *Achilles*, we mean that broad, strong Tendon which extends the Foot, and reaches from the Calf of the Leg to the Heel: Its Name is derived from the *Grecian Hero Achilles*, who, by a Wound of this Tendon, is said to have lost his Life. By a Division of this Tendon, the natural Power of moving the Foot is lost; and unless it be carefully re-united, the Lameness will continue during Life. I am not, indeed, ignorant, that *Garengot* mentions a Surgeon of *Paris* who cured a Man of a Fracture of the *Os Calcis*, by dividing the *Tendo Achillis* with the Knife, leaving it without a Suture, and taking out the Fragment of the Bone, and the Patient afterwards had no Defect in the Limb. But I am so far from recommending the Imitation of this Method, that I rather advise against it; nor can I see any Reason why, in a Fracture of the *Os Calcis* only, the Surgeon should cut the *Tendo Achillis*; neither does it appear from this Relation, whether the Author only disapproves of the Suture of this Tendon, or intirely rejects it. I wish *Garengot*, who often enlarges on Difficulties of much less Importance, had, also, explain'd this surprizing Case, if true, so as to have made it intelligible. *Borelli* relates, that a Surgeon extirpated a large Tendon of the Ankle, (I suppose the *Tendo Achillis*) corrupted with an Ulcer; and that after the Wound was healed, the Patient could walk without any Inconvenience, being supplied with a new Tendon, or some analagous Substance. The Wounds of this Tendon may be of different Kinds: If it be only punctured, perforated, or partially cut, the Patient is seized with very dangerous Symptoms, as was observed in the other Tendons; but here the Disorder is more violent, as this Tendon is larger than the others. Probably on this Account the antient Physicians reckon'd the Wounds of this Tendon, as it is the largest in the Body, mortal, or at least extremely dangerous, especially as they had heard and read that such a Wound was the Occasion of the Death of *Achilles*. The Symptoms accompanying a Tendon entirely divided, are much more mild and tolerable, and therefore, when a Puncture or partial Wound is attended with very violent Disorders, which will not yield to proper Remedies, let the Tendon be cut through, and then will the Pain and Convulsions cease; and in reuniting the Tendon by the Suture, none of these dreadful Symptoms appear. But why the accidental Puncture of a Tendon should be attended with such dangerous Consequences, and yet the Perforations made by the Needle should occasion little or no Disorder, is by no Means evident to me, though the Truth of this Fact is undoubtedly proved by Experience. For this Reason, it is not surprizing that *Paré*, who in many Cases was not so timorous, and many eminent Physicians, should be afraid to attempt this Operation: And *Veslingius*, when he had seen the Tendon of *Achilles* reunited by Suture, and that of the *Extensors* of the *Tibia* under the *Patella* performed by an *African* Surgeon, owns, that he abhorred the Rashness of such Operators, although the Success and Ease of the Cure sufficiently demonstrated the Unreasonableness of his Timidity. However, that

the *Tendo Achillis* when divided may be united, like other wounded Tendons, without a Suture, is not impossible, if the Foot can be bound up in such a Position, that the divided Extremities may be brought into Contact.

The Method of performing this Suture differs little from the Suture of the Tendons of the Hand, (see *Tab. 57. Fig. 7. and 10.*) except that the Needle should be larger and stronger, but either strait, as at *Fig. 8. Let. A.* or crooked and flat, as at *Fig. 9.* The Thread, also, is required to be stronger, as at *Fig. 8. B B.* The first Account of this Operation, so far as I know, was given us by *Veslingius*. One Instance he relates of the Suture of the Tendon of *Achilles*, and the other, which he saw in *Africa*, of that of the *Extensors of the Tibia*. It was afterwards performed by the eminent *Mr. Cowper, of London*; whose Description of this Operation, being the most particular yet published, I shall here deliver, taking Care to supply his Defects, and illustrate his Obscurities.

Mr. Cowper's Patient was about thirty Years of Age, having the *Tendo Achillis* of his left Leg cut through, about the Breadth of three Fingers above the *Os Calcis*, the superior Part being drawn up from the inferior about two Inches. (See *Fig. 10. A B.*) *Mr. Cowper* first open'd, by Incision, the Integuments *a b*, before he could have Access to the Extremities of the Tendon. This Incision *Garengot*, and some other Moderns, forbid, because from it they apprehend various Inconveniencies. But that no bad Consequences can arise from this Circumstance, is evident from the happy Conclusion of this very Case, not to mention the same Sort of Incision already recommended in treating the Tendons of the Hands. And if the Ends of the Tendon recede so far from one another as is here related, the Suture cannot be performed without such Incision. *Cowper* here used two strait, small Needles; but *Garengot* directs two very large, crooked Needles: But this Instance shews, that the Operation may be well executed with the small, strait Needles, though, perhaps, those which are crooked may be more convenient. We, also, learn from this Case, that the *Acutenaculum*, or Handle for the Needle, is not so extremely necessary as *Garengot* has represented it; for *Cowper* makes no Mention of it, and therefore it is probable he did not use it. He passes the first Needle *C* with a waxed Thread of Silk through the superior Part of the Tendon *A*, about half an Inch from the Extremity. By the *Figure* it appears that he entered the Needle on the Outside of the Tendon, guiding it to the Inner-side, though he makes no Mention of it; but the *Figure* does not exactly shew what Part of each End of the Tendon was perforated by the Needle *C*; that is, neither where it enter'd, nor where it came out, both of the superior and inferior Part of the Tendon. With another Needle *D*, and a like silken Thread, he in the same Manner pierced the superior Part of the Tendon, entering it a little lower than the first; then he passes both the Needles through the inferior Part of the Tendon *B*. The Foot was afterwards extended, and the Extremities of the divided Tendon were brought into Contact by drawing the Ends of the Threads together, which were tied so as to keep the Extremities of the Tendon in Conjunction, while the Foot was retain'd in this Position, and the Ends of the Threads were cut off. In what Manner the Ends of these Threads were tied, whether *C* with *D*, or *C* with *C*, and *D* with *D*, is not mentioned in the Relation, nor appears from the *Figure*. But from what is below observed, I am of Opinion, that *C* is tied with *C*, and *D* with *D*. The Wound was then dressed with Lint dipped in Balsam of Turpentine, and a Compress and Bandage was applied. Next, that the Foot might be retained in a proper Extension, and the Extremities of the Tendon exactly kept in Contact, a sort of Arch was made of the thickest and firmest Pastebord, which was so applied to the anterior Part of the Foot and Leg, as to keep the Foot extended and immovable, and prevent a Rupture of the Suture. He observes, that the Patient complained of severe Pain, when with the Needle he perforated the superior Part of the Tendon; but felt none when he pierced the inferior Part. Then, in order to prevent various Mischiefs, fourteen Ounces of Blood were extracted from the Arm of the Patient, who was next put to Bed, and in the Evening an Ounce of the *Syrupus e Mecconio* was exhibited to him, to compose him to Rest. Next Day the Patient was in a favourable Condition, slept well, and only complained, that in the Night he felt lancinating Pains in the Calf of his Leg when he happened to awake. The third Day, the Wound was dressed in the same Manner as the first, adding only a Fomentation of Wormwood, Sage, Rosemary, and Bay-Leaves. On the fourth Day, the Wound appeared very wet with a serous Humour called *Synovia*; on the 6th, this Matter was thicken'd, and on the 8th, still more inspissated, after which it disappeared. All this Time the two Extremities of the divided Tendon

had not at all receded, but between them appeared a white Substance, to which the Balsam of Turpentine and Tincture of Myrrh were applied. Soon after this white Substance cast off, and the two Extremities appeared covered with a fungous fleshy Substance. To the Wound were afterwards applied dry Dressings, sometimes dry Lint, and sometimes the Powder of Turpentine. On the tenth Day, one of the Threads appeared relaxed, which *Cowper* cut and extracted. Two or three Days after, the other Thread became loosen'd, which he also cut and extracted, the Foot being all the while kept extended with the Pastebord Arch. Hence it appears, that the Ends of the Thread *C C* were tied together, and likewise those at *D D*, as I above hinted, because one of the Threads became relaxed, was cut, and extracted, while the other remained tight; for had they been tied in any other manner, if one of the Threads had been cut, the other would also have been loosened. In one Circumstance *Cowper* widely differs from all others; for it does not appear by his Relation, that he used any Compresses of Leather, Cork, or of waxed Linen or Silk. He also directs how the Threads of the Suture should be extracted, a Particular which is generally overlooked by other Writers; as is the Pastebord Arch, which however is so necessary in this Case, that the Extension of the Foot cannot easily be preserv'd without it. Nor does any other Author mention the frequent Application of corrosive Medicines, to remove or diminish the spongy or luxuriant Flesh. In thirty Days the Patient was able to walk a little, though lamely. He gradually came to walk with greater Ease, and about the End of the second Month, recovered the perfect Use of his Foot. But *Paré* gives an Instance of the Tendon of *Achilles* being cut with a Sword, which not being united by Suture, was not only tedious and difficult of Cure, but after a Cicatrix was induced, it again broke as the Patient was rising out of Bed.

Veslingius gives a very imperfect Account of the Sutures which he saw of this kind: *I saw*, says he, *the Tendon of Achilles, in my Father's Ammanensis, which had been divided a little above the Os Calcis, united with some Sutures performed by Surgeons. I likewise saw the Tendon of the Extensors Tibia, in an Arabian, which had been cut with a Scymetar, transversely under the Patella, brought into Conjunction in the same manner by a Surgeon of Tunis.* From this Relation we can only learn, that more than one Suture was used, but no Mention is made of the Manner of Dressing, and Method of Cure. *Kisner*, in his Dissertation *de Tendinum Læsionibus*, has delineated another Method of performing the Suture of the Tendon of *Achilles*, which I have represented in *Tab. 57. Fig. 7.* which is so plain as to need no further Explication. But though the Generality of Authors direct to make the first Perforation in the upper Part of the Tendon, he begins with the lower at *D E*, and makes the slipping Knot on the superior Part, which others make on the inferior. But though I do not deny, that this Method proposed by *Kisner* may succeed, yet I would prefer that followed by *Cowper* and others.

The Method of performing the Suture of the Tendon of the Extensors of the Tibia, has not, I believe, been hitherto described by any Author; but I conceive it may be done in the same manner as that just described. But as this Tendon is larger than the Tendon of *Achilles*, one Puncture in each Part of the Tendon may not be sufficient; it may therefore be proper, the Leg being first extended, to use a Thread with two Needles, and to make two Perforations in each Part of the Tendon, after the Manner proposed by *Nuck*, [See *Tab. 57. Fig. 4. Lit. E F.*] which we have already given. The Wound may be afterwards treated, as we have directed in Tendons of the Hands, or according to the Method proposed by *Cowper*. The Ham must afterwards be bound up with Splints of Wood, or thick Pastebord, as in a Fracture of the Patella; so that the Knee cannot be bent, but retained in continual Extension. But by carefully observing to keep this Posture of the Leg, and treating the Wound in a proper manner, I make no doubt but this Tendon may coalesce without a Suture; because the superior Part of the divided Tendon will not shrink so much as in the Tendon of *Achilles*, on account of the Connexion of the Patella with the Tibia; and therefore the two Extremities may more easily be brought together, and retained in Contact by proper Bandages.

OF THE SUTURE OF THE LIGAMENTS.

As the Ligaments consist of a similar Substance with the Tendons, in all probability they may be successfully united by the same Method, though I know no Instance of this Operation. But in this Suture the Thread with two Needles seems to be most proper, and the Method recommended by *Garengot* for Sutures of the Tendons, which we have already given, should be observed. The Dressings and other Treat-

ment may be the same as in the preceding Cases. *Heister's Surgery.*

SYALITA. *H. M. Arbor Indica flore maximo, cui multae innascuntur Siliquae.* This is a tall Tree, forty or fifty Foot in Height, growing in *Malabar*, and bearing a most beautiful and sweet-scented Flower, succeeded by a very large Fruit resembling an Apple, and much like our subacid or vinous Apples both in Taste, Smell and Pulp, tho' somewhat too acid to be eaten as a Delicacy; it is, however, used by the Natives, especially in their Broths.

Of the Leaves of the Tree they prepare a Lixivium, which is of use in cleansing the Greasiness of the Hair, and detaching the Sordes of the Head, and also in smelting and depurating Silver. The expressed Juice of the Roots applied in Linen moistened therewith, resolves inflammatory and Oedematous Tumors. The expressed Juice of this tender Fruit, made into a Syrup with Sugar, cuts and expels Phlegm, and cures the Aphthae and Inflammations of the Fauces. The mature Fruit loosens the Belly, and frequently excites a Diarrhea. And the Bark of the Tree bruised with an Infusion of Rice, which the Natives call *Ambata-Confja*, being rubbed on the affected Part, cures the Gout. *Raii Hist. Plant. p. 1707.*

SYCAMINOS. The Mulberry.

SYCE. *συκη.* The Fig.

SYCIA, by Corruption for **SICYA**, which see.

SYCION. *συκιον.* A Decoction of dry'd Figs.

SYCITES. *συκιτης.* An Epithet for Wine impregnated with Figs.

SYCOMA. See **SYCOSIS**.

SYCOMORUS. *Offic. J. B. 1. 124. Ger. 1326. Emac. 1509. Sycomorus sive Ficus Egyptia, Park. Theat. 1492. Ficus folio Mori, fructum in caudice ferens, C. B. P. 459. Raii Hist. 2. 1439. THE EGYPTIAN SYCOMORE.*

It grows in *Egypt* and other Countries, and the Fruit and Tear are in Use. The Fruit is cooling and moistening, and relaxes the Stomach, and cures hard Tumors; the Tear resists Poisons and the Pestilence.

The Fruit of the Sycomore agrees with the Belly, but affords very little Nutriment, and is bad for the Stomach. It is supposed to be of a refrigerating and moistening Quality, and to loosen the Belly, whence it is proper to be applied with the Oil of Roses to the Stomach in feverish Disorders. *Galen* bestows very high Commendations on the Plaster *δαδονικον*, *Diafycorum*, for the Cure of a Tumor proceeding from a gross and vaporous Spirit. The Tear of the Tree has the Virtue of mollifying, conglutinating Wounds, and discussing what is difficult to be matured. It is also taken inwardly, and used outwardly in Inunctions against the Bites of Serpents, scirrhus Hardnesses of the Spleen, and Pains and Coldness of the Stomach. The Ancients prepared a Wine of the Fruit, which easily degenerated into a very sharp Vinegar. *Raii Hist. Plant.*

SYCOSIS. *συκωσις*, in Latin *Marisca*, is a Tumor in the Anus, differing from the Thymus only in Bigness. *Sykosis*, in *Celsus*, *Lib. 6. Cap. 3.* is also an Ulcer, so called, he says, by the *Greeks*, from its Resemblance to the *συκη*, or *Ficus*, because the Flesh grows up in it. He proceeds to tell us, that it is of two Kinds, one hard and round, the other moist and unequal. From the hard Ulcer, or *Sykosis*, is discharged a glutinous Substance in small Quantities; from the humid Ulcer, a larger Quantity and of an ill Smell. They both arise in those Parts which are covered with Hair; but that which is round and callous, is generally seated in the Beard; the moist Kind, for the most part, among the Hair of the Head. Thus *Celsus*.

For the Cure of both these Kinds of *Sykosis*, the same Author advises the Application of the Elaterium, or Linseed bruised and made into a Mafs with Water, or Figs boiled in Water, or the *Emplastrum Tetracharmatum* made up with Vinegar, or to rub the Place with *Terra Eretria* dissolved in Vinegar.

Sykosis, *συκωσις*, is also the same as *Sycoma*, *συκωμα*, or *Sycon*, *συκων*, which is an Eminence and Tumor of the Eyelids with an Asperity, whence the Eyelid is called *Ficosa Palpebra*. *Paulus* gives this Name to a rough Excrecence of the inner Part of the Eyelid, which increases so as to have Incisures, by which it is distinguished from a *Trachoma*, *τραχημα*. And the Author of the *Ilagoge* defines a *Sykosis* to be something like Flesh growing in the interior Part of the Eyelid, and hanging out in such a manner as to incommode the Eye in its Motion. *Aetius*, *Tetrab. 2. Serm. 3. Cap. 45.* tells us, that what we call a *Sykosis*, has high Eminences, and, as it were, Incisures.

Galen, *Com. 2. in 6 Epid.* for exulcerated Tumors and Eminences in the Eyelid, directs, first to use exasperating Medicines, and then Corrosives, that their Virtue may penetrate the deeper; and tells us, that in such Cases he has made

use of the rough Skin of a Whale, the Shell of a Sepia, and a Pumice-stone. The same Author, *Lib. 11. de Simpl. Med. Fac.* says, that they call great and considerable Asperities of the Eyelids *Sycofes*; and *Lib. 4. de C. M. S. L.* that small Asperities of the Eyelids are called *Trachomata*, but considerable ones *Sycofes*.

SYCOTA. *συκωτα*, from *συκη*, a Fig; are a delicate Sort of Food prepared of *Caryca*, which, as *Galen* says, *Com. 3. in Lib. de R. S. J. A.* on account of their Sweetness, are very grateful to the Viscera, particularly the Liver, but very hurtful in Fevers and internal Inflammations, because they are easily converted into Bile.

SYCOTON. *συκωτον*, we are told by *Aetius*, *Tetrab. 2. Serm. 2. Cap. 127.* is a Name for the Liver of a Pig fatten'd with *Caryca*.

SYDIA. Wool. *Rulandus.*

SYLETUM, is defined by *Paracelsus*, a Medicine compounded of three Salts. *De Tartaro, Tract. 2. C. 5.*

SYLO. The whole World. *Rulandus.*

SYMBOLISMUS. Means a Consent of Parts, in the Writings of some of the Chymists.

SYMOLOGICE. That Part of Pathology, which treats of the Signs or Symptoms of Diseases.

SYMPARATAXIS. *συμπαράταξις*, from *συν*, importing Conjunction or Mixture, and *παράταξις* (of *τάξις*, to order) to draw up an Army in Order of Battle, is properly a Conflict between two Armies, but is used by *Hippocrates*, *de Pristia Medicina*, to signify the Conflict or Contention between the Disease, Nature, and the Aliments.

SYMPASMA. *συμπασμα*. The same as **CATAPASMA**, or **DIAPASMA**.

SYMPATHETICUS PULVIS. The Sympathetic Powder.

Take good *English* Vitriol, such as we call Bow Copperas, purify it by two or three Dissolutions, Filtrations, and Crystallizations; set those Crystals in a clean Pan in the Sun, either in *June*, *July*, or *August*, till they are calcined to Whiteness. When one Side is calcined, turn the other, and in a few Days the Crystals will crumble into Powder; if they do not, they may be again beat and exposed to the Sun, and stirred three or four times every Day. At last beat them into a very fine Powder, and again set them in the Sun, stirring as before for two or three Days more, in which Time they will be very white; then take in the Matter while the Sun shines hot upon it, and keep it from the Air in Glasses well stop'd, and in a dry Place.

It is a mild powerful Styptic, very successfully applied in the Stopping of Blood, either at the Nose or Wounds, and will incarnate and heal up, where the Bone is not unsound. We have a great many surprising, and even romantic Stories, of its Efficacy, by some Writers in that Way, by which it has obtained its Name, and particularly by Sir *Kenelm Digby*; but the present Practice owns no such Chimæras.

Powder of Sympathy, according to Sir *Kenelm Digby*, from whose Discourse on this Subject, made before a solemn Assembly of Persons of Quality and Learned Men at *Montpellier* in *France*, the following Account is taken, is a Powder which naturally, and without any Magic, cures Wounds without touching, and even without seeing the Patient.

The Method and primitive Manner how to make use of this sympathetic Remedy, was to take only some Vitriol, and that of the common Sort, as it came from the Druggist's, without any Preparation or Addition at all, and to dissolve it in Fountain-water, or rather Rain-water, in such a Proportion, that putting therein some polished Iron, it should come out changed into the Colour of Copper. And into this Water they put a Clout or Rag, embued with the Blood of the Party hurt (the Rag being first dry); but if it was yet fresh, and moist with the reeking Blood, there was no Need but to powder it with the small Powder of the same Vitriol, in such sort that the Powder might incorporate itself, and imbibe the Blood remaining yet behind, and keep both the one and the other in a temperate Heat and Place, viz. the Powder in one's Pocket, and the Water (which admits not of this Commodity) in a Chamber where the Heat was temperate, and every time that one puts new Water of Vitriol, with fresh Powder and new Cloth, or other bloodied Stuff, the Patient should feel new Ease, as if the Wound had been then dressed with some sovereign Medicament; and for this Reason, they used to reiterate this Manner of Dressing both Evening and Morning.

But now the most part of those who make use of this Remedy of the Powder of Sympathy, do endeavour to have Vitriol of *Rome*, or of *Cyprus*, and calcine it white in the Sun.

Sun. And besides, some use to add the Gum of Traga-canth, it being easy to add unto Things already invented.

The Virtue of this Powder is confirmed, as our Author says, by one of the clearest, most perspicuous, and most averred Instances that can be, not only from the remarkable Circumstances thereof, but also for the Hands through which the whole Business passed. For all the Circumstances were examined and sounded to the Bottom by one of the greatest and most knowing Kings of his Time, King James [the First] of England, who had a particular Talent, and marvellous Sagacity, to discover natural Things; as also by his Son King Charles, and the Duke of Buckingham, their Prime Minister. And all was register'd among the Observations of the Great Chancellor Bacon, to add, by way of Appendix, to his *Natural History*. The Matter of Fact is as follows.

Mr. James Howell, well known for his publick Works, and particularly his *Dendrologics*, endeavouring to part two of his Friends engaged in a Duel, seized with his Left Hand the Hilt of the Sword of one of the Combatants, and with his Right Hand laid hold of the Blade of the other. They being transported with Fury one against the other, struggled to rid themselves of the Hindrance their Friend made, that they should not kill one another; and one of them roughly drawing the Blade of his Sword, cut to the very Bone the Nerves and Muscles of Mr. Howell's Hand; and then the other disengaging his Hilt, gave a cross Blow on his Adversary's Head, which glanced towards his Friend, who heaving up his fore Hand to save the Blow, he was wounded on the Back of his Hand, as he had been before within. The two Combatants seeing Mr. Howell's Face besmeared with Blood, by heaving up his wounded Hand, left fighting at once, and ran to embrace him, and having searched his Hurts, they bound up his Hand with one of his Garters, to close the Veins which were cut and bled abundantly. They brought him home, and sent for a Surgeon; but this being heard at Court, the King sent one of his own Surgeons; for his Majesty much affected the said Mr. Howell.

It was my Chance to be lodged hard by him, and four or five Days after, as I was making myself ready, he came to my House, and prayed me to view his Wounds; for I understand, said he, that you have extraordinary Remedies upon such Occasions, and my Surgeons are apprehensive that it might grow to a Gangrene, and so the Hand must be cut off. In effect, his Countenance discovered that he was in much Pain, which he said was insupportable, in regard of the extreme Inflammation. I told him I would willingly serve him, but if haply he knew the Manner how I would cure him, without touching or seeing him, it may be he would not expose himself to my Manner of Curing, because he would think it perhaps either ineffectual or superstitious. He replied that the wonderful Things which many have related unto me of your Way of Curing, make me nothing at all doubt of its Efficacy. I asked him then for any thing that had the Blood upon it; so he presently sent for his Garter, wherewith his Hand was first bound; and having called for a Basen of Water, as if I would wash my Hands, I took a Handful of Powder of Vitriol, which I had in my Study, and presently dissolved it. As soon as the bloody Garter was brought me, I put it within the Basen, observing in the mean while what Mr. Howell did, who stood talking with a Gentleman in a Corner of my Chamber, not regarding at all what I was doing; but he started suddenly, as if he had found some strange Alteration in himself. I asked him what he ailed. I know not what ails me, replied he; but I find that I feel no more Pain; methinks that a pleasing Kind of Freshness, as if a wet cold Napkin did spread over my Hand, has taken away the Inflammation that tormented me before. I answered, since you feel already so good an Effect of my Medicament, I advise you to cast away all your Plaisters, only keep the Wound clean, and in a moderate Temper betwixt Heat and Cold. This was presently reported to the Duke of Buckingham, and a little after to the King, who were both very curious to know the Circumstance of the Business, which was, that after Dinner I took the Garter out of the Water, and put it to dry before a great Fire. It was scarce dry, but Mr. Howell's Servant came running, that his Master felt as much Burning as ever he had done, if not more, for the Heat was such, as if his Hand were betwixt Coals of Fire. I answered, that tho' that had happened at present, yet he should find Ease in a short time, for I knew the Reason of this Accident, and I would provide accordingly, for his Master should be free from that Inflammation, it may be, before he could possibly return unto him; but in case he found no Ease, I wished him to come presently back again; if not, he might forbear coming. Thereupon he went, and at the Instant I did put again the Garter into the Water, he found

his Master without any Pain at all. To be brief, there was no Sense of Pain afterwards; but within five or six Days the Wounds were cicatrised and entirely healed.

King James, who had received a punctual Information of what had happen'd, would fain know how it was done. I readily told him what the Author, of whom I had the Secret, said to the Great Duke of Tuscany on the like Occasion. It was a religious Carmelite, who came from the Indies and Persia to Florence; he had, also, been in China, and having done many strange Cures with his Powder, after his Arrival in Tuscany, the Duke said he would be very glad to learn it of him. The Carmelite answer'd, that it was a Secret he had learnt in the Oriental Parts, and he thought there was not any Person in Europe who knew it but himself, and that it deserved not to be divulged, which could not be done if his Highness meddled with the Practice of it, because he was not likely to do it with his own Hand, but must trust a Surgeon, or some other Servant; so that, in a short Time, divers others would come to know it as well as himself. But a few Months after I had an Opportunity to do an important Curtesy to the said Friar, which induced him to discover unto me his Secret; and the same Year he returned to Persia, so that now there is no other knows this Secret in Europe but myself. The King replied, that I need not be apprehensive that he would discover any Thing, for he would not trust any Body in the World to make Experience of his Secret, but that he would do it with his own Hands, and therefore desired some of the Powder; which I deliver'd, instructing him in all the Circumstances. Whereupon his Majesty made sundry Proofs, whence he received singular Satisfaction.

In the Interim Dr. Mayern, his first Physician, wanted to discover what was done by this Secret; and at last he came to know that the King made use of Vitriol. Afterwards he accosted me, saying, he durst not demand of me the Secret, because I made some Difficulty of discovering it to the King himself; but having learnt with what Matter it was to be done, he hoped that I would communicate unto him all the Circumstances how it is to be used. I answered him, that if he had asked me before, I would have frankly told him all, for in his Hands there was no Fear that such a Secret should be prostituted. A little after the Doctor went to France, to see some fine Lands which he had purchased near Geneva, and in this Journey went to see the Duke of Mayenne, who had been his Friend and Protector, and taught him his Secret, whereof the Duke made many Experiments, which if any other than a Prince had done, that had perhaps passed for Effects of Magic and Enchantment.

After the Duke's Death, who was killed at the Siege of Montauban, his Surgeon, who waited upon him in doing Cures, sold this Secret to divers Person of Quality, who gave him considerable Sums for it, so that he became very rich thereby. The Thing being thus fallen into many Hands, remained not long a Secret, but by Degrees came to be so divulged, that now there is scarce any Country Barber but knows it.

The Author proceeds from Matter of Fact to assign Reasons, or, as he says, to make good convincing Proofs, that this *sympathetical* Cure may be done naturally. Here, tho' indeed he manages his Argument very ingeniously, and shews a great Insight into Nature for those Times, and enlivens his Discourse with many remarkable and surprising Relations; yet what he says, I doubt, will not appear demonstrative to one whose physical Notions are built upon modern Principles and Discoveries. The Powder itself, and its Effects, how well soever they seem attested, are left intirely to the Judgment of the Reader.

SYMPEPSIS. Concoction, or Digestion.

SYMPHONOS. *συνφωνος*. An Epithet for a Medicine against a Cough and Fever, recommended by Galen, L. 7. de Comp. M. S. L. Cap. 2.

SYMPHORANEUROS. A Term peculiar to Forestus, importing a severe Tremor in acute Fevers, accompanied with an Hebitation of the Senses.

SYMPHYSIS. *σύνφυσιν*, from *σύν*, with, or together, and *φύω*, to grow, in Anatomy, is a Species of Articulation. In Surgery, *Symphysis* is a Coalescence of the natural Passages, as the Anus, Vagina, Nostrils, or any other Part.

SYMPHYTUM.

The Characters are;

The Calyx is cut, even to the Base, into five long slender Segments. The Flower is monopetalous, pendulous, cylindrical, in the lower Part, and in its upper Part, which has its Margin quinquefid, resembling a Pitcher. From the interior, lower, fistulous Part of the Flowers, where it begins to be explicated, proceed five Stamina, and as many sharp, nodding Pales, placed alternately. The Seeds are smooth, shining, and resembling those of the *Lithospermum*.

Boerhaave mentions six Sorts of *Symphytum*, which are;

1. *Symphytum*; *Consolida major*; mas; flore purpureo. *Boerb. Ind. A.* 195. *C. B. P.* 259. *Symphytum*, *Consolida major*. *Offic. Tourn. Inst.* 138. *Symphytum magnum*, *J. B.* 3. 593. *Raii Synop.* 3. 230. *Symphytus majus vulgare*, *Park. Theat.* 523. *Consolida major*, *Ger.* 660. *Emac.* 806. *Raii Hist.* 1. 505. **COMFREY.**

Comfrey has a large Root, divided into many Branches, which are black, on the Outside, but white within, full of a slimy tenacious Juice. The lower Leaves are pretty large, long, narrow, and sharp-pointed, hairy and rough. The corner'd Stalks grow to be two or three Foot high, clothed with smaller Leaves, and bearing on their Tops reflected Spikes of white Flowers, opening by Degrees; each Flower being hollow and cup-fashion, cut into five blunt Segments on the Top, and set in a very hairy Calyx; in which, after the Flower is fallen, grow four rough Seeds. It grows by River Sides and watery Places, and flowers in *June*.

There is one Sort of great *Comfrey*, that bears purple Flowers; but it is not so frequently met with as that with white.

The Roots, Leaves and Flowers are used.

Comfrey is a good vulnerary Plant, having the Name of *Consolida* given it, because it consolidates Wounds. It is likewise good against inward Bruises, Spitting of Blood, and is useful against sharp corroding Humours, that cause Erosions in the Bowels. The Roots beaten to a Cataplasm, ease Pains of the Gout.

The only official Preparation from *Comfrey*, is the *Syrupus de Symphyto*. *Miller's Bot. Off.*

The Leaves of *Comfrey* are insipid, glutinous, and give a very faint Tincture of red to the blue Paper; the Roots give it a little deeper, and abound with a viscid Juice. This Plant contains a Salt very much resembling the Salt of Coral, dissolved in a very glutinous Phlegm, in which there is a little Sulphur, and a very little Sal Ammoniac: For

By the Chymical Analysis it yields several acid Liquors, a great deal of Earth, very little Sulphur, no volatile concrete Salt, but a little urinous Spirit. There is but a very small Quantity of the fix'd Salt; so that it may probably act principally by its viscid Juice, which the Fire destroys.

Dioscorides says its Roots are vulnerary; that being bruised with the Leaves of Groundsel, they assuage the Inflammation of the Piles; that their Juice is good for spitting Blood; and lastly, that being boiled with Meat, they join the Pieces together again. The Moderns agree that its Roots incrassate and lenify; they are good in Hæmorrhages and spitting of Blood, caused by acrid Salts, which render it too fluid; and, in Defluxions of the Breast, caused by saltish and corrosive Serosities. The Roots are candy'd, and Lozenges are also made of them. *Fernelius's* Syrup of *Comfrey* is very compound; so is likewise that of *Dodonæus*, but it is more lenifying.

Take two Ounces of *Comfrey* Roots; of Liquorice, one Ounce; two Handfuls of the Leaves and Roots of Colts-foot; an Ounce and an half of the Kernels of Pine-Apples; twenty Jujubes; two Drams of Mallow Seeds; two Drams of the Heads of white Poppy: Boil all this in a Pound and a half of Water; strain the Decoction thro' a Sieve; make it into a Syrup with six Ounces of Sugar, and as much *Narbonne* Honey.

The Roots of *Comfrey* bruised and applied as a Cataplasm, very much assuage the pricking of the Tendons, the Pains of the Gout, and stop spreading Ulcers. *Simon Paulli* advises not to use them alone for the Gout, for fear they should repel the Humour. He prescribes the following Cataplasm, which he had from *Semertus*, as an incomparable Remedy.

Take three Ounces of *Comfrey* Roots; two Ounces of Marsh-mallow Roots; one Ounce and a half of those of Dwarf Elder; one Handful of the Leaves of Southern Wood; two Handfuls of St. John's Wort; three Handfuls of Chamomile Flowers; four Handfuls of those of Elder; two Ounces of Fœnugreek Seed; three Ounces of Linseed; boil all together in Elder-Water, to make a Cataplasm. This Medicine is very compound. I mix some Drops of fetid Oil with the Root of *Comfrey* well bruised, and apply it to the Parts affected with the Gout. *Martyn's Tournesfort.*

Symphytum is principally used in all Sorts of Fluxes, especially of the Belly, in an Erosion of the Lungs, and a Phthisis. But I, says *Baubine*, (with whom agrees *C. Hoffman*) would not use the Root of *Comfrey* in all Kinds of Disorders of the Thorax, but only in such as proceed from a thin, subtle and hot Humour. The Flowers boiled in Red Wine, and taken twice a Day, are an excellent Remedy, according to *Camerarius*, for bloody Urine. *Parkinson* commends the

Roots cut small, then pounded and apply'd, in Pains of the Gout, and for restraining phagedenic Ulcers, and even Gangrenes. Take of the Roots of *Comfrey*, as much as you think fit, beat them in a Mortar to a Mass, which spread upon Leather, and apply to the Part affected; this Cataplasm is not only effectual for mitigating the Pain of the Gout and Sciatica, but, also, Pains of the Arms, attended with a Privation of Motion, and for some Kinds of venereal Pains, in which it has been successful, after many Embrocations used to no Purpose. Pulverise the dry'd Root of *Comfrey*, and mix the Powder with warm Spring-Water, stirring it about till you observe the Water to become ropy with the Glue or Slime of the *Comfrey*. This very simple Medicine is prefer'd by the most skilful Surgeons, as well in Hæmorrhages, as Fractures and Luxations, before many others which are more compounded. A certain Person labour'd under a malignant Ulcer, which the Surgeons pronounced a Cancer, but could not cure it. A Mountebank was consulted; he took the Root of the greater *Comfrey*, and scraping off the black outer Bark, he bruised the rest, and spreading it on a Linnen Cloth, applied the same twice every Day to the Part affected, and the Patient was cured; the Cancer, however, was but recent, and of no more than eight or ten Weeks standing. *Raii Hist. Plant.*

2. *Symphytum*; *Consolida major*; fœmina; flore albo, vel pallidè luteo. *C. B. P.* 259.

This agrees in Virtues with the former.

3. *Symphytum*; *Consolida major*; mas; flore purpureo cæruleo. *C. B. P.* 259.

4. *Symphytum*; *Consolida major*; mas; flore coccineo.

5. *Symphytum*; majus; tuberosâ radice. *C. B. P.* 259.

6. *Symphytum*; *Echii folio angustiore*; radice rubrà; flore luteo. *T.* 138. *Anchusa*, lutea, minor. *C. B. P.* 255. *Boerb. Ind. Alt. Plant.*

It is called *Symphytum* from *συνφύω* (*Symphyo*) to conglutinate, to cause a Coalition, from its well known conglutinating Quality.

The first Species has a viscous and glutinous Juice, and is of excellent Service in Wounds and malignant Ulcers, attended with Hæmorrhages, in Spitting of Blood, bloody Urine, and a Phthisis. The Root is insipid, but very demulcent, and the Juice is very good in an Hæmoptoe from an excessive Tenacity, and in Hernias. The *Syrupus de Symphyto* of *Fernelius* is good in Asperities of the Lungs, but not proper for a Cough in old Persons, for it increases it. A Cataplasm of the Roots is effectual in Punctures of the Tendons. The Herb is good in a Dysentery, and an Exulceration of the Kidneys and Bladder from Cantharides; it is exhibited like the *Althæa*, but in a smaller Dose, because of its grosser Mucosnefs. The Flowers bruised and boiled, with an Addition of Syrup of *Althæa*, make an excellent Cataplasm for consolidating recent Wounds. *Hist. Plant. Ascript. Boerb.*

SYMPHYTUM is also a Name for several Sorts of *Pulmonaria*.

SYMPHYTUM MINIMUM. See **BELLIS MINOR.** It is also a Name, in *Boerhaave*, for the *Omphalodes*; *pumila*; *verna*; *Symphyti folio*.

Besides the foregoing Sorts of *Symphytum*, *Dale* mentions the following Species;

SYMPHYTUM PETRÆUM. *Offic. Symphytum petraeum foliis Thymi.* *C. B. P.* 280. *Coris cærulea maritima*, *Ejusd. Raii Hist.* 1. 882. *Tourn. Inst.* 652. *Coris cærulea Monspeliaca*, *Ger. Emac.* 544. *Coris Monspeliensis*, *Park. Theat.* 571. *Coris Monspessulana purpurea*, *J. B.* 3. 434. **HEATH-PINE.**

It grows in maritime Places, and flowers in *May*. The Herb, which is used, is drying, astringent and conglutinant; the Plant is a Vulnerary. There are a Multitude of Plants which pass under the Name of *Symphytum Petraeum*, as *Prunella*, *Sanicula*, *Virga aurea*, *Coris Monspessulana*, *Hyssopus vulgaris*, *Polium vulgare montanum*, *Trachelia et Consolida Species aquosa*, and some others. *Dioscorides* describes the *Symphytum Petraeum* in the following manner: "It grows on the Rocks, and has Branches like *Origanum*, but small Heads, and thin Leaves like *Thymus*. The whole Plant is "ligneous, sweet-scented, of a sweet Taste, and provokes "Spittle. The Root is long, reddish, and about the Thickness of a Finger." After thoroughly considering this Description, I cannot persuade myself, that those Authors are in the right, who, with *Thalium*, take the *Symphytum Petraeum* to be the same as the *Caryophyllus Saxatilis*; or, with *Lebel*, to be a Species of *Prunella*; or, with *Tabenmontanus*, the same as *Virga aurea*. *Dale.*

Dioscorides says, that the Root boiled in Hydromel and drank, clears the Lungs of excrementitious Particles, and given in Water cures Vomiting of Blood, and nephritic Disorders. Boiled in Wine it cures the Dysentery, and the *Flux Ruber* in Women; and taken in Oxymel, it is effectual in

in Ruptures (*Ecclynoses*) and Convulsions. Chewed in the Mouth, it allays Thirst, and cures Asperities of the Fauces. Made into a Cataplasm, it conglutinates recent Wounds, and cures an *Enterocela*. *Dioscorides, Lib. 4. Cap. 9.*

SYMPLESIASMOS, συμπλεσιασμός. In Latin expressible nearly by *Conjunctio* or *Appropinquatio*; a modest Term by which the Antients expressed the Act of Coition, or Duty of Procreation. *Castellus.*

SYMPTOMA, σύμπτωμα, from σύν, importing Conjunction, and τίσις, to fall or happen; a Symptom or Accident. *Symptom* is a very noted Term in Medicine; and, according to *Galen, Lib. de Diff. Symp. Cap. 1, 2.* is taken in a large or strict Sense. In a large Acceptation, it signifies whatever preternaturally befalls a Person, whether it be a Disease, a morbid Cause, or supervening preternatural Accident. In a strict Sense, it means no more than the third or last Species; that is, the Consequences of Diseases, and of their Causes, exclusive of the Diseases and Causes themselves, and so is no other than a preternatural Affection, which follows the Disease, as the Shadow follows the Body. *Galen.*

Whatever preternatural Incident, proceeding from the Disease, as its Cause, befalls a sick Body, yet so as that it may be distinguished from the Disease itself and its proximate Cause, is called σύμπτωμα, "the Symptom" of that Disease; when it proceeds from a prior Symptom as its Cause, it is called σύμπτωμα συμπτωμάτων, "a Symptom of a Symptom." But whatever happens over and above in a Disease, and owes its Rise to a different Origin from the beforementioned, is rather called ἐπιγίγναι, (*Epigenema*) ἐπιγινόμενον, (*Epiginomenon*) and συμβεβηκός, (*Symbebecos*).

Hence it follows, that those very Symptoms first mentioned, are really Diseases in their Turn, and very different in Number, Variety, and Effects. We may, however, in Compliance with the Sentiments of the Ancients, conveniently enough reduce them, as they do, under three Heads, and make them to be either *Injuries of the natural Functions, Defaults in Retention and Excretion, or Alterations in the Qualities of the Body.* The natural Functions may be said to be injured, when they are diminished, abolished, increased beyond due Measure, or depraved; for example, the Symptoms, or Injuries of the Function which regard Appetite, are a *δισφορέα* (*Dysorexia*) "a Diminution of the Appetite to Food;" an *ἀνρεξία* (*Anorexia*) "an Abolition of the Appetite;" a *βόρυμος* (*Bulymos*) "an immoderate Appetite;" and a *χόσος, μαλακία* (*Cissa*, or *Malacia*) a "depraved Appetite, or a Desire after improper Food." The Default, or Disorders which fall under the Head of *Retention and Excretion*, are treated of in their proper Places, when they come to be consider'd as Causes of Diseases. And as to the third Head, a Quality of the Body is said to be alter'd or vitiated, when it is offensive to the outward Senses; and this is consider'd chiefly with respect to Colour and Smell; such, for Instance, as a fetid Scent, and a pale, yellow, green, livid, red or black Colour of the Skin. *Boerb. Institut.*

SYMPTOSIS, σύμπτωση, of the same Original with the preceding, is a Subsidence and Contraction of the Vessels, as it happens under Evacuations, and is opposed to *Dioncosis*, which see; and such a *Symptosis* appears not only in Evacuations and a *ρύσις* (*Rhysis*) or Flux, but, also, in a *στεγνότης* (*Stegnosis*, a Constriction or Constipation) and a Suppression of the Menes; as, on the contrary, a *Dioncosis* may proceed not only from a Suppression of the Excrements, but, also, from Fluxes and Excretions. *Symptosis* signifies, also, a sinking and Contraction of the Body and its Limbs, when oppressed with a Lassitude and Faintness; which is an Indication, according to *Hippocrates, Lib. πρὶ χυμῶν*, of the Violence and Malignity of the Disease. The Word, also, means a Sinking of the Limbs, and is joined with a *Dialysis*, a Resolution, and *Parexis*, a Remission. *Lib. 4. Epid. T. 37.* Again, by *Symptosis*, σύμπτωση, we are to understand the Subsidence and Compression of the Vessels, expressed, 1 *Aph. 2.* by *καταγγίη*, *Cataangia*. It is applied, also, to a sinking, or falling away of the Face, Eyes, and other Parts. *Foefius.*

SYNACTICOS, συνακτικός, from σύναγω, to contract, endued with a contracting Quality. *Castellus.*

SYNÆSTHESIS, συναίσθησις, from σύν, and αἴσθησις, is used for the Sense which the Patient himself has of his Distemper; for Instance, of the Tension of an inflamed Part. *Galen de M. M. Lib. 13. Cap. 1.* The Brain, also, is said to have not only an *Æsthesis*, but a *Synæsthesis*. *Castellus.*

SYNÆTION, συναΐτις, from σύν, and αἴτις, a Cause, is the same as *CONCAUSA*, which see.

SYNAGELASTICOS, συναγελαστικός, from σύν and ἀντράζω, to congregate, is an Epithet of such Fish as swim together in Shoals.

SYNAGMA, σύνζυμα, from συναγωγή, to bring together, a Concretion, Coition, Coagmentation. Thus, 6 *Epid. Sect.*

3. *Aph. 11.* τὸ μὲν ἔργον σύνζυμα παχύνει μᾶλλον, "a Concretion after making Water, is incident mostly in Children." That is; Concretion of such calcaous Matter as produces the Stone in the Bladder. *Galen* here expounds, τὸ σύνζυμα by τὴν σύνταξιν καὶ πύξιν, a Composition, and Concretion; and in his *Exegesis* he says, that "Synagma is either a Concretion, or an Enzorema, or an Hypostasis, or a Tophus, which last is probably the Meaning of the Word in 6 *Epid.*"

SYNANASTOMOSIS, συναναστόμις, a Connection of different Blood-Vessels.

SYNANCHE, συνάγχη. See *ANGINA*.

SYNARTHROSIS, συνάρθρωσις. See *ARTICULATIO*.

SYNCAMPE, συναμπετή, from κάμπτω, to bend, in *Hippocrates*, is the Joint or Flexure where the upper Part of the Arm is joined to the lower. *Castellus.*

SYNCAUSIS, σύγκαισις, from σύν, and καίω, to burn; *Lat. Combustio*, in *Hippocrates de R. V. J. A.* is apply'd to a Torrefaction of the Excrements by an internal, febrile Heat.

SYNCHONDROSIS, συγχονδρωσις, from χόνδρος, a Cartilage, is a Connexion of Bones by the Intervention of a Cartilage; thus the Ribs are connected to the Sternum, the Bodies of the Vertebrae to each other; as are, also, the Ossia Pubis.

SYNCHRISMATA, συγχρίσματα, from χρίω, to anoint, are Ointments of the Class of *Acopa*, so called by *Paulus Aegineta, Lib. 7. Cap. 15.* *Galen*, also, *de Antid. Lib. 11. Cap. 6.* among other Antidotes, mentions some Ointments, which *Aesclepiades* called *Synchrysmata*.

SYNCHYSIS, σύγχυσις, from συγχύω, to confound, a Confusion, Σύγχυσις δὲ, in 6 *Epid. Sect. 3. Aph. 1.* is a Confusion and Perturbation of all the Humours in Concoction, from the Imbecillity of the Stomach. *Synchysis*, also, in particular signifies a Disease of the Eye, consisting in a Confusion of the Humours, generally proceeding from a violent Blow, sometimes from an Inflammation of the Uvea, occasioning a Rupture of the Vessels, and an Eruption of the Humours. *Castellus.*

SYNCIPUT, corruptly for *SINCIPUT*.

SYNCLEISIS, σύγκλεισις, from σύν, and κλείω, to shut, a Conclusion, or Clofe, and apply'd to the Veins in the following Passage of *Hippocrates, Lib. de Morbo Sacro*, φλέβες εἰς αὐτὴν συνκλείουσι, καὶ συγκαλείουσιν ἔχου, ὥστε ἀποθανόντας ἢ τις πῶτος ἢ οὐρανὸς γίνεσθαι τῷ ἀνθρώπῳ: "The Veins have their Course towards it, [the Heart] and there conclude, or are closed up, so as that it is sensible of any Pain or Contraction happening to the Patient." But perhaps, as *Foefius* well observes, and the Construction seems best to warrant, the Meaning is that the Heart, of which he was speaking, ἔχου συγκαλείουσιν, "has the *Synclisis*," or contains in itself Conclusions; that is, the Extremities of these Vessels by which the Humours and Spirits are convey'd to that Part, which, by that Means, is immediately sensible of any Pain or Uneasiness incident to the whole Body.

SYNCOMISTOS, συγκαμίστος, from σύν, implying Mixture, and κομίζω, signifying, among other Senses, to have, or contain; mixed all the Parts together. Thus (*Lib. 2. πρὶ διαίτης*) συγκαμίστα, in Foods are those which are taken intire with all their Juices, in Opposition to *ξηρά* (*xera*) dry; and *συνκαμίστος ἄψτος*, is Bread made of the whole Corn. See *ARTOS*.

SYNCOPE, συγκοπή, from σύν, and κόπτω, to cut, or strike. *Swooning.*

If there be any Part of medicinal Knowledge which deserves, in a more than ordinary Measure, to be clearly explain'd and understood, it is certainly that which treats of the Forces of the human Body, and their Causes; since the whole Strength and Energy of Nature, which constitute the Soundness and Perfection of Life, with regard to the Mind as well as Body, by which Diseases are both prevented and cured, and by which Death itself is averted and delay'd, are observ'd to consist only in these Forces, which exert themselves in a certain, determinate, and efficacious Motion: For as a Person may be said to be of a robust Nature and firm Body, when, being in his perfect Health and Strength, he is not easily injur'd and incommoded by external Causes; or when he suffers Detriment from them, recovers, and is restor'd by meer Strength of Nature, without any considerable Assistance of Medicine; so, on the contrary, it is a Sign of Weakness of Nature, when any one, from a Decay, or languid State of those Forces, be render'd subject to various Disorders, and seldom emerges and recovers from them without the Help of the Physician. And, indeed, if we take a View of Diseases in their several Stages, we shall find, that all Hopes of Recovery appear to be founded only on the Strength of the Patient: for if this should happen to fail on a sudden, and for any considerable Time, it is very

very certain that Life is in Danger. Even that Malignity, which often attends Diseases, will be found to consist, for the most Part, in this Decay of the Forces; so that from this weak State there lies an easy Passage to Death, which itself is nothing but a full Cessation of the Strength on which the vital Motions depend.

Since, then, we stand in such absolute Necessity of those Forces, that without them the Physician can do nothing, either for preserving or restoring Health, I have often wondered how it comes to pass, that among so great a Multitude of good Authors, and under such Improvements in Medicine, which every Day receives new Lights, so few have attempted to set this most useful Point in Medicine in a just Light. There are, indeed, several Opinions scatter'd up and down in the Writings of Physicians concerning the Causes of the Forces, which some, who refer all the vital and mechanic Motions of the Body, both voluntary and involuntary, to some higher Principle, consider as the Effect of the Soul; others, who deduce the Strength and motive Force of the Solids, by which the Fluids are directed, from a highly moveable Matter, of an aereo-cæthereo-elastic Nature, contained in the Blood, endeavour to establish their Opinion by quite contrary Arguments. As the Subject is not yet exhausted, nor, as we imagine, well explained as it deserves by bare Authorities, and these too of opposite Sentiments, we shall crave Leave, in this present Discourse, where we shall treat of a *Syncope* and *Lipthymy*, to interpose our own Judgment, which we take to be just and right, in this Affair.

But before we enter upon a more particular Explication of this Subject, we think it proper first of all to examine what Condition of the Forces is requir'd to constitute a strong or a weak Nature. In attempting this, is to be remark'd, that though all the Functions of our Body, animal, vital, and natural, are perform'd solely by the Motion of the Solids and Fluids, we are by no Means to argue from hence, as in other corporeal Matter, or conclude from the Efficacy of the same, and the great Power of Moving, the extraordinary Firmness of the Strength, and, what depends upon it, the Soundness of the Health: For since the Structure of the human Body is, by the infinitely wise Creator contriv'd in such a Manner, that only a determinate Number and Measure of Motions are subservient to the Forces necessary for Health, it amply follows, that we are only to call that Nature robust and sound, in which we perceive no excessive nor deficient, but a moderate and equable Proportion of Motions; as, on the contrary, those Bodies are to be accounted weak which are easily excited to disorderly Motions from some slight external Cause. The Truth of this Assertion is illustrated by only considering the disorderly, and exalted even to the Degree of convulsive Agitations of the Heart, Arteries, and the rest of the Members, which, tho' they indicate an extraordinary Efficacy of Motion, can yet by no Means be taken for a salutary Measure of Strength, or such as is accommodated to the Confirmation of Health, but are rather Prognostics of an extreme Decay of the vital Forces, and oftentimes Death itself.

This premised, we proceed to consider the sudden Decay or Failure of the natural Forces, of which there are three principal Degrees: The first Degree consists in a remarkable Diminution of the Strength of the Body, and is known principally by these Signs, an extraordinary and unusual Lassitude of the Body, with an Inertness and Indisposition of the Limbs to voluntary Motions, a Torpor, or Numbness of the Senses, Loss of Appetite, Restlessness, Anxiety about the Præcordia, a weak and slow Pulse, with a Refrigeration and Heaviness of the Extremities. The next Gradation, on Account of its being a greater Defect or Failure of the Strength of the Body and Spirits, is called a *Lipthymy*, which begins with a Paleness of the Face, Lips, and Cheeks, and a Stupor of all the Senses, so that the Patient is quite insensible of what is done to him; a Sort of Dimness of Sight, also, seizes him, his Pulse beats very small, he falls to the Ground, and his extreme Parts are deprived of their natural Heat, and refrigerated. The third and last, as well as worst Degree, constitutes a *Syncope*, in which the Patient is deprived of all Manner of Strength, both of Body and Mind, and seems to be dead; for he falls to the Ground quite speechless, as if oppressed with a profound Sleep, and lies immoveable, without the Appearance of Convulsions or Tremblings; the Pulse and Respiration are intercepted, the Limbs are refrigerated, and collapsed, he has the *Facies Hippocratica*, and a copious Eruption of cold Sweat about his Temples.

After a Fit of the *Lipthymy*, or *Syncope*, has spent its Force, the Patient by Degrees recovers his Senses, fetching deep Sighs, the Motion of the Heart is restor'd, and consequently the Pulse, which before was very weak or quite insensible, beats higher and brisker; the Anxieties cease; the

Heat returns into the extreme Parts; the Face, which was contracted and pale, becomes more explicated and red; all the suppressed Functions by little and little resume their Office; and the Patient, who but the Day before was taken for dead, now seems to enjoy perfect Health; only he still complains of an extraordinary Lassitude and Imbecility of the Limbs, and of the whole Body.

Though these terrible Disorders come suddenly and unexpectedly, there are, however, some Symptoms which give Warning of their Approach: The principal of these are, a Languor of the whole Body, with an unusual Weakness, Vertigo, a Ringing in the Ears, and a sudden Change of Colour in the Face. In some the preceding Signs are Oscillations, Punctuations, and Anxieties about the Præcordia, with an unequal Pulse, and a Sense of Horripilation, attended sometimes with a Distension and Rumbling of the Abdomen from Flatulences.

From the Premises, it will not be difficult to know how to distinguish a *Syncope* and *Lipthymy* from other Disorders, and how they may and ought to be known by Physicians. For, first of all, they differ from an Epilepsy, which indeed is preceded by some slight Kinds of Faintings, which attack the Patient before his Body is agitated with convulsive Motions and Contractions, but yet fall short of a *Lipthymy*. They differ, also, from an Apoplexy, in which Disease, though under the Abolition of both the internal as well as external Senses, there still remains a pretty strong Pulse of the Arteries, with a Respiration, though very difficult, and attended with a Stertor; which are Phenomena not observable in a simple *Lipthymy*. And they are distinguish'd, in the last Place, from an hysterical Suffocation; for in this latter you may observe, indeed, an extraordinary Perturbation of the Senses, but the Fauces are at the same Time extremely straiten'd, and under a Strangulation, as it were, by a Cord; the Arteries are agitated with violent Motions; and the Face appears of a lively red; the contrary to which Symptoms happens in *Lipthymies*, as it appears when a *Syncope*, as it often happens, joins itself with an hysterical Fit; for in that Case, there is a sudden Alteration of the foremention'd Symptoms.

As to the Subjects most obnoxious to these Affections, we are taught by Experience that such Disorders are most incident to Persons of a phlegmatic and torpid Nature; or those who, on Account of a tender Contexture of the Vessels and Fibres, are of a spongy Habit of Body; full of Blood and Juices; such, also, as being tenderly educated in Idleness, are incapable of bearing Hardships, and are easily disorder'd by any slight external Cause, as by a Temperature of the Air hotter or colder than ordinary, or by Medicines, or even by Aliments, or, what is more, by an ungrateful Smell alone. And since there have been observ'd by the best of Physicians, a surprizing Harmony and Consent between the Functions of the Body and those of the Mind, we may reckon among the Number of those who are obnoxious to such Diseases, such as are prone to sudden and violent Commotions of the Mind, as Anger, Impatience, Fear, and Variety of confus'd Imaginations. Hence we see the Reason why, in respect of Age, Children and old Persons, and of Sexes, Women more than Men, are expos'd to *Syncopes* and Fainting-Fits; and most of all, Women with Child, or when waken'd with Hæmorrhages, through an immoderate Flux of the Menstrues, or Lochia, or much fatigu'd in Childbirth.

If we now proceed to examine into the Causes of these Disorders, there is no Person of competent Knowledge in Medicine, but will ascribe them to a vitious and disorderly Motion and Contexture of the Blood; for as a free and equable Influx of a sufficient Quantity of well temper'd Blood into each particular Part, and by that Means a due Distribution of the spirituous Liquid throughout the Nerves, constitutes all the Strength and Forces on which the Vigour of the Functions, whether animal or natural, intirely depend, so, on the contrary, when there is a remarkable Decay of the Strength, which manifests itself by a Diminution of all the Functions, we may very justly conclude that there is some Disorder in the arterial and nervous Fluids. We have fully demonstrated elsewhere that the Progress of all the Fluids through the Body, and their Influx into the several Parts and Organs, wholly depend on the Heart, which is the *Primum Movens*; and *Ultimum Movens*, or moves and lives first, and dies last, as being the principal Machine, which with its Motions animates all the other Parts. There can be no Doubt, then, but that the Cause of a Prostration of the Body, and a Fainting, is to be deduced from a Diminution or total Suspension of the Motions of the Heart. And we are the more confirm'd in this Persuasion, by considering that the essential and characteristic Sign of a *Syncope* and *Lipthymy*, is a very small, or no

Pulse, which is a true Indicator of the Motion of the Heart.

Since, therefore, we are oblig'd in so many Respects, if not for all Things that pass within ourselves, to the Motion of the Heart, it will be of very great Use, briefly, though accurately, to explain this Motion from its natural Causes: That the Substance of the Heart is muscular, is an Assertion not only of *Hippocrates*, who lived so many Ages ago, but of all the famous Anatomists of our Times; for if we rightly examine all the Properties which any Way belong to the Texture of a Muscle, we shall find them all in the same Manner existing in the Structure of the Heart; we may observe herein a pretty strong Tendon, which surrounds the Vessels in the Basis of the Heart, and is here, as it is in all other Muscles, the Beginning and End of Motion, and is very justly supposed to produce the *Vena Cava*, and, in an especial Manner, the Great Artery. Into this Tendon are inserted two Kinds of Fibres, dispos'd in such admirable Order, as very fitly to constitute a *Biventer* Muscle; for the exterior Fibres, which wind about the Cone in the Manner of a Screw, are inserted into the Tendon of the opposite Side; but the interior Fibres are inserted in an inverted Order. Besides these common Fibres, there are others proper to each Ventricle, of which the internal proceed in like Manner in a contrary Direction, and in the left Ventricle are more numerous and robust, for the Sake of a stronger Propulsion of the Blood over the whole Body, and to its remotest Parts; but in the right Ventricle they are fewer and more flaccid, as serving only to propel the Blood into the adjacent Lungs. The Motion of these Fibres is, also, the same with that of the Fibres of other Muscles; as is, also, their Contraction, which consists in an Abbreviation, that they may acquire as much in Breadth as they lose in Length, by which Means the Cone may always approach nearer the Base, whence a Tumor is observed not only externally, but principally in the internal Parts. Hence, when the Auricles of the Ventricles are contracted, the Sides touch one another, and so expel the contained Fluid. The Nerves, which impart Life and Vigour to all these Muscles are implanted in the Basis of the Heart, and the Roots of the Vessels, which were before observed to be Tendons of the Heart, and are Branches of the eighth and intercostal Pair; to say nothing of the coronary Veins and Arteries, which are dispers'd in great Numbers over the muscular Structure of the Heart, and greatly assist its Motion.

That the Heart moves then, we are convinc'd from its Fabric, as well as the Evidence of Sense; but there is a double Motion which belongs to it; one of Dilatation, called by the *Greeks*, *Diastole*, by which the Ventricles of the Heart are dilated, and its Fibres lengthen'd towards the Sides, to admit the Influx of the Blood from the Auricles; and the other of Constriction, or *Systole*, by which the Fibres are contracted, and the Blood, as by an hydraulic Machine, is forced into the Canals of the Arteries, and from thence into those of the Veins, and from those again into the right Auricle, by which Means Circulation is performed.

In contemplating these Subjects, there arises a Doubt of no small Moment, which is, whether the Diastole of the Heart be promoted by the plentiful Influx of the Blood distending the same. And here we are not of Opinion, that this simple and spontaneous Restitution depends only on the Blood, since it resists a strong Pressure of the Hand as much as the Systole, which we cannot imagine to be owing to the Force of the Blood, especially when we observe, that the Hearts of Fishes, after they are pulled out of their Bodies, and are empty of all Manner of Liquor, retain their Diastole, as well as Systole, for a considerable Time. It is much more probable, that the Diastole proceeds as well from the different Series of Fibres of this wonderful Muscle, as from the Influx of a very subtle, elastic Fluid, convey'd by the Nerves, and of a spirituous Blood. The Influx of a nervous Fluid into the Fibres of the Heart, is proved by that well-known Experiment of *Willis* and *Lower*, in which the Nerves in the Neck belonging to the eighth Pair being divided, and those which proceed from the intercostal Plexus, ty'd, and the Influx of the Blood into the musculous Substance of the Heart intercepted, the Heart is deprived of all Motion. So that it is very certain, that the Blood, as it endu'd with a hot, intestine Motion, and impregnated with aereo-æthereo-elastic Particles, as well as the nervous Liquid, are greatly instrumental in promoting the Act of Dilatation. And the same will be further illustrated by this Experiment, that the Pulse of the Heart in an Animal, after it has ceased, may be restored for some Moments by Means of Heat, or fomenting the Heart with hot Water.

But though what we have advanced appears so clear and evident, as not to be question'd, there are still some so incredulous as to object against our Doctrine of the Motion

of the Heart, in which we suppose it be the *first Mover*, being of Opinion, that there is in an *Embryo*, a certain *Punctum Saliens*, which is, as it were, a Rudiment of a Heart, before the Structure of the Heart is finished. But, in my Judgment we are to have very different Notions of an Animal, while yet imperfect, and under Formation, and one actually formed, and compleat in all its Parts, and produced into the World; for which Reason it can hardly be allow'd to draw Inferences from one State to another quite different; for in this little Bubble, as in a Compendium, is included that architectonic Spirit, which is of itself sufficient to communicate Motion without the Help of many Organs, and extends its Workmanship by still framing Parts without Parts on all Sides; which Actions, in a perfect Animal, are not performed without the Help of Organs.

Having thus explain'd the Structure and natural Constitution of the Heart, and inquir'd into its genuine Use and Function, it will be easy for us to attain to the Knowledge of its preternatural State, and to give clear and distinct Definitions as well of a *Syncope* as *Lipthymy*, which, by the Consent of Physicians of all Ages, depend on a depraved Motion of the Heart. A *Syncope* is a sudden Check or Stop put to the Motion of the Heart, attended with a vast Loss of Strength and Suspension of the Functions both of Body and Mind, proceeding from a vital Obstruction, or great Impediment of the Influx of a spirituous Liquid by the Nerves, and of a well-temper'd Blood through the coronary Vessels into the muscular Substance of the Heart. Nor does the Definition of that other Species of a Privation of Sense, call'd *Lipthymy*, require much Alteration from the former, as differing only in Degree from a *Syncope*, and consisting not in a total Suspension of the Motion of the Heart, but in a very weak and low Degree of the same.

These Things being premised, let us now proceed to inquire into the remote Causes which contribute towards the Production of these severe and formidable Disorders. And since the proximate Causes either of a total Interruption, or great Deficiency of the Motion of the Heart, consists in a suspended, or sparing and irregular Influx of a nervous Fluid, and laudable Blood, as sufficiently appears from what has been said, it follows, that these are the two main Points which deserve our Consideration. For, first, it is certain from general Experience, that Persons labouring under a Weakness of the Head and nervous System, and are frequently afflicted with pressive Pains, Vertigo, and Ringing in the Ears, cold Rheum, Stuffings of the Head, Dimness of Sight, and troublesome Sleep, are very subject not only to extreme Lowness of Spirits, and Loss of Strength, but, also, to Faintings and Swoonings.

But nothing in the whole Series of Causes will sooner, or in a more violent Degree induce the Distempers treated of, than vehement Perturbations of the Mind, particularly panic Terrors, Fear, and Sorrow. For tho' the vital and mechanic Motions, of which Nature are those of the Heart and Arteries, and other Canals appointed for the Secretion and Excretion of the Humours, as well as those of the Stomach and Intestines, do not directly and immediately depend on that thinking and intelligent Principle within us, which we call the *Soul*, whose Office it is rather to direct and regulate, after a Manner unknown to us, those Motions which are voluntary; yet we are convinced by the closest Observation and Experience, that from the admirable and intimate Harmony which subsists between the voluntary and involuntary Functions, that the Affections or Passions of the Mind have a surprising Force and Efficacy in disturbing and interrupting the vital Motions in our Bodies. Hence if we curiously examine the Manner of Action of a Terror, or Fright, which among all the Passions is the most destructive of the Oeconomy of the vital Motions, we shall find it to be of such a Nature, that by causing a Constriction of the external Parts, it procures an excessive Congestion of the Blood at the Heart and Vessels connected with it, the plain Consequences of which are Coldness of the extreme Parts, a prodigious Languor and Numbness of the Limbs, Anxieties of the Præcordia, Palpitation of the Heart, with a great Difficulty of Breathing, and a small and low Pulse; all which Symptoms are more certainly consequent if there be an immoderate Redundance of the Blood. Nor are the Effects of Fear, or Dread, on the Apprehension of some imminent Danger, less surprising, since, by diminishing the Influx of the nervous Liquid into the several Organs of Motion, they greatly retard the equable Progress of the Blood, and disturb the due Circulation and Distribution of its most spirituous Part, so that it is no Wonder if the Consequences are a vast Loss of Strength and sudden Failure of the vital and animal Forces; which is the more formidable in weak Subjects, or such as are already debilitated by a Disease, or some other Cause.

There are also many Circumstances belonging to what we call the *Non-Naturals*, which are assistant in promoting these Disorders. Among those, what deserves our first Notice is a bad Regimen of Diet; for as Aliments abounding with good Juices, when taken in proper Quantities, are disposed for the Generation of good and lymphatic Blood, which is the Support of the Strength; so, on the contrary, Foods, which are crude, and afford but small Nourishment, if subsisted upon for a considerable Time, by mere Want of Nutriment, highly contribute to Faintings and Lipothymies. And not only Diet, but the Temperature of the Air, is also a procaccatic Cause of these Disorders; for if the Air be too cold and humid, or too hot and sultry, and impregnated with Multitudes of impure Exhalations, it becomes very detrimental to the Strength and Vigor of the Body. With these Causes may be ranked immoderate Watchings and Labour, which, by keeping the Solids and Fluids in continual Action, cause a Dissipation of the spirituous and subtle Parts, by which means the Mass of Blood is altered from its due Temperature, and all our Functions, as we find, by daily Experience, begin to languish.

A *Lipothymy* is also frequently occasioned by a sphacelous Corruption, either internal or external, and of all things the most prejudicial to the Oeconomy of the vital Motions. The Truth of this Position will appear not only from the Consideration of malignant and contagious Diseases, as the *Petechiæ*, *Dysentery*, and pestilential Fevers, but of chronical Diseases, particularly the *Scurvy*, *Cachexy* and *Dropsy*, where, as the Corruption and Putrefaction increase, all the Forces of Nature, together with the Motions of the Heart, languish and decay. Not unlike are the Effects of Opiates and Narcotics imprudently exhibited, whose Way of Operation consists principally in mixing their sulphureous and noxious Effluvia with the Substance of the Fluids, and so contaminating those highly moveable Parts, as to render them incapable of performing their Functions according to the Laws of Nature. Besides the forementioned Causes, there is one, which is somewhat surprising; I mean, fragrant and sweet Smells. These, tho' otherwise very grateful to Nature, are yet found to be offensive and prejudicial to Women subject to *Hysterics*, or those whose Bodies are weakened by any other Disease to such a Degree, that all the Symptoms are exasperated by them, and the Patient falls down in a *Syncope*, and lies for dead. The Reason of so remarkable an Effect, as we imagine, consists in that such strong odoriferous Substances, by their vaporous Quality, suppress more and more the elastic Force of the nervous Fluid, which was before much diminished by the Violence of the preceding Distemper, in the same manner as Preparations of Castor have sometimes good, sometimes bad Effects, according to the vastly different Constitution of the nervous Juice and Fibres.

Among other Causes of these Disorders, we are not to omit Poisons with Cathartics and Emetics of a violent and caustic Quality, which, by exciting strong Spasms in the universal System of the nervous Parts, with Crispations and Contractions in the highly sensible Tube of the Intestines, intercept the equable Influx of the Blood and highly subtle Fluid into the several Parts, and thus occasion a violent and sometimes mortal *Syncope*. From the same immediate Cause it happens, that we may observe that a violent *Lipothymy*, and such as falls little short of a *Syncope*, usually succeeds such Diseases as were attended with very sharp Pains; and the same has been often known to proceed from a violent Fit of Anger; whence the ancient Physicians used to call this Species of *Syncope* by the particular Name of *Cardia*. For tho' it be the Nature of this Disorder to exert its destructive Force principally upon the biliary Ducts, it cannot be avoided, but that, on account of that remarkable Consent of Parts, which subsist between these Parts and the Stomach, Lungs and Heart, by means of the eight Pair of Nerves, and the common *Par Vagus*, all these sensible Parts will at the same time be Fellow-Sufferers, and labour under severe Spasms.

A *Lipothymy* is no less incident to Persons whose Strength has been much exhausted by immoderate Hemorrhages, or any other excessive Excretions. On this Occasion I cannot but observe, that I have several times known Persons who have indulged themselves in the immoderate Use of venereal Pleasures, contract by Degrees *Lipothymies*, and even *Synscopes*. And nothing is more frequent than, after copious Evacuations by Sweat and Stool, Phlebotomy unseasonably administered, Blood lost by Wounds, or any other excessive Profusions of the same, for the Patient to fall into Fainting-Fits, especially if proper Preservatives be not at hand. And the Reason is obvious; for since by such Accidents not only the more subtle Part of the Blood, which is the Foundation of the Strength, is exhausted, but the Quantity itself of the Fluids is diminished, it is no wonder if the Dilatation of the Heart and its Vessels, which ought to keep pace alternately

with the *Systole*, is by the same means prevented, and consequently, the Motion of the Heart itself suspended, in which consists the very Nature of a *Lipothymy*; which Disorder is, in such Cases, more frequent and incident to Persons of a tender Constitution, or who have long continued in an erect Posture, by which the Course of the Blood to the Head is much more obstructed than in other Situations.

Again, the Motion of the Heart may be weakened, and a vast Loss of Strength occasioned, by an excessive Repletion, owing to a thick and viscid Blood, which being incapable of making its Progress through the narrow Channels of the coronary Vessels, is there congested, and so diminishes the *Systole* of the Heart and its Vessels. And nothing more disposes to mortal *Synscopes* than a polypous Concretion of Humours adhering to the Cavities of the Heart, and the contiguous Vessel, as is confirmed by Multitudes of Instances. For Concretions in those Places, by their Bulk intercepting the Circulation of the Blood through the whole Body, must at last of necessity, if not removed, destroy all vital Motion.

Having thus assigned the Causes of these Disorders, we proceed to the Prognosis, and to examine the Signs from which we may be enabled to predict a good or bad Event to them. And here I would have it most carefully observed, that the Danger in such Cases is to be estimated with regard to the Diversity of the Nature, and Causes. Thus we are told by *Hippocrates*, 2 *Apb.* 41, "that they who often fall into violent Faintings without a manifest Cause, die suddenly." For in this Case, there generally is a polypous Coagulum firmly impacted in the Vessels of the Heart and Lungs, which discovers itself upon Dissection. A *Syncope*, also, is generally observed to be mortal, when it happens after a difficult Childbirth, in which the Patient has been extremely fatigued by the Unskilfulness of the Midwife, in exciting her to unreasonable Efforts for Delivery, and has suffered an immoderate Profusion of Blood from the *Uterus*. The Patient, in a *Syncope* thus contracted, lies in a copious and cold Sweat, with a Refrigeration of the extreme Parts, the Breath expired is cold, the Countenance pale, and she can by no Remedies be recalled to Life. Nor is that Species of *Syncope*, which seizes the Patient under *Hysterics* void of Danger; and we have often known Women, in such Cases, taken for dead, and committed to Burial.

An extraordinary Loss of Strength in malignant Distempers, as in high Fevers, and a Proneness in the very Beginning to Faintings, especially in an erect Posture, is a most certain Sign that Life is in danger. Nor is it of good Prognostication to be dejected in Mind, contrary to Custom, utterly to despond, and to give over all Hopes of Life, tho' the Spirits, in other respects, are calm and composed; especially if these Symptoms, in an acute Fever, are attended with a Delirium and a languid Respiration, with a remarkable Smallness, or tremulous Palpitation of the Pulse. In the confluent Small-Pox, also, if the Patient, as it frequently happens, through the intolerable Pain and Heat at the Time of Suppuration, be seized with a *Lipothymy*, and particularly in an erect Posture, he is in imminent Danger of Death; for soon after succeed Refrigerations of the whole Body, a Constriction of the Skin, a Disappearance of the Pustules, and then mortal Convulsions. A *Syncope* seizing a Person already weakened by other Causes, on occasion of a vehement Fit of Anger, or the Exhibition of a strong Cathartic or Emetic, becomes mortal, unless proper Remedies be instantly administered. The same Disorder in Children, excited by Worms lancing the nervous Coats of the Stomach, is generally mortal; and we have seen the dead Worms crawling out of the Mouth a little before the Death of the Patient.

A *Lipothymy*, or *Syncope*, attendant on hysteric and hypochondriac Cases, occasioned by a Regurgitation of the Blood to the Heart and Lungs, through an extraordinary Distension of the Stomach by Flatulences, leaves room for a Cure. And a sudden Fit of Fainting or Swooning, proceeding from some external Cause, as the immoderate Heat of a Stove or Bagnio, or Venesection too freely administered, and especially when Women or Children are the Subjects, is not so much to be dreaded. In general, it is to be observed, that the slighter the Cause of such Disorders is, the less is the Danger from them.

The Cure principally consists in answering the two following Indications: The first of these requires, that in the very Paroxysm the Motion of the Heart, which is the Fountain of all the vital Heat and Forces, may, by proper and effectual Remedies, with all possible Speed be restored.

The other directs us to make use of the first Opportunity, when the Paroxysm is past, to provide ourselves with proper Medicines for removing the Causes, and so preventing the Return of so dangerous a Disorder.

In order to answer the first Indication, let the Patient, at the Time of the Fit, be kept in a convenient Posture, not too much inclining nor erect, and in a serene, temperate, and spacious Place; and in order to provoke and recall the Influx of the Spirits, it will be proper to irritate and animate the sensible Parts with external Remedies, which are of a penetrating Quality. For this End, let there be a Superfusion of cold Water over the whole Face, let the Lips be rubbed with common Salt, and apply to the Nostrils strong Vinegar, with Balsam of Life, or English volatile Salt, which is nothing but the volatile Salt of Sal Ammoniac, impregnated with the cephalic Oils of Rue, Mint, and Lavender. It may, also, be of service to rub the Eyelids with a few Drops of some spirituous Water, particularly the Balsam of Life, and to use strong Frictions of the whole Region of the Breast, and the extreme Parts with hot Cloths, impregnated with some corroborative Water.

When the Patient, by the Use of these Remedies, begins to come to himself, it will be proper to administer some internal Medicines, in order to revive the Strength. For this purpose Wine is of excellent Service, and especially old *Rhenish*, which far exceeds all other Wines. Much Good, also, may be expected from the Use of spirituous and aromatic Waters, particularly those of Cinnamon, Lillies of the Valley, Roses, Baum, and Orange and Lemon-Peel, prepared with or without Wine.

A Physician, who intends a perfect Cure of these Disorders, and to prevent all Relapses, must first acquire a competent Knowledge of the Causes, and accommodate his Remedies to them. Thus, if a *Syncope* owes its Rise to severe Pains, or a violent Fit of Anger, in this Case mild Anodynes afford present Relief, and the more effectually, if mix'd with analeptic Waters, not too spirituous, but endued also with somewhat of an anodyne Virtue. A sovereign Remedy of this Nature is the mineral anodyne Liqueur, impregnated with some Drops of Oil of Mace, or mixed with double the Quantity of Essence of Castor. Accommodated to the same Purpose, are *Sydenham's* Laudanum, and analeptic Powders, such as the *Pulvis Marchionis*, mixed with one or two Grains of Castor or *Theriaca Caelestis*, which I have found by Experience to be very safe Remedies. If a Cardiac *Syncope* proceed from an acido-bilious Humor settled in the *Primæ Viæ*, and corroding the nervous Parts, as it frequently happens in hypochondriac Cases, there will be occasion for absorbent Powders, such as those prepared of Shells, Mother of Pearl, Coral, Crabs-Eyes, fossil Unicorn, and Mountain Cryстал, with an Addition of a few Drops of the Oil of Cedar; and, if the preternatural Heat require it, of some purified Grains of Nitre for each Dose. In an hysterical and hypochondriac *Syncope*, Clysters, and Medicines compounded of Galbanum, Castor, Asa fetida, Sagapenum and Myrrh, prudently administer'd, are all the Remedies necessary for a perfect Cure.

If a *Lipothymy* seizes the Patient under immoderate Evacuations from too potent Cathartics or Emetics, in this Case, besides Theriacals, Anodynes, and Analeptics, warm Milk, or Barley-water with Almonds, the Yolk of an Egg, and Saffron, taken in a sufficient Quantity, are of surprising Efficacy by their demulcent Virtue. And when there is reason to be apprehensive of more than ordinary Danger from a caustic Poison, the same Remedies are the most likely to afford Relief, especially if mixed with a good Quantity of expressed Oil of Almonds or Olives. In malignant Distempers, where a *Lipothymy*, and the like Symptoms, are the Effects of an occult Putrefaction, Mixtures endued with an analeptic and bezoardic Quality are most proper. Such are those compounded of the Waters of Carduus Benedictus, Scordium, Cinnamon without Wine, Roses, and common Baum; the *Mixtura Simplex*, Wine-Vinegar, and Syrup of Citron-Juice, with which may be mixed a due Proportion of the bezoardic Powder of *Sennertus*. If the Strength be exhausted by an excessive Profusion of Blood, then, besides the Use of the more temperate Analeptics, the Patient is to be comforted and refreshed with nourishing Food, which is accommodated to the supplying and restoring of the lost Juices. Such Meats as are most recommended for this purpose, are Jelly-Broths made with Veal, Beef, or an old Cock, prepared by Decoction with Shavings of Hartshorn, Slices of Lemons, a little Mace, and a small Quantity of Wine, in a covered Pot. Chocolate is also of good Service in such Cases; and, to mention no more, old and generous Wine, sparingly exhibited, will of itself contribute more than all other Remedies towards the Restoration of the Patient.

It is certainly of the greatest Importance towards a safe Management and Conduct in the Cases before us, justly to distinguish between a gravative or oppressive Laxitude, proceeding from a Fulness and Expansion of the

Humours, and a defective Weakness, occasioned by a Want of good Blood and nervous Juice; these two Circumstances are widely different with respect to their Causes, and require as different Remedies. Phlebotomy, for instance, which in the Case of a Repletion, which was first supposed, is most salutary; in the latter Circumstance, where the Blood is deficient, and therefore wants to be restored, it cannot but be highly pernicious. A just Distinction, also, is to be made between a Weakness and Loss of Strength, which owes its Origin to some Passion of the Mind, as long Sorrow, or long concealed Anger, which commonly goes by the Name of *Chagrin*, and what proceeds from some material Cause. To the first Case, moral Remedies, with every thing that contributes to render the Mind easy and chearful, are best accommodated.

As to Venesection, in particular, by way of Caution, we ought to know that when the Motion of the Heart is suppressed by an excessive Congestion of Blood, which is very often occasioned by violent Spasms of the Intestines, and there is a Turgescence of Humors in the Vessels of the superior Parts, tho' a Discharge this Way is by all means proper to be made, yet Phlebotomy is never to be administered during the Time of the Fit; for the Languor would be increased, and the Disease protracted by so doing. It is no less fruitless, as well as dangerous, under a *Lipothymy*, to pour into the Mouth spirituous Liquors, because they easily fall into the *Aspera Arteria*, and endanger Suffocation.

If a *Lipothymy* proceeds from a Suppression and Diminution of the Menstrues, we are not, but with the greatest Caution, to administer Emmenagogues, especially such as are qualified to raise impetuous Commotions, as Baths impregnated with Salt or Saffron, and other Things of that kind; for by causing a greater Rarefaction of the Humors, they increase the Disease.

A Loss of Strength from severe Distempers, when the Patient is naturally weak and infirm, generally portends a bad Event; and therefore we cannot be too speedy with our Assistance, which the sooner it comes the more seasonable it proves, according to that elegant old Proverb;

Principiis obsta, sero Medicina paratur.

“Prevent the Mischief, Physic comes too late.”

Much more Reason have we in such acute Disorders, and especially at their Height, to avoid the Use of such Medicines as by stimulating and provoking to Stool, or other Excretions, may any way disturb or irritate Nature. For by such means the Strength, which is necessary for subduing the Disease, is still more exhausted; and if this be consumed and reduced to nothing, all the Art and Skill of the Physician are vain and insignificant. I am, therefore, mightily pleased with that Golden Rule of *Fernelius*, *Lib. II. Cap. 10.* which it were to be wished were universally observed: “While the *Strength*,” he says, continues firm, and on a good Foundation, we “may boldly evacuate as much as the Disease requires; but “if the *Strength* be quite gone, or much diminished, nothing is to be attempted of that Nature.”

The Principal of those boasted Remedies which have for so many Ages been extolled even to Superstition as the highest Cordials, and specific Analeptics in all *Syncofes* and Faintings, as Pearls, Oriental Bezoar Stones, Bone of a Stag's Heart, the fine precious Stones, and others, are so far from exceeding in Virtue some other fix'd Diaphoretics and Absorbents, that they are rather to be esteemed much inferior to them. The same Judgment is to be passed on Medicines prepared of Gold; for the cordial and analeptic Quality ascribed to that Metal, is, in our Opinion, a mere Chimera, and a very remarkable Instance of the fond Credulity of the common Herd of Physicians and Patients; not to mention how incredible a Thing it is, that Gold should be reduced to mild Essences, and Quintessences by any Arts of Chymistry.

Wine, especially old *Rhenish*, which, on account of its spirituous Acid, is far preferable to other Wines, besides its internal Use before prescribed, being applied to the Nostrils, and the Region of the *Præcordia*, gives present Relief under a *Syncope*. Those Faintings, also, which are incident to tender and sensible Subjects, under the Administration of Phlebotomy, are prevented by taking a moderate Draught of Wine before the Operation.

There is even in simple cold Water seasonably exhibited a highly analeptic Virtue, especially when the Fainting, or *Lipothymy*, is occasioned by an immoderate internal or external Heat, and Rarefaction of the Blood. Of this *Celsus*, so long ago, was very sensible; and therefore, *Lib. 4. Cap. 5.* very strongly recommends cold Water for correcting the Disorders of the Stomach. And *Pliny the Younger*, who had by Nature a weak Stomach, and was much subject to inward Estu-

ations, assures us, *Lib. 6. Epist. 17.* that he had often received great Benefit from cold Water. *Frederic Hoffman.*

SYNCRIMATA. *συνκρίματα*, from *συνκρίνω*, to collect together, a Word used by *Galen, de S. F. Lib. 5. Cap. 25.* to signify the Mixtures and Concretions of simple Bodies, and the Confusion of Elements. He applies the same Word, *Lib. de diff. Morb. Cap. 5.* to the Bodies of Animals, as consisting of a Mixture of Atoms.

SYNCRISIS. *σύνκρισις*, a Concretion, Conformation, from *συνκρίνω*, which Verb is used by *Hippocrates, 6 Epid. Sect. 2. Aph. 35.* to express the Coalition or Conformation of the Male; and by *Galen, M. M. Lib. 4. Cap. 4.* where it is opposed to *διακρίσις*, "to be dissolved." *Syncrisis*, with the Chymists, is a Concretion or Coagulation, effected by a spontaneous or violent Reduction of a liquid Substance to a solid one, by a Privation of the Humid. *Castellus.*

SYNCRITICA. *συνκρίτικα*, *Syncretics*, a Name given by the Methodics to such Medicines as were of a coercive or affrignant Nature (not to Relaxants, as *Blancard* will have it) *Galen de Anat. Adm. Lib. 3. Cap. 2.* The same Author, *de M. M. Lib. 1. Cap. 2.* observes, that *Theophilus* wrote a whole Volume on *Syncretics*. See the preceding Word.

SYNCYRIA. *συνκυρία*, from *σύν*, and *κύρω*, to be, is a Chance, or casual Event; and the same as *συνκύρημα* (*Syncretema*) *Hippocrates de Præf. Med. et Lib. de Hum.*

SYNDESIS. *σύνδεσις*, from *σύν*, and *δένω*, to bind, a Binding or Straitening. Thus, *6 Epid. Sect. 3. Aph. 1.* *ἡ δὲ μάλιστα ἀραιότης ἢ κοιλότης πυκνότης, ἢ δειγνυμένη ἐκιδόσις ἢ σφικτὴν αὐξήσις*, "the Rareness of the Skin causes a Constipation of the Belly; but a Straitness (Astriction of the Pores) of the Skin causes an Increase of the Flesh."

SYNDESMO-PHARYNGÆUS (*Musculus*) a Muscle of the Pharynx. See **PHARYNX**.

SYNDESMOS. *σύνδεσμος*, from *σύν*, and *δένω*, to bind, a Ligament. See **LIGAMENTUM**.

SYNDESMOSIS. *σύνδεσμις*, a Sort of Connexion of the Bones, otherwise called **SYNNEUROSIS**, which see.

SYNDIACRISIS. A Name given to that Chymical Operation used in preparing of the diaphoretic Precipitate from the Cinnabar of *Hartman*, by a Separation of the Principles of the Cinnabar, and a new Composition. *Castellus.* See *Schroder, L. 3. C. 16.*

SYNDROME. *σύνδρομος*, from *σύν*, and *δρέμω*, to run, *Lat. Concurfus*, a Concourse. This is a Word introduced into Medicine by the Sect of the Empirics, who mean by it a Concourse of Symptoms. Thus under a Plethora, an Empiric judges Venesection necessary from a *Syndrome* of Symptoms, such as a Distention of the Vessels; a Redness and Gravity of the whole Body; an Indisposition to Motion; Tensions of the Limbs; and a Sense of an ulcerous Lassitude; besides a Life spent in Idleness, high and full Feeding, and a Suppression of wonted Excretions. This is the *plethoric Syndrome* of an Empiric; and after the same manner he forms a *Syndrome*, or Concourse of Symptoms, in a Peripneumony, Quinsey, Epilepsy, and other Diseases. *Galen* ridicules these *Syndromes*, because, he says, they happen very rarely, and also very slowly; so that should a Physician wait for a *Syndrome* of all the Symptoms he expects, he might administer his Remedies too late. *Galen, Com. 2. in 1 Prorrh. et Com. 2. in R. V. J. A. et Lib. 6. de M. M. Cap. 4.* and in other Places.

SYNDYASMOS. *συνδυασμός*, from *σύν*, and *δύω*, two, is a Word used by *Hippocrates, Lib. 2. de Morb. Mul.* to express the Commerce between the Sexes.

SYNECHES. *συνήχεις*, from *συνήχω*, to connect, hold together, continual, is an Epithet of a Sort of Fever. See **SYNOCHOS**.

SYNECTICON. *συνεκτικόν*, from the same Original as the preceding, continent, an Epithet applied to the proximate Cause of a Disease usually called *Causa continens*, also *conjuncta*, and *contentiva*; and always remains closely united with the Disease. *Castellus.* See **CAUSA**.

SYNEDREUONTA. *συνεδρεύοντα*, from *σύν*, and *ἰδρᾶ*, a Seat, *Lat. Assidentia*, assisting, attending, an Epithet bestowed on such Signs or Symptoms as accompany a Disease. See **ASSIDENS**.

SYNEILEMMENOS. *συνειλημμένος*, straiten'd, one who is coſtve or bound in his Belly. *Castellus.*

SYNDEICNYMENA. *συνδεικνύμενα*, from *σύν*, and *δεικνύω*, to shew or indicate, co-indicating, are Signs so called, which conspire with those that are proper to a Disease; for instance, the Age and Strength of the Patient, the Country, Season, Custom, and the like. *Galen, Lib. 13. de M. M. Cap. 16.*

SYNENOMENA. *συνενόμενα*, from *σύν* and *ένω*, to unite, become one, are expounded in *Galen's Exegesis* by *συνεία* (*Synonia*) co-existing; but there is a Variation in the Copies,

and many of them have it *σύννομα* (*Synnoma*) converſant together, or feeding together. *Fæsius.*

SYNEREPHES. *συνερείς*, in *Galen's Exegesis*, is expounded by *ἐνπερικλυμένη, σπασμασμένη*, envelop'd, covered, shady, opaque.

SYNERGASMA. *συνέργασμα*, from *σύν* and *ἐργάζω*, to work, operate, Co-operation. *Libavius* divides the *Synergasmata Chymica*, or chymical Co-operations into *ἐνεργητικά*, energetic, or such as are endued with an efficacious Virtue; and *παρασκευαστικά*, preparatory.

SYNERXIS. *συνέρξις*, from *σύν* and *ἐργω*, to refrain, confine, is explained in *Galen's Exegesis* by *σύνγκλισις*, **SYNCLEISIS**, which see.

SYNESTECOS. *συνεστῆκος, συνεστῆκος*, from *σύν* and *ἵστημι*, to stand; consistent, is applied by *Hippocrates*, in *Prognost. 1 Prorrh. et Coac.* to the Faces, when firm, coherent, and figur'd, in Opposition to diffuent, liquid, humid, and aqueous.

SYNIDROSIS. *συνίδρωσις*, from *σύν* and *ἰδρῶσις*, Sweating; is a Sweat in Conjunction with some other Affection, for Instance with a Factor of the *Alæ*. *Castellus* from *Nomus*.

SYNISTAMENOS. *συνίσταμενος*, consistent, the same with **SYNESTECOS**, which see.

SYNIZESIS. *συνίζησις*, from *σύν* and *ἵζωμαι*, to fit, *Lat. Conſidentia*, is the same as **APOCATASTASIS**, which see.

SYNNEUROSIS. *συννεύρωσις*, from *σύν* and *νέω*, a Nerve, is a Species of Articulation of the Bones by the Intervention of Ligaments. *Cowper.*

SYNNOMA. *σύννομα*, from *σύν* and *ένω*, to feed. See **SYNENOMENA**.

SYNOCHA. the same with **SYNECHES**, or *Febris continua*. *Blancard.* See the following Word.

SYNOCHOS. *σύνωχος*, *Lat. FEBRIS CONTINENS*.

Συνήχεις πυρετοί (Synchees Puretoi) continual Fevers, in *Hippocrates*, are such as continually molest the Patient without Remission, as we often find in the *Epidemics*, to which he sometimes adds *τὸ μὲν ὅλον ἐ διαλείποντες*, "Upon the whole not intermitting." That he might more clearly distinguish between them and intermittent Fevers. And this he does in express Words, *1 Epid. Sect. 3.* where he says, *συνήχεις, οἱ μὲν ἡμέρη ἐχρῶσι, οἱ δὲ νύκτα διαλείποντες, οἱ δὲ ἡμέρη ἐχρῶσι, οἱ δὲ νύκτα ἐχρῶσι, ἡμέρη διαλείποντες.* "There were Fevers, some continual; others moſt left the Patient by Day, and intermitted by Night; and others again were urgent in the Night, and intermittent in the Day." On this Place *Galen* thus comments: *καὶ τὸ τὸ συνήχεις ὅνομα, καὶ τὸ τὸ διαλείποντες οἱ παλαιοὶ διττῶς φησίν οἱ λέγοντες, &c.* "The Ancients seem to have used the Words *Syneches* (continual) and *Dialipon* (intermittent) in a double Sense. Sometimes they gave the Name of *Syneches* to all those Fevers which never came to an Apyrexia [perfect Cessation]; and at other times they bestowed not that Appellation on all which never come to an Apyrexia, but on those especially which undergo no Mutation till a Crisis. Thus, also, sometimes they apply the Epithet of *intermittent* to those Fevers which have a perfect Cessation, at other times to those which have no such total Cessation, but undergo considerable Mutations, in the different Parts of the Paroxysms, as in the Beginning, Increase, Height, and Remission of the same. But some of the more modern Physicians call those Fevers which undergo no remarkable Alteration, not by the Name of *Syneches*, but *Synochus*; bestowing the former Appellation only on those which never come to an Apyrexia; or perfect Cessation, but intermit after each Paroxysm, which Kind the Ancients sometimes call *Syneches* (continual), sometimes *Dialipon* (intermittent). And these are really a middle Sort between the *Syneches*, and those which have a perfect Cessation, or Apyrexia; when compared, therefore, with the *Synochus*, they may very well be called *intermittent*, but in comparison of those which have a total Cessation, they deserve the Name of *Syneches*." The same Author, *de Crif. Lib. 2. Cap. 2.* gives the Name of *Syneches* to a Fever, "which, as he says, never comes to an Apyrexia before a total Solution, tho' it has a sensible Remission."

From the Premises it appears very plainly, that *Hippocrates* and the Ancients comprehended the *Synochos* under the *Syneches*.

A Fever consisting of one Paroxysm from the Beginning to the End, and lengthened out for many Days, is by some called a *Synochus*, not indeed by a proper Greek Word, but they rather chose to commit a Solecism in Terms, than want a Name for their Idea. But the Nature of these Fevers is by no means so simple as the Idea they have formed of them, from whence they give them the Name of *Synochus*; for some of them are attended with a manifest Putrefaction; others are wholly free from it; as, for Instance, the Diary Fever. *Galen, Meth. Med. Lib. 4. Cap. 2.*

The Fever, which some of the *Greeks* call *Synochus*, σύνωχος, and the *Latins* *Febris continens*, "a continent Fever," is either attended with a Putrefaction or not; the latter is called *Febris continens non putrida*, "the continent and not putrid Fever," and has the same Signs as a putrid *Synochus*, but somewhat less evident. There are a Pain or Heaviness of the Head, with an immoderate Heat and Redness of the whole Body, and especially of the Face, accompanied with a profound Sleep; a great Pulsation of the temporal Arteries; a great, full, frequent and swift Pulse, with a Sluggishness, and a kind of Lassitude of the whole Body.

The putrid *Synochus* is known by the same Signs as the other, but these Signs are more manifest in this putrid Kind; the Heat, for instance, is more acrimonious; the Throat and Parts adjacent swell, and burn with Heat, so as to be an Impediment to the Patient's Speech; the Eyes are full of hot Tears, and sometimes the Belly swells, and sounds, when struck, like a Drum. The Pulse is great, strong, swift and frequent, as in the other *Synochus*; but in this it is also unequal, in the former not so. The Urine is thick, red, turbid, and void of Sediment. There are often exanthematous Eruptions on the Superficies of the Body, which are most commonly livid or black, and sometimes of other Colours. This Disorder generally ends on the fourth Day, and if it continually increases, may endanger Life, particularly if the Tongue be rough and black, if the Eyes avoid the Light, and if the Urine appear like black Wine. Where these Symptoms are not seen, but the Fever decreases more and more, the Patient seems to be in a safe Condition. When the Disease maintains itself in one constant State, it is safer than when it increases, tho' less favourable than when it declines; which Observation is to be made, also, in the non-putrid *Synochus*. It is to be observed, that the *Synochus* usually happens only to Persons of a temperate Constitution, of a fleshy Habit, and abounding with no bad Blood; and that the Transition is easy from a non-putrid to a putrid *Synochus*, and from this to a continual Tertian.

What the *Greeks* call *Syneches*, and we *Febris continua*, "a continual Fever," is a kind of putrid Fever resembling the putrid *Synochus* in the Continuation of the Paroxysms, but different from it in that it proceeds either from Bile or Phlegm, and has its Periods according to the Nature and Motion of these Humors, in which, tho' it does not totally cease, it yet remits, and gives the Patient Time for Refreshment; but the *Synochus* owes its Original to a putrefy'd Blood, and affords no Remission till the Time of the Crisis. To proceed, a continual Fever, is not preceded by a Rigor, Horror, or Coldness, but suddenly seizes the Patient all at once with a Heat, tho' perhaps the corrupted Humor about the Præcordia may sometimes excite a Rigor or Horror, for a short time, till it be overcome and subdued by the Fever. The Heat is always of a rough and acrimonious Quality, and especially at the Increase and Heat of the Paroxysm. The Respiration and Pulse are unequal, and in this latter the Systole is perceived to be quick, and the Diastole slow. The Pulse, also, is sometimes quick, sometimes slow, sometimes strong, at other times weak; particularly in the Beginning of the Fit, or Paroxysm, it is quick and small; in the Height thereof it is not only quick, but remarkably great. The Urine in the Beginning is thick, red and turbid, and has neither Cloud, Enæorema or Hypostasis; sometimes it is thin, but red, and not at all transparent; and all the Excretions, whether Stool, Urine or Sweat, have generally a rank and offensive Smell.

A continual Quotidian and Quartan are commonly very irregular, so as in one Day to have two or three Exacerbations, on another but one, or perhaps none at all; a continual Quartan is very rare, a continual Quotidian more frequent than the other; but the most frequent is a continual Tertian, by the *Greeks* called καυσός, (*Causus*) by us *ardens Febris*, "a burning Fever." *Lammi Med. Obs.* See PYRETOS.

SYNOCOCHÉ. συνοχώη, is expounded in *Erotian* on *Hippocrates*, by συνοχή καὶ σύνδεσις, "a continued Coherence and Concourse." The Word occurs in *Lib. de Officium Natura*, where σύνδεσις συνοχώη is the Frame or Compages of the Breast.

SYNOVIA, a Term in *Paracelsus*, which he uses sometimes in a physical Sense for the nutritious Juice appropriated to the Nourishment of any Part: Thus the nutritious Liquor in the Joints, or rather in the Nerves which supply the Joints, is called by him *Synovia*, the white Glue of the Joints, otherwise *Hydarthros*, *Melicerta*, the Ichor of the Nerves. *Synovia*, in the same Author, is used in a pathological Sense for the Gout, or the Diseases of any Part where a Corruption of the proper nutritious Juice is the Cause of the Disorder. *Helmont*, *Dornæus* and *Rulandus* describe the *Synovia* to be a pellucid Sort of Mucilage, like Sperm, or like the Liquor which distils from the Legs of a Calf, when his Feet are cut off. *Castellus*.

SYNTASIS. σύντασις, from σύν and τάω, to distend or stretch, a Distention; it is opposed to *Chalasis*, χαλᾶσις, a Relaxation, as σύντασις, *Syntactica* (*Medicamenta*) Medicines inducing a Tenseness are opposed to χαλᾶσις, *Chalactica*, relaxing Medicines. See CHALAXIS and CHALACTICON.

SYNTAXIS. σύνταξις, from σύν and τάω, to order, or regulate, in *Galen*, *Lib. de Officibus*, signifies any Order or Composition of the Bones in general, and is there divided into *Artibron* and *Symphysis*. It is otherwise, as we are told, called *Symbes*, σύνβησις, and *Homilia*, ὁμιλία.

SYNTENOSIS. A Species of *Synneurosis*, in *Spigelius*, when two Bones are connected by a Tendon, as the *Ossa Sesamoidea* to the Bones of the Toes, and the *Patella* to the *Os Femoris* and *Tibia*. *Castellus*.

SYNTEXIS. σύντηξις, from σύν and τήω, to liquefy, a Colliquation. See COLLIQUATIO.

SYNTHENA. So *Paracelsus* calls a kind of Epilepsy, or apoplectic Disorder, attended with Gripes, and a Pain of the Stomach, which is generally mortal. *Castell*.

SYNTHESIS, σύνθεσις, from σύν, together, and τίθημι, to put; Composition, in Anatomy, is the same as *Syntaxis*, which see. It is also one of the six Parts into which some divide the Art of Surgery, as we are told by *Heister*, the other five being *Diarsis*, *Exarsis*, *Apharsis*, *Prosthesis*, and *Dierthosis*; which see in their proper Places. *Synthesis* is also the Name of a Disease much like a Phthisis, in *Plinius Secundus de Re Medica*, *Lib. 2*.

SYNTHEISMUS, a Term used by some in Surgery to comprehend the four Operations in the Restitution of Fractures, which are *Extension*, *Coaptation*, *Reposition*, and *Deligation*, or Bandage.

SYNTHETOS, σύνθετος, from σύν and τίθημι, to put or place; compact, is an Epithet applied by *Hippocrates*, *Coac.* 110. to *Fæces* of a hard Consistence.

SYNTOMOS, σύντομος, from σύν and τέμνω, to cut; concise, short, quick, is sometimes, if the Word be not corrupted, put for vehement and intense. Thus πᾶσι σύντομος, *Coac.* 160. signifies violent Pain; but *Ræsius* thinks we should read σύντονος, and observes that σύντομος is often read corruptly for σύντονος, which signifies intense. The Adverb σύντομος signifies soon, speedily, shortly, for instance, 3 *Aph.* 12. καλῶς σύντομος ἀνθρώπινος, are "Defluxions which soon prove mortal."

SYNTONIA, σύντονια, from σύν and τήω, to stretch, signifies Strength and Firmness of Tone. *Galen*, *Com. 4. in Lib. de R. V. J. A.* explains σύντονια κατὰ τὰς φλέβας, "a Syntonia of the Veins," by πύκνωσις, a Denseness, or a Thickness of the Coats of the Veins, which he makes the Cause of the Stillation or Falling of Blood by Drops from the Nose; σύντονος πᾶσις, *Coac.* 160. is intense or vehement Pain.

SYNTROPHOS, σύντροφος, from σύν and τροφίω, to nourish; nourished together, is expounded by *Galen*, *Com. 2. in Lib. καὶ ἰσχυρῶς*, by ἐκείνους, familiar, accommodated, convenient. *Σύντροφος νόσος* is a Disease which is nourished and grows up with the Patient; thus, *Lib. de Morbo Sacro*, the Epilepsy is said to be ἡ νόσος ἐκ παλαιῶν σύντροφος, "a Disease nourished and growing with a Person from a Child."

SYNULOTICON, συνυλोटικόν, is the same as *Epuloticum*. *Galen de M. M. Lib. 13. Cap. 5.* See EPULOTICA.

SYNYMENSIS, in *Spigelius*, is a Species of Junction of two Bones by means of a Membrane; as, for instance, in new-born Children, the Bones of the Sinciput are connected to the *Os Frontis*.

SYPHAR. The same as EXUVIÆ, which see.

SYPHILIS. See SYPHILIS.

SYRIACON. An Epithet of an Ointment, called also *Commagenum*, or *Comagenum*. See COMMAGENUM. The *Lapis Judaicus* is also called *Syriacus*; for *Ulcus Syriacum*, see TONSILLÆ.

SYRICON, according to *Paulus Aegineta* and *Aetius*, is the same as *Sandyx*; but *Pliny* makes it a Composition of equal Parts of *Sandyx* and *Sinopsis*. It is also the Name of a Collyrium described in *Aetius*, *Tetrab. 2. Lib. 3*.

SYRINGA.

The Characters are;

The Calyx is monophyllous, and divided into four large and expanded Segments. The Flower is rosaceous and pentapetalous, or tetrapetalous, and furnished with Stamina to the Number of Sixteen. The Ovary in the Bottom of the Calyx is adorned with four erect, apiculated Tubes, and becomes a turbinate, quadricapsular Fruit, growing to the Calyx, gaping into four Parts, and pregnant with small Seeds.

Boerhaave mentions two Sorts of *Syringa*, which are;

1. *Syringa*; alba; five *Philadelphus Athenæi*. *C. B. P.* 398. *Frutex Coronarius*, *Clus. H.* 55.
2. *Syringa*; flore albo, pleno. *C. B. P.* 398. *Boerb. Ind. Ali. Plant.*

It is called *Syrinx*, from σύριξ, (*Syrinx*) a Pipe, because the Branches, when the Pith is taken out, may serve for Pipes

Pipes in Syringes; but I find no medicinal Virtues ascribed to it. *Hist. Plant. ascript. Boerb.*

SYRINGOTOMIA, *συνγυρομία*, from *σύνγυζ*, a Fistula, and *τομή*, to cut; Syringotomy, or cutting for a Fistula.

SYRINGOTOMUM, *συνγυροτόμιον*, of the same Original with the preceding, is a Surgeon's Instrument for cutting a Fistula.

SYRINGOTOMUS. The same with **SYRINGOTOMUM**.

SYRINX. See **FISTULA**.

SYRIUS. A Name for a strong cathartic Powder prepared of Scammony, being no other than an Extract, Refine, or Magistery of that Drug.

SYRMA, *συρμα*. The same as **APOSYRMA**, or **ABRASUM**, which see.

SYRMÆA, *συρμαίν η συρμαία*, as some say, is a Species of *Raphanus*, so called [from *σύνγω*, *syro*, to draw] because it was proper to provoke Vomiting; *συρμαία* was also a sort of Sweetmeat prepared of Honey and Fat, which was the Prize of a certain Game or Exercise among the *Spartans*; also a Purgative Potion composed of Salt and Water. The Scholiast on *Aristophanes*, is *ισμν*, says, that the *Syrmæa* was the Juice of a certain Herb with which the *Egyptians* used to purge themselves; and it seems to be the Juice of the *Raphanus*, which, mixed with Salt, was a common Purge among that People. *Varinus* says, that the *Syrmæa* works both by Stool and Vomit, whence comes the Word *Syrmæismus*, which signifies a moderate Purging, whether upward or downward; and *Galen* also tells us, *Com. 2. in Lib. de Artic.* that a moderate Evacuation whether by Stool or Urine, was called by the Antients *Syrmæismus*. *Erotian* on *Hippocrates* says, that the *Syrmæa* is a long sort of *Raphanus*, which with Brine was used in Food, in order to excite a kind of Purging, which they call *Syrmæismus*, by which he means Vomiting. *Paulus*, *Lib. 1. Cap. 100.* informs us from *Diocles*, that *Syrmæismus* with the Ancients signified *ἰσμεν*, *isemes*, "fasting Vomits;" that is, provoked by some Medicine taken fasting, and the Verbo *Syrmæizo* expressed the Action of using that kind of Evacuation; for which purpose he prescribes small Radishes, Nasturtium, Eruca, Mustard and Purslain, to be taken in warm Water. Some commenting on this Place observe, that *Syrmæa* signifies a Drink prepared of Water and Barley; and in *Diodorus Siculus*, Provisions for Food. Thus, *Syrmæam facere*, "to make the *Syrmæa*," is to provide Victuals. The *Syrmæa*, in *Hippocrates*, seems to be some Potion or Juice, in which he orders his Medicines to be taken; particularly, *Lib. 11. apud γυναικ.* he orders the *Conyza Odorata* to be made into a Maf with Honey and Rosin, and taken in *Vinum odoratum* or *Syrmæa*, in order to expel the Fœtus and Secundines; and in the same Book he advises *Ærugo* with Honey to be taken in *Syrmæa*. *Herodotus* in *Euterpe*, speaking of the Manners of the *Egyptians*, says, "As to their Way of Living, every Month, for three Days together, they provoke Evacuation with *Syrmæa*, *συρμαίνωσι*, taking care, by Vomiting and gentle Purges, to preserve their Health;" and describing their Manner of preserving dead Bodies, he says, "that the third Way of preparing the Bodies, and which was used by those of meaner Fortunes, was, first, to cleanse out the Belly with Percolations of *Syrmæa*, and afterwards to let it lie in Salt for seventy Days." Where by *Syrmæa*, *Hermolaus Barbarus* assures us, is meant a Species of *Raphanus*. *Foesius*.

SYRMÆSMUS. See the preceding Word.

SYRONES. See **SIRENES**.

SYRRHCEA, *συρρηχεια, η συρρηχεια*, from *σύν* and *ῥέω*, to flow, a Conflux. *Hippocrates*, *Lib. de Aliment.*

SYRUPUS. A Syrup.

As various Simples, such as Herbs, Roots, Seeds, Fruits and Flowers, together with their Juices, cannot always be had, especially in the Winter and Autumn, in order to prepare Decoctions, Infusions, and other Medicines, suited to particular Intentions; as the Virtues of these Simples cannot be long preserved; and as some Disorders are so violent and acute as not to afford Time sufficient for reducing them into various Forms, in order to extract their Qualities; so Syrups became necessary, since by means of this Formula the various Virtues of Roots and Plants might speedily, and without Delay, be used for answering different Intentions, according to the different Qualities of these Roots or Plants.

The Word *Syrup*, as is shewn under the Article **SILPHIUM**, is derived from the *Chaldean*, *Sirpi*.

Syrups were first invented by the *Arabian* Physicians, and were unknown to the ancient *Greeks*; since *Hippocrates* and *Galen* only make mention of *Oxymel* and *Mulsim*. But the *Moors*, in Imitation of the *Arabians*, enriched the pharmaceutical Part of their Medicine with various Kinds of Syrups.

A Syrup is a liquid Form of Medicine, prepared of Decoctions, Juices, or Infusions, preserved by means of Honey

or Sugar, and reduced to such a Confidence, that a Drop let fall on a Marble does not spread.

Syrups, like all other Official Preparations, may be made to answer various Intentions; and consequently may be either of a cooling, heating, drying, inciding, expectorating, incrassating, diuretic, sudorific, lithontriptic, alexiterial or corroborating Quality, according to the different Virtues of the several Ingredients of which they are prepared.

Syrups are used either alone, and without any Admixture of any other Substance; or they are dissolved and diluted in some proper Liquor.

Unmix'd Syrups, or such as are not diluted with any Liquor, cannot (before their Virtues are in a great measure lost) penetrate so far, nor act so quickly and easily on the Parts affected, or the Humours to be alter'd, as Syrups diluted to the Confidence of a Julap, which, in consequence of their destroyed Viscidity, penetrate more expeditiously, arrive at the Parts affected, and mix with the noxious Humours before their Virtues are considerably lost. Hence 'tis obvious, that either unmix'd Syrups, or such as are diluted, are to be exhibited according to the different Parts affected, the Diversity of Diseases, and the Variety of their productive Causes.

Thus undiluted Syrups are universally prescribed;

1^{mo}. For preventing and checking, by their tenacious Confidence, Defluxions on the Fauces, Lungs, and Stomach; for which Purpose they are to be long retained in the Mouth.

2^{do}. For removing Hoarseness, and the Asperity or Roughness of the *Aspera Arteria*, which Intentions they excellently answer by their tenacious Lensor. For these Purposes they are to be gradually swallowed or lick'd out of a Spoon, like a *Linctus*.

3^{io}. For Expectoration, and the Elimination of any fordid Matter collected and infarcted in the Lungs; for which Purposes they are to be licked out of a Spoon, or taken with a Piece of Stick-liquorice.

4^{to}. For alleviating Coughs; for which Purpose they are to be taken in the same Manner.

5^{to}. For Disorders of the Stomach, and Parts adjacent, to which they easily penetrate without a Vehicle.

Diluted Syrups, on the contrary, or such as are reduced to the Form of a Julap, are prescribed;

1^{mo}. For Disorders of the Liver, Spleen and Mesentery.

2^{do}. For various other Disorders, especially of the Head, Heart, Lungs, Kidneys, Bladder, Uterus and Limbs, to which the Virtues of Syrups alone can hardly, if at all, be convey'd, unless they are diluted.

Syrups are generally order'd to be diluted in some proper Liquor, adapted also to remove the particular Grievance for which the Syrup is prescribed. But the Liquors most commonly used for this Purpose, are distilled Waters, or Decoctions, which are more efficacious than Water; as also Broths prepar'd of Fowls, either alone or boiled with proper Roots and Flowers.

In determining the Doses of Syrups, we are to have a due Regard,

1^{mo}. To the Situation and Condition of the Parts affected; for if the Virtue and Efficacy of the Syrup are to be convey'd to remote and distant Parts, a proportionably large Dose is to be exhibited, otherwise little or no Effect will be perceived; because by the Length of the Passage, the Virtues of the Syrup will be greatly impair'd.

2^{do}. To the Virulence of the Disorder, and the Strength of the morbid Cause.

3^{io}. To the Age and Habit of the Patient.

4^{to}. To the Virtue and Efficacy of the Syrup itself.

5^{to}. To the Manner in which the Syrup is taken; for as large Quantities of Syrups cannot be taken at once, in order to remove several Disorders of the *Aspera Arteria* and Lungs, so the Doses are to be frequently repeated. The same Rule is, also, to be observed in the Use of such Syrups as are exhibited for extinguishing Thirst.

As for the Quantity of Liquor used in diluting Syrups, it is the same as in Julaps; only the Quantity is to be augmented when the Intention is to allay Thirst excited by Fevers and other acute Disorders, especially in the Summer Time.

The Time most proper for exhibiting Syrups, is to be estimated from the Intention of their Exhibition: Thus Syrups design'd to prepare and digest the Humours, are to be exhibited in the Morning, four or five Hours before Eating, that their Virtues may not be obtunded by Aliments lately taken, or as yet not digested.

These Directions principally belong to the Syrups of the alterant Kind; and as for those of a purgative Quality, they are to be exhibited at the same time, and with the same Precautions, as other Purges; only 'tis to be observed in general, that Syrups are better adapted to chronic than to acute Disorders. *Petr. Morell. de Formul. Remed.*

In making the Official Syrups to the best Advantage, some

some principal Qualities in the Things themselves, before such a Process is entered upon, ought to be particularly regarded. The most simple Treatment in this Form, is the dissolving Sugar enough in the Juice, or Infusion of some Things, to give it a Consistence for keeping; the Proportion required for this purpose is generally double the Quantity of Sugar to that of the Liquor; and where it is ordered with less Sugar, Boiling is required to bring it to a due Consistence.

Among the Materials thus ordered, all Acids ought to have their due Quantity of Sugar to bring them to a Consistence without Boiling; because the very Action of much Heat upon them destroys their Acidity, and makes them liable to candy; and this more particularly holds good, where a Juice hath any Fragrancy in Flavor, as that of Oranges, Lemons, Citrons, and the like; because Boiling also exhales and destroys that Fragrancy. Such Infusions, also, as give to a Syrup a desirable Colour, ought at once to be so charged with Sugar as not to require Boiling; because their Colours, by such Procedure, would be spoiled; as with the Violets, red Poppies, Cloves, and the like; none of which can bear the Fire without Detriment.

The alterant Syrops, either simple or compound, which are made from Decoctions, and take not in Sugar enough to give them a due Consistence without boiling, require Clarification most, which is commonly done with the Whites of Eggs; but this Addition to their Beauty, is an Injury to their Virtues, where any thing mucilaginous or viscid is required. But among this whole Tribe, this Caution is no where so necessary as in the *Syrupus de Meconio*. What is taken from the Poppy, and which solely gives the Virtue to this Syrup, will make a Decoction thick; and if that be taken out by Clarification, the Medicine becomes of little or no Effect; so that a certain Way to know when this may be trusted to is, by making a Draught thick and foul, and depositing a light Sediment upon Standing.

There are so many under this Title of Syrops yet retained in the Dispensatory, which are hardly ever made or prescribed, that the particular Examination of them would be a needless Trouble; and therefore it may be sufficient to observe, that these are the *Syrupus de Absinthio simplex*, justly neglected for its Nauseousness; the compound Syrup under the same Title; the *Syrupus de Artemisia*, de *Erysimo*, *Myrtinus*, de *Pomis alterans*, de *Paeonia compositus*, de *Prasso*, de *Stachade*, de *Symphyto*; and, among the Purging Syrops, the *Syrupus de Cichereo cum Rhabarbaro*, de *Pomis purgans*, and *Rosaceus solutivus cum Sena*.

Of those which are frequently in Use, the *Syrupus de Althæa* is the most considerable Compound; but if we examine the Efficacies or Fitness of the several Ingredients for this Form, we shall soon discover the Reason why it is now frequently ordered in its Decoction, to be used like a common Apozem, in large Draughts at a time; by which way it is certainly a good Emollient, and serviceable in nephritic Disorders, by lubricating the Passages; but if a Quart or two of this may safely be drank in a Day, little Consequence can be expected from what Syrup can be taken in the same time.

The same holds good in the *Syrupus Capillorum Veneris*, *Syrupus de Glycyrrhiza*, and the *Syrupus à quinque Radicibus*; for their Decoctions may be drank in large Quantities with Safety, and require to be so taken, when any thing is expected from them; so that all these Things are of use in Syrops only to sweeten Decoctions, or Juleps of like Intention; or else to make up Boluses and Electuaries into a due Consistence.

The *Syrupus de Mentha* is a Composition of some Efficacy, being a grateful Astringent. But even this ought to be trusted to only as a weak Auxiliary. The same is observable of the *Syrupus de Rosis siccis*.

The *Syrupus de Cinnamomo* may answer the Intention of a Restrictant; but its spicy and cordial Quality must necessarily be lost in the long Boiling that is required, to give it Consistence, with half a Pound of Sugar to one Pint of Water. The other Spices and Seeds directed to be made into Syrops after the same manner, are liable to the same Inconveniences; as are, also, the Syrops from the Citron, Orange, and Lemon-Peels. But all the Flavour from these Ingredients, which can be retained in a Syrup, as this Form is commonly kept in the Shops in open Pots, or those loosely covered, is soon lost by standing; so that such Things are to great Disadvantage ordered this Way. The *Syrupus Balsamicus* is liable to the same Loss, but is directed with the utmost Care, to preserve its more fragrant and volatile Parts. This last mentioned Syrup is frequently, for Cheapness, made with Storax or Benjamin, or both; the Difference being hardly discoverable, and the Fraud of no very ill Consequence.

The first Way directed to make the *Syrupus Chalybeatus* is hardly practicable, because the *Sal Martis* does not seem dis-

solvable in the compound Gentian Water; and as the *Syrupus de Pomis alterans* is scarce ever made, this Way I believe has never been tried. That with only Steel, Wine, and Sugar, is the old and common Way of making it, but it is very subject to run into Candy; as is also the *Syrupus Croci*, and any other of this Form made with a vinous Liquor, because the Sugar is not so naturally suspended in them, as in Water and the thicker Fluids; and therefore they are more ready to shoot into Crystals.

Amongst the purging Syrops, the first from Succory with Rhubarb has been formerly much esteem'd; but the whole Croud of Ingredients in it, which have been thought either Correctors or Purgers of Bile, are now known to be of so little Efficacy as to any such Purposes, that they are grown into Neglect; and that shorter Composition, which bears the Title of *Syrupus de Rhabarbaro*, is now much more valued, though the Violet Flowers, the Succory and Fennel Waters seem but very insignificant Ingredients.

The *Syrupus e Floribus malorum Persicorum*, which orders the Infusion to be five times repeated with fresh Flowers, is commonly made with one Infusion only, with just Water enough to cover and scald the Flowers; and that proves a good gentle Emetic or Purge to young Children; the other Way would certainly render it stronger; but so very few care for the Trouble, that I never yet met with any who would vouch for its being thus made. The *Syrupus rosaceus solutivus* is directed somewhat in the same manner, but a stronger Infusion of the dried Damask Roses, or the Residuum after Distillation, will make it with less Trouble and full as good, if not better, than is here ordered by frequent Infusions, or from the expressed Juice.

The Syrup of Buckthorn is of Strength sufficient to require not above two Ounces for its largest Dose, which may conveniently enough be given; but the customary Way of putting in the Spices hath been in a thin Bag, during its boiling to a Consistence; and the less time they are exposed to such Treatment the better. *Quincy's Prelections.*

The Syrops directed by the College are the following.

SYRUPUS DE ABSINTHIO SIMPLEX.

The simple Syrup of Wormwood.

Take of the clarified Juice of common Wormwood, and of clarified Sugar, of each four Pounds; and boil them together into the Consistency of a Syrup.

After the same Manner are prepared the simple Syrops of the Juice of Succory, of Ground Ivy, of Raspberries, of the outer Peel of Walnuts, of Coltsfoot; and also of other Juices that are not acid.

SYRUPUS DE ABSINTHIO COMPOSITUS.

Compound Syrup of Wormwood.

Take of common Wormwood moderately dried half a Pound, of red Rose Leaves, two Ounces; of Spike-nard, three Drams; of old strong white Wine, and Juice of Quinces, of each two Pounds and a half. Let them infuse together warm in an earthen Vessel for a whole Day, then gently boil in a Bath Heat, and strain out the Liquor; and with two Pounds of white Sugar, boil it up to the Consistence of a Syrup.

SYRUPUS ACETOSUS.

Syrup of Vinegar.

This is made by dissolving with a gentle Fire, five Pounds of Sugar in one Quart of the best White Wine Vinegar.

This is reckoned good to expectorate and cut Phlegm, and in such Intentions any other Syrup may be helpful; because the Sugar itself has a Tendency that Way.

SYRUPUS DE ALTHÆA. See ALTHÆA.

SYRUPUS DE ARTEMISIA.

Syrup of Mugwort.

Take of Mugwort, two Handfuls; of Penny-royal, Camamint, Origany, Baum, Dittany of Crete, Savine, Marjoram, the lesser Centory and Rue, of each one Handful; of Fennel, Smallage, and Parsley Roots, of each one Ounce; of Juniper Berries, of the Seeds of Lovage,

vage, Parsley, Smallage, Cubebs, and the Roots of Afanum, of each half an Ounce. Let these be cleansed, cut and bruised, as they require, and boil then in six Quarts of Water to four Quarts. To the expressed Liquor, add of Cinnamon and Spikenard, of each three Drams; of white Sugar, six Pounds; and boil up to a Syrup. *S. A.*

SYRUPUS BALSAMICUS. See **BALSAMUM TOLUTANUM.**

SYRUPUS DE BERBERIS.

Syrup of Barberries.

Take two Pints of the fine Juice of Barberries, and one Pound and a half of very fine Sugar: Boil them in an earthen glazed Vessel to the Consistence of a Syrup.

SYRUPUS CAPILLORUM VENERIS.

Syrup of Maiden Hair.

Take of Maiden Hair, five Ounces; of Liquorice Root, two Ounces: Infuse them for twenty four Hours in six Pints of hot Water; then after a gentle Boiling in a Bath Heat, press out the Liquor; and to four Pints of it clarified, put of Sugar three Pounds, and boil up to a Syrup.

SYRUPUS INFUSIONIS FLORUM CARYOPHYLLORUM. See **CARYOPHYLLUS.**

SYRUPUS CHALYBEATUS.

Syrup of Steel.

Take of the Salt of Steel, two Drams; dissolve it in one Ounce of compound Gentian Water; and add to it nine Ounces of the alterant Syrup of Apples. Or otherwise,

Take equal Quantities of Steel Wine and Sugar, and boil them into the Consistence of a Syrup.

SYRUPUS CICHOREI CUM RHABBARBARO. See **RHABBARBARUM.**

SYRUPUS DE CINNAMOMO.

Syrup of Cinnamon.

Take of the best Cinnamon a little bruised, three Ounces; infuse it for three days in a sufficient Quantity of hot Spring Water, to strain off one Pound, and put to it half a Pound of the finest Sugar; and with a gentle Heat boil it up to a Syrup.

SYRUPUS E SUCCO CITRIORUM. See **CITREUM.**

SYRUPUS CORTICORUM CITRIORUM. See **CITREUM.**

SYRUPUS CROCI. See **CROCUS.**

SYRUPUS CYDONIORUM. See **CYDONIA.**

SYRUPUS DE ERYSIMO. See **ERYSIMUM.**

SYRUPUS DE GLYCYRRHIZA.

Syrup of Liquorice.

Take of fresh Liquorice, cleansed and bruised, two Ounces; of white Maiden Hair, one Ounce, of Hyssop, half an Ounce. Pour upon these three Pints of boiling Spring Water; and after twenty-four Hours Infusion in a Bath Heat, strain out the Liquor and clarify it; and with the best Honey and fine Sugar, of each ten Ounces, boil it up to a Syrup in a Bath Heat. *S. A.*

SYRUPUS GRANATORUM.

Syrup of Pomegranates.

Take of white Sugar, one Pound and a half; of the Juice of Pomegranates made fine, one Pound. Let it be brought into a Syrup with a Bath Heat.

SYRUPUS DE MECONIO, SIVE DIACODION. See **DIACODION.**

SYRUPUS DE MENTHA.

Syrup of Mint.

Take of the Juices of sweet and sub-acid Quinces, and of the Juice of sweet and acid Pomegranates, of each one

Pound and an half; of dried Mint half a Pound; of red Roses two Ounces. Let them stand in Maceration one whole Day; then boil in a Bath Heat to a Consumption of half, strain the Liquor, and with four Pounds of Sugar make it into a Syrup.

SYRUPUS MYRTINUS.

Syrup of Myrtles.

Take of Myrtle Berries, two Ounces and an half; of the white and red Sanders, of Sumach, of Balauftines, Barberries, and red Roses, each one Ounce and a half; of Medlars sliced, one Pound, bruise as required, boil in eight Pints of Water to four Pints; and to that, when strain'd, add of the acid Juice of Quinces and Pomegranates, each six Ounces. Then with four Pounds of Sugar boil into a Syrup, adding the Juice towards the latter End.

SYRUPUS DE PÆONIA COMPOSITUS.

Compound Syrup of Peiony.

Take of fresh Piony-Roots, both the Kinds, cut into Slices; and infused a whole Day in white Wine, of each one Ounce and an half; of Contra-yerva Root, half an Ounce; of common Hartwort, six Drams; of Rosemary with its Flowers, one Handful; of Betony, Hyssop, Origany, Ground-Pine, and Rue, of each three Drams; of Aloes Wood, Cloves, and the lesser Cardamoms, of each two Drams; of Ginger and Spikenard, of each one Dram; of Stæchas and Nutmegs, of each two Drams and a half. After one Day's Infusion in six Pints of warm Spring-water, boil in a Bath-Heat to the Consumption of a third Part; and to the Liquor afterwards strained through a Flannel Bag, put four Pounds and a half of the finest Sugar, and boil up into a Syrup with a moderate Heat.

SYRUPUS DE PAPAVERE ERRATICO.

Syrup of wild Poppies.

Take of the fresh Flowers of wild Poppies two Pounds, and pour upon them two Quarts of Spring-water; the next Day press it out, and repeat the Infusion with fresh Flowers, and then make it into a Syrup in a Bath-Heat, with as much Sugar as there is of the strained Liquor.

SYRUPUS E FLORIBUS MALORUM PERSICORUM.

Syrup of Peach-Flowers.

Take Flowers of Peaches, one Pound, and pour upon them three Pints of boiling Water; after twenty four Hours steeping, press out the Liquor, and repeat the Infusion with a fresh Quantity of Flowers five times; then in the last Straining dissolve two Pounds and a half of Sugar, and boil it up to a due Consistence.

It is a pretty Puke for Children, and opens a little downwards; for which purpose it is much in Use. The Dose is from two Drams to one Ounce.

SYRUPUS DE PETO.

Syrup of Tobacco.

Take of the Juice of English Tobacco three Pounds; of simple Oxymel four Ounces; of Mead one Pint. Digest them together for four Days; then to the clear strained Liquor put two Pounds of Sugar, and make into a Syrup.

This is designed for an Emetic.

SYRUPUS DE POMIS ALTERANS.

The Alterant Syrup of Apples.

Take of the Juice of fragrant Apples four Pints; of the Leaves of Garden and wild Buglafs, and of Violet Flowers, each one Pound: Boil in a Bath-Heat, and to the clear strained Liquor put seven Pound of the finest Sugar, with one Pint of Damask Rose-water, and make into a Syrup.

[A 222]

SYRU-

SYRUPUS DE POMIS PURGANS.

Purging Syrup of Apples.

Take two Pints of the Juice of fragrant Apples; of the Juices of Borrage and Bugloss, of each one Pint and a half; of the Leaves of Sena picked from the Stalks and Duft, two Ounces; of Aniseeds half an Ounce; of Saffron tied into a little Knot, one Dram. Let the Sena and Aniseeds steep in the Juices; and after that is continued twenty four Hours, and they have been just boiled together, strain out the Liquor; to which add two Pounds of white Sugar, and squeezing the Knot of Saffron frequently between whites, let it be boiled into a Syrup.

SYRUPUS DE PRASSIO.

Syrup of Hore-hound.

Take of the Leaves of fresh white Hore-hound two Ounces; of Liquorice, Polypody of the Oak, Smallage, and sweet Fennel Roots, of each an Ounce; of the Leaves of white Maiden-Hair, Origanum, Hyssop, Calamint, Thyme, Scabious, Savory, and Coltsfoot; of each six Drams; of the Seeds of Anise and Quinces, of each three Drams; of stoned Raisins two Ounces; of fat Figs, No. 10. Let these stand in a warm Digestion for a whole Day, in one Gallon of thin Mead; then boil in a Bath-Heat, and to five Pints of the Liquor strongly pressed out, and settled clear, put two Pounds of clarified Honey and as much Sugar, and boil up to a Syrup; which may be flavoured with one Ounce of Florentine Orrice-Root.

SYRUPUS DE QUINQUE RADICIBUS.

Syrup of the five aperient Roots.

Take of the Roots of Butchers-Broom, sweet Fennel, Asparagus, Parsley, and Smallage, of each two Ounces; of Spring-water three Quarts. Digest them together warm, and boil them in a Bath-Heat. To two Quarts of the Liquor strongly pressed out and clarified, put five Pounds and a half of fine Sugar, and make into a Syrup in the same Heat; adding to it at the latter End eight Ounces of Vinegar.

SYRUPUS DE RHABBARBARO.

Syrup of Rhubarb.

Take of the best Rhubarb, and of Sena Leaves, of each two Ounces and a half; of Violet Flowers one Handful; of Cinnamon one Dram and a half; of Ginger, half a Dram, of Succory, and Fennel Waters, of each four Pints. Let them steep a whole Night warm, and then boil the strained Liquor up into a Syrup with two Pounds of white Sugar towards the latter End, mixing with it two Ounces of the solutive Syrup of Roses.

SYRUPUS ROSACEUS SOLUTIVUS. See ROSA.

SYRUPUS E SUCCO ROSARUM. See ROSA.

SYRUPUS DE ROSIS SICCIS. See ROSA.

SYRUPUS DE SPINA CERVINA.

Syrup of Buckthorn.

Take of the Juice of ripe and fresh Buckthorn Berries gathered in the Month of September, two Pints; let the Fæces subside, and to the clear Liquor add of Cinnamon and Nutmegs, each three Drams; and let them stand in Maceration for the space of one whole Day; then strongly press it out, and put to it one Pound and a half of white Sugar, to be boiled up to the Consistence of a Syrup in a Bath-Heat.

SYRUPUS DE STOECHAUDE.

Syrup of Stoechas, or French Lavender.

Take of Stoechas Flowers four Ounces; of Rosemary Flowers half an Ounce; of the Herbs of Thyme, Calamint, and Origanum, each one Ounce and an half; of the Seeds of Rue, Peony, and sweet Fennel, each three Drams. Digest these for one or two Days in a suf-

ficient Quantity of hot Spring-water, to press out five Pints clear; to which add of the finest Sugar five Pounds and an half, and make into a Syrup by a Bath-Heat, according to Art. It may be aromatized with some Drops of the distilled Oil of Cinnamon.

SYRUPUS DE SYMPHYTO.

Syrup of Comfrey.

Take of the Roots and Leaves of the Greater and Lesser Comfrey, each three Handfuls; of fresh red Roses, Leaves of Betony, Plantain, Pimpernel, Knot-Grass, Scabious, and Coltsfoot, each two Handfuls; bruise them, and press out their Juice; to each Pound of which put one Pound of Sugar; in the Boiling take off what Scum rises, until it is of a due Consistence for a Syrup.

SYRUPUS VIOLARUM.

Syrup of Violets.

Take of fresh Violet Flowers clean picked one Pound, and pour upon them two Pints and an half of hot Water; cover them down close in a new earthen glazed Pot for a whole Day, and then squeeze out the Liquor with a Press; and to every Pint of it put two Pounds of fine Sugar, which dissolve in a Bath-Heat, and take off what Scum arises during its Continuance over the Fire.

SYRUPUS E SUCCO VIOLARUM.

Syrup of the Juice of Violets.

This is made with the expressed Juice and double the Quantity, at least, of Sugar melted in a gentle Bath-Heat, as directed in the preceding.

Besides these there are a great many other Syrups, perhaps not inferior in Virtues, and consequently not less useful. The following are taken from Lemery's *Pharmacopée universelle*.

SYRUPUS ANTI-ASTHMATICUS ANT. DAQUIN.

The antiasthmatic Syrup of Anthony Daquin.

Take of well-cleaned Barley, two Ounces; of the Roots of Butterbur, Elecampane, Smallage, Fennel, Liquorice, and of well-cleaned Damascus Raisins, each an Ounce and an half; of enucleated Dates, twelve; of Jujubes and Sebestens, each thirty; of the Leaves of Coltsfoot and Lungwort, of the Tops of Hyssop and white Horehound, and of true Maidenhair, each one Handful; of the Seeds of Anise, and the Cotton Bush, each half an Ounce; and of the Flowers of Coltsfoot and Catsfoot, each half an Handful; make into a Syrup.

For this Purpose, the Barley is first to be boiled in nine Pints of Water for about half an Hour, then we are to add the Roots cut into small Pieces, then the Fruits opened and cleansed, and then the Leaves, Seeds, Flowers and Liquorice bruised. When the Decoction is boiled to about a third Part, permit it to become half cool, strain it and mix the Sugar with it. Clarify the Mixture with the White of an Egg, and boil it to the Consistence of a Syrup; which, when cold, is to be rendered of an aromatic Flavour, by an Elæosaccharum prepared of six Drops of the distilled Oil of Anise, two Drops of the Oil of Cinnamon, and a sufficient Quantity of the Powder of Sugar-candy.

This Syrup incides and disengages thick Phlegm, affits Respiration, removes Obstructions of the Lungs and Diaphragm, and is beneficial against Asthmas and inveterate Coughs.

The Dose is from half an Ounce to an Ounce.

SYRUPUS ANTI-EPILEPTICUS ANT. DAQUIN.

Take of Birdlime, and the Roots and Seeds of male Piony, each two Ounces; of the Roots of the greater Valerian, Angelica, Master-wort, Illyrian Orris, and white Dittany, each one Ounce; of the Leaves of Betony and Rue, and of the Flowers of Lilly of the Valley, the Lime-tree and Lavender, each one Handful; and of the white Tartar of Montpellier, one Ounce and an half; make into a Syrup.

For which Purpose we are to choofe all the Ingredients good, and cutting them in Pieces and bruifing them, we are to put them into a large Matrafs; then we are to pour upon them of the Waters of black Cherries and Lime-tree Flowers; each three Pints; then ftopping the Matrafs clofe, we are to put it in a tepid *Balneum Mariæ*, where the Ingredients are to digeft for twenty-four Hours: Then the Water of the Bath is to be fet a boiling for two or three Hours, after which the Infufion is to be ftrained and expreffed; then four Pounds of Sugar are to be mixed with it, after which it is to be clarified with the white of an Egg, and boiled over a flow Fire, to the Confiftence of a Syrup, which, when cold, is to be rendered of an aromatic Flavour, with an Elæofaccharum, prepared of the diftilled Oils of Lavender and Cinnamon, together with a fufficient Quantity of the Powder of Sugar-candy.

This Syrup is good againft Epilepfies, Apoplexies, Palfeys, and other Diforders of the Brain.

The Dofe is from half an Ounce to an Ounce and an half.

SYRUPUS ANTINEPHRITICUS ANT. DAQUIN.

The antinephritic Syrup of Anthony Daquin.

Take of the Roots of Marfh-mallows, Reft-harrow, Strawberries, Burdock, Water Lily, and the five aperient Roots, each one Ounce and an half; of Winter-cherries and Dog-hips, each three Ounces; of the Seeds of Burdock, Gromwel, Mountain Hartwort, the four cold Seeds well cleaned, and the Kernels of Medlars and Peaches, each one Ounce; of the Leaves of Saffrafas, Burnet, Chervil, Golden-rod, Saint John's-wort, and true Maidenhair, each one Handful; and of white Tartar reduced to Powder, two Ounces; make into a Syrup in the following Manner:

Cleanfe the Roots and cut them into fmall Pieces, reduce the white Tartar to a grofs Powder; boil all together in ten Pints of the diftilled Water of Pellitory of the Wall, over a gentle Fire, for about an Hour; then add the Fruits opened, then the Kernels and Seeds bruifed, and laft of all the Leaves cut fmall. The Decoction is to be boiled into about an half; after which four Pounds of Sugar are to be added; then the Mixture is to be clarified with the white of an Egg, and boiled to the Confiftence of a Syrup, which is to be rendered of an aromatic Flavour with fix Drops of the Effence of Anife reduced to an Elæofaccharum, with about half an Ounce of the Powder of Sugar-candy.

This Syrup refolves the Stone, attenuates and climinates the Phlegm lodged in the Kidneys, Ureters and Bladder, provokes Urine, and is good for the green Sicknefs.

Its Dofe is from half an Ounce to two Ounces.

SYRUPUS ANTISCORBUTICUS ANT. DAQUIN.

The antifeorbutic Syrup of Anthony Daquin.

Take of the Roots of male Fern, Angelica, Eringo, and Horfe Radifh, each three Ounces; of Citron and Orange Peel, each two Ounces; of the Leaves of Baum, Fumitory, Spleen-wort, Scurvy-grafs, Brooklime, Water-creffes, Money-wort, and Mint, each three Handfuls; of the Seeds of Garden-creffes, *Carduus Benedictus*, and Citrons, each one Ounce; of the Flowers of Broom and Clove July-Flower, each one Handful; and of white Tartar, two Ounces; make into a Syrup in the following Manner.

Boil the Roots cut into fmall Pieces, and the Tartar reduced to a grofs Powder in nine Pints of chalybeate Water; then add, whilst the Water is ftill boiling, the Barks and Seeds bruifed, then the Herbs cut down, and laft of all the Flowers. When the Decoction is boiled in about a third Part, permit it to become half cool, then ftrain and exprefs it; add fix Pounds of the beft Sugar, clarify the Mixture with the white of an Egg, and boil it to the Confiftence of a Syrup, which, when cold, is to be rendered of an aromatic Flavour, with an Elæofaccharum prepared of the Oils of Cinnamon and Cloves, each three Drops, and a fufficient Quantity of the Powder of Sugar-candy.

This Syrup purifies the Blood, refifts the Malignity of the Humours, provokes Urine, excites the Menfes, and is of excellent Service in the Scurvy, malignant Fevers, and other Diforders, where it is neceffary to accelerate the Circulation of the Humours.

Its Dofe is from half an Ounce to an Ounce and a half.

SYRUPUS LIENTERICUS ANT. DAQUIN.

Anthony Daquin's Syrup againft the Lientery.

Take of the Tops of the greater Wormwood, and red Rose Leaves exungulated, each three Handfuls; of the Filings of Steel inclos'd in a Bag, two Ounces; of the beft Rhubarb and Bark of Citrin Myrobalans, each an Ounce and an half; of the Powder of white Tartar one Dram, and bruifed red Sanders, half a Dram; make into a Syrup in the following Manner.

Put all the Ingredients into a glafs earthen Veffel; pour upon them of the Juices of Plantain and red Roses, each two Pints; cover the Veffel, fet it on warm Afhes for twenty four Hours, then boil the Infufion gently for a Quarter of an Hour; ftrain and exprefs it, add four Pounds of Sugar, clarify with the white of an Egg, and boil to the Confiftence of a Syrup.

This Syrup ftops Fluxes, and efpecially Lienteries, corroborates the Stomach, and the other Vifcera, corrects the Acrimony of the Humours, and is good againft Hemorrhagies.

Its Dofe is from half an Ounce to an Ounce and an half.

As the primary Cause of a Lientery confifts in a Weaknefs and Relaxation of the Fibres of the Stomach, fo that it is not fufficient for concocting the Aliments, fo the Ingredients of this Syrup are very proper, fince after having gently evacuated the Humour producing fuch a Relaxation, they brace up and corroborate the Fibres of the Stomach.

SYRUPUS MAGISTRALIS ASTRINGENS, seu DYSENTERICUS.

The astringent or antidyfenteric magiftrial Syrup.

Take of the beft Rhubarb one Ounce, of Citrine Myrobalans, half an Ounce; of Pomegranate Peel and red Rose Leaves, each three Drams; make into a Syrup in the following Manner.

Cut the Rhubarb into fmall Pieces, bruife the Myrobalans and Pomegranate Peel. Let the whole infufe together warm for twenty four Hours, in three Pints of diftilled Plantain Water. Then boil the Infufion, gently ftrain and exprefs it. Mix with it four Ounces of the clarified Juice of Barberries, and two Pounds of white Sugar. Clarify the Mixture with the White of an Egg; ftrain it, and boil to the Confiftence of a Syrup.

This Syrup was fome time ago look'd on as a great Secret, but is now inferted in feveral Difpensatories, and esteem'd one of the beft of all the Syrups: For it gently evacuates bilious Humours by Stool, corroborates the Inteftines, ftops Dyfenteries and other Fluxes, and ftrengthens the Stomach.

The Dofe is from one to three Ounces. Three Spoonfuls, or an Ounce and a half, are generally taken in the Morning fafting for eight or nine Mornings.

SYRUPUS MORORUM SIMPLEX.

Simple Syrup of Mulberries.

Take of the Juice of Garden Mulberries, and of white Sugar, each two Pounds. Make into a Syrup in the following Manner. Bruife the Mulberries in a Marble Mortar, let them digeft cold for feven or eight Hours; then exprefs the Juice through a Linen Cloth, and mix it with an equal Weight of fine Sugar; after which boil to the Confiftence of a Syrup. This Preparation is in the Shops call'd *Diamorum cum Saccharo*.

It is good for Diforders of the Mouth and Throat, and an excellent Ingredient in Gargarifms. A Spoonful of it is fometimes taken with Succes againft Colds.

SYRUPUS MORORUM COMPOSITUS.

Compound Syrup of Mulberries.

Take of the Juice of Garden Mulberries, and of white Sugar, each two Pounds; of the Juice of unripe Grapes, fix Drams; of Myrrh and Saffron, each two Drams: Make into a Syrup in the following Manner. Boil the Juice of the Mulberries, the Juice of unripe Grapes, and the Sugar together. When the Syrup is half boil'd, put into it a fmall Bag with the Myrrh bruifed, and the Saffron. Boil to a due Confiftence, and when the Syrup

rup is cold, pour it into a Vessel, permitting the Bag still to remain in it.

This Syrup is good against the Quinsy, cures Ulcers of the Palate and Throat, is of a very deterfve Nature, and an excellent Ingredient in Gargarisms.

The Mulberries should not be entirely ripe, because they are then of a more deterfve Quality, than when arrived at perfect Maturity.

SYRUPUS PANCHYMAGOGUSSIVE CATHOLICUS VERNUS MEYSS.

The universal de-obstruent Syrup.

Take of the Roots of Asparagus, and recent Polipody, each two Ounces; of the Leaves of Mallows, Mercury, Monks Rhubarb, and Fumitory, each three Handfuls; of the Leaves of Lettices and Succory, each three Handfuls; of Bugloss and Borrage, each an Handful and an half; of Sorrel and Mint, of the Tops of Fennel, Thyme, and Hyssop, each one Handful; of the Tops of Rosemary, half an Handful; of the Leaves of Marigold, three Pugils; of pale Roses, thirty; and of the Leaves of Broom and Elder, each fifteen Pugils. Make into a Syrup in the following Manner. Cut and bruise all the Ingredients, put them into a glazed earthen Vessel, and pour upon them of the depurated Juices of Mercury, Fumitory, Pale Roses, and Succory, a sufficient Quantity. Boil to the Consumption of the half over a gentle Fire; so that after Expreffion, two Pints may remain; to which add two Pounds of Hony, then clarify the Mixture, and boil to the Consistence of a Syrup.

This Syrup is highly efficacious in removing all Obstructions, and purges effectually without producing Gripes. The Dose is from two to four Ounces.

SYRUPUS PLANTAGINIS.

Syrup of Plantain.

Take of recent Plantain Roots, four Ounces; of Plantain Seeds, one Ounce. Bruise and boil in two Pints of distilled Plantain Water, to the Consumption of about a third Part; and with the expreffed Liquor, mix of the Juice of Plantain two Pounds; and of white Sugar, two Pounds and a half: Clarify the Mixture with the White of an Egg, and boil to the Consistence of a Syrup.

This Syrup is proper to stop Fluxes, Hæmorrhages, and Gonorrhæas. The Dose is from half an Ounce to two Ounces.

This Syrup includes the Qualities of all the Parts of the Plantain, and is consequently the best that can possibly be prepared.

SYRUPUS RESUMPTIVUS, SIVE DE TESTUDINIBUS, MESUES.

Mesues Restorative Syrup.

Take of the Fleth of Wood Tortoises, one Pound, of River Crabs, eight Ounces; of clean Barley, Pulp of Dates, and Damascus Raisins, each two Ounces; of Jujubes and Sebestens, each twelve; of bruised Liquorice Root, one Ounce; of the Kernels of Pine and Pistachio Nuts, of the Flowers of Violets and Water Lilly, of the Seeds of the Cotton Bush, Melons, Cucumbers and Citrulls, each half an Ounce; of the Seeds of Lettuce and white Poppy, each two Drams. Boil in a sufficient Quantity of common Water, strain and exprefs. To the strained Liquor add three Pounds of Sugar. Clarify with the White of an Egg, and boil to the Consistence of a Syrup, which, when cold, is to be render'd of an aromatic Flavour, by an Elæosaccharum, prepared of

fix Drops of the distilled Oil of Anise, and about an Ounce of powder'd Sugar.

This celebrated Syrup is called Restorative, because it surprisingly recruits Persons wasted and extenuated by chronic Distempers. It is good against a Phthisis, is of a moistening Nature, and corrects the Acrimony of the Humours.

The Dose is from half an Ounce to an Ounce and an half.

This Syrup cannot be long preserved, on account of the Juices of the Fleth, which are soon corrupted, tho' boiled with Sugar; for which Reason it ought not to be prepared, till it is to be used.

SYRUPUS ROBORANS.

The corroborating Syrup.

Take of the best Rhubarb cut small, four Ounces; of bruised Myrtle Berries, and the exungulated Leaves of red Roses, each three Ounces; and of the Powder of white Tartar, one Dram.

Infuse all warm for twenty-four Hours in six Pints of Chalybeate Water. Then boil gently, strain and exprefs the Decoction; add four Pounds of Sugar; clarify the Mixture with the White of an Egg; and boil to the Consistence of a Syrup.

This Preparation corroborates the Stomach and the other Viscera, stops Fluxes and Hemorrhages.

The Dose is from half an Ounce to two Ounces. See CLARIFICATION.

SYRINCHIUM. See SISYRINCHIUM.

SYSSARCOSIS, συσσερωσις, from συν, and σαρξ, Fleth, is a Species of Articulation of the Bones by the Intervention of the Fleth; or, as *Monro* expresses it, when Muscles are stretched from one Bone to another. *Syffarcosis* is, also, a Method of curing Wounds, particularly those of the Head, where the Cranium is laid bare, and the Interstice between the Lips of the Wound too wide for a Contraction, by promoting a Growth of new Fleth, which they call a Granulation. *Paulus, Lib. 6. Cap. 63.* uses the Word to exprefs a preternatural Generation of Fleth about the Vessels and Coats of the Testes, whence proceeds a *Sarcocoele*.

SYSTASIS, συστασις, of συστήναι, to consist, Consistence. See CONSISTENTIA. In *Hippocrates* it signifies a Collection or Concretion. Thus, *Coat. 238.* συστασις ὑγρῶ περὶ τὴν ὑπερώην, "a Collection of Humor about the Palate." It is also used by the same Author, to exprefs a kind of Contraction of the Body, occasioned by some uneasy Sensation, as in *Lib. de Morb. Sacr.* ἢ τις πόνος ἢ σύστασις γίνηται τῷ ἀσθενείῳ, "if the Patient be affected with some Pain, or a *Systasis*, (a dolorific Contraction.)"

SYSTATHMOS, συσταθμός, from συν and σταθμός, a Weight, is expounded in *Galen's Exegeſis* by ἰσοσταθμός, equiponderous.

SYSTEMA, σύστημα, from συνίστημι, to consist, in 7 *Epid.* signifies the concrete Matter, or Sediment at the Bottom of the Urinal; tho' *Galen*, for σύστασις, reads σύστημα, (*Synagma*) as we find in his Comment on 6 *Epid. Sect. 3. Aph. 11.*

SYSTOLE, συστολή, from συτίλλω, to contract, a Contraction or Constriction; in Anatomy it is the Motion of the Heart and Arteries by Contraction, which is alternate and contrary to the *Diastole*. See *Cor.*

SYSTREMA, σύστημα ἢ ἐνστέμμα, from σύστροφμα, to be collected, hardened, condensed, or concreted; in *Hippocrates* signifies a Collection of Humors, hardened Concretions, Tubercles, and Tumors. Thus in the following Passage, 2 *Prorrh.* ἐνστέμματα συνήπτεσθαι μὲν ἥτοι ἐν τῷ ἰσχίῳ, "you are to examine whether there be any Concretions of Matter in the Ischium." ἐνστέμματα signifies the same as συστροφμα, (*Systrophæ*) which *Galen* expounds by φημίαι καὶ συνήπτεσθαι, "Tubercles and Hardnesses," or hard Collections and Concretions of Humors, by *Celsus* called *Humoris Coitus*. And to give but one more Instance, 7 *Epid.* we read καὶ ἐν τῷ ἐνστέμματι ἀνώδυνος, "near the Spleen was an indolent Hardness."

SYSTROPHE, συστροφή, is of the same Original and Signification with the preceding Word; which see.

T.

T. For the Signification of this Letter in the Chymical Alphabet. See ALPHABETUM CHYMICUM.
TABACUM. Tobacco. See NICOTIANA.
TABASIR. The Arabic Word for *Spodium*.

TABANUS, TABE, or ASILUS. The Gad-fly. This is a kind of an oblong, slender blackish Fly, with a Trunk of the Figure of a small Hunting-horn, and sharp-pointed, with which it pricks or stings Asses, Horses, and other Beasts, in order to extract their Blood, with which it is nourished; it has six black Feet, and flies about Roads, Forests, and Woods. There is another Species of greenish *Tabanus*, which is called *Tabanides*.

These kinds of Flies are resolute, and proper to make the Hair grow, being bruised, or pulveriz'd, and applied to the Head. *Lemery des Drogues*.

TABARZET. An Epithet for double-refin'd Sugar.

TABELLA. A Lozenge.

TABERNÆMONTANA. The Characters are;

It hath a tubulous Flower, consisting of one Leaf, which is spread open toward the Top, and divided into several Parts; from the Bottom of the Flower arises the Pointal, which afterwards becomes the Fruit, composed of two Capsules, which open lengthways, and are filled with oblong Seeds, surrounded with a thin Pulp.

Miller mentions two Species;

1. *Tabernæmontana lactescens, citrii foliis undulatis.* *Plum.* *Nov. Gen.* Milky *Tabernæmontana*, with a waved Citron-leaf.

2. *Tabernæmontana lactescens, Lauri folio, flore albo, siliquis rotundioribus.* *Hoult.* Milky *Tabernæmontana*, with a Bay-leaf, a white Flower, and rounder Pods.

The first of these Sorts is common in the Island of *Jamaica*, and in several other Places in the warm Parts of *America*, where it rises to the Height of fifteen or sixteen Feet, having a smooth strait Trunk, covered with a whitish Bark; at the Top of the Trunk come out the Branches, which are irregular, and beset with shining green Leaves; from the Foot-stalks of these Leaves are produced the Flowers, which are yellow, and extremely sweet-scented; these Flowers are succeeded by two forked Pods, in which the Seeds are contained. This Genus of Plants is nearly related to the *Nerium* or *Oleander*, and has been, by some botanical Writers, ranged under that Head; but the Seeds of this Genus have no Down adhering to them, as have those of the *Oleander*, being included in a soft, pulpy Substance. *Father Plumier* has constituted this Genus, in Honour of *Dr. James Theodore*, who was called *Tabernæmontanus*, from a Village in *Germany*, where he was born. He was one of the most knowing Botanists of his Age, and published, at *Frankfort*, a Folio in a long Form, in the Year 1590, in which are the Figures of two thousand two hundred and fifty Plants.

The second Sort was discovered at *La Vera Cruz*, by the late *Dr. William Houstoun*, who sent the Seeds into *England*, from whence several of the Plants have been raised. *Miller's Dictionary*.

TABES DORSALIS.

Hippocrates, in *Lib. 2. de Morbis*, mentions this Disorder in the following manner. "The *Tabes Dorsalis* arises from a Disorder of the Spinal Marrow, and is principally incident to Persons of a salacious Disposition, or such as are newly married. The Patients are free from a Fever, eat and digest well. The Person, labouring under this Disorder, when interrogated with respect to his State, affirms, that he perceives, as it were, Ants falling from the superior Parts of his Body, his Head, for Instance, into the Spine of the Back; and, when he discharges his Urine or Excrements, there is, at the same time, a copious Evacuation of liquid Semen, in consequence of which he is incapable of propagating his Species, answering the Purposes of Marriage, or being amus'd with Venereal Dreams; he is generally short-breath'd, and weak; especially after running, or walking up a steep Place; he perceives a Sense of Weight in his Head, and is afflicted with a ringing of his Ears. The Patient is, in Process of Time, seiz'd with various Species of violent Fevers, and at last dies of that kind of Fever call'd *Lippiria*."

According to *Salvus Diversus*, *Hippocrates* constitutes four different Kinds of *Tabes Dorsalis*: The first of which proceeds from excessive Venery, the second from a too copious Influx of the Blood into the Spinal Marrow; the third from a Driness of the Spinal Marrow; and the fourth from a Defluxion of peccant Humours upon it.

As for the first Species; in *Lib. 6. Epidem. Sect. 8. Text. 52.* we have an Instance of it, in the Case of *Grypalopax*, a Man

of twenty-five Years of Age; who not only discharg'd his Semen during Sleep, but, also, frequently in the Day-time; but, when this Patient was in the thirtieth Year of his Age, he died of a Consumption.

Hippocrates, as is obvious from his Books *de Aere, Aquis, & Locis*, & *de Genitura & Natura Pueri*, asserts that the Cause of this Disorder is, that the Semen is convey'd from the Brain, through the Spinal Marrow, to the Genitals. But, without any Dispute with respect to the Justness of this Doctrine, we can from Experience affirm, that the whole Body is wasted, and the Brain, together with the Spinal Marrow, which is only, as it were, an Elongation of it, considerably injur'd by an excessive Discharge of the Semen. Hence the Patient is render'd so weak, that a Difficulty of breathing is produc'd by any violent Exercise, such as running or walking up a steep Place. Tho', in the Beginning, this Disorder is not accompanied with a Fever, yet in Process of Time, when the vital Powers are weaken'd, a putrid Fever is brought on, which is generally of the malignant Kind, and in which the internal Parts are burnt with Heat, whilst the external Parts are excessively cold. In this Case, after the Use of universal Remedies, *Hippocrates* orders Asses Milk, and then that of Cows, for forty Days; after which he feeds the Patient with soft Aliments.

The second Species of *Tabes Dorsalis* is, when the Heat of the Spinal Marrow is impair'd, and almost extinguish'd, by a superfluous Quantity of Blood.

The third Species of *Tabes Dorsalis* is, when the Spinal Marrow becomes dry, in consequence of an Obstruction of the Vessels, thro' which the Nourishment is convey'd to it.

The fourth Species of *Tabes Dorsalis* is, when there is a Defluxion of peccant Humours upon the Spinal Marrow; an Instance of which is found in *Gulielmus Fabricius, Cent. 1. Obs. 45.*

Baldwinus Rossius in *Tract. de Scorbut. Epist. 4.* speaks of the *Tabes Dorsalis* in the following manner. "The Disease which the Greeks call *ἀσθμα*, and the Latins *Lumbago*, is familiar, and almost epidemical, to the *Hollanders*, both on account of their Aliments, and the moist and cloudy Nature of their Country; tho', in other Parts, it, also, seizes those who use immoderate Venery; for, as we are inform'd by *Hippocrates* in *Lib. 2. de Morb.* it is principally incident to married Persons, and those addicted to Venery: Whilst a large Quantity of liquid Semen is discharg'd, the Conception does not remain in the Uterus of Women, and in Men there is a copious Discharge of Semen during Sleep, whether they lie with their Wives, or not. But, in my Opinion, this Species of *Tabes Dorsalis* is not much to be dreaded, since 'tis probable, that the Disorder draws its Origin from a pituitous Matter, or Flatulencies, or a melancholic Humour, mixed with the Blood, and falling from the Head, thro' the Vessels, by way of Catarrh, upon the Spinal Marrow. For since, according to *Hippocrates*, in his Book *de Glandulis*, there are seven Kinds of Defluxions, by means of which the Brain generally frees itself from what is offensive to it, that is, by the Nostrils, the Ears, the Eyes, the Palate, and the others, thro' the Vessels, into the Spinal Marrow and Blood, 'tis necessary, the Part in which the Defluxion is, should be variously affected, according to the Quantity and Quality of the peccant Matter; for, if the excrementitious Sordes, falling from the Brain to any other Part, are but small in Quantity, and not absolutely malignant, the Disorder, and its concomitant Pain may be easily surmounted and discuss'd by Nature; but if the excrementitious Matter is peccant both in Quantity and Quality, it lays a Foundation for very terrible Symptoms. But because, omitting fix Species of these Defluxions, we only treat of that which comes from the Head, thro' the Vessels, to the Spinal Marrow, 'tis to be observ'd, that where there is a Defluxion of cold and tough Humours upon the Spine, these Humours first seize and affect the adjacent Parts, which, unless they are strong enough to subdue and dissipate the received Matter, forthwith transmit it to the subjacent, and especially the most contiguous Parts; and, as this Matter distends the whole nervous System, so it affects the whole Body with violent Pains, beginning at the Scapulae, and gradually proceeding to the Loins, and sometimes to the Os Coccydicis. The Patient afflicted with this Disorder, which is properly the *ἀσθμα* of the Greeks, and the *Lumbago* of the Latins, can hardly walk or move from one Place to another. But if, with the Moderns, we rather chuse to call it *Gutta*, because the Humours drop, as it were, from the Brain, we are more in the right, than those who apply the word *Gutta* to

"all Disorders of the Joints. The *Tabes Dorsalis* has this Circumstance in common with a Quartan Fever, that it seizes at all Seasons of the Year, tho' 'tis shorter in the Summer, longer in the Autumn, and longest of all in Winter. If an acrid and tenacious Humour falls with an Impetus from the Brain, it produces a Defluxion, not only on the Spinal Marrow, but also, on the *Acerabula* of the *Os Coccenicis*, and at last a *Tabes Dorsalis*, or a *Tabes Ossis Sacri*, as *Hippocrates* calls it, a Disorder, in which Death proves the only Blessing; because the Pain is continually more and more increased; for, as *Hippocrates*, in *Lib. de Glandulis*, informs us, this Disorder arises from a Defluxion from the Head, thro' the Vessels, upon the Spinal Marrow; after which it affects the *Os Sacrum*, to which the Marrow itself promotes a Defluxion, which is deposited on the *Acetabula* or Junctures of the Hips; and, if it produces a *Tabes*, the Patient is wasted and reduc'd to a State so miserable, that he is no longer fond of Life; for the *Scapulæ*, and both Legs, become painful; and the Patient dies at last, after long, but fruitless Attempts for a Cure. Such Patients have, also, this in common with other consumptive Persons, that the Autumn is generally most fatal to them, whereas the Spring is the most commodious Season for taking Medicines: Besides, the Driness and Ex-cenuation of the Spinal Marrow is owing to an Obstruction of the Vessels, which convey the Blood and Spirits from the Brain to the Spinal Marrow; for which Reason the Method of Cure consists in opening the Obstructions of the Vessels, and evacuating the peccant Matter. But, if the Patient is plethoric, the Humerary Vein of the Right Arm, or the Median Vein of the Left, or, if Necessary requires, the *Saphena*, is to be previously open'd; and, if the hæmorrhoidal Veins are tumid, 'tis expedient to open them, either by the Application of Leeches, or in any other manner; for, as we have before observed, the Cause of a Lumbago is generally a melancholic Humour, which, tho' apparently thicker, than that it should seem to be, commodiously transmitted to the Spine, yet certainly is so, since we daily observe, that Persons labouring under Disorders of the Spleen easily fall into a Lumbago: And *Galen*, in *Comment. 3. in Lib. 1. Protrhet. Hippocrat.* confirms this Doctrine, whilst he says, that in Pains of the Loins we are to expect an Evacuation from the hæmorrhoidal Veins, because such Pains are frequently produc'd by a Retention of the Hæmorrhoids; especially in Persons of melancholic Constitutions, or when the Remains of the Disease convey'd to these Veins cannot be discharg'd.

"After Venesection, such Decoctions as render the peccant Matter fluid, are to be us'd, and then Purgatives according to the peccant Matter; beginning with such as are mild, and always remembering, that the Head is a Part primarily affected. Then, if Necessary requires it, we are to use stronger Purgatives; for which Purpose *Hippocrates* greatly recommends his *Elaterium*. But I should rather approve of small Pills of Agaric, macerated in a due Quantity of Turpeth, and exhibited in a Decoction of Sena-leaves, with the Addition of a few Fennel-seeds, or in any other Decoction, as the Condition of the Patient shall require: After Purging 'tis expedient to use Fomentations, Frictions, and Unctions, both in order to eliminate the peccant Matter, mitigate the Pain, and corroborate the Parts affected. For the same Purpose, if Time, Place, and the Custom of the Patient, admit, Baths of sweet Water are to be us'd; or artificial Baths prepared of Vervain, Roses, Sage, Fennel-herb-frankincense, Chamomile, and Melilot. If the Patient's Body is not sufficiently soluble, *Hippocrates* orders that Effect to be produc'd by a Clyster; but when the Humour is viscid, deep-impacted, or of a stautent Quality, we are not only to use these Measures, but, also, apply Cupping-glasses, in order to attract the Matter; carefully observing that the Matter be not too copious to be evacuated by their means; for otherwise there is Danger of supplying a new Fomes to the Disease: An inciding, attenuating, and not absolutely weak Diet is to be us'd. This Disorder, like others of the articular Kind, is protracted till the twentieth, generally the fortieth Year, and sometimes beyond that Period. Let the Drink be small Wine, or Ale well boil'd. The Sleep ought to be temperate, and sufficient for the Concoction of the Aliments; for too much Sleep renders the Brain subject to Catarrhs. The Exercise ought to be moderate, and proportion'd to the Strength; but never so violent, as to create Fatigue." *Sennert. Vol. 2.*

This is a violent Disorder, little treated of by Physicians, tho' fully describ'd by *Hippocrates*, and frequently observ'd by me in the Course of my Practice. The Head of the Patient is affected with a violent and acute Pain, after which, in some Patients, as it were, Ants seem to descend from the superior Parts. The Neck and Loins, together with their Muscles, and the Articulations of the Legs, are so painful, that they cannot sometimes be bended. The Patient is costive, and the Urine with Difficulty discharg'd. But when he either goes to Stool,

or discharges his Urine, a large Quantity of liquid Semen is evacuated; which, also, happens during Sleep, when the Person lies with a Woman, or not. In Women the Conception, is not retain'd in the Uterus; by hard walking, especially up steep Places, the Body is greatly weaken'd, the Breathing becomes difficult, the Head is afflicted with a Sense of Weight, and a Ringing of the Ears is produc'd. The Patient labouring under a *Tabes Dorsalis* is free from a Fever; and, tho' he is not afflicted with the Loathing of his Food, yet he reaps no Advantage from it; but is totally consum'd. In the Beginning of the Disease, the Patient is pretty quiet and easy; but, as the Disorder proceeds, all the Symptoms are increas'd, the Legs swell, as in dropical Cases; in some, Ulcers arise on the Loins, some of which are heal'd, whilst others rise in their stead. At last, a violent Cataract arising, the Patient is render'd totally blind. This Disorder is principally incident to new-married Persons, and those who indulge themselves in excessive Venery. A *Tabes Dorsalis* has, also, by some been observ'd to intermit, and again to recur. This is observ'd to have happen'd to many Persons, by a Physician, whose own Fate I knew it to be, and who was render'd blind by the Disorder, after an Intermission for seven Years. *Lommius Medicinal. Observat.* See GONORRHOEA and FLUOR ALBUS.

OF A CONSUMPTION, FROM A GONORRHOEA, AND FLUOR ALBUS.

This Consumption seems to have been known, even to the Antients, under the Name of a *Tabes Dorsalis*, when it proceeds from a Gonorrhœa. *Galen*, also, gives the History of the Wife of *Boethius*, a certain Nobleman of Rome, who fell into a consumptive Dropsy, from the empirical Suppression of a Fluor Albus, that had flow'd in too great a Quantity, and a long time.

It is very true indeed, that a Gonorrhœa, and a Fluor Albus, that are of an ill Nature, and Venereal, (when the Impurity proceeding from that Venom has once infected the Humours) often terminate in a Consumption of the Lungs, unless they are perfectly and timely cured. I affirm, from a long Experience and Observation, that a Consumption often arises from a simple or benign Gonorrhœa, and Fluor Albus; and, therefore, this Sort, arising from the continual Subtraction of the nutritious Juice by the Seminal Glands, must be reckoned under the Head of an originary Consumption: For in a Gonorrhœa, and Fluor Albus, sometimes the Flux is so extraordinary, and continues so long, that the Mass is thereby plainly despirited, and render'd unfit for Nourishment: Whereupon the Blood, being loaded with heterogeneous and disagreeable Particles, grows hot; and at length an hectic Disposition is, by degrees, brought upon the solid Parts, and the Habit of the Body; which is the same Sort of Consumption, that we are now treating of.

The Symptoms which preface this Consumption, I have, for the most part, observ'd to be these: An hypochondriacal Oppression, Melancholy, and too much Thoughtfulness, with a Decay of Strength, and Loss of Appetite, in Men that are affected with a plentiful Gonorrhœa: But in Women, that have been long afflicted with a Fluor Albus, flowing in a great Quantity, a soft and bloated Habit of the Body, a squalid and pale Countenance, together with hysterical Fits, a remarkable Weariness, and Decay of Strength; all which Symptoms proceed from the same Cause, as from the poor despirited Nature of the Blood, caused by a want of new Chyle, whereby not only the Spirits are weakened and oppress'd, but, also, the Habit of the Body is render'd cedematous from the waterish Disposition of the Blood, as it is full of old and despirited Chyle. And, therefore, the Signs which preface this Consumption, are, hypochondriacal Oppressions, hysterical Affections, a Decay and Want of Strength, a bloated Habit of the Body, and a Want of Appetite: Which Symptoms, in Progress of Time, that is, when the Distemper comes to be confirm'd, are followed, also, by some others, as a Thirst, an hectic Disposition, Atrophy, and Wasting of the Flesh, till, at length, the Body is brought to the highest Degree of a Consumption; and that, very often, without any Cough, or any other remarkable Sign of a Consumption of the Lungs.

This Distemper is easily cured, if the antecedent Cause of it can be removed, that is, if the Gonorrhœa and Fluor Albus can be cured. But, when it comes once to be confirm'd, it is evidently incurable.

If a Physician be sent for in time, he ought to do all he can, by all proper Means, and a convenient Method, to stop the Gonorrhœa, or Fluor Albus, which are the Cause of this Consumption. This Efflux of the nutritious Juice being once stop'd by Art, we must endeavour, with all our Power, to replenish the despirited and impoverished Blood, as soon as may be, with new, oily, and benign Chyle; and, therefore, such Food as is delicious, and affords a good Juice, and is most grateful to a Patient's Palate and Stomach, must be given often in a Day, though in a little Quantity at a time. And, that this Appetite may be the more excited, let him be advis'd to be cheerful: For there is nothing that destroys the Appetite, and confirms a Consumption, more

more than Grief and Sadness. Let him, also, enjoy the Advantage of an open and benign Air, which is very beneficial to the Nerves, and, consequently, to the Appetite and Stomach: Let him, also, use Exercise every Day, and rubbing of his Body, even to the procuring of moderate Sweats, (if his Strength will bear it) that the Load of old, despirited, and unprofitable Chyle, with which the Blood-vessels, and Habit of the Body, are stuff'd, may be sweated out, to make more room for new and useful Chyle, and, consequently, for the Improvement of the Appetite in the Stomach: But he must religiously abstain from the liberal Use of Wine, and spirituous Liquors, which are subject to put the Blood, which is before become too hot, into a greater Flame. Let the Physician, also, take heed he does not prescribe any Purges, or any Medicine whatsoever, to procure any other considerable Evacuation, which may create farther Expences to Nature, when she is already weak: But if an hectic Heat, even in the least Degree, be kindled in the solid Parts, he must presently endeavour, with all his Industry, to quench this Flame by the Use of Asses Milk, a Milk Diet, and of such mineral Waters as are chalybeate. *Morton's Phthisiologia, Cap. 4.*

TABULA. A Lozenge.

TABULATUM. The same as **TABULA.**

TABUM. Gore; a thin, sanious, and putrid Humour, flowing from malignant Ulcers, or mortify'd Parts, when the vital Powers are insufficient to form good Pus, or Matter.

TACAMAHACA. Offic. C. B. P. 503. Park. Theat. 1608. Raii Hist. 2. 1846. *Tacamahaca Populo similis, fructu colore Peonia simili.* J. B. 1. 346. *Tacamahaca foliis crenatis, Sadelbouts Lignum ad ephippia conficiendum aptum.* Parad. Bat. Prod. 379. *Tecomahaca.* Hern. 55: **TACAMAHAC-TREE.**

Tacamahac flows from a large Tree as big as a Poplar, bearing Leaves like those of a Rose-tree, crenated about the Edges, consisting of sometimes five on a Stalk; the Flowers are small, growing in Clusters, of a white Colour, which are followed by triangular Seed. It grows in the *Spanish West-Indies*; there are two Sorts of Gum, one in Lumps, which is dry and resinous, crumbling at first between the Teeth, but, when chewed awhile, sticking together, made up of little yellow-redish Grains, clinging together, of a pleasant strong Smell, somewhat like Mastich; the other Sort is called *Tacamahac* in the Shell, being of one Texture, smooth, and in Colour like strained Galbanum, but lighter, of a pleasant Smell like the former.

Tacamahac is heating and drying, dissolving and ripening, though it is seldom used inwardly; it is good for the Head and Nerves, and is sometimes applied to the Temples for the Head-ach; is frequently mixed with *Galbanum*, and is applied to the Navel in Disorders of the Womb. *Miller's Bot. Off.*

This is a resinous Substance, of which there are two Kinds, one in Shells, and one in Lumps. The first is most esteemed, and is sometimes named *Tacamahaca Sublimis*. It is of a very agreeable Smell, like that of Lavender and Angelica; and is brought from *Madagascar* and *New Spain*, being the Product of a Tree named *Tacamahaca Populo similis fructu et colore Peonia*. J. B. *Tecomahaca.* *Hernand.* It is used externally in the same Intentions with the Gum Caranna, and likewise resolves Tumors, strengthens the Nerves, and cures the Head-ach, when applied in a Plaister to the Scalp. *Geoffroy.*

It is very much used by the *Indians*, in all sorts of Distempers, especially in Tumors of all kinds; for it is highly dissolvent, maturating, and discussing; it, also, removes all Pains from cold and flatulent Humors; thrown upon the Coals, or held to the Nostrils, it gives immediate Relief in Hysterics. A Plaister of it, applied to the Navel, retains the Uterus in its Place, as is known by common Experience; the more delicate sort mix it with Amber and Musk; spread upon Linen, and apply'd behind one or both Ears, or the Fumes of it attracted, it represses all manner of Defluxions from the Head. Apply'd to the Temples by way of Cerate, it restrains all sorts of Rheums or Defluxions upon the Eyes, or other Parts of the Face; and, put into an hollow parrot Tooth, it eases the Pain thereof.

A Plaister prepared of *Tacamahac*, with a third Part of *Styrax*, and a small Quantity of Amber, is an excellent Topic for the Stomach; for it strengthens that Part, provokes an Appetite, helps Concoction; and discusses Flatulencies; apply'd to the Head, it strengthens the Brain. It is of great Efficacy in the Sciatica, and all Diseases proceeding from cold or mix'd Humors. Being apply'd alone to Wounds of the Joints or Nerves, it cures them effectually; for it causes an immediate Suppuration, and prevents Spasms. I, says *Monardes*, mix it with a third Part of Wax, for the more convenient spreading. Thus far *Monardes*; to which we may add, that a Plaister of *Tacamahac*, apply'd to the Belly, is said to mitigate the Head-ach; it is, also, effectual in discussing Tumors and Hardnesses of the Spleen. *Raii Hist. Plant.*

TACEROS, *ταχερος*, imports colligated; or lean and thin, from too great a Colligation. *Moschion.*

TACHY, **TACHEOS**, *ταχύ, ταχίος*. Besides its common Signification, importing Speed and Celerity, it is sometimes used

instead of *ταχύς*, often, frequently, with quick Repetitions. Thus *Lib. de R. V. I. A. επασιλίσσις ταχέαις* are frequently or quickly repeated Perfusions; where *Galen* on the Place says, that the Antients confounded the Use of those two Words *ταχέαις* [*pycnos*] and *ταχύς* [*tachys*]; and that sometimes frequent Actions [*ταχύναι ἐπὶ ταχέαις*] are called quick [*ταχέαις*] Actions.

TACTUS. The Touch, in Midwifery, is the Exploration of the State of the *Vagina*, and Uterus, and of the Situation of the Fœtus, and whatever else is contain'd therein. *Hippocrates*, in his Treatises concerning the Diseases of Women, has been very full and exact in his Directions upon this Subject. See **OASTETRICATION**.

But *Tactus* is the Sense of Touch, in the common Acceptation of the Word. Now, in order to account for this, it must be observ'd, that soft, pulposus, medullary, nervous, and pyramidal Papillæ arise from hard subcutaneous Nerves, which, however, become soft, when stript of their exterior Membrane: Hence these Papillæ are highly sensible; they are, also, moisten'd by the perpetual Afflux of a very fine Liquor, and defended with a very slender, but solid Epidermis; and, that their Sensibility may be the better preserv'd, they lie conceal'd in Sinuses and Depressions under the Cuticula or Scarf-skin. In the Parts most immediately destined to the Purposes of Touch, such as the Tongue, the Points of the Fingers and Toes, they are contractile, and capable of being sent out again. These Papillæ are the corporeal Organ or Instrument, by the Mediation or Intervention of which, Objects handled are said to be touch'd.

'Tis remarkable, that tho', in the Surface of other Parts of the Body, these Papillæ are perpendicular, yet in the Fingers and Toes they run out longitudinally. Hence acquiring an Epidermis in these Parts, being wrapt up, as it were, in a Sheath, and depriv'd of Juice, they are condens'd into Nails, which are render'd thick by the Accession of the consolidated cutaneous Vessels, and are fit for defending the Papillæ, and preventing their Callosity.

The Sensation of Touch is, therefore, produc'd, when, applying the Point of the Finger to any Object, these Papillæ are, by the Determination of the Mind, emitted, and gently rub'd on its Surface; for by this means a certain Motion is impress'd on these Papillæ, the Effect of which, being convey'd to the Common Sensory, excites in the Mind the various Ideas of hot and cold, moist and dry, soft and hard, smooth and rough, as, also, of Figure, Motion, Rest, Distance, Titillation, Itching and Pain.

Hence we understand, why, when the Epidermis is remov'd, macerated, wash'd off, or burn'd, a Sense of Pain is excited by touching any Object: Why, when the Epidermis is thick, hard, callous, or spoil'd with a Cicatrix, the Sense of Touch is lost: What is the Cause of that disagreeable Motion excited by a Tremor, or by the Cramp-fish, and which gradually degenerates into a Stupor: Why the internal Surface of the Nails is affixed to the subjacent Skin, and at their Roots so intense a Pain is produc'd by the Application of any Object. Hence, also, we understand why the Sense of Touch is most intense and acute, where the Nails, and spiral Lines, or small Furrows, of the Epidermis are found. *Boerhaave Institut.*

TÆDÆ. See **DAIS**. Certain Pharmaceutical Compositions, intended for Suffumigations, or Pessaries, and made in the Shape of Torches, are, also, thus call'd.

TÆNLÆ. Flat-worms. See **VERMES**. Many sorts of flat Fish, of the Sole-kind, are also call'd **TÆNLÆ**.

TAGENITIS, *ταγηνίτις*, or **TEGANITIS**, *τηγανίτις*. A kind of Pancake made of Oil and Wheat-meal only.

TAGERA. *H. M. Sena spuria Malabarica* is a Plant of the *East Indies*, growing in sandy Places to the Height of three or four Feet. The Root is fibrous, woody, and blackish; the Stalks round, woody, and green: The Leaves stand on short Pedicles in two Series, by Pairs, and are of a roundish, oblong and broad Figure, with a round Edge on the fore Part, and striated towards the Pedicle, smooth, and of a dull Green; and the Flowers, in Shape and Colour, resemble those of the *Sopbera*.

The Leaves, bruised, cure the Stings of Bees, being rubbed on the Part affected. The Seeds, bruised, and mixed with Saffron, are effectual for Pustules and Ulcers; and, with the Juice of the Plant *Vetla-caitu*, heal a Paronychia. *Raii Hist. Plant.*

Wellia **TAGERA.** See **WELLIA**.

TAGETES, *African* or *French* Marigold.

The Characters are,

The Root is fibrous and annual; the Leaves resemble those of Tansey; are ferid, and cut home to the Rib; the Calyx is monophyllous and tubulated. The Beards of the Flowers are plain or fistulous, and the Seed is angulated, and furnished with a foliated Head.

Boerhaave mentions ten sorts of *Tagetes*; which are,

1. *Tagetes, maximus; rectus, flore simplici, ex luteo pallido;* J. B. 3. 160. *Tanacetum, Africanum, majus, simplici flore, pallente.* C. B. P. 133. *Caryophylli Hispanici diffi, vel Caryophylli Mexicani Planta.* *Hernand.* 154. *Chrysanthemum Africanum, erectum, Tanaceti folio, flore simplici majore.* M. H. 3. 16.

2. *Tagetes*; *maximus*; *rectus*; *flore maximo*, *multiplicato*.
 J. B. 3. 100. *Tanacetum*, *sive flos Africanus*, *major*, *flore pleno*, *aureo*. C. B. P. 132. *Chrysanthemum*, *Africanum*, *erectum*, *Tanacetii folio*, *flore pleno majore*. M. H. 3. 16. *Caryophyllus*, *Mexicanus*, *primus*. Col. 2. 47. *Cempoal xochitl*, *vel Giubna xochitl*. *Tzneyepobual*. *Caryophyllus Mexicanus*. J. Hernand. 154.

3. *Tagetes*; *Indicus*; *medius*; *flore simplici*, *luteo pallido*.
 J. B. 3. 99. *Oquichitli*, *Cotaxochitl*, *Caryophyllus Mexicanus*, II. Hernand. 155.

4. *Tagetes*; *Indicus*; *medius*; *flore luteo*, *multiplicato*.
 H. L. 587. *Tlapalte*, *Cacayatl*, *Caryophyllus Mexicanus*, III. Hernand. 155.

5. *Tagetes*; *Indicus*; *minor*; *simplici flore*; *five Caryophyllus*, *Indicus*; *five flos Africanus*. See AFRICANUS FLOS.

6. *Tagetes*; *Indicus*; *minor*; *multiplicato flore*. J. B. 3. 99. *Macuil xochitl*, *feu Maon*, *Caryophyllus Mexicanus*, IV. Hernand. 155.

7. *Tagetes*; *Indicus*; *flore simplici*, *fistuloso*. H. L. 588. *Chrysanthemum Africanum*, *erectum Tanacetii folio*, *petalis florum fistulosis*, *flore simplici*. M. H. 3. 16. *Caryophyllus Mexicanus*, *flore fistuloso*, *simplex*. Col. 2. 46. *Tanacetum*, *sive flos Mexicanus*, *flore fistuloso*, *simplici*. C. B. P. 133.

8. *Tagetes*; *Indicus*; *flore fistuloso*, *duplicato*. H. L. 588. *Caryophyllus Mexicanus*, *flore fistuloso*, *alter Polyanthos*. Col. 2. 46. *Tanacetum sive flos Mexicanus*, *flore fistuloso pleno*. C. B. P. 133. *Chrysanthemum Africanum*, *erectum*, *folio Tanacetii*, *petalis florum fistulosis*, *flore pleno*. M. H. 3. 16.

9. *Tagetes*; *Indicus*; *flore aureo*, *simplici*, *minor*. *Caryophyllus*, *Indicus*, *flore aureo*, *simplici*, *minor*. H. Æyst. Æst. o. 14. T. 1. F. 3.

10. *Tagetes*; *Indicus*; *minimus*; *flore sericeâ hirsutie obfita*.
 H. L. 587. *Tanacetum Africanum*, *minimum*, *sericea hirsutie obfita*. C. B. P. 133. *Tlapalcacatl*, *Coaxochitl*, *Caryophyllus Mexicanus*, V. Hernand. 156. *Caryophylli Hispani dicti varietas septima & octava*. Col. 2. 47. *Descr. Boerb. Ind. alt. Plant. Vol. 1.*

The *Tagetes* was first brought not out of India, but from Catalonia. The first eight Species are commended by some as very salutary Herbs, and are said to have an attenuating and aperitive Virtue. The expressed Juice of the Leaves, mixed with Wine, is recommended for a cold Stomach, and Obstructions of the Menfes, and for an intermittent Fever, a Cachexy and Dropsy; others, on the contrary, say, they are poisonous Plants. In Mauritania (Barbary) the *Tagetes* is a very good Plant against many Distempers; but Boerhaave often observes, the same Plant may be poisonous in one Country, and salutary in another. It is certain, however, that the ninth and tenth Species are mortal, if eaten; for, if Children happen only to hold the Flowers, which are, indeed, beautiful, in their Mouths, an Inflammation is excited therein, which, if communicated to the Stomach, proves mortal. For this Reason, tho' many things are said of the Virtues of the former Species, we suspend our Assent; and, indeed, there is so great a Copiousness and Variety in Botany, that we may very well be without the Use of this Plant, which Dodonæus asserts, and proves by a Multitude of Experiments, to be poisonous. *Hist. Plant. adscript. Boerhaav.*

TAL. The Dung of Peacocks; or *Alcali*. *Rulandus*.

TALAGAS. See PALMA.

TALC. Boil'd Wine. *Rulandus*.

TALCUM. Offic. Boet. 394. Geoff. Prælect. 67. Schrod. 357. De Laet. 128. Aldrov. 685. *Talcum*, *alias stella Terra*. Charit. Foff. 24. Worm. 57. *Talcus fossilis*. Calc. Mus. 458. *Stella Terra quibusdam*. TALC.

Talc is a shining, fissile Stone, easily divisible into very thin pellucid Laminæ, a little flexible. In the Fire it does not melt, is not calcined, nor does it lose its Colour. Some Talc is of a Silver Colour, called by the Chymists *Argyrolithos*; some yellow, called solar Talc; some greenish, and some black. That which is brought from Venice is reputed the best, and is of a light-green Colour. This Stone is seldom used in Physic; but is very much in Vogue as a Cosmetic, the Ladies being of Opinion that it cleanses and whitens the Skin.

It is, first of all, prepared by being reduced to an impalpable Powder; which can be done no way so readily, as by heating it red-hot several times in the Fire, and as often quenching it in cold Water; for, by this means, it may easily be levigated on a Porphyry-stone, to any Degree of Fineness, the Powder being of a shining Silver Colour, and very smooth to the Touch. Of this Powder the Women make Ointments, or Pomatums, which they use as a Wash. Some Chymists have endeavoured, by the Oil of Talc, to fix Quicksilver, and afterwards convert it into Silver; but they never considered, that what they called Oil of Talc was entirely the Product of the other Substances mixed with it. *Geoffroy.*

TALENTUM. A Talent, the greatest Weight among the Greeks. See PONDUS. It was equal to fifty-six Pounds, eleven Ounces, seventeen Grains, and $\frac{1}{2}$ Troy Weight.

TALIIR KARA. H. M. *Arbor Indica*, *spinosa*, *flore & fructu vidua*.

This is a tall Tree, with a thick whitish Trunk, and a dusky Ash-colour'd smooth Bark, and furnished with a Multitude of small Branches, which extend themselves to a wide Compass, and are arm'd with oblong, hard, and rigid Spines. The Root is whitish, cover'd with a dusky Bark, of a strong Smell; and an astringent Taste. The Leaves are green above, and greenish underneath, of an oblong Round, acuminate, slightly crenated in the Edges, thick, dense, shining, of a strong Smell, and of a rough and astringent Taste; but the tender Leaves, which come forth from the Top, are, for the most part, of a purple-red Colour. The Tree was never observ'd to bear either Flowers or Fruit; it grows in Malabar, is an Evergreen, and lives a long time.

Of the Root, boiled in Water, they prepare a Drink, which potently evacuates acid and salt Humours by Diaphoresis; and, of the Leaves fry'd in Oil with green Turmeric, they prepare a Liniment, which is much commended for removing the Scabies.

TALPA. Offic. Schrod. 5. 308. Mer. Pin. 168. Schw. Quad. 128. Aldrov. de Quad. digit. 451. Charit. Exer. 25. Gefn. de Quad. Digit. 931. Jonf. de Quad. 118. Raii Synop. A. 236. THE MOLE.

It lies in Burrows under the Earth; and the Animal itself, the Heart, and the Blood, are used in Medicine. The Ashes of the burnt Mole is good for the Leprosy, strumous Swellings, and Fistulas. Taken inwardly in Beer or Wine, it cures the wandering Gout and Scrophula. The Heart cures an Hernia, and the recent Blood cures an Alopecia, being rubbed on the Part. *Dale from Schröder.*

TALPA is, also, a Species of Tumor affecting the Head, of the atheromatous Kind. It is, according to *Blancard*, call'd sometimes TALPARIA.

TALUS. The same as ASTRAGALUS. The Ankle-bone. *Dioscorides*, L. 2. C. 62. recommends this Bone in a Swine, calcin'd, powder'd, and taken internally, for Inflammations of the Colon, and chronical griping Pains.

TAMANDUA. The Name of an American Beast, somewhat like a Fox; call'd, also, *Myrmecophagus*. The Fat is esteem'd resolvent and nervous.

TAMARATONGA. The same as CARAMBOLAS; which see.

TAMARINDI. *Tamarindi*.

The Characters are;
 The Leaves are pinnated, without an odd Lobe at the End. The Flower is tripetalous, furnished with three Stamina, and seated in a carnosus Calyx, which runs out into four long small Leaves. The Ovary, arising from the Centre of the Calyx, becomes a long, broad Pod, divided into Cells, and full of an acid Pulp, containing oval Seeds.

Boerhaave mentions but one Sort of Tamarind; which is, *Tamarindi*. J. B. 422. Boerb. Ind. alt. 2. 59. *Tamarindus*. Offic. Ger. Emac. 1607. Park. Theat. 217. Raii Hist. 2. 1748. Tourn. Inst. 660. *Tamarindus*, *Oxyphoenix*. Mont. Exot. *Tamarindi*; *Lusitanis Tamaracazecla*. Marcg. 107. *Tamarindus Derelside appellata*. Alpin. Egypt. 2. 19. 170. *Il Tamarindo*, *è Derelside de gli Egittii*. Pon. Ital. Bald. 23. *Siliqua Arabica*, *quæ Tamarindus*. C. B. P. 403. *Hijabila*, *Tamarindus*. Herm. Mus. Zeyl. 27. *Intra sive Tamarindus*. Pif. (Ed. 1658.) 157. *Balam pulli sive Maderam pulli*. Hort. Mal. 1. 39. Tab. 23. THE TAMARIND-TREE.

This grows to be a large Tree, whose Branches are clothed with many winged or pinnated Leaves, made of several opposite oval Pinnæ, with never a single one at the End. The Flowers grow on the young Shoots in Clusters, eight or ten together, each of seven Leaves, four yellow, and three white, in purple Veins, in form of Orange-flowers, having three crooked Stamina, or Horns. The Fruit is of a yellowish-brown Colour, of a flatish-round Shape, three or four Inches long, having two or three swelling Knots, or Protuberances, containing an acid Pulp, full of stringy Fibres, and hard flat Stones, or Seed, of a Chestnut-colour; and these are the Tamarinds of the Shops. This Tree grows both in the East and West Indies, and in Egypt. The Tamarinds brought from East India are darker and drier, but contain more Pulp, being preserved without Sugar; and fitter to be put into Medicines: Those from the West Indies are redder, and have less Pulp, and are preserved with Sugar, and so pleasanter to be eaten as they are.

They are cooling and opening, good to purge cholerick Humours, and correct the bilious Heat in the Stomach and Bowels; they allay Thirst, provoke Urine; and help the Jaundice. *Miller's Bot. Off.*

This is the blackish Pulp of a Pod, something like common Beans: The Pulp lies between two Husks, or Shells, one of which is woody, the other tough and membranous. The Tree which bears the Fruit grows in Egypt, and in both Indies; and is described by *Tournefort*, in the *Memoirs of the Royal Academy* for 1699. We owe the Knowledge of this Purgative to the *Arabians*; for neither *Greeks* nor *Romans* knew any thing of it. The Dose, in Substance, is from an Ounce to an Ounce and an half; and three or four Ounces in Decoction. Some Physicians order a Tamarind-whey, *Serum Lactis Tamarindinatum*, as a gentle Purge,

Purge, in inflammatory Dispositions, Colics, &c. and Tamarinds are very properly mixed with Cassia: They may, likewise, be given as an Alterative, in the Quantity of half an Ounce; and they are very proper to be mixed with Pisans, and other Liquors, given to quench Thirst in acute Distempers. *Geoffroy.*

Tamarinds correct the Acrimony of Humours; purge Bile, and allay its Heat, and that of the Blood; cure acute Fevers, and the Jaundice; extinguish Thirst, and all unnatural Heat of the Liver and Stomach; and restrain Vomiting.

The *Turks* and *Arabians*, as we are told by *Bellonius*, when about to undertake a long Journey, provide themselves with Tamarinds: The *Turks* make great Use of them, not in Medicine, but to allay their Thirst. The *Indian Physicians*, as we are informed by *Garcias* and *Acosta*, apply the Leaves to an Erysipelas.

The *Arabians* preserve the small and green Pods with Sugar, or the Honey they call *Carob*; and when they are larger, and grown mature, preserve their Pulp with Sugar, and carry it with them in their Journeys, through the desert Places of *Africa*; and find it of extraordinary Use in quenching their Thirst, and refreshing them when inflamed, and almost spent with Heat, and the Journey, in evacuating great Quantities of hot-Humours by Stool.

In pestilential Fevers, and all other putrid burning Fevers, they drink Water, in which great Plenty of Tamarinds have been infused with Sugar, finding it a most pleasant as well as refreshing Liquor, under their burning Heat, and intense Thirst. They frequently use Tamarinds, also, in a Gonorrhoea; and *Fallopian* commends them in a Gonorrhoea of a bilious Kind.

In a Redundance of Bile, a Fervor and Ebullition of the Blood, a preternatural Thirst, cutaneous Diseases, and particularly the Jaundice, the *Indians* prescribe a simple Medicine, composed of Cassia Fistula, with Tamarinds, and the Sugar commonly called *Fagra de Canina*, which Preparation gently works by Stool. The Fruit of the Tamarind is not brought to us entire, but bruised, that, being by this means well compacted, it might keep out the external Air. Tamarinds are preserved three Years in a Glass Vessel with a narrow Mouth, and well stopped, and deposited in a clean Place, which is pervious to the Air and Winds, unless some external Heat or Moisture corrupts it. *Raii Hist. Plant.*

The Tamarind, which the *Egyptians* call *Derelside*, is a Tree of the Bigness of a Plum-tree, and full of Branches; the Leaves much resemble those of the Myrtle, called *Sesban*: It bears white Flowers, very like those of the Orange-tree, from the Midst of which proceed four white and very slender Threads, which become thick Pods; first green, but, when ripe, of an Ash-colour, and containing thick, uneven, and hard Seeds, involved in a black and acid Pulp.

The Tamarind-tree is not very plentiful in *Egypt*, which is not its native Soil; for it is brought thither from *Arabia* and *Ethiopia*, and kept in Green-houses. There grows a Tamarind-tree in the Desert of *St. Macharius*, near the Monastery of the *Affryians*, in a Place where no other Plant lives, which is looked upon as a Miracle: This Plant is to be admired for one Property, which is, that its Leaves always follow the Sun, and are called *Sun-flowers*; for, when the Sun setteth, they all close up, and open again at Sun-rising; and this Motion of the Leaves is so remarkable, that while the Pods are on, the Leaves, at Sun-set, close in upon them, and embrace them very strictly; and, when the Sun rises, open, and discharge themselves from the Pods, till the Return of Sun-set. This Conversion of the Leaves is observed in several other Plants of *Egypt*, as in the *Acacia*, *Abrus*, *Ab-fus*, and *Sesban*.

The Leaves of the Tamarind-tree are used to kill Worms in Children, and an Infusion or Decoction of the same is a gentle Purge; the Leaves are acid, and not unpleasant to the Taste. *Prosper Alpinus, de Plant. Egypt. Vol. 2.*

The *Arabians*, who are the present Inhabitants of *Egypt*, call this Tree, together with its Pod, *Tamarhendi*, that is, the *Indian Fruit*, because it was brought out of *East-India* into *Arabia Felix*, or out of *Ethiopia*, as *Alpinus* rightly observes, into *Egypt*, and the bordering *Arabia*; for that *Ethiopia* had the Name of *India*, among the Antients, is undoubtedly certain, from *Servius* and others. This noble Plant, therefore, was not transported from *Arabia* to the *Indians*, as some have written; but from *India* to the *Arabians*. But they are wider from the Truth, who derive the Name from Dates: For *Tamar* not only signifies a Date, but, as it is known to those who are but little skilled in *Arabic*, all Fruit whatever, so as, in its largest Signification, to comprehend the Fœtus of Trees and Animals. They who call the Tamarind the *Arabian Pod*, are pretty bold Nomenclators, and are obliged to find Distinctions for so many other Pod-bearing Plants among the *Arabians*. The Fruit of the Tamarind-tree is shorter than the Pod of the *Acacia*, but thicker and broader; and, for the grateful Acidity of its Pulp, is of principal Estimation among gentle Cathartics, though it has but little Effect, if gather'd while too green, or left to hang till it be grown too dry. *Vestlingii Observ. in Prosp. Alpin. de Plant. Egypt.*

Tamarinds are gently laxative, and are proper in febrile Heats, where not only Coolers, but Laxatives, are required: They are of Service in continual Fevers and Diarrhoeas, strengthen the Stomach, and are commended in a Flux of the Hemorrhoids, from a bilious and acrimonious Blood. The Leaves quench Thirst, and are useful in burning Fevers. *Hist. Plant. adscript. Boerhaave.*

TAMARISCUS.

The Characters are;

The Leaves are very thin, the Calyx small, the Flower small, rosaceous and pentapetalous; the Ovary is an oblong, membranaceous, bivalve Capsule, full of downy Seeds.

Boerhaave mentions two Sorts of Tamariscus; which are,

1. Tamariscus; Germanica. *Offic. Tourn. Inst. 66. Boerb. Ind. alt. 2. 257. Ger. 1194. Emac. 1378. Tamariscus folio latiore. Park. Theat. 1479. Raii Hist. 2. 1705. Tamarix fruticosa folio crassiore, five Germanica. C. B. P. 485. Tamarix Germanica five minor fruticosa. J. B. 1. 351. Tamarix minor, five fruticosa. Chab. 75. GERMAN TAMARISK.*

It is cultivated in Gardens, flowers in *June*; and the Parts in Use, with their Virtues, are the same with those of the common Tamarisk.

2. Tamariscus; Narbonensis. *Ger. 1194. Emac. 1378. Tourn. Inst. 661. Boerb. Ind. alt. 2. 257. Tamariscus. Offic. Tamariscus folio tenuiore. Park. Theat. 1479. Tamarix altera folio tenuiore, five Gallica. C. B. P. 485. Tamarix major five Arborea Narbonensis. J. B. 1. 351. Raii Hist. 2. 1704. Myrica five Tamarix. Chab. 75. TAMARISK.*

The Tamarisk never grows to be a Tree of any great Bigness in *England*, though beyond the Seas it will; having a rough dark-brown Bark. The younger Branches are of a Chestnut-colour, clothed with very fine tender green Leaves, somewhat like those of *Cypress*, but thinner and finer, and not at all hard or rough: The Flowers grow in round Spikes, at the Ends of the younger Shoots, an Inch or more in Length, several Spikes growing together, each consisting of a great many small, five-leaved, pale-red Flowers, which are succeeded by very small Seeds, included in a downy Substance. It is only planted in Gardens in *England*; its native Place being *Spain*, and the Southern Parts of *France*. The Wood, Bark, and Leaves, are used.

They are accounted specific for all Disorders of the Spleen, as being believed to lessen it much; and they used to drink out of Cups made of this Wood, to cure those Illnesses: And the Antients believed, that Swine, that fed out of a Trough made of this Wood, would have no Milt. The Bark is sometimes used for the Rickets in Children. *Miller's Bot. Off.*

It is cultivated in Gardens, flowers in *May* and *June*; and the Bark, Wood, Tops of the Branches, and the Flowers, are used.

Tamarisk is heating, drying, attenuant, aperitive, abstergent, subastrigent, diuretic, and splenic. Its principal Use is in Obstructions and Tumors of the Spleen, and in Diseases proceeding from black Bile, and Serum; as the Itch, Itchings, black Jaundice, and the Fluor albus. Outwardly applied, it cures the Tinea of the Head.

The Tamarisk was first transplanted into *England*, by the Care of *Edmund Grindall*, Archbishop of *Canterbury*, who had experienced its Virtue in the Cure of an Hardness of the Spleen, *Camden, in the Life of Queen Elizabeth.*

TAMARIX. See TAMARISCUS.

TAMISON, *тапион*. The same as COAGULUM.

TAMNUS. See BRYONIA.

TAMOATA, by the *Portuguese* called *Soldido*, is an *American* fresh-water Fish, about a Foot and an half long, three Inches in Circumference, and of an obscure ferruginous Colour: It is esteemed good Food, and said to be of an aperient Nature, and proper for the Cure of a Gravel. *Lemery des Drogues.*

TAMOATARANA: The Name of a *Brazilian* bulbous Plant, the Bulb of which is eaten like Potatoes, and is said to have an agreeable Taste. *Raii Hist. Plant.*

TANACETUM.

The Characters are;

The Root is fibrous; the Leaves alternate, and divided into pinnated and crenated Segments. The larger Flowers are closely compacted into a thick Umbella, and the Calyx is squamous and hemispherical.

Boerhaave mentions six Sorts of Tanacetum; which are,

1. Tanacetum; vulgare; luteum; maximum.
2. Tanacetum; vulgare; luteum. C. B. P. 132. *Tourn. Inst. 461. Boerb. Ind. alt. 124. Tanacetum. Offic. Ger. 525. Emac. 650. Raii Hist. 1. 365. Synop. 93. Tanacetum vulgare. Park. 80. Parad. 482. Tanacetum vulgare flore luteo. J. B. 3. 131. TANSIE.*

The Root of Tanse is large, stringy, and full of Fibres, sending forth many pretty large, yellowish-green, winged Leaves, divided into several deeply serrated Segments, set opposite to one another, with one cut into three Parts at the End, of a pleasant grateful Scent. The Stalks arise to the Height of about two Feet, having several similar, but smaller, Leaves growing on them, and, on their Tops, pretty large Umbels of yellow naked Flowers,

T A N

Flowers, composed only of fistular Thrums, without any Petals. It is found wild by Road-sides, and the Borders of Fields; and flowers in July.

The Leaves are used; being warming and aperitive, opening Obstructions of the Liver and Spleen, and helping the Jaundice: They likewise provoke Urine, and the Catamenia, though the good Women give a Syrup of the Juice to prevent Miscarriage. The Flowers are accounted good to destroy Worms in Children. *Miller's Bot. Off.*

This Plant is acrid, aromatic, bitter, and gives no Tincture of Red to blue Paper: The Roots are first insipid, afterwards astringent, but without Bitterness.

Tansie contains an aromatic, oily, volatile Salt, loaded with a great deal of Sulphur: For,

By the chymical Analysis, it yields a great deal of Oil, a pretty deal of Earth, a little urinous Spirit, and no volatile concrete Salt: Thus it is stomachic, febrifugous, sudorific, vulnerary, and aperitive. *Cesalpinus* says, its Leaves, infused in Wine, provoke the Terms; and that two Drams of their Juice, drank with Plantain-water, cure intermitting Fevers. *Saxonia* used this Juice with Success for chape Hands: It is highly esteemed for the Tettors and Scurf. For the Rheumatism, macerate the young Shoots of Tansie some Days in Brandy, and then distill it: The Spirit is very penetrating. Bathe frequently the afflicted Parts, and cover them with warm Cloths. Let the Patient drink two or three Spoonfuls of it every Day. It is very good for hydropic Cases; and the Decoction of Tansie with Wine is excellent to make Fomentations upon their Legs. For the Cachexy, Dropsy, or Green Sickness, drink three or four Ounces of the Juice; or else make a Tea of its Leaves, Flowers, and Seeds; cover the Pot, and, when cool, give it by Glass-fulls, in a malignant Fever, and the Diseases of the lower Belly: It cleanses the urinary Passages, purifies the Blood, removes Obstructions, and kills Worms. The Conserve of the Flowers of Tansie is esteemed for the Epilepsy and Vertigo. *Marty's Tournefort.*

It is usual, in time of Easter, to make a sort of Cakes of Eggs and Flour, mixed with the tender Leaves of Tansie, when it begins to shoot: These Cakes are not unpleasant to the Taste, and good for the Stomach, on account of dissolving the Flatulencies, generated by eating Puls and Fish, during Lent: The Tufts and Seed are often exhibited by Mountebanks, with surprising Success, for the Worms. A Conserve of the Leaves, and tender Tops, resists Putrefaction, opens Obstructions, comforts the Spleen, and invigorates the Senses. The Juice, used with any Kind of Oil, is said to give Relief in Pains and Contractions of the Nerves.

A Soldier of Montpelier, labouring under a stubborn Dropsy, was restored to perfect Health, by a Decoction only of Tansie. *Raii Hist. Plant.*

Tansie, in Temperature and Virtues, agrees with Feverfew: It is vulnerary, uterine, and nephritic; and is principally used against Worms, the Gripes, Stone in the Kidneys and Bladder, Obstructions of the Menfes, Flatulencies, and the Dropsy. The distilled Water kills Worms. *Dale.*

3. Tanacetum; Folis crispis. C. B. P. 432.

4. Tanacetum; Africanum; arborescens; Folis Lavendulæ, multifido Folio. H. A. 2. 201.

5. Tanacetum; Africanum; frutescens; Folis Lavendulæ multifidæ longe minoribus, graveolens.

6. Tanacetum; Africanum; fruticans; multiflorum; Folis Tanacetii vulgaris decuplo minoribus. H. A. 2. 199.

Tansie is considerably aromatic, very penetrating, comforting, aperitive, and heating: The first, second, and third Species afford the *Semen Sanctonicum Europæum*, as good against Worms as the *Sanctonicum Egyptiacum*. An Infusion of the Leaves drank, or a Cataplasm of the Flowers applied to the Navel, the distilled Water of the Flowers, or the Seed taken in Wine fasting, or three Ounces of the Decoction of the Leaves sweeten'd with Syrup or Honey, and so taken, are effectual for the same Purpose. These Herbs are balsamic, and extremely bitter, and may supply the Places of Nutmegs and Cinnamon: For I believe Asia does not afford a Plant of greater Fragrance than those Species of Tansie: They are, also, taken for the *Parthenium* of the Antients. The Leaves applied to a dead Body, and intruded into the Mouth and Nostrils, preserve it from Putrefaction and Insects; whence the Plant is called *Athanasia*, that is, the immortal Plant. The Juice performs the Effects of those of Wormwood and Feverfew in Conjunction. The latter Species are of a strong Smell, and proper in all cold Diseases. *Cesalpinus* tells us, that the Leaves of this Herb, infused in Wine, provoke the Menfes; that the Juice, drank with Plantain-water, cures all intermitting Fevers, with the Itch, Rheumatism, and Dropsy. Fomentations, prepared of the Leaves, are of great Use, and the Juice of the Plant relieves those who labour under a Chlorosis and Cachexy. The Conserve hereof is good for the Epilepsy, Colic, and hysterick Passion, and cleanses the Kidneys from Sand and Gravel. Tansie agrees in Virtue with Savine, Feverfew, and Southernwood; and is now used in Baths for the Uterus. The Flowers, dressed in a Cake, are of excellent Service in corroborating the Stomach. *Hist. Plant. adscript. Boerhaav.*

T A P

TANACETUM is, also, a Name for several Sorts of TAGETES; which see.

TANACETUM HORTENSE. A Name for the BALSAMITA MAs; which see.

TANACETUM INODORUM. A Name for the *Leucanthemum Tanacetii*; folio; flore majore.

TANACETUM-MINUS. A Name for the *Millefolium, nobile, Tragi.*

TANACETUM MONTANUM. A Name for the *Millefolium; Tanacetii folis; flore albo.*

TANGARACA. Marcgr. *Tangar. 2.* Pison. *Erva de Rato Lusitanis, Frutex baccifer Brasiliensis, Flore flammifera, Fructu deleterio.* A Brazilian bacciferous Shrub, whose Fruit is present Poison. *Raii Hist. Plant.*

TANGE, τανγῆ, in Hippocrates, is a preternatural Tumor; and, *Lib. 2. Epid.* is a putrefying Tumor. Some understand by the Word a strumous Swelling. *Cornarius* renders τανγῆ (Tangai) putrefying Tumors, because the Verb τανγίζω (tangizo) signifies to become putrid or rancid; whence τανγῆ τανγῆ, a putrid or rancid Oil. *Foesius.*

TANI. H. M. *Prunus Indica racemosa, Fructu pyriformi.* A kind of Plum-tree, growing in the East-Indies, and bearing a Pear-shaped Fruit, of the Size of a large Plum, consisting of a green, succulent, and insipid Pulp, surrounded with a smooth, shining, and red Skin, and containing an oblong-round Stone, which incloses a white Kernel, of a grateful Taste, and much resembling that of a Filberd.

The Kernels of the Fruit are eatable; and, being pulverized, cure that epidemic Cachexy, which the Portuguese call *Pitua*, and correct Disorders of the Eyes: The expressed Oil thereof, the Head being anointed therewith, strengthens the Hair: The Bark of the Tree is accounted an Antidote against the Poison of the Tree *Katou Tsjerou*, and its Fruit, however communicated: It is exhibited, finely triturated with a small Quantity of Asa-fetida. The Juice of the Bark and Root, boiled with Rice and Milk, mitigates the Pain of the Colic. *Raii Hist. Plant.*

TANTALUS, among the Alchymists, in the Affair of the Philosophers Stone, is an enigmatical Term for Mercury or Quicksilver. *Theat. Chym. Vol. 4.*

TAPHIUSIUS (*Lapis*) a fourth Species of *Ætites*, in *Pliny, Lib. 36. Cap. 11.* so called from the Place where it is found, *Taphiusa*, near *Leucadia*, now the Island of *St. Maura*. At present, says *Schroder*, it is unknown.

TAPHNEUS, a Term in *Paracelsus*, for a Species of Earth, whence are produced such Things as change not their Nature by Reverberation, or Calcination. *L. Grad. et Comp. Or. Taphneus* is a Medicine mundify'd, *Schol. in Lib. 7. L. Grad. et Comp. Cap. 9.*

TAPIA. *Brasil. Marcgrav. Pison. Pomifera trifolia Brasiliensis Fructu corticoso multis Officulis Pericarpio inclasis pleno.* This is a Tree of Brasil, which grows to the Height of a Beech, or Oak; and bears a Fruit of the Size of a moderate Apple, which, when ripe, becomes yellow, like an Orange, and has a Rind equal to it; within which it is full of hard little Stones, of the Size of Cherry-stones, oblong, yellow, and containing a white Kernel; about the Stones is a white soft Pulp, of a sweet Taste, and a nauseous Smell; the Fruit is eatable.

The Leaves, bruise'd, are an excellent Remedy against a Disorder very common in Brasil; and which they call *Richos de Ca*, being externally applied, and intruded into the Anus, like a Suppository. They are, also, cooling, and extinguish all manner of preternatural Heats, and mitigate Pains: Besides, being introduced into the Ears, they mitigate Pains of the Head, proceeding from Heat.

There are two Species of this Tree; the Wood of the first is esteem'd the hardest, and is the most ponderous, of all the Woods which grow in this Country; this Tree is accounted barren.

The other Species, which was known to *Piso*, has a smooth large Leaf, and bears a Fruit bigger than an Orange, with an hard, thick, yellowish Rind, variegated with ash-colour Spots, and containing an Honey-like Liquor, as sweet as Sugar, in which are intermixed a Multitude of little Stones, which, when the Liquor is dry'd up, make a rattling Noise, like Poppy-heads.

This Plant is used in Medicine, for Diseases of the Breast. *Raii Hist. Plant.*

TAPIRA *pecis.* A Species of smooth *Somchus*, in *Piso*. It grows with a single Stalk, above the Height of a Man's Leg, and has narrow, oblong, dentated, lanuginous Leaves, and white Flowers towards the Top of the Stalk, laden with Down. This Plant is an excellent Vulnerary. *Raii Hist. Plant. Index.*

TAPSIMEL. HONEY OF MULLEN.

Take of the Juice of Celandine, and bearded Mullen, each one Pint; of despumated Honey, three Parts; boil gradually, till the Juices are evaporated; adding, if the Operator pleases, calcined Virriol and Alum, with Copperas, and again boil into an Ointment.

The first College Dispensatory adds from the Author, that, if Occasion requires, this should be, at least, boil'd up to a pretty thick Con-

Confistence; and says, that it certainly will cure Itchings in any Part of the Body, and is a most noble Ointment. But, it seems, the present Practice has no Regard for it, as neither this, nor the following, are ever prescribed, or made. However, it has been thought fit to continue such Discoveries upon Record, for the sake of those who may think proper to make Trial of them.

TAPSI VALENTIA. THE POWERS OF MULLEN.

Take of the Juice of bearded Mullen, and of Hog's-lard, each as much as you please; let the Lard be cleansed of its Membranes and Fibres, and broke into small Parcels; then beat it with the expressed Juice; press out, and strain. Let it, afterwards, be put into a proper Vessel, for nine or ten Days; and then be twice more impregnated with fresh Juice, until it be quite green. Lastly, after all the Humidity, that will separate, is pour'd off, beat it again briskly, and put it by, in a proper Manner, for Use.

We are told by the first Compilers of the College Dispensatory, that this, and the preceding Process, were the Contrivance of John Arden an experienced Surgeon, at Newark in Nottinghamshire, who lived in the Reign of Edward the Third; and, about three hundred Years ago, were in great Esteem among the Surgeons of our own Country. The Contriver directs the Medicines, thus made, to be fresh beat once in a Month.

TAPSUS BARBATUS. See VERBASCUM.

TAPYRA-COAYNANA, *Brasiliensis*. Marcer. et Pison.

Cassia fistula Brasiliensis. C. B. *Solutiva Brasiliensis*. Park. *Cassia Siliqua Brasiliensis purgatrix compressa*. Lob. in Pharmac. Rond. *Cassia fistula Brasiliensis Flore incarnato*. Breyn.

It is a great, tall, and very spreading Tree, outwardly of a whitish Ash-colour; the Leaves stand in opposite Order, upon very short Pellicles, like the Leaves of Sena; the Flowers are disposed in Spikes, without Branches, and consist of five Petals, with three little semilunar Horns, which stand erect, in Conjunction with the Stamina; the Whole of a very fine carnation Colour, and visible at a great Distance. These Flowers are succeeded by Pods, green while immature, but black, or dusky-colour'd, when ripe, propending downwards, about two Feet long, and five Digits in Compals, and somewhat incurved. These Pods have a very hard ligneous Bark, which requires an Hammer to break it; and consist of a Multitude of Cells, of the Capacity of a Goose-quill, separated by Partitions, and containing every one a Kernel, of the Size and Figure of an Almond, of a white Colour, inclining to yellow, shining, smooth; of a white Medulla on the Inside, of an horny Substance, and immersed in a glutinous, blackish Pulp, like *Cassia Solutiva*, but of a bitter and ungrateful Taste; of a binding Quality before Maturity, but laxative, or solutive, afterwards.

The Tops of the Leaves cure Wounds and Pustules; and one Ounce of the Pulp, as *Lobel* observes, purges more than two Ounces of the other, or *Egyptian Cassia*. *Raii Hist. Plant.*

TARACHE, *ταράχη*. The same as TARAXIS.

TARANTISMUS. The Disorder which is said to be produced by the Bite of a *Tarantula*.

TARANTULA. The *Tarantula* (of which the Figure may be seen in *Baglivi's* Dissertation) is a Spider of *Apulia*, of the octonocular Kind; that is, of that Species that has eight Eyes, and spins Webs; it has eight Legs, four on each Side, and in each Leg three Joints; from the Mouth proceed two Darts, in Shape just like to a hooked Forceps, or Crab's Claw; these are solid, and very sharp, so that they can easily pierce the Skin; and between these and the fore Legs, there are two little Horns, which, I suppose, answer to those Bodies, call'd, from their Use in Flies, the Feelers; because as they do, so this Creature is observed to move them very briskly, when it approaches to its Prey.

This, as other Spiders do, propagates its Species by laying Eggs, which are very numerous; so that there are found sometimes, in the Female, when dissected, an hundred, or more; and these are hatched, partly by the Heat of the Mother, and partly by that of the Sun, in about twenty or thirty Days time.

There is, also, a Spider, of the like Nature with the *Tarantula*, in the *West-Indies*, which *Francis Hernandez* describes by the Name of *Hoitztocatl*, or the Pricking Spider; and says, that its Bite induces Madness.

In the Summer Months, especially when the Heats are greatest, as in the Dog-days, the *Tarantula*, creeping among the Corn in the Fields, bites the Mowers and Passengers; in the Winter it lurks in Holes, and is scarcely seen; and, if it bites then, it is not venomous, neither does it induce any ill Symptoms.

But in the hot Weather, altho' the Pain of its Bite is, at first, no greater than what is caused by the Sting of a Bee, yet the Part, quickly after, is discoloured with a livid, black, or yellowish Circle, and raised to an inflamed Swelling; the Patient, within a few Hours, is seized with a violent Sickness, Difficulty of Breathing, universal Faintness, and sometimes Trembling, with a Weakness of the Head: Being ask'd, what the Ail is, makes no Reply; or, with a querulous Voice, and melancholy Look, points to his Breast, as if the Heart was most affected.

During this mournful Scene, all the usual alexipharmic and cordial Medicines are of no Service; for, notwithstanding their repeated Use, the Patient growing, by degrees, more melancholy, stupid, and strangely timorous, in a short time expires; unless Music be call'd to his Assistance, which alone, without the Help of Medicine, performs the Cure.

For, at the first Sound of the musical Instrument, altho' the Sick lie, as it were, in an apoplectic Fit, they begin, by degrees, to move their Hands and Feet, till, at last, they get up, and fall to Dancing with wonderful Vigour, at first, for three or four Hours; then they are put to Bed, refreshed from their Sweating for a short time, and repeat the Exercise with the same Vehemence, perceiving no Weariness or Weakness from it, but professing they grow stronger and nimbler, the more they dance.

At this Sport they usually spend twelve Hours a Day, and it continues three or four Days; by which time they are generally freed from all their Symptoms, which, nevertheless, attack them again, about the same time, the next Year; and, if they do not take care to prevent this Relapse by Music, they fall into a Jaundice, want of Appetite, universal Weakness, and such-like Diseases, which are every Year increased, if Dancing be neglected, till at last they prove incurable.

As Music is the common Cure, so they who are bitten, are pleased, some with one Sort of it, some with another; one is raised with a Pipe, another with a Timbrel; one with an Harp, another with a Fiddle; so that the Musicians make, sometimes, several Essays, before they can accommodate their Art to the Venom. But this is constant and certain, notwithstanding this Variety, that they all require the quickest and briskest Tunes, and are never moved by a slow, dull Harmony.

While the *Tarantati*, or Affected, are dancing, they lose, in a manner, the Use of all their Senses, like so many Drunkards; do many ridiculous and foolish Tricks; talk and act obscenely and rudely; take great Pleasure in playing with Vine-leaves, with naked Swords, red Cloths, and the like; and, on the other hand, can't bear the Sight of any thing black; so that if any By-stander happen to appear in that Colour, he must immediately withdraw; otherwise, they relapse into their Symptoms with as much Violence as ever.

It may afford some Light towards understanding the Nature of this Poison, to observe, that *Apulia* is the hottest Part of all *Italy*, lying Eastward, and having, all the Summer long, but very little Rain to temper the Heats; so that the Inhabitants, as one of that Country observes, breathe an Air, as it were, out of a fiery Furnace: Hence their Temperament is dry and aust, as appears by their being generally lean, passionate, impatient, ready to Action, quick-witted, very subject to inflammatory Distempers, Phrenies, Melancholy, and the like; upon which Account, there are more mad People in this, than in all the other Parts of *Italy*: And what in other Countries is but a light Melancholy, arises here to a great Height; for Women in a Chlorosis suffer almost the same Symptoms as Persons poison'd by the *Tarantula*, and are cured the same Way; and, in like manner, the Venom of the Scorpion, does here, in Effects and Cure, agree very much with that of this Spider.

From all this History, it sufficiently appears, that those that are bitten by a *Tarantula*, thereupon, become delirious; and that, in order to account for their surprising Symptoms, the Nature of a Delirium, from which many of them proceed, ought to be understood.

Such is the Constitution of the human Oeconomy, that as, upon the Impression of outward Objects made upon the Organs, and by the Fluid of the Nerves, convey'd to the common Sensory, different Species are excited there, and represented to the Mind; so, also, upon this Representation, at the Command and Pleasure of the Soul, Part of the same Fluid is determined into the Muscles, and, mixing with the arterial Blood there, performs all the Variety of voluntary Motions and Actions.

This Order has been always so constant in us, that, at length, by a kind of natural Habitude, without the Intervention of the reasoning Faculty, Representations made to the Mind immediately, and necessarily, produce suitable Motions in the bodily Organs. When, therefore, these Representations are irregular, the Actions consequent to them must necessarily be so too.

This being premised, it may, perhaps, be probably said, that a Delirium is the Representation, and various Composition, of several Species to the Mind, without any Order, or Coherence; together, at least most commonly, with irregular, or, as it were, undesign'd Motions of the Body; that is, such a wandering and irregular Motion of the nervous Fluid, whereby several Objects are represented to the Mind, and, upon this Representation, divers Operations perform'd by the Body, tho' those Objects are not impress'd upon the Organs, nor those Operations or Motions deliberately commanded by the Soul.

The Mind, indeed, is the first Principle of all muscular Motion; but, in such Cases as these, its Promptitude to Action, or Habit, being so great, it is, in a manner, surpris'd, and cannot recover itself, after the Spirits are, with violent Force, determin'd, pursuant to the Representation of the Species. For, as, in the former State of Things, a Man is said to act rationally, so this

this latter Case is called a Perturbation of Mind, that is, a Delirium; tho' it is very manifest, that, in Reality, the Defect is not in the rational, but corporeal Part; such Species being really presented to the Mind, upon which, by the Order of our Constitution, such Motions ought to follow in the Body.

Thus, for Instance, if the Liquor of the Nerves is, without the Presence of any thing hurtful, put into a Motion, like that which a painful Impression makes in it, the same bodily Actions must ensue, as proceed from Fear, Anger, or the like Passion, determining the Spirits towards the muscular Parts; and a By-stander, who sees no Reason for such a Representation made to the Mind, will presently conclude, that the Person thus acting acts without, or besides, his Reason, that is, is delirious; especially if the Hurry and Confusion of the Spirits be such, that not only one, but several different Species, be, at the same time, presented to the Mind; for a Man, in this Case, may act the Part of one joyful, angry, timorous, or the like, without any appearing Reason, and all this, almost, in the same Moment of Time.

In one Word; *Deliria* are the Dreams of those who are awake: And as these in us sleeping are infinitely various, and wonderfully compounded, and all from the same common Cause, diversely pressing the Orifices of the Nerves, and thus making different Repercussions of their Fluid; and as we all know, that this Confusion making the Representation of several Species to the Mind, there hereupon follow, tho' the Body seem now at Rest, and in perfect Repose, such Motions in the Organs, as are, usually, the Effect of the arbitrary Determination of the Spirits thither; we are now to inquire, what Alteration of the Body, made by this Venom, can be the Occasion of this Disorder and Tumult in the nervous Fluid, which excites, in the Party infected, such surprising, and almost contradictory, Representations.

Most of the Symptoms of those who are bitten by the *Tarantula*, are, at the first, that is, before they rise to a Delirium, plainly the same with those which the Bite of a Viper induces. Without Doubt, therefore, as we have before observed [under *ARANEA*] of the common Spider, that it pierces the Flesh with its hooked Forceps, and, at the same time, instils, from the Proboscis in the Mouth, a liquid Venom into the Wound; so the like Claws, in this, serve to make way for an active and penetrating Juice, emitted from the same Part.

Of the Nature of which we may probably conjecture, that it is, when mix'd with the Blood, being exalted by the Heat of the Climate, of so great Force and Energy, that it immediately raises an extraordinary Fermentation in the whole arterial Fluid, by which its Texture and Crasis are very considerably alter'd; the Consequence of which Alteration, when the Ebullition is over, must necessarily be a Change in the Cohesion of its Parts, by which the Globules, which before, with equal Force, pressed each other, have now a very differing and irregular Nisus, or Action, so that some of them so firmly cohere together, as to compose Molecular, or small Clusters; upon which account, there being now a greater Number of Globules contained in the same Space than before, and, besides, the Impulse of many of these, when united together, differing according to the Conditions of their Cohesion, as to Magnitude, Figure, and other Qualities, not only will the Impetus, with which this Fluid is drove towards the Parts, beat some Strokes at least greater than ordinary; but the Pressure upon the Blood-vessels must be very unequal and irregular; and this, more especially, will be felt in them which are most easily distended; such as those of the Brain. And, hereupon, the Fluid of the Nerves must necessarily be put into various undulatory Motions, some of which will be like unto those which different Objects, acting upon the Organs or Passions of the Mind, naturally excite in it; whereupon such Actions must follow in the Body, as are usually the Consequents of the several Species of *Sadness*, Joy, Despair, or the like Determinations of the Thoughts; and we shall readily pronounce one in this Condition, sad, joyful, or timorous, and all without any apparent Reason or Cause; that is, in one Word, we shall say, he is delirious.

This is, in some Degree, a Coagulation of the Blood, which will the more certainly, when attended with an extraordinary Heat, as in the present Case, produce such-like Effects as these, because the Spirits separated from the Blood thus inflamed, and compounded of hard, fixt, and dry Particles, must unavoidably share in this Alteration; that is, whereas their Fluid consists of two Parts, one more active and volatile, the other viscid and glutinous, which is a kind of Vehicle to the former, their active Part will bear too great a Proportion to the viscid; and thus they must necessarily be of more than ordinary Volatility and Force, and will, therefore, upon the least Occasion imaginable, be irregularly determined to every Part; and hereupon will follow Tremblings of the Body; Anger, or Fear, upon a light, or no Cause; extreme Pleasure at what is but a trivial Entertainment, as red, green Colours, or the like; and, on the other hand, wonderful Sadness at any thing not agreeable to the Eyes, as dark and black Things; nay, ridiculous Laughter, obscene Talk and Actions, and such-like Symptoms; because, in this Constitution of the nervous Fluid, the most light Occasion will make as real a Re-

flux and Undulation of it to the Brain, that is, will present as lively and vivid Species there, as the strongest Cause and Impression can produce in its natural State and Condition; and, in such a Confusion, the Spirits cannot but sometimes, without any manifest Cause at all, be hurried towards those Organs, to which, at other times, they have been most frequently determined; and every one knows which they are in hot Countries and Constitutions.

It must, however, be remember'd, that the nervous Fluid is immediately alter'd by the venomous Juice. It will, perhaps, make this Theory more than probable, that *Baglivi*, in the Dissection of a Rabbit kill'd by a *Tarantula*, found the Blood-vessels of the Brain very turgid, and the Substance of the Brain itself, that is, the Beginning of the Nerves, lightly inflamed, and with livid Spots here-and-there; the Lungs, and other Viscera, distended with concrete clotted Blood, and large Grumes of Blood, with polypous Branches in the Heart; a large Quantity of extravasated Serum upon the Brain, which is (as he takes Notice) mostly observed in those Subjects which died by a Coagulation of the Blood.

Neither is it amiss to remark, that in a Chlorosis there is nothing preternatural, but an Infarction of the Arteries; and hence a retarded Circulation, from an Evacuation suppress'd; and, in this Country, too much Heat; that is, a beginning Coagulation, together with an inflammatory Disposition.

In short, *Bellini* has, at large, demonstrated, how *Deliria*, as well melancholic as maniacal, proceed from a State of the Blood and Spirits, not unlike to that I have here described.

But no less a Confirmation of these Notions may we have from the Cure; as to which, it is observable, that the *Tarantati* have no Inclination to dance, before they hear the Music; for, being ask'd to do it, they answer, 'Tis impossible, they have no Strength.

As for the Reason, therefore, of their starting up at the first Noise of the Instrument, we must reflect upon what we have just now been saying, concerning the Cause of the Motions of the Body in a Delirium; and consider withal, that muscular Motion is no other than a Contraction of the Fibres from the arterial Fluid, making an Effervescence with the nervous Juice, which, by the light Vibration and Tremor of the Nerve, is derived into the Muscles.

And thus we have a twofold Effect and Operation of Music; that is, both upon the Mind and Body.

To conclude with this Poison, we may take notice, that, as to the Return of the Symptoms the next Year, that is owing to the same excessive Heat in those Months acting again upon the small Remains of the venomous Ferment: Thus *Bartboline* relates a Story of a melancholy Physician at *Venice*, who suffered the Attacks of this Disease only during the Dog-days, which yearly ended and returned with them. A convincing Proof, how great a Share Heat has in all these Cases. *Mead on Poisons*.

Baglivi, who resided in *Italy*, and probably had good Opportunities of informing himself with respect to this Insect, has written a Treatise expressly upon this Subject; and most medicinal Writers mention the Distempers arising from the Bite thereof, as a Thing certain, and not to be disputed. But, notwithstanding all these great Authorities, there is good Reason to believe, that the whole Story is fabulous, and a vulgar Error; for it is treated as such by an *Italian* Physician in the *Philosophical Transactions*; and the late Mr. *Stanhope*, Brother to the Earl of *Harrington*, who resided at *Taranto* many Months, and during the Season, in which the Bite of a *Tarantula* is said to be most pernicious, assured me, that there was not a Physician in the Country, who believed there ever was such a Distemper, from such a Cause; that, amongst the Vulgar, there was a Tradition, that Distempers, attended with very extraordinary Circumstances, had been excited by the Bite of the *Tarantula*, but that nobody ever remembered a single Instance; and that he hired People to search in the Fields for this Insect, but could never procure one; nor ever learn, that any Sort of Spiders were to be found, different from those, which are common in most warm Countries. This was confirmed to me by a Gentleman of Honour and Fortune, now alive, who, likewise, resided for a considerable time at *Taranto*, and who, upon the strictest Inquiry, met with much the same Information. This last Gentleman told me, that the most eminent Physicians at *Taranto* told him, that what gave Rise to the vulgar Error, relative to the Bite of the *Tarantula*, was an epidemical Fever, which frequently affected the Country-people during Harvest, and which was usually attended with a few petechial Eruptions, and some very odd nervous Symptoms; and this Disorder the unthinking Vulgar, always fond of the Marvellous, had sometimes idly attributed to the Bite of a *Tarantula*. And his Opinion is, I think, confirmed by the Accounts we have, of the Disorders incident to the People of *Apulia*. Thus *Frederic Hoffman*, speaking of the Diseases to which the *Italians* are subject, says, that the Inhabitants of *Apulia* are highly subject to burning Fevers, Pleurisies, and other inflammatory Disorders, which, in a great measure, draw their Origin from that Redundance of Blood, which is generated by the high Living of the Inhabitants; for here the Soil is incredibly fertile; and large Quantities of Flesh are eaten by the Natives. Here, also, the Wines are black, fragrant, and rich, and the

the Air so intensely hot, as not only to render the Inhabitants highly impatient and uneasy; but very frequently delirious.

TARAXACUM. A Name for the *Dens Leonis latiore folio*.

TARAXIS, ταραξίς, from ταραξήναι, to disturb, a Disturbance, is frequently used by Hippocrates, as well as the Verb, from whence it is derived, to signify such a Disturbance, or Perturbation, of the Belly and Intestines, as is excited by some Cathartic, or other Means, irritating them to Excretion. The Verb ταραξήναι, according to Galen, *Com. 3. in Lib. de R. V. I. A.* indicates, in that Place, not a moderate, but a profuse Evacuation by Stool. In this Sense we are told, by Hippocrates, in the same Book, that Hydromel, drank by itself, is more effectual than Water, *εἰ μὴ ταραξείην τὴν κοιλίην*, "if it does not disturb the Belly," that is, waite the Strength by immoderate Irritations of the Belly. In *Coac. 342. ἐξήλασεν (Ektaraxis) κοιλίην* imports a critical Excretion, or such a Disturbance, or Perturbation, excited in the Belly, as issues in a sudden; violent, and profuse Discharge of its Contents. Hippocrates often uses ταραχόμενος κοιλίας to express the Belly under Irritations to Excretion, and actually discharging its Contents, particularly *Coac. 10.* And in the same Sense is the Word ἐξήλασεν used, 2 *Prophet.* where we read, *ἀπὸ κοιλίας ἰσχυρὰς δυνάμει ἐκστασεν ἀνὲρ ἐξήλασεν*, "the Belly labouring under violent Pains, without Perturbations" (in order to Evacuation); agreeably to which Sense, Celsus, *Cap. 8. Lib. 2.* renders ἐξήλασεν κοιλίην, 4 *Apb. 60 Ventrem resolutum*, "a loosen'd Belly."

The Adjective tarachodes, ταραχώδης, frequently signifies, also, turbulent, and is applied to those, who are disturbed and disordered for little or no Reason, which is an Indication of a delirious and disordered Mind. The same is applied to Diseases, Fevers, and Sleep attended with irregular Perturbations, and mental Disorders.

Idaxis, Taraxis, is, also, a Disease of the Eye, consisting in a Perturbation of that Part, when it is offended by some Compression, Attrition, Smoke, or the like. The Author of the *Isagogé* reckons, among ophthalmic Disorders, the *Taraxis*, which is, he says, when the Eye appears redder than ordinary, on occasion of some slight and superficial Commotion. But Galen, in 6 *Epid. Com. 5.* makes a *Taraxis* to be a morbid Disposition of the Eye, preceding an Inflammation, and the Beginning of an Inflammation; and Paulus, *Lib. 3. Cap. 22.* defines it to be an Heat and Humidity of the Eye, attended with a preternatural Redness, proceeding, not from the Body, but some external Cause, as the Sun, Smoke, Dust, and Wind; whence the Disorder is very speedily remedied, by removing the Cause.

TARBASON, or LARBASON. Antimony.

TARCHON. The same as DRACO HERBA.

TARDA. The Bustard; the same as OTIS.

TARERIAYA. The Name of a *Brasilian* siliquous Sort of Cinquefoil, of no Use in Medicine.

TARIROQUI. The Name of a *Brasilian* Vetch, called, by the Portuguese, *Metapasto*, of no Use in Medicine.

TARFATI, or TARFE. A barbarous Word, importing an Ecchymosis, or Sugillation.

TARGAR. Oil of Juniper, *Rulandus*.

TARICHOS, τάρχος, *Lat. Salsamentum*, Salt-meats, properly Fish seasoned and kept in Salt, and especially the Thynnus, of which Kind are also the *Cybia*, as appears from the fifth Book of Galen, *de C. M. S. L.* at the End, and from *Athenaus, Lib. 3.* at the End; and also from *Pliny*, who assures us, that the *Pelamis*, (a large Fish, see the Article *CYBIVM*) cut into Pieces, belonged to the *Cybia*, *Lib. 32. Cap. 11. and Lib. 9. Cap. 15.* *Suidas* expounds τάρχος by τὰ κρέατα ἀσπὶ πεπασμένον, "Flesh sprinkled with Salt;" and τάρχος signifies not only what is seasoned, and kept in Salt, but what is dried, and preserved without Salt. *Τάρχος τὰ δεικνύειν*, "such Salt-meats, as come from Gades," are recommended by Hippocrates, *Lib. de intern. Affect.* in more than one Place, to be eaten in an Anasarca. The same Author, *Lib. de Cap. Vuln.* in describing an Ulcer of fatal Prognostication, and drying up a little before Death, says, *καὶ φαίνεται ὡς περὶ τάρχος*, "It looks, also, like Flesh macerated and dried in Salt." And, *Lib. 2. de Morbis*, he advises eating the best and fattest *Tarichos* (Salt-meats). *Πεπασμένον τὰς ἀνθρώπους, Lib. de R. V. I. A.* is, to dry up, emaciate, and extenuate Patients with Hunger and Fasting, which was the Practice of some Physicians in the Time of Hippocrates, who, in the Beginning of Diseases, tormented the Sick with three or more Days total Abstinence. The Word is used in the same Sense by Galen, *Lib. 8. M. M.* and applied to the *Diatritarii* of his Time. See *DIATRITOS*.

TARITH. Mercury. *Rulandus*.

TARSI. A Name for the *Cyperus*; *rotundus*; *esculentus*; *angustifolius*.

TARSO is a kind of hard, and most white Marble, found in *Tuscany*, at the Foot of the *Verucola* of *Pisa* at *Seraveza*, and at the *Massa* of *Carara*, and in the River *Arnus*, above and below *Florence*; and it is, also, well known in other Places. It is used in making Glafs. *Ant. Neri*.

TARSUS, ταρσός. The Space between the Bones of the Leg and the Metatarsus. It consists of seven Bones; the *Astragalus*,

or *Talus*, *Calcaneum*, *Naviculare*, three *Ossa Cuneiformia*, and the *Cubiforme*.

The cartilaginous Edges of the Eye-lids, out of which the Eye-lashes grow, are, also, called *Tarfi*.

TARTARHAN. A barbarous Name for the Spirit of Tartar.

TARTARUS. Tartar.

The Generation of Tartar from Wine.

Wines, especially those prepared from Grapes, or of an acid and austere Taste, usually afford a copious Tartar, but not in Perfection, till they are once thoroughly fermented; and they afford the purest, when put up into a clean Vessel. It is more plentifully obtained from the Wine, when this has rested some time upon the Lees, and, in some measure, gently consumed it. The Tartar of fine White-wine is white; whence *Rhenish* Wine affords the best, which is white; and collected in thick Pieces, for Medicinal Use; and the whiter, heavier, more thinning, and thick, the Pieces are, the better. That of Red-wine is red, more impure, less firm, and the Pieces less solid, and more unctuous: This stony Salt of Wine is difficultly dissolved in Water, or Wine itself, but remains almost like a Stone therein. If boiled in a large Proportion of Water, it dissolves in some measure, and makes a turbid Liquor, wherein numerous shining Corpuscles are observed to float; and thus, in the Boiling, it constantly throws up a Skim to the Surface; which, if taken off with a Skimmer, and put into a wide Vessel to be dried, is called by the Name of *Cream of Tartar*: And thus, by degrees, the whole Quantity of Tartar may be converted into a kind of white acid Powder, excepting only a few feculent Parts, remaining at the Bottom.

If pure white Tartar be boiled with twenty times its Quantity, or more, of Water, till the Whole is perfectly dissolved therein, and the boiling Liquor be now immediately put into a Cask, without admitting any Faeces, a Crust will presently begin to form in all the internal Parts of the Vessel touched by the Liquor; and this Crust increases, till, in a short time, nearly all the Tartar shoots into little shining figured Lumps, called *Crystals of Tartar*; which, being collected, and gently dried, are thus to be preserved separate. The remaining Water, when cold, retains but little of the Tartar.

These Operations shew, that the Nature of the Salt, which is produced by vinous Fermentation, entirely differs, in these Properties, from any other known Salt. A new Solution, also, of the Cream or Crystal of Tartar, may be made in fresh boiling Water, so as to obtain them each time more pure and white; but the Virtue of them both scarce appears greater for any chymical or medicinal Uses, than that of Tartar itself.

REMARKS.

A Knowledge of this Process greatly conduces to the understanding the Nature of Fermentation, and the Tartar produced thereby. And thus we procure this wonderful Salt suited to so many Uses. Dyers, Silversmiths, Chymists, and Physicians, require it on many Occasions. The Chymists prepare many Things from it, and some of them capital ones. In Medicine it is highly serviceable for gently cleansing the first Passages, in a small Dose, or for purging strongly in a larger Quantity. And upon this Subject that candid Chymist *Angelus Sala* has written excellently.

The Resolution of Tartar into Water, an acid Spirit, Oil, and fixed alkaline Salt, by Distillation.

Fill Two-thirds of a glass Retort with choice Pieces of the best white Tartar, and place it in a Sand-furnace; apply a large Glass Receiver, or one that is of the greatest Size; and lute the Junction with a common Mixture of Linseed-meal: Apply a gentle Fire for some considerable time, scarce exceeding a hundred Degrees; there will come over a small Quantity of a limpid, thin, tartish, somewhat spirituous, bitterish, and lightly-odorous Liquor, which is so penetrating, as easily to sweat through the Luting. Let this be kept separate; then the Fire being raised to the Heat of boiling Water, a white Vapour comes over, and along with it an highly penetrating Spirit, which is wonderfully flatulent, and will pass through almost any Luting; and, if we endeavour to confine it by that called the *Lutum Sapientiae*, it bursts the Glass by its Elasticity; and it usually breaks out with Force, or perspires, at Intervals, through the Luting; and, along with this wild flatulent Spirit, there comes over a thin and extremely subtle Oil, of a yellow Colour, a somewhat aromatic Taste, bitter, heating, and of no ungrateful Odour. This surprising Oil I have found so incredibly penetrating, that when the Neck of the Retort entered five Inches into the Mouth of the Receiver, and the Junction was closely luted, yet this volatile Oil always returned back, and passed through the Body of the Luting, so as partly to distil in Drops, into a Cup set underneath, and in part to run down the external Surface of the Receiver: Nor could I hitherto, by any means, prevent this Effect; for, if a Luting be applied, that the Oil cannot pass through, the Vessel

fel flies to Pieces. I did not therefore wonder to find *Parasellus* and *Helmont* so highly recommend this Oil in Diseases of the Ligaments, Membranes, and Tendons, which they, upon Experience, have declared, may be cured by it, even though contracted.

The former Matters being collected separate, let the Remainder be urged gradually to the utmost Degree of Heat that Sand will give; and thus again a Spirit will come over, and an Oil, as before; but at the same time a gross, black, feid, ponderous, glutinous, and bitter Oil, leaving the remaining Tartar black, sharp, and, in every respect, truly alkaline. If this Mass be urged with the strongest Fire of Suppression, it will still yield a very thick, black, and pitchy Oil, along with a certain Smoke; and these will continue to rise, how violent soever the Fire be made, and how long soever the Operation is continued; and there will still remain an extremely black, sharp, alkaline, and dry Mass, at the Bottom; which, being exposed to the open Air, by breaking the Glass, grows hot, upon Contact therewith, and readily dissolves into a Liquor; nor can it be kept dry, without great Caution; whereas the Tartar, from whence it was produced, would scarce dissolve in Water.

When this black dry Mass is exposed to a naked Fire, in the open Air, it takes Flame; and, after burning, leaves a copious white alkaline Salt behind, as strong, fiery, and pure, as can any way be prepared. It affords but little Earth, and readily dissolves of itself: If long detained in a strong Fire, it grows blue, of a marble Colour, and sometimes brown; and thus always becomes stronger.

REMARKS.

From hence we learn many Particulars; and, first, how wonderful a Thing Fermentation is, which separates all the gross Parts, and leaves a transparent, subtile, fluid Wine, which generates an almost stony Body, that does not dissolve in cold Water, whilst the Principles of this Body lie concealed in so thin a Liquor. This stony Mass, also, contains Water, a Spirit, and different Kinds of Oil, thick and copious. It is hard to conceive, how this Oil could lie concealed in the Wine, which seems to contain Alcohol indeed, but no such Oil: But, what is more surprising, the entire Mass of Tartar is merely acid, and makes an Effervescence with Alkalies, as we shall clearly see in the Preparation of tartarised Tartar; and yet, by the bare Action of no violent Fire, in a close Vessel, without any considerable Separation of an Acid, the greatest Part of its whole Bulk is changed from Acid to true Alkali; and this, perhaps, is the only Example, where a fixed alkaline Salt is produced in a close Vessel, by a moderate Fire, without the free Admission of the Air; whilst, in other Cases, only a black insipid Coal is thus produced. Who would have suspected, that a manifest Acid could, by this means, have changed to an Alkali? And if the acid Water, the Spirit, and the Oil, be poured back upon this alkaline Mass, from whence they were before extracted, and the Distillation be performed, as before, scarce any Acid will come over, and little Oil, but nearly the whole Mass will be turned into Alkali. Whence we see, that a large Quantity of a very acid Matter may be easily changed to an alkaline Substance; but, on the contrary, I am acquainted with no Instance in Chymistry, of such a manifest Change of a strong Alkali into an Acid: Whence I cannot sufficiently admire the particular Nature of this Tartar, as knowing nothing like it. The first distilled and highly penetrating Oil of Tartar is recommended for dissolving cold Tumors, and for restoring Motion to the dried tendinous Parts in contracted Limbs, together with the Assistance of proper Baths, Fomentations, and Frictions. If these Oils be rectified, and rendered more subtile and penetrating, they are recommended by Chymists, even for resolving gouty Knots and Concretions. It is said by many, that rich Perfumes may be exalted by this Oil; but they, also, say, that decayed Musk and Civer may have their Scent invigorated, by being suspended in a Jakes. Salt of Tartar may be thus prepared in a greater Proportion to the Tartar employed, than by any other known Method; and in greater Plenty, the slower the Distillation was performed. This, also, is the best, sharpest, most penetrating and pure, of all the fixed Alkalies; nor is there any other known Body in Nature, that affords more of such a saline alkaline Matter, than Tartar. And if the black alkaline Matter, remaining after the most violent Distillation, be set by in the Retort, slightly covered with Paper, it wholly resolves into a Liquor, which, filtered, affords an admirable Oil of Tartar per Deliquium, extremely fit for numerous chymical Uses, and particular Operations. If the same Salt be first strongly calcined in an open Fire, it thus, also, resolves in the Air, and affords an Oil of Tartar per Deliquium, but of a more sharp and alkaline Nature, than the former.

THE NATIVE SALT, OR TARTAR OF VEGETABLES, FROM THEIR FERMENTED JUICE.

1. The expressed Juices of ripe Summer-fruits, being perfectly fermented, and so become Wine, deposit their Fæces, or Lees, barely by standing, and thus become bright. If, now,

this Wine be drawn into a clean Vessel, and suffered to rest for a long time, it produces in its Body little, shining, sharp Corpuscles, moving about therein. These Corpuscles, dispersing themselves from the Wine's Centre of Gravity to every Point of the Surface, at length touch, and fix themselves to the Sides of the Cask, and thus crust them all over, where-ever the Wine reaches. By degrees the Liquor deposits more of this Matter, which easily sticks to the former, whereto it seems to be attracted, till at length the whole Body of the Wine contains no more of it: After this, if the Wine, thus grown milder, be drawn off into another Cask, and fresh Wine, fined down as before, be put into the Cask that was emptied, but still remains lined with its Crust, the same Kind of Matter will be sooner generated, and grow to the former Crust, which more powerfully attracts it.

2. This appears to be the true Generation of that strange Production, which is the genuine saline Crystals of the Wine, tho' not, like other saline Crystals, found only in the Bottom, but equally all round the Sides of the containing Vessel. This Substance is, in many respects, different from the Lees of Wine, though it seems nearly of the same Nature; but it is more subtile, more pure, less earthy, less feculent, less unctuous, more difficultly soluble in Water, and of a more acid Taste. The Germans call it by a very proper Name, *Wine-stone*, but the Chymists, less properly, *Tartar*. There is a great Difference in it, according to the Nature of the Wine; the acid, austere Kinds whereof afford more; but the sweet and oleaginous, less. The Wines, that have their Fermentation stopped, before it was completed, afford a less Quantity; and those perfectly fermented, and become thin, a greater, as *Rhenish* Wine, for Example. The Tartar of Red-wine is red; and of White-wine, white.

REMARKS.

1. This is a Way of obtaining the natural Salt of Vegetables; which Salt is always acid and oily. It is easily changed into an Alkali; it dissolves neither in Water, Wine, nor Vinegar, without Heat, but remains like a Stone therein; and, like a strong Vessel, contains within its Crust the Wine from whence it is shot. It requires a boiling Heat, before it will perfectly dissolve in Water; and then again, as soon as the Water begins to cool, it immediately begins to become solid in the Water; and is there called *Cream*, or *Crystal of Tartar*. It requires twenty times its Quantity of Water, to dissolve it perfectly. It generates more elastic Air in Burning, than any other known Body, and yields a Vapour that can no way be confined. It is a great Corrector in those Bodies, which abound with a sharp bilious purid Matter; and hence becomes an approved Remedy in acute Diseases. It cleanses the first Passages, without much disturbing the more internal Parts. With a corrupt acrimonious Matter, it loses its Acidity, changes into a very soluble Substance, and hence becomes a good aperitive Remedy.
2. We may hence understand, what Salt that is, which resides in the natural or fermented Juices of Vegetables; but we shall shew, that these Salts, so generated, are easily resolved, by Art, into highly elastic Air, a tartish Water, a tartish and strong-smelling Spirit, an Oil the most volatile of any hitherto known, a gross and fixed Oil, a black alkaline Coal, an excellent Alkali, and an Earth. Salts, therefore, do not exist pure in Plants, but are always mixed with other Matters. And hence we may begin to understand the Nature of the chymical Analysis of Vegetables.

THE PREPARATION OF TARTARISED TARTAR.

Reduce the purest white Tartar to fine Powder, and boil a sufficient Quantity thereof with ten times its Weight of Water, in a large copper Vessel, till the Tartar appears sufficiently dissolved; let the Vessel remain over the Fire, that the Water and the Tartar may continue constantly boiling; the Liquor, being now tasted, proves acid, and is almost transparent, and tolerably pure. Then let fall, from an Height, a Quantity of Oil of Tartar, Drop by Drop, into the boiling Liquor, which is still to be kept boiling, whilst the Oil of Tartar is dropped in. Upon the falling of each Drop, there arises a great Ebullition in the Liquor, proceeding from the Meeting of the Acid and the Alkali; as appears from hence, that the Ebullition, soon after, spontaneously ceases, and is raised again by dropping in more of the alkaline Liquor; and, because this is performed in a strong boiling Heat, large spherical Bubbles are generated on the Surface of the boiling Liquor, that presently crack, burst, and appear again. In these Bubbles Chymists have found, or rather imagined they found, the Figure of Grapes. The Operation is thus to be patiently continued, till at length no more Effervescence arises from dropping the alkaline Liquor into the boiling Lixivium. And now the Acidity of the Tartar will be so saturated with such a Quantity of its own Alkali, as neither to appear acid, nor alkaline, but a third new Salt: But this Point of Saturation must be exactly hit; otherwise the Salt will be acid, if too little Alkali were added; or alkaline, if too much: Great Caution must, therefore, be used at the End. This Liquor is to be strained hot and quick through Flannel, till it becomes clear; it will be of a blackish-

T A R

blackish-brown Colour, of a particular bitterish, saline, unctuous Taste, but scentless; if inspissated by Heat, till a Skin appears on its Surface, and then set, for some time, in a cold Place, it deposits, to the Bottom and Sides of the Vessel, certain saline Grains, which, when collected, are a Tartar easily soluble in Water, even in the Cold; whereas before it could scarce be dissolved therein, without a boiling Heat: Whence this Preparation may properly be called *soluble Tartar*.

R E M A R K S.

Tartar comes so near to a strong Hardness, as to remain insoluble in its own Wine, which is thus contained, as it were, in an earthen Vessel; whence the *Germans* appositely call it Wine-stone. It has a manifest Acidity; by the prevailing Force thereof it acts kindly upon the first Passages; and this Acidity is the Cause, that it makes so strong an Effervescence with its own fixed Alkali, which is so easily produced from it: For, after this Acidity is overcome by the Alkali, the Tartar becomes easily soluble, and a new Kind of Salt, which has a considerable Virtue in the Body, when taken upon an empty Stomach, dissolved in Water; for thus it deterges, and gently purges, and helps to cure many inveterate Diseases. Externally used, it cleanses foul Ulcers, and disposes them to heal: But whether this be the boasted Remedy of *Paracelsus*, by means whereof he declares he cured all fresh Wounds in a few Hours without Suppuration, I cannot tell. That Medicine he called *Samech*, which seems derived from a *German* Word, which signifies, *to conglutinate*. Thus much I can say, that a Solution of this Salt in Water is one of the best Menstruums hitherto known in Chymistry; as any one may learn, by boiling Gum Lac, Myrrh, and the like, therein. Whence he will find it can scarcely sufficiently be commended; and hence it is plain, that, used as a Medicine, it will dissolve viscous Matters in the first Passages; and it is even supposed to dissolve the tartarous Matter of the human Stone, generated in the Receptacles and Passages of the Bile and Urine, provided it be used plentifully every Day, the Dose being gradually increased. It is useful in the Stone, Jaundice, and hypochondriac Disorders. Lastly, the Examination of this Process shews, how proper Cream of Tartar is in all those Distempers, where the Bile in particular, and other Humours, purify in the Intestines, from a burning Fever, or other Causes, and thus become alkaline; for this Disposition is then corrected by the latent Acidity of the Tartar, and, at the same time, converted, in the Body, into a mild, aperitive, and soluble Salt, which opens the Passages, without greatly stimulating them, and removes Obstructions.

REGENERATED TARTAR.

To a Quantity of sharp, pure, and dried, fixed Alkali, contained in a large Glass, with a narrow Neck, pour strong distilled Vinegar, till it almost covers the Salt; scarcely any sensible Effervescence will appear, which seems strange, because so strong an Alkali might be expected to make an Effervescence with the Acid; but it seems, on the other hand, as if so weak an Acid would not make an Ebullition with so strong an Alkali: Shake them strongly together, and then some small short-lived Ebullition appears. Pour on more distilled Vinegar, and then a greater Ebullition will arise, and appear sufficiently manifest; after shaking the Glass, add a third Quantity, and then a violent Ebullition, frothing and hissing, will be found, and prove the stronger, the more the Glass was shook; and this continues a long while, so that the Vinegar poured on makes the stronger Effervescence, the nearer the Operation approaches to the Point of Saturation with the Alkali; which Point is generally obtained, when about fourteen times the Weight of strong distilled Vinegar is added to the Alkali. Now, towards the End, let the Mixture be well heated, and long and strongly stirred, that no more Acid may be poured on, than is exactly required, to obtain the Point of Saturation; which will, at length, be hit, by continuing to add a little of the distilled Vinegar by degrees, and well agitating the Mixture, till the Addition, and shaking in of a little more, no longer causes an Effervescence, even in the Heat. Then let the Mixture stand warm, for twenty-four Hours; and if, upon shaking, it makes no Ebullition, again drop in a little Vinegar, and shake the Vessel; and, if now no Effervescence arises, then the exact Point of Saturation is hit. During the Experiment, the violent Effervescence throws off a very elastic Vapour, which bursts out of the Glass with an hissing Noise, after having been confined by pressing the Hand against the Mouth of the Glass, whilst it was shook, and then suddenly taking it away; and if the Orifice should be closely and strongly shut up, during the Effervescence, the Glass would be burst to pieces. The Liquor thus prepared is transparent, of a particular Odour, not acid, and of a Taste neither acid nor alkaline, but particularly Saline, and almost without Acrimony. It has a mild and innocent Virtue, though powerfully attenuating and resolving, being purgative, diuretic, and sudorific; whence it proves an admirable Remedy in chronical Diseases, attended with a tenacious Matter, being given in a proper Dose, at proper Seasons.

T A R

The Liquor, being decanted clear from its Fæces, and distilled in a glass Alembic, affords a pure simple Water; whilst the Liquor remaining behind becomes of a brown or blackish Colour, and at length perfectly black, fat, thick, or an extremely penetrating, or, as it were, melting Taste, which discovers it to be of a saponaceous, penetrating, and resolving Virtue. Take a little of this Liquor, and mix it with a little Vinegar; when, if it yields an Effervescence, this shews, that the Alkali still predominates; and therefore the Whole must be again saturated, by the careful Addition of distilled Vinegar; and, as this usually happens to be the Case, the Point of Saturation is to be carefully and anxiously secured.

When at length this is happily obtained, let the Liquor be separated, by Rest, from its Fæces, and then all the Water be drawn off by a gentle Fire, till a saline Mass remains at the Bottom, of a black-redish Colour, and an highly penetrating, but very particular saponaceous Taste. This Mass will have attracted and retained all the Acid of the Vinegar, and given out all the Water. Mr. *Homburg* has laboriously shewn, that the Weight of the fixed Alkali is here increased Nine-twentieths in respect of the Alkali, by the Acid of the Vinegar so attracted; and that this Acid, in respect of the Vinegar, was in the Vinegar about a thirty-seventh Part of the Whole; the other thirty-six Parts being pure Water. And thus the Salt is procured, which the Chymists call regenerated Tartar.

If the Salt, thus laboriously prepared, be urged with a strong Fire, it becomes volatile, and flies off into the Air. When carefully dried with a very gentle Fire, it appears like a Mass, that had strangely concreted, in the Cold, by the Apposition of little thin Plates, like Talc. It presently runs with Heat into a kind of a thick Oil, but again appears leafy in the Cold; and hence it has been called *Terra foliata*; and *Tachenius*, pretending it to be dissolved Talc, is reproved for it by *Zwelfer*, in his apologetic Discourse against *Tachenius*.

R E M A R K S.

There is not in all Chymistry a more instructing Experiment, than this; it shews us a new, unexpected, and particular Appearance of Alkali and Acid in the making an Effervescence. We here see all the Degrees of Colour from the transparent Whiteness of Water, up to Blackness; we see, that a fat, inflammable Oil is regenerated from Alkali, calcined by a violent Fire, and a thin, hungry Spirit of Vinegar; for this dry Salt takes Flame in the Fire, and, when distilled with a strong Heat, affords a true Oil. Hence we learn, that Salts, produced by a Mixture of Acid and Alkali, are not barely made up of the Acid and Alkali, as they are again separable, but that a new Thing is produced, of which no Sign appeared before. We are taught what Proportion of Acid, and what Proportion of Water, is contained in an acid Liquor; what Proportion of Acid is required exactly to saturate an Alkali; and the true Manner of converting fiery fixed Alkali into a mild, compound, volatile, saponaceous, oily Salt. This Salt, when properly prepared, is a most admirable Menstruum, converting its Subject, by Mixture and Digestion, into an uniform, soluble Mass, that will readily pass through the Body, and remain rich in its own Virtues. It is the greatest Resolvent in the Body hitherto known, and therefore highly valuable, as it is not hurtful in hot Cases, yet serviceable in cold ones, and almost suited to every Patient. Upon carefully considering all these Particulars, I have often doubted, whether this were not *Helmont's* volatile Salt of Tartar, which he so highly commends, and substitutes for the Alcahest itself, especially since it flows like Wax in the Fire. It seems certainly to be the *Acetum radicum* of the ancient Chymists, as in its Preparations Vinegar returns, and is joined with its own Matrix of calcined Tartar. But whoever shall over-carefully endeavour to dissolve, purify, filtre, inspissate, or calcine this Salt, in order to make it white, he will find it fly off into the Air, and be lost; and may thus indeed be convinced of its Volatility with the Loss of his Labour and Cost. And this Admonition I give, principally because *Sennertus* recommends a scrupulous Diligence in purifying this Salt; which is not only a Loss, but an impoverishing Labour.

TINCTURE OF TARTARISED TARTAR.

Reduce dry tartarised Tartar to fine Powder; put it into a tall Bolt-head, and pour pure Alcohol thereon, till it rises four Inches above it. Stop the Glass with Paper, and boil with a gentle Heat, for twenty-four Hours; by which means the Alcohol will become of a gold Colour, and of an aromatic, hot, penetrating Taste. If the Operation be repeated with fresh Alcohol, a white Salt will remain at the Bottom. Let the Tinctures be inspissated with a gentle Fire, till a tenth Part remains condensed behind.

RE-

T A R

R E M A R K S.

The Tincture thus prepared is aromatic, heating, cleanses Ulcers, and heals up Wounds; the remaining Salt is purer, and more simple, than before; which shews that Salts may be whitened, by drawing a Tincture from them with Alcohol.

THE DISSOLUTION OF REGENERATED TARTAR IN ALCOHOL.

Put regenerated Tartar prepared as above, and made as dry as it can be with Safety, into a tall Bolt-head; pour thereto six times its Quantity of pure Alcohol, and boil them carefully with a gentle Fire; they will thus be united into an uniform compound Liquor, that deposits some Fæces at the Bottom; which being subsided, let the Liquor be poured off pure. And, if any Salt remain undissolved behind, add fresh Alcohol, and proceed as before. Lastly, distil the Liquors with a gentle Fire to one half; and thus the Tincture or Solution of regenerated Tartar will be obtained.

R E M A R K S.

We have here the Alkali, the oily Acid, and the oily Spirit, of vegetable Subjects united together; whereby the most active Principles of Plants are freed from their indolent Earth, and yet remain safe, or not dangerous on account of their Acrimony. This Mixture, also, seems to be the lesser Elixir of the Philosophers; which the ancient Chymists commended for restoring Health. Certainly, it dissolves almost all Obstructions, penetrates the Vessels, agreeably stimulates the vital Faculties, and cures by Sweat. It is, also, a most excellent Solvent in Chymistry, whereby Bodies are dissolved into their smallest and most active Parts, without impairing their seminal Virtue; so as to gain them Entrance into the innermost Recesses of the Body, in order for conquering the most obstinate Distempers. It is no less serviceable, when externally used in Wounds, Tumors, and Ulcers. And, that the Poor may not want so excellent a Remedy, it may be directly prepared by mixing Pot-ashes with fifteen times their Weight of strong Vinegar; then straining and inspissating the Solution; and thus without less Labour, or great Expence, a Medicine may be easily prepared for Use. This Medicine was known to the ancient Romans, and is mentioned by Pliny in his Preface, where he says, *The Ashes of Vine-twigs, being dissolved in Vinegar, are drank in Diseases of the Spleen.*

HARVEY'S TINCTURE OF SALT OF TARTAR.

Take the black alkaline Salt, remaining in the Retort after the strongest Distillation of Tartar; reduce it to Powder, in an hot iron Mortar, with an hot Pestle; and immediately put it into a tall Bolt-head; pour the best common Spirit thereon, so as to rise four Inches above it; boil with a gentle Fire for twenty Hours; and thus a black, thin, bitter, aromatic, lixivious Liquor will be obtained; which, being decanted pure, may long be preserved perfect in a close Glass for Use, under the Title of *Harvey's Tincture of Salt of Tartar.*

R E M A R K S.

The common Spirit consisting of Water, Acid, and Alcohol united, coming to boil with the Alkali of Tartar, that still remains oily, makes a mild and safe Lixivium; the Alkali being here tempered by the Acid, Oil, and Alcohol: Whence we have a noble kind of Medicine and Menstruum; wherein if Vegetables be boil'd or digested, it dissolves them to good Advantage. In Surgery it is an excellent Remedy for cleansing, deterging, drying and healing all weeping, purulent, putrid, sanious, and virulent Ulcers, as well the fistulous, as the sinuous, and burrowing; and, also, for consuming proud Flesh; especially if artificially mixed with a little Oil. It has similar Effects, when used internally, in Distempers where acid, austere, aqueous, mucous, or terrestrial Matters and Coagulations abound, provided they be not attended with a putrid Dissolution of the Humours: And hence it is commended in old Obstructions of the Viscera, Collections of Water, dropical Dispositions, the Green-sickness, Jaundice, and cold Gout. It acts strongly as a Diuretic, a Diaphoretic, and sometimes, as a Purgative; and may be safely given in a large Dose. Two or three Drams thereof, being mollified with an Ounce of the Syrup of the Five opening Roots, and diluted with Fennel-water, will have a very good Effect, being taken in a Morning fasting, and repeated three or four times at due Intervals, or a better than most other Remedies. Hence the famous Dr. Harvey deservedly recommends it; though the ancient Physicians, also, were not unacquainted with the like for the same Purposes, as may appear from *Dioscorides.*

T A R

HELMONT'S TINCTURE OF SALT OF TARTAR.

Take the black Salt of Tartar, remaining upon the Distillation of Tartar; put it into a large and strong Crucible; burn and calcine it well in the Fire, with Care to prevent the Coals, or other Matters, falling into it, till it becomes white, and all its oily Matter be consumed. Or, to make more Dispatch, take a Parcel of the best Tartar, and tie it up in Cap-paper, first made a little moist; then put it into the Fire, and surround it every-where with live Coals, and let the Fire at last go out of itself; then removing the hot Ashes, an alkaline saline Mass will be found run together at the Bottom; this is called common Salt of Tartar. Let either of these Preparations be dissolved in Water, filtered and exhaled away in a clean iron Pot; and let the Salt be afterwards calcined, and reduced to fine Powder, the finer the better; this will be excellent Salt of Tartar. Then have ready at Hand a tall and dry chymical Glass, with a wide Mouth, One-third full of pure and warm Alcohol; let, also, the whole Neck of the Glass be well heated all round, lest it should burst by the Heat of the Salt of Tartar, to be now presently poured in; fit a Paper Funnel to the Mouth of the Glass; and through this pour the Powder of the Salt of Tartar now extremely hot, as it comes from the Fire, and therefore dry, into the Alcohol. If all these Particulars are rightly observed, the Salt will fall into the Alcohol, with a great Hissing and Noise, and immediately cause an Ebullition. When a sufficient Quantity of Salt is put in, stop the Glass slightly with a Cork; and, when all is cold, pour in more Alcohol, till the Glass be Three-fourths full; shake them together; so that no Salt may hang on the Sides of the Neck of the Glass; but all of it remain entirely under the Alcohol: Otherwise these adhering Particles of Salt would dissolve by the Moisture of the Air, then mix themselves with the Alcohol, and frustrate the whole laborious Operation. Let the Glass now be set in an Heat of an hundred Degrees, and be often shaken, and lightly stopped, to exclude the Moisture of the Air, which is here so prejudicial. The Liquor will thus soon become of a deep and beautiful red Colour, and contain the manifest Virtue of the alkaline Salt, as appears by the Smell and Taste, though scarce by any Effervescence; but especially if it be very cautiously inspissated by Distillation; for, being afterwards examined, it is found manifestly saponaceous, and somewhat saline. If the least Particle of Water be mixed with either Ingredient, no Tincture will be obtained; but the Alcohol remain colourless, and transparent upon the Alkali, how long soever they stand together. And thus even the lightest Sign of Moisture will, also, appear: Whence I do not wonder to find, that some eminent chymical Authors have wrote, that this Tincture was impossible; for it cannot be made, if any one, even of the slightest Circumstances here required, be omitted. And as to what other Professors of the Art have wrote, that the Colour, by our Method communicated to the Alcohol, should be owing to a spontaneous Change thereof in time; this is confuted by the Experiment, and the Marks above described: But it is easy to mistake in so laborious and difficult an Experiment. I have not found the Tincture alkaline; but rather of a compound, saponaceous Nature.

R E M A R K S.

This Experiment, again, shews, that pure fixed Alkali has an Appetite of attracting almost all Liquids to itself, whenever it exists by itself. Thus it greedily drinks in Water, Acids, and Oils, and Alcohol, also, though not so strongly, or so closely, as the former. Hence we have a new Method of making an extremely subtle Soap of Alkali and Alcohol; for this Tincture is truly saponaceous, as appears by rubbing it between the Fingers, where it has a manifest detergent Property, in an high Degree; while pure Alcohol, thus treated, would manifest itself only by Driness. It shews itself to be saline and fiery by its Taste; it does not, indeed, make a manifest Effervescence with Acids, or readily precipitate Bodies dissolved therein. If the pure Tincture be inspissated by Distillation, it leaves a saline, saponaceous, scarcely alkaline, but sharp, coagulated Substance at the Bottom, of a deep-red, or almost black Colour. As a Menstruum, it incomparably dissolves all distilled Oils with great Expedition and Perfection; it, likewise, extracts excellent Tinctures from Gum Lac, Myrrh, and Amber: It is recommended by the Chymists for internal Use, against Distempers arising from a stubborn tartarous Matter; but, to say the Truth, it cannot be given, unless diluted with Water, Wine, or the like mild Liquor otherwise; it instantly burns the Parts it touches; and, when weakened, as it requires, to what Purpose was all the Pains taken to purify the Alcohol, and unite it with the Alkali?

Alkali? I judge, therefore, that *Harvey's Tincture of Salt of Tartar* affords a more excellent Medicine, with much less Trouble. The present Operation, however, is by no means useless; for it teaches many Particulars, some whereof are mention'd above.

I have long considered upon that casual Saying of the great *Helmont*, that, if Spirit of Wine be distill'd from thoroughly calcined Salt of Tartar, one half of it will be turned to Water. This I understood of Spirit only once rectified; especially, because, in another Place, he says, the same thing happens with Vinegar. But, because the principal Followers of *Helmont* declare, that we are to understand this Saying of pure Alcohol, one half whereof is joined to Salt of Tartar, whilst the other is turned to Water, and, therefore, that true Alcohol consists of these two separable Parts; and, also, that the Salt of Tartar is thus, also, converted into that noble Balsam, or *Samech*, of *Paracelsus*, which miraculously heals Wounds, without any Inconvenience; I judge proper here to declare, what I have myself found with great Labour. I made a perfect Tincture of the Salt of Tartar, in the manner above described; it was extremely strong, red, and fragrant, and of a sharp, fiery, and almost alkaline Taste: I digested it upon its Alkali for many Months, then set it by four Years; the Salt continued extremely dry at the Bottom, and the Tincture exceeding red above it: I then poured out all this Salt, and the Tincture, into a perfectly dry and clean glass Body; they were extremely fragrant. I distilled off all the Alcohol with a gentle Fire, having exactly luted the Juncures; the Alcohol was perfectly limpid, subtile, and fragrant; the Salt at the Bottom was now of a purple Colour, tho' it was white before; I poured the Alcohol upon its Salt, and distilled as before; the Alcohol now rose with more Difficulty, and a saline red Mass remained behind; the Alcohol was of a fiery Taste: I thus continued to cohobate it for one-and-twenty times, after which a black saline Mass remained at the Bottom, and the Alcohol came over exceeding sharp; in the last, I urged this black alkaline strong-smelling Mass with the greatest Heat that Sand could give; upon which there came over, not Alcohol, but Water, tho' I had with the utmost Care prevented any Water from getting in. And thus I found, that Water might be obtained from this Salt and Alcohol, but, not half the Quantity in respect of the Alcohol; and still I have some Doubt, whether this Water did not proceed from the Air, or was not secretly taken up upon returning, and distilling the Alcohol so many times over: This I am certain of, that the Alcohol thus first put to digest with the Salt of Tartar, for so many Months, and afterwards left for some Years therewith, then drawn off from it two-and-twenty times, did not make this Salt volatile, but left it fixed, and perfectly black. Having now broke the Vessel, and taken out all the Salt, I exposed it, in a hollow Glass, in a Cellar, where it ran into a brown Liquor of a sharp alkaline Taste, which I reserved by itself. This Labour I undertook, that I might at length be certain of the Nature of Salt of Tartar, and of the Conversion of Alcohol into Water by its means; the Union of Alcohol with Salt of Tartar, by distilling it therefrom; and the volatilizing of Salt of Tartar, by means of Alcohol: And hence we see what the great Promises made about these Matters end in. The Alcohol, so many times cohobated, was extremely clear, fragrant, of a fiery Taste, would burn away without leaving any Fæces, and made no kind of Effervescence upon the Addition of Acids; and this was the Reward of my Labour.

TARTARUM VITRIOLATUM.

Vitriolated Tartar.

1. Take three Ounces of pure Oil of Vitriol; dilute it with thrice the Quantity of warm Water, in a tall capacious glass Body, with a narrow Neck; add to it, Drop by Drop, a Quantity of Oil of Tartar *per Deliquium*; till the Point of Saturation is perfectly obtained; otherwise a pernicious Acrimony, either acid or alkaline, remains. In this Experiment a violent Effervescence will arise; and a white Salt begin to appear at the Bottom, long before the Saturation is completed. After this Point is found, shake the Vessel for a considerable time; and taste the Liquor: If it tastes neither acid nor alkaline, take a little thereof, and heat it; divide it into two Parts; and to one add a Drop of Oil of Vitriol, and to the other a Drop of Oil of Tartar *per Deliquium*; and, if no Effervescence appears in either, the Point of Saturation, here so requisite for medicinal Use, is exactly hit. If any Effervescence arise upon the Addition of the Acid, the Alkali prevails; and, if the Alkali causes any Effervescence, the Acid prevails; but, when the Equilibrium is obtained, let the Liquor be entirely dissolved by the Addition of hot Water, so that all the Salt may be taken up. Let the Liquor be strained while it is hot, evaporated to a Pellicule, and crystallized. A white Salt will be obtained, of a neutral Taste, that requires a large

Proportion of Water to dissolve it: What remains cannot be crystallized; as happens in the Case of Nitre, Sea-salt, and almost every other Salt.

2. Some eminent Chymists, among whom we reckon *Tachenius*, imagine that the Oil of Vitriol, after having suffered so great a Fire, carries up with it some volatilized metallic Part, that gives a noxious Quality to this Salt, not to be easily destroyed: Hence they endeavoured to obtain this Acid native and simple, without Fire, and join it with fixed Alkali of Tartar. They, therefore, dissolved Vitriol in Water, so as to make a dilute and pure Liquor, to which, when filtered, they added Oil of Tartar *per Deliquium*, Drop by Drop; upon which the Liquor grows turbid, and the Iron, in form of yellow Oker, falls to the Bottom: They carefully proceed thus, till no more Precipitate is obtained, upon Addition of the Alkali. This Point they carefully observe, and set by the Mixture, till all the metallic Fæces are precipitated; then filter the pure Liquor, insipitate and crystallize as before. Thus a *Tartarum Vitriolatum* is obtained without Fire; and, as they seem to imagine, without any Suspicion of a sharp corrosive Virtue; and if there be no blue, or green Colour remaining in the Liquor, or the Salt prepared from it, the Preparation will be good; but otherwise it will retain something of Copper, and prove malignant.
3. When, by the like means, a Salt is prepared with any pure volatile Alkali, and Oil of Vitriol, either alone, or diluted with Water, a like, but a semi-volatile and more penetrating Salt is obtained; whereas the former is wonderfully fixed. This Salt, in whatever manner prepared, appears considerably ponderous and solid; and, yet at the same time, is mild and opening.

R E M A R K S.

The Virtue of this Salt is esteemed highly opening, if taken upon an empty Stomach, diluted with Broth or Whey, and assisted with the Exercise of the Body; for thus, by attenuating, resisting Putrefaction, and stimulating, it opens the obstructed Viscera, so as to have acquired the Name of the universal Digestive; but *Tachenius* calls it an unmetallic Vitriol. It appears from various Chymical Processes, that the most corrosive Alkalies and Acids grow perfectly mild upon mixing together. Whence we learn, that two Poisons, as they would prove, if taken separate, may be render'd innocent, if drank mixed together; or even that one may be corrected by taking the other soon after. Hence, also, we see, that Water may lie wonderfully concealed in Salts, and at length be set free from them; for the acid Spirit of Nitre contains sixty Parts of Water, to nineteen of true Acid: Spirit of Salt holds fifty-two Parts of Water, to thirteen of Acid; and Oil of Vitriol sixty of Water, to thirty-seven of Acid; even supposing all these Liquors highly rectified: So large a Quantity, therefore, lay concealed in decrepitated Sea Salt. And hence we learn, that there are but very few simple fossil Acids; as the Acid of Alum, Vitriol, and Sulphur, is the same; Aqua-fortis, and Spirit of Nitre, have no Difference; and the Spirit of Sea-salt, salt Springs, and Sal Gerni, are all the same. *Boerhaave's Chymistry.*

TARTON RAIRE. The same as the *Sanamunda*. See THYMELÆA.

TATAIBA *Brasilensis*, Marg. & Pison. *Sive Arbor bacifera Brasilensis, fructu Tuberculis inæquali, Mori æmulo.*

A Tree growing in *Brasil*, of an ash-colour'd Bark, and a croceous or redish Wood; the Leaves are acuminate and serrated, resembling, in some measure, the Leaves of Birch. The Fruit is of the Size of a moderate Mulberry, round, and composed of Tubercles of a pale Colour, with many Filaments on the Outside, which are of a dark-brown Colour, and not very long: This Fruit is eaten, as Mulberries are, either alone, or with Sugar and Wine; it contains within it small whitish Grains dispersed through the Pulp.

The Wood of the Tree is extremely hard, and lasts a very long time, as well in Earth, or Water, as without them, being always green. It is the best of all Woods, and excels that of the *Masandiba*, in what manner soever it be used. Of the old Wood they prepare a Tincture of a very fine yellow Colour. The Tree grows every-where in the Woods, especially in maritime Places; and the Fruit is ripe in May. *Raii H. P.* 1639.

TATARIA, *Hungarica edulis, Panacis Heraclei folio, semine Libanotis Cachryophoræ.* J. B. *Panaci Heracleo similis Ungarica.* C. B. *Panaci Heracleo similis Tataria Ungarica dicta.* Park.

This is no common Plant, but has a very long and thick Root; for *Clusius* tells us, that he was presented with some of the Roots, which were as thick as a Man's Arm, and a Cubit or more in Length, by the noble *Balthasar de Barbyan*, who had order'd them to be brought from *Hungary* beyond the *Danube*, on his Account, that he might plant them in his Garden at *Vienna*. They produced Leaves not much unlike those of Turneps in their Jags and Incisures; but shorter, and in Shape more

resembling those of the *Panax*, cover'd with a rough lanuginous Substance, and of a palish-green Colour; after these were produced other Leaves with smaller Jags, but no less rough, from the Middle of which arose a striated, concave, and nodous Stalk to the Height of a Cubit, or more, as thick as a Man's Thumb, and as rough as the Leaves, and set with lesser multifid Leaves on broad Pedicles, and cover'd, also, with a rough woolly Substance; the Top of the Stalk expanded into an Umbrella, resembling that of the *Panax Heracleus*, on which are the Flowers equal in Shape and Colour, and succeeded by a few scattering Seeds (for all the Flowers are not fruitful) very thick, and not much unlike the large striated Seed of the *Libanotis Cachryophora*. *Clusius* had the Root two Years in his Garden, before ever a one of them produced a Stalk and Seed; after which they putrefy'd, and exhaled so noisome a Smell, that he was obliged to throw them away.

The Hungarians who live about *Agria*, and also, those who border upon *Walachia* and *Moldavia*, in a time of Dearth, make use of the Roots for want of better Bread; as *Clusius* was assured by the aforesaid Nobleman, and other Persons of Quality, who lived in that Country. *Raii Hist. Plant.* 424.

TATL. The Name of an extremely minute *American* Bird; I suppose the same as that call'd the Humming Bird. I don't know that it is of any Use in Medicine.

TATURA. The same as **DATURA**.

TAUROCOLLA. Glue made of the Ears and Genitals of Bulls. This Sort of Glue was esteem'd the best.

TAURUS. The Bull. See **Bos**.

TAXUS.

The Characters are;

The Leaves are broader, thicker, and blunter than those of Juniper; and disposed like the Teeth of a Comb. The Flower is amentaceous, consisting of a squamous Calyx, from whose Centre arises one Style, furnished with a Multitude of Testiculi or Apices shaped like a Mushroom. The Fruit grows on the same Plant with the Flower, but in a different Place, and is pulpy, bellied, and hollow like a Pot, or shaped like an Acorn, and containing one Seed.

Boerhaave mentions three Sorts of *Taxus*; which are,

1. *Taxus*. *Offic. Ger.* 1187. *Emac.* 1370. *Raii Hist.* 2. 1416. *Synop.* 3. 445. *J. B.* 1. 241. *C. B. P.* 505. *Tourn. Inst.* 589. *Boerb. Ind. A.* 2. 208. **THE YEW-TREE.**

This Tree grows in mountainous and rocky Places, and is commonly found in the Western and Southern Parts of *England* in hilly Woods and Hedges. Our Ancestors planted Yew-trees in Church-yards, on account, it is supposed, of the everlasting Greenness of its Leaves, which was a Symbol of that Immortality and eternal Life, to which they expected the dead Bodies there deposited would arise, at the general Resurrection. The Antients, and many of the Moderns, have affirmed, that the Fruit of this Tree is destructive and deadly. *Dioscorides* writes, that those who eat the Berries are seized with a Flux of the Belly; and elsewhere he says, that the *Taxus*, taken inwardly, induces a Coldness of the whole Body, Suffocation, and speedy Death. *Cesar, Lib. 6. de Bell. Gall.* writes, that *Cativulus*, King of the *Eburones*, killed himself with drinking the Juice of the *Taxus*. Some there are, says *Pliny*, who tell us, that from this Tree the poisonous Juices, with which the barbarous People tinged their Arrows, were called *Taxica*, though now *Toxica*. But *Vossius* and *J. Bodeus* shew, that the *Toxicum* was another Kind of Poison, with which they anointed their Arrows, that Wounds from them might prove mortal: *Toxicum*, therefore, is so called from *Toxon*, τόξον, a Bow. *Matthioli* affirms, that, in the Mountains of *Trent*, not only Horses, and other Beasts of Burden, but ruminating Animals, have died with eating of the *Taxus*; and that Shepherds, and Cutters of Wood, have been seized with burning Fevers, and a Flux, from eating the Berries, to the great Hazard of their Lives. *J. Bauhine*, also, tells us, that he has been assured by Persons of good Credit, that, in the Mountains of *Burgundy*, Oxen and Cows have died with eating the Leaves and Bark of this Tree. And *J. Lutz*, an Apothecary of *Kirchenheim*, told him, that a white Turtle-dove, with a black Collar, which he kept in his House, died with eating the Berries; and that, in the Village of *Oberentzingen*, an Ass died suddenly, after eating of the *Taxus*.

On the contrary, we are of Opinion, that the *Taxus* is unjustly blamed, since *Lobel* assures us, that Children in *England* use to feed on the Berries, without any ill Effects; and that he had tasted them himself, towards the End of the Autumn; and that they had no disagreeable Taste, only maukish and bitterish; and that the Swine there fed upon them as freely as on Acorns. Our Countryman *Gerard* relates, that both he himself, and great Numbers of his Schoolfellows, had often eaten of the Berries to Satiety, and had slept not only under the Shade, but on the Branches of the Yew-tree, without the least Inconvenience. *Camerarius* holds the *Taxus* to be harmless; that its red Berries are greedily covered by the Birds, who are stupefied by them, in such a manner as to be easily taken. Either, therefore, the Antients are mistaken in the Accounts they give us of the *Taxus*; or the Constitution of the Air, or Condition of the Soil, have occasion'd this Difference

in its Quality. The Tree, I confess, is of a sad Green, and its melancholy Aspect, if I may so say, seems to indicate some malignant Quality belonging to it; and at the time it is in Flower, and most pregnant with Juice, it may, possibly, be noxious to Cattle: However, I affirm nothing; for the Antients themselves do not talk very consistently, about the noxious and deadly Qualities of this Tree. *Theophrastus* writes, that some Persons eat the Fruit without Harm; and that the Leaves are mortal to labouring Beasts, but not to ruminating ones. *Plutarch* says, it is hurtful only when it begins to be in Flower. And *Dioscorides* gives a Hint, that it is not every-where deadly and poisonous, when he says, that the *Taxus* in *Italy*, and the Southern Parts of *France*, is mortal; that of *Italy*, with its Berries; and the other, with its very Shade. It is strange, that Birds, which eat of the Fruit of the *Taxus*, should turn black: And we learn from *Virgil*, that this Tree is prejudicial to Bees. Of old the best Bows were made of the Wood of the *Taxus*, which is still highly valued by Joiners, Turners, and other Artificers in wooden Work.

Evelyn speaks of another Species of *Taxus*, in the Garden at *Pisa*, whose Leaves are more like those of the Fir-tree, and the Tree thicker of Leaves and Branches; being clothed with Leaves from the very Root upwards, and so thick-set with Boughs, and small Branches, as to appear rather like an Hedge than a Tree, though it be, also, very tall. This Tree is supposed, by *Evelyn*, to be the deadly *Taxus* of the Antients, because *Bellucci*, the Keeper of the Garden, affirms, that the Gardeners, who sometimes clip the Tree, are not able to continue at their Work above half an Hour at a time, by reason of a very severe Pain in the Head, excited by the noxious and poisonous Smell, emitted from it while under Cutting. *Raii Hist. Plant.*

2. *Taxus*; *Folio latiori, magisque splendente.*

3. *Taxus*; *Foliis variegatis. H. R. Par. App.*

The Wood is very elegantly coloured, and used to make Walking-staves. The Berries eaten induce a Dysentery and Fever. This was a very noted Tree among the Antients, for its deleterious Quality, which proved mortal, as it was pretended, to all who took it. But though it was formerly accounted a poisonous Plant, we are now-a-days better informed, and cultivate it everywhere, for the sake of Ornament, in Gardens. *Hist. Plant. adscript. Boerhaav.*

Taxus is, also, a Name for the Badger; which is thus distinguished by Authors:

Taxus. *Offic. Schrod.* 5. 308. *Schw. Quad.* 130. *Ind. Med.* 115. *Aldrov. de Quad. Digit.* 264. *Jonf. de Quad.* 101. *Taxus etiam Daxus.* *Charlt. Exer.* 18. *Taxus suillus, Meles.* *Mer. Pin.* 168. *Taxus sine Meles.* *Raii Synop. A.* 185. *Meles.* *Gefn. de Quad. Digit.* 686. **THE BADGER.**

The whole Animal incinerated, its Blood, and its Fat, are applied to medicinal Uses. The Ashes of the burnt Animal are exhibited with Success in pulmonic Disorders, and an Hemorrhoe. The Blood, pulverized, is said to be good for the Leprosy; and the same, distilled, to be effectual against the Pestilence. The Fat, as it is a little thicker, so it is somewhat hotter, and more efficacious, than the Fat of Swine: It gives Relief under Pains of the Kidneys proceeding from the Stone, mitigates the Heat of Fevers, and restores Contractions and Weaknesses of the Joints and Nerves. *Schroder.*

TEAPHIN. This Word occurs in *Nicolaus Myrepsus, Sect. 12. Cap. 27.* It is mentioned as an Ingredient for a Fumigation, in Disorders of the Anus. The Word is utterly barbarous; and *Fuchsius*, his Commentator, confesses, he don't understand what the Author means.

TECMARSIS, τέκμασις, from τεκμαίρω, to indicate, of τέκμαρ, a Sign, is a Word used by *Hippocrates*, in the Beginning of his Book *de R. V. I. A.* importing a judicial Knowledge, or a Judgment founded upon determinate and necessary Signs. This Way of judging is syllogistic, or rational, and much in Use among Philosophers as well as Physicians. It comprehends the γνῶσις, διδῶσις, ἀνέστισις, and διαπίσις, and, consequently, almost the whole Art of Medicine, which depends on artificial Conjectures, or Judgment formed according to the Rules of Art; as sufficiently appears from those Words of *Hippocrates*, in the Book before-mentioned, ὁρίσταν δ' ἐς τέκμαρσιν λέγειναι ὡς καὶ ἐκασα ἰατρῶν. But since we must come to a Tecmarsis [Judgment formed upon Indications] for the Management of particular Cases, &c. And just before, καὶ ἐκασα ἰατρῶν ἐκασα ἐς τέκμαρσιν, And some Things well accommodated to a Tecmarsis. Here *Galen* explains τέκμαρσιν by ἡ διὰ τεκμήριον γνῶσις, Knowledge acquired from a Sign, that is, from the proper Signs, or distinguishing Characters, of Things, or from necessary and perpetual Signs, which are called syllogistic. *Erotian*, on *Hippocrates*, expounds τέκμαρσιν by ἀνέστισις, A Knowledge acquired by Signs, with an Eye to the above-quoted Places: He, also, says, that τέκμαρ and τεκμήριον, in *Hippocrates*, are ἰδίως τὸ σημεῖον, properly a Sign.

Tecmar, τέκμαρ, though expounded, in *Hesychius*, by τὸ πέρας καὶ τέλος, A Limit and End, and though *Aristotle, Lib. 1. Rhetor.* says, that τέκμαρ and πέρας (*Peras*) are the same thing in the ancient Language, yet it seems to mean a Sign in *Hippoc.* *Lib.*

Lib. 2. περί γυναικ. where it is said, ἀλλὰσι δ' ἄλλῃ πᾶσι τέμασι (ἰστέ), In others the Sign is contained in some other Part: For he seems to intend, that the Signs of the Disease are various in different Subjects. Some, however, understand by τέμασι the End, and then the Sense of the Quotation will be, In some Women the End (of the Disorder) is observable in a different Part. For as he had before told us, that a Fit of the Hysterics induced, at least, a great Heaviness and Oppression of the Head, so here he intends to say, that sometimes the Disorder ends with some ill Effects on a different Part.

TECMERION, τεκμήριον. How it differs from σημεῖον (*Se-me-ion*), we are taught by *Galen, Com. 3. in Prognost.* where he says, that Συλλογιστικὸν σημεῖον, A syllogistic (rational, or such as gave Room for Ratiocination) Sign was by the Antients called τεκμήριον.

TECOLITHOS, τηκόλιθος. A Name for the *Lapis Judaicus*.

TECOMAXOCHITL. The Mexican Name for a Sort of Bastard *Apocynum*, called *Gelsemium Hederaceum Indicum*. *Cornuti. Gelsemium Indicum maximum flore phœniceo. Ferrar. Pseudo-Apocynum Virginianum, alias Gelsemium maximum Americanum flore phœniceo. Park.* It is not used in Medicine. *Raii Hist. Plant.*

TEGANITES, τήσανιτης, from τήσανον, a Frying-pan. An Epithet for Bread, importing its being fried in a Pan.

TEGULA HIBERNICA. Irish Slate. It is thus distinguished:

Lapis Hibernicus. Offic. Mer. Pin. 213. Dougl. Ind. 50. Lapis fissilis Hibernicus. Charlt. Foss. 16. Tegula Hibernica. Full. Pharm. Ext. 281. Ardesia Hibernica, Tegula Hibernica. Ind. Med. 57. IRISH SLATE.

It is a fossil Stone, of a black Colour, somewhat inclining to an Azure, and of an earthy Taste; and found in Mines, as well in England as Ireland.

This Stone is frequently used in Contusions; for it resolves coagulated Blood: Some say it is effectual in Quartan Fevers; but it is of excellent Use in all Kinds of Hæmorrhages, uterine Fluxes, and Spitting of Blood. *Dale.*

TELA ARANEI. A Spider's Web. See **ARANEUS**.

TELAMONES, τελαμώνες. Lint, applied to Wounds; or the Fillers with which Bandages are made.

TELEPHIOIDES. Bastard Orpine.

The Characters are;

It hath a Rose-shaped Flower, consisting of several Petals, which are constantly placed in a circular Order; from whose Empalement rises the Pointal, which afterwards becomes a roundish Fruit, divided into six Cells, each containing a single Seed, of the same Form with the Cell.

Miller mentions five Species:

1. *Telephioides Græcum, humifusum, flore albo. Tourn. Cor.* Low trailing Greek bastard Orpine, with a white Flower.

2. *Telephioides Americanum, erectum, folio ovali subtus glauco, flore herbaceo.* Upright American bastard Orpine, with an oval Leaf, which is of a Sea-green underneath, and an herbaceous Flower.

3. *Telephioides Americanum, arborescens, fructu parvo, foliis acuminatis. Houst.* Tree-like American bastard Orpine, with a small Fruit, and pointed Leaves.

4. *Telephioides Americanum, arborescens, foliis latis, subrotundis, & subtus incanis, fructu maximo. Houst.* Tree-like American bastard Orpine, with broad roundish Leaves, which are hoary underneath, and the largest Fruit.

5. *Telephioides Americanum, arborescens, foliis latoribus subrotundis, fructu majore ex longo pediculo pendulo. Houst.* American Tree-like bastard Orpine, with broader roundish Leaves, and a larger Fruit hanging on long Foot-stalks.

The first Sort was discover'd by *Tournefort*, in Greece; who constituted this Genus, giving it this Name from the Similitude there is between this Plant and the true Orpine of *Imperatus*: This is a low trailing Plant, which seldom continues more than two Years.

The second Sort grows in *Barbadoes, Jamaica*, and several other Places in the *West-Indies*.

The third Sort was discover'd by the late *Dr. Houstoun*, at *La Vera Cruz*; from whence he sent the Seeds into England. This Sort rises to the Height of eight or ten Feet, having a woody Stem; the Leaves are branched into many Wings, and the Flowers, which are small, and of a whitish-green Colour, grow on the under Side of the Leaves, and are succeeded by small Fruit, which hath not as yet ripened in England.

The fourth and fifth Sorts were discovered by the late *Dr. Houstoun*, at *Campechy*; where they grow to the Height of twelve or fourteen Feet: The Leaves of these Kinds are broad, and come out alternately on the Branches. The Fruit of the fifth Sort is about the Size of a small Nut, and is produced on the under Side of the Leaves, hanging on very long Foot-stalks. The Fruit of the fourth Sort is as large as Walnuts, and hath hard woody Coverings, or Shells. *Miller's Dictionary.*

TELEPHIUM.

The Characters are;

The Leaves are alternate, the Calyx is polyphyllous, and the Flower resembling that of the *Helianthemum*: The Fruit is triangular, unicapular, and full of roundish Seeds.

Boerhaave mentions but one Sort of *Telephium*; which is the *Telephium*; *Dioscoridis. Imperat. 665. Polygonum, perenne, procumbens, folio breviori, floribus in capitulum congestis. M. H. 2. 592. Sedum, procumbens, rotundifolium, glaucum, purpurascens floribus. M. H. 3. 474. Boerb. Ind. alt. Plant.*

This Plant is emollient, consolidating, resolvent, and vulnerary. The Leaves, bruised, resolve Tumors, and accelerate Suppuration; and the bruised Root is effectual in Inflammations of the hæmorrhoidal Veins.

TELEPHIUM is, also, a Name for the **ANACAMPSEROS**; which see.

TELESPHORUS. See **ACESIUS**, and **ÆSCULAPIUS**.

TELLINA. *Offic. Jonst. Exang. 48. Tellina secunda. Rondel. de Aquat. 2. 7. Aldrov. de Exang. 518. Gefn. Aquat. 940. Tellina. Charlt. Exang. 67. Bellon. de Aquat. 403. Maris Italici. Bonan. 104. n. 57. Tellina intus ex Viola purpurascens, in ambitu serrata. Liff. Hist. A. A. 190. Subfusta angustior intus purpurascens. Ejusd. Hist. Conch. 3. n. 217. THE LIMPIN.*

Fresh Limpins are good for the Belly, especially the Liquor of them: Salted and burnt, then triturated, and distilled with *Resin*, they prevent the Hairs of the Eye-lids, which have been pulled out, from ever growing again. *Dioscorides, Lib. 2. Cap. 8.*

TELMA, τέλμα, is ὁ τόπος πηλῶδης ὑδάτος ἔχων, A clayey or muddy Place holding Water. And τελαμάδεα, telmatodea, in *Hippocrates, Lib. περὶ ἀδένων*, are the ousy, moist, and spongy Parts of the Body, which receive the superfluous Humours, as where he says, ὅτε οὐκ τελαμάδεα ἐνὶ τῇ ἀδένει, So that where the moist and spongy Parts of the Body are, there you meet with Glands: The Term being translated, by a Metaphor, from signifying ousy, boggy, and marshy Places of the Earth, as appears from the following Expression a little after; καὶ οὐδ' ἐν τοῖσι τέλμασι τῆς γῆς καὶ καθύπερθε, ἢ ἐν τῇ τῇ (πέρμα, For neither does Seed grow in Bogs, and watry Soils.

TELON. Fire. *Rulandus.*

TELMUM. A Dart. Tho' the modern way of making War has render'd a Detail of the Method of curing Wounds inflicted by Arrows and Darts of less Importance, it is necessary to take notice of the Artifices employ'd by the Antients for the Extraction of Darts, and curing the Wounds thereby inflicted.

Darts, and other missile Weapons, which have penetrated into the Body, and there remain, are oftentimes extracted with great Difficulty; which proceeds sometimes from the Kind of Weapon, with which the Wound is inflicted, sometimes from the Place in which it is lodged. All Darts, or other like Weapons, are extracted the Way, by which they enter'd; or by that to which they tended: In the first Case, the Weapon makes a Way for itself, by which it may return; in the other, a Passage is prepared for it by the Knife in cutting the Flesh against the Point of the Weapon. If the Dart, or the like, has not deeply penetrated, but is lodged in the outer Flesh, or, at least has not passed through the larger Veins, and nervous Parts, the best Method is to extract it the Way by which it enter'd; but, if the Passage, by which it must return, be longer than what remains to break through, and it has already made its Way through the Veins and Nerves, it will be most convenient to open a thorough Passage for it, and extract it the opposite Way, as being the nearest, as well as safest. And in one of the larger Members, if the Point be pass'd through, the Wound is the easier to be healed, as giving an Opportunity for the Application of Medicines to both Orifices; but, if the Weapon is to be retracted, the Wound is to be enlarged, that the Extraction may be the easier, and the Inflammation the less, which is always increased from a Laceration of the Parts by the Weapon in its Return. If a Wound be opened on the other Side, it is to be sufficiently large, so as not to be subject to Enlargement, from the Transition of the Weapon; and, in short, care is to be taken in both respects of wounding a Nerve, or Artery, or one of the larger Veins; but, if any such Misfortunes should happen, the Part, as soon as discover'd, is to be taken up with the blunt Hook, and cut off with the Knife. When the Incision is large enough, the Weapon is to be extracted, the same Care being taken, that none of the Parts, whose Security was before recommended, be injur'd by its Extraction.

OF EXTRACTION OF ARROWS.

Thus much has been said of Extraction of missile Weapons in general; but there are, besides, some particular Methods of Extraction properly belonging to the several Weapons. Nothing penetrates so easily, and lodges so deeply in the Body, as an Arrow, not only because it comes with great Violence, but, also, on account of its narrow and slender Make: For these Reasons, it oftener requires to be extracted at the adverse Part, than retracted the Way by which it enter'd; and the rather, because it is generally armed with Barbs, which cause a greater Laceration of the Parts in Retraction, than in Propulsion. For extracting

an Arrow, then, a Passage being opened, the Flesh is to be drawn asunder with a Steel Instrument, of the Figure of the Greek Letter γ ; and if the Point, or Head, appears with the Shaft fastened to it, the Arrow is to be propelled, or thrust forwards, till it may be taken hold of on the other Side, and pulled out. If the Shaft be fallen out, and only the Iron Head remains within the Body, it is to be taken by the Point, with the Fingers, or with the Forceps, and so extracted. Nor is there any other Method of extracting an Arrow, when it is thought most convenient to do it, the Way by which it enter'd; for the Wound must be enlarged; and the Shaft, if there be any, if not, the Iron alone, must be drawn out. If there appear any Spicula, or Barbs, and they are but short and slight, they are to be broken with the Forceps, and the Arrow is to be extracted without them: If they are thick and strong, they are to be sheathed in slit Reeds, to prevent their lacerating the Parts, and so pulled out.

OF EXTRACTING BROAD DARTS.

If a broad Dart be lodged in the Flesh, it cannot conveniently be extracted on the other Side, because that would be to add one large Wound to another: It is to be pulled out, therefore, with an Instrument which the Greeks call *Διουκλῆς γράφισκος*, *The Graphiscus of Diocles*; who was one of the greatest Physicians among the Ancients. This Instrument consists of an iron, or a copper Plate, which at one End is furnished with an Hook on each Side, bent downwards; at the other End it is doubled in on the Sides, with an easy Slope from the Extremity to the folded Part; and a Slope, also, in the Part which is perforated. This Instrument is introduced athwart the Weapon, till it reaches its Bottom, when they turn it a little, that it may receive the Point within its Perforation; which done, the Operator, with two Fingers under the Hooks, at the other End of the Instrument, extracts both that and the Weapon together.

OF EXTRACTING SOME OTHER KINDS OF WEAPONS.

A third Kind of Weapons, which sometimes require to be extracted, are leaden Balls, Stones, and the like, which have their whole Substance buried within the Skin. In all these Cases the Wound must be enlarged, and the offensive Body extracted with the Forceps by the Way it entered.

But there is, besides, an additional Difficulty in all Wounds, if the Weapon sticks or lodges in a Bone, or in a Joint between two Bones. If it be fixed in a Bone, it is to be moved, and gently agitated, till it be loosen'd from the Place in which it lodged, as the manner is in drawing Teeth; and the Weapon seldom or never fails to follow, upon drawing; but, if it stays, some Instrument must be used to dislodge it. The last Method, where other means of Extraction fail, is to make a Perforation near the Place, with an Instrument for that Purpose, and from that Perforation to cut the Bone, towards the Seat of the Weapon, in the Figure of the Letter V; which done, the Weapon must of Necessity be loosened, and may easily be separated.

If the Dart, or other missile Instrument of War, have made its Way through the Joints, and lodged itself between two Bones, the two Limbs, near the Wound, are to be swathed, and then pulled and drawn this Way and that Way, that the Tendons may be distended; by which means more Space will be left between the Bones, and so the Weapon may be extracted without much Difficulty, Care being taken, as before advised, that no Nerve, Vein, or Artery, be wounded by it in the Extraction.

OF EXTRACTING POISONED DARTS, OR OTHER WEAPONS.

Poisoned Weapons are to be extracted by the same Methods, if possible, as the others, only greater Speed is required; and, moreover, the same means are to be used as for drinking of Poison, or the Bites of Serpents. The Method of Cure, after Extraction of the Weapon, is the same here, and in all other Cases, as it would have been, if the Weapon had never lodged in the Wound. *Celsus, Lib. 7. Cap. 5.*

Darts, and other Kinds of missile Weapons, differ in Substance, Figure, Magnitude, Number, Structure, and Effects. With respect to Substance; as to the Shaft, it may be of Wood or Cane; and for the Head, it may be made of Iron, Brass, Tin, Lead, Horn, Glass, Bone, or even of Wood or Cane, as well as the Shaft; so many Differences are to be found, especially among the Egyptians. As to Figure, some are round, others angular, as are those which are triangular; some cuspidated or lancinated, as they are called, such are those with three Points; some are barbed, others not; and of those which are barbed, some have their Barbs inflected backwards, that they may wound and enter the Parts in Extraction; others have them directed forwards, that they may do the same in Impulsion; some, again, have their Barbs oppositely disposed in such a manner, after the Figure of a Thunderbolt, that, whether they are retracted or impelled, they wound alike; others, which move on an Hinge, have their Barbs contracted, but expanded by drawing, and by that means impede the Extraction of the Dart. With respect to Magnitude; some are three Digits in Length, others but one, which the Egyptians call *Missa*; others are of a middle Length. With regard to Number; some are simple, others compound, be-

ing furnished with slender Spikes of Iron, which, in Extraction, remain behind in the Body. With respect to their Make or Structure; some have the End of the Shaft first sharpened, and then inserted into the Head; others have a Tube, into which the Head is inserted; some have the Shaft firmly fastened to the Head; others but slightly, to the end, that in Extraction they may be separated, and the Head remain behind. As to their Effects, some are medicated, or poisoned, others not.

We have given you the Characters by which Darts differ from each other, and are now to shew the Methods of their Extraction from the Bodies of those who are either wounded in War, or otherwise, whether voluntarily or involuntarily, whatever may be the Occasion, or whatever the Substance of the Dart, by which the Wound is inflicted. Darts may be extracted from the Body, either by Attraction or Impulsion; Where the Wound is but shallow, the Extraction is performed by the first Method; as it is, also, in deep Wounds, when it is dangerous to open a Passage on the opposite Side, on account of an Hæmorrhage, or Consent of Parts [*συμπάθειας*]. The Method by Impulsion is to be preferred, when the Weapon has deeply penetrated, and the Remainder of the Passage to the opposite Parts is but short, and not incommoded by Nerve, Bone, or any other thing which may forbid a Section: But when the Weapon is fixed in the Bone, there is no other Method but Attraction to be used.

If, then, the Weapon appears in Sight, we immediately set about extracting it: If it be remote and latent, the Patient, says *Hippocrates*, is, if possible, to be placed in the same Posture in which he was wounded, and the Wound explored: If this cannot be done, he must, at least, lie in a Position the most conformable that may be to that Posture, and the Wound is to be probed. And if the Weapon be fixed in the Flesh, we are to pull it out with the Hands, by the Shaft, or the Part which is principally of Wood, if not fallen out; but if this Part be fallen out, or separated from the Head, the Extraction must be performed with the Forceps contrived for the pulling out of Teeth, or Roots, or Weapons of this Kind; and the Flesh must be cut, if the Wound be not large enough to admit the Instrument. If the Dart, or the like, has penetrated to the opposite Parts, so as to render it impossible to extract it the Way by which it entered, we are to open it a Passage by dividing those Parts, and bring it out through the Section, either extracting it in the Manner above directed, or impelling it, either by the Shaft, or, if that be fallen out, by introducing some impulsive Instrument, taking due Care, that no Nerve, Tendon, Artery, or any other necessary Part, be divided; for it would be a Shame, in extracting the Weapon, to make a worse Disorder than that caused by the Dart. And here, if the End of the Weapon inserted in the Shaft be sharp, which may be known by probing, it is to be propelled, or thrust forward, by the Help of a female Instrument, adapted and introduced for that Purpose: If the End of the Weapon be hollow, or tubulous, the Propulsion is effected by a male Instrument. If the extracted Head appears with Indentments, so as to give Occasion for suppleing Spikes inserted in it, the Wound is again to be searched, and the Spikes extracted: When the Head is barbed both Ways, and, therefore, cannot be propelled or retracted, Incisions are to be made in the adjacent Parts, that the Weapon, being laid bare, may be extracted without Molestation: Some sheath the Barbs in a Reed; and by that means secure the Flesh from Laceration, in the Extraction. If the Wound be free from an Inflammation, after convenient Sutures, we heal it by the common Method of treating green Wounds; if the Part be inflamed, we use Embrocations, Cataplasms, and other Topics proper for an Inflammation. If the Weapon be poisoned, we cut away, if it be possible, all the infected Flesh, which is known to be so by its Difference from what is sound, in appearing pale, livid, and, as it were, mortified. The *Dacians* and *Dalmatians* are reported to anoint the Barbs of their Arrows with *Helenium*, called, also, *Ninus*, which, if it mixes with the Blood of the wounded Person, proves mortal, though, if it be eaten by them, it does them no manner of Harm. If the Weapon be fixed in the Bone, we make a new Search with the Probe; and, if the Flesh be an Impediment, we cut it away, or lay it open: If the Head be deeply lodged in the Bone, which is known by its Firmness, in not being subject to Concussion, though Violence be offered, the Bone is to be cut round about, or, if it be thick, perforated, in order to dislodge the Weapon.

If the Dart, Arrow, or the like, be fixed in some principal Part, as the Brain, Throat, Heart, Lungs, Liver, Stomach, Intestines, Kidneys, Uterus, and mortal Symptoms already appear, and the Extraction cannot be made without much Trouble and Difficulty, we decline the Operation, not only on account of the Impossibility of Success, but lest we should expose ourselves to the Reproach of the Ignorant. If the Event be dubious, the Extraction is to be undertaken, Warning being first given of the Danger: For many have recovered of a Wound in some principal Part, beyond all Hope, a Suppuration arising therein; and even a Lobe of the Liver, a Part of the Omentum, and of the Peritonæum, and even the entire Uterus, have been often known to be removed; and yet the Consequence has not been Death; and

and we frequently use Bronchotomy in a Quinsy. In such Cases, to leave the Weapon in the Part induces inevitable Death, besides an Imputation of Cruelty and Inhumanity upon the Art; whereas the Extraction of it has been the means of saving many Lives.

It is not difficult to know whether some principal Part be wounded; for it may be discovered by peculiar Symptoms, as well as from the Excretions, and the Situation of the Parts. A Wound in the Membranes of the Brain is succeeded by a violent Pain all round the Head, a Fervor of the Eyes, a Redness of the Tongue, and a Disorder of the Reason. If the Wound reaches the Brain, the Patient falls down, loses his Voice, vomits Bile, distorts his Face, bleeds at the Nose, and discharges a white and pulsatious Humour at the Ears, if there be an Evacuation of Sanies from the Part affected. If the Weapon be fixed in the Cavity of the Thorax, so as that a Space be left for it, the Breath passes through the Perforation. If the Heart be wounded, the Weapon appears about the Left Breast, not as if it had penetrated into a Cavity, but, as it were, fixed in another Part, and sometimes seems to have a pulsatory Motion; there is, also, an Excretion of black Blood, if there be a Passage for it, with an universal Coldness, Sweat, Fainting, and Death speedily follows. A Wound of the Lungs is succeeded by a Discharge of spumous Blood, through the Perforation, if there be Room for it, if not, it is discharged mostly by Vomiting, the Vessels about the Neck are elevated, the Tongue changes Colour, there is a great Respiration, and a Desire of cold Water. In a Wound of the Diaphragm, the Weapon at the spurious Ribs appears fixed, there is a great Inspiration, with a Pain, and an universal Angustation of the Parts about the Shoulders. A Wound in the Abdomen is manifest from the Excrements, if there be room for it; or else from the Weapon, when extracted, or the Shaft broken within; there is a Vomiting of Chyle, and a Discharge of the Excrements. When the Bladder is wounded, there is an Effusion of the Urine.

As for Extractions in these Cases, when the Brain, or its Meninges, are wounded, we extract the Weapon through the Perforation of the Cranium. In the Thorax, if the Weapon resists, we make a moderate Incision between the Ribs, or even cut out a Rib, placing a Meningophylax [an Instrument to guard the Membrane]. We take the same Method in Wounds of the Abdomen, Bladder, and other deeply seated Parts; that is, if the Weapon readily follows, we extract it without Hesitation; otherwise we enlarge the Perforation, and treat it as other recent Wounds are treated; only, for the Abdomen, a Suture, also, may be necessary.

If the Weapon be fixed in some large Vessel, as the internal Jugulars, the Carotides, or the large Arteries about the Groin, or Armpits, and a larger Hemorrhage is to be feared from the Extraction, a Bandage is to be applied, above and below the Place, before you make the Extraction.

If, by the Weapon, one Part be fixed to another; as, for Instance, the Arm to the Thorax; or the Cubit to other Parts of the Body; or the Feet to one another; if both Parts are not thoroughly perforated, we take hold of the external Part of the Weapon, and extract it, as in a single Perforation: But, if it has penetrated through both Parts, we cut the Shaft in the Middle, and extract the Pieces.

It often happens, that Stones, ragged Flints, Pieces of Lead, and the like, discharged from Slings, by the Violence of their Motion, and the Angulosity of their Figure, penetrate into the Body: These discover themselves by a rough and unequal Tumor; and in that the Division they make has no direct Course; it is, also, larger, the Flesh appears contused and livid, and the Pain is attended with a kind of Heaviness. In such a Case, the offending Masses are to be dislodged, and extracted by a concave or vulnerary Probe, or some other fit Instrument; or, if the Wound will admit of it, may be taken out with the Forceps contriv'd for drawing Teeth; or that for pulling up Roots [*ὀδονόμορος ἢ ῥιζόμορος*]. There are many Instances in which the Weapon has lain concealed within the Body, a long time after the Wound has been cicatrized, and has at last discharged itself through an Abscess, arising and breaking in the same Place. *P. Egineta, Lib. 6. Cap. 88.*

TEMACHOS, *τεμάχιος*, from *τέμνω*, to cut, is a Piece separated from the Whole by Section. *Lat. Tomaculum*. It is the same as *τεμάς*, *Tomos*; but is chiefly spoken of Pieces or Fragments of Fishes, as is observed by the Scholiast on *Aristophanes's Plutus*, where he says, that *Temachos* is spoken of a Piece or Fragment of a Fish, or a Cake; but not of Flesh. The same Scholiast, on the Comedy of *the Frogs*, expounds *τεμάχιον* by *ῥήματα τῶν ἰχθύων*, *Slices of Fishes*. The Word, as well as its Diminutive, *Temachion*, *τεμάχιον*, is used in the same Sense, that is, for a Piece, Cut, or Slice of a Fish, in several Places of *Hippocrates, de Morbis & de intern. Affect.*

TEMPERAMENTUM. A Temperament, or Constitution. The ancient Division of Constitutions was into hot, cold, moist, dry, bilious, sanguine, phlegmatic, and atrabilarious.

The Characteristics of an hot Constitution were said to be, a large Quantity of yellow-grois Hairs all over the Body; a redish

Colour of the White of the Eye; a very red Colour of the Carunculae Lachrymales, Face, Lips, and Mouth; a slender, agile, robust, and hot Body; a large and frequent Pulse; a Propensity to Anger, which, however, is soon over: Such Persons seem to have robust and contracted Vessels, strong Viscera, and very dense and acrid Humours, in a brisk Motion. Moistening, diluting, and temperating Substances are beneficial; whilst, on the contrary, all heating things are highly pre-judicial to such Persons.

The Signs of a cold Temperament are directly opposite to the former; such as a Smoothness of the Skin; small Hairs; a pale Colour; a gross, slow, weak, cold, and easily swelling Body; a small and slow Pulse; Insensibility; and Fearfulness. The Humours of such Persons are mild, aqueous, pituitous, and languid in their Motion, whilst their Solids are lax and flaccid: Corroborative and heating Substances are beneficial, whilst cold, moist, and relaxing Things, are injurious to such Persons.

A dry Temperament is discover'd, almost, by the same Signs with those of the hot Kind, if there is, at the same time, a Leanness of the Habit. The Vessels of such Persons are contracted, and their Fluids small in Quantity, and almost acrid. Moistening, diluting, and temperate Substances are beneficial, but all heating Things injurious, to such Persons.

A moist Temperament approaches greatly to that of the cold Kind; for, if in the former there is a Swelling of the Body, they are, in other respects, the same.

A bilious Temperament is known from the great Quantity of black and curl'd Hairs; an Hardness, Extenuation, and Leanness of the Body; a dark-brown Colour; large Veins; a quick and large Pulse; Obstinacy, and a Propensity to Anger. In such Persons, the solid seem to exceed the fluid Parts. This Temperament approaches to those of the dry and hot Kinds. Hot and drying Substances are prejudicial, but moistening and refrigerating Things beneficial, to Persons of bilious Temperaments.

A sanguineous Temperament is discover'd by a small Quantity of Hairs, of a dark-brown, or whitish-yellow Colour; a large Quantity of soft Flesh; large blue Veins, distended with Blood; a redish Colour; a Propensity to Anger; and a flexible Mobility of Body. Evacuating and temperating Substances are beneficial, whereas heating and drastic stimulating Things are pernicious to such Persons.

A phlegmatic Temperament is known from the great Smoothness of the Skin; white, slender, and slow-growing Hairs; a Whiteness, Swelling, Softness, and Farness of the Body; narrow, and latent, or deep-seated Veins. Such Persons seem to have narrow Blood-vessels, but somewhat larger lateral Vessels. This approaches to the cold Temperament; for which Reason, moist and cold Things are prejudicial, whereas heating, corroborating, and drying Substances are beneficial, to Persons of phlegmatic Temperaments.

The Signs of a melancholic Temperament are, Smoothness; highly black Hairs; extreme Leanness; great Dryness of the Skin; and the blackish Colour which is observed in all the Parts of such Persons Bodies; Slowness; Constancy; long Retention of Anger; and great Penetration of Understanding: For this Reason, such Persons seem to have constricted, robust, and lean Vessels, and dense tenacious Humours, so thoroughly mix'd, that their Parts cannot be easily separated or changed. Such Persons are greatly injur'd by hot, drying, and acrid Substances; whereas moistening, refrigerating, relaxing, emollient Substances, and such as gently dissolve without any Acrimony, are beneficial to them.

This Doctrine is of great Advantage in investigating the Natures of those Diseases, which may be foreseen to arise from, and be most incident to, each particular Temperament. Upon this Doctrine, also, depends a great Part of the predisposing Causes of Diseases. *Boerhaav. Institut.*

TEMPERANTIA. Temperating Medicines.

Among the various Alteratives, we may justly reckon temperating Medicines, which not only check the hot intestine Motion of the sulphureous Particles in the Blood, but, also, contemperate, subdue, and consequently refrigerate, the excessively hot bilious Humours in the Intestines. Among Vegerables, the most considerable of this Kind are, the Root and Herb of Sorrel, Wood-sorrel, Citrons, China Oranges, Pomegranates, Currants, Strawberries, Barberries, Raspberries, Cherries, and their prepared Juices; Syrups and Waters distill'd from these, when recent; the Four greater cold Seeds, and Decoctions of Barley. Among Animal Substances, the most considerable, of a temperating Kind, are Whey, Butter-milk, Juice of River-crabs, Decoctions of Tortoises, weak Decoctions of the Shavings of Hartshorn and Vipers-grass, with or without Barley; Gellies of Hartshorn, and the Water distill'd from Shavings of Hartshorn. Among mineral Substances, the most efficacious of this Class is well purified Nitre; or, which is still better, Nitre regenerated from Aquafortis, by the Addition of Salt of Tartar. And, among Chymical and Pharmaceutical Preparations, the most considerable are, the essential Salt of Wood-sorrel; Cream of Tartar; Phlegm of Vitriol; sulphurated Clyffus of Antimony; and the Tinctures of Roses, Daisie-flowers, and Violets, prepared with Spirit of Vitriol.

Temperating Medicines act in three Manners; for, by means of their acid Salt, they bridle the volatile sulphureous Particles; and, by fixing their hot, internal, vertical Motion, and coagulating them, they, in some measure, lessen them: Or they operate by a certain expansive aereo-elastic Quality, such as that of which Nitre is possessed, which, being composed of an acid and alkaline Salt, contains not only a large Quantity of sulphureous Particles, but, also, of an aereo-etheral Fluid, by which it dispels the hot Matter in a violent, preternatural and vortical Motion, and produces, as it were, an Explosion of it from the Centre to the Periphery; whilst, at the same time, by the neutral Salt it contains, it resolves, attenuates, and separates the thick Matter, which is the Matrix of the Heat and Sulphur, the quick Motion of whose Parts it stops by its subtil Acid: Or they exert their Operation, by diluting and disjoining the adhering Parts, and restoring the Moisture consumed by the Heat, whilst, at the same time, they relax the too great Elasticity of the Vessels on which the Heat depends; as is principally observed in aqueous Liquors, such as Whey, Decoctions of Hartshorn, and of Barley.

These temperating Medicines are certainly of great Use in Medicine, where a greater natural Heat is to be extinguished; for which Reason, the Physician can by no means be without them in Fevers of all Kinds; as, also, in Inflammations, Spasms, and Pains, which are always attended with an hot and excessive Commotion of the Blood. But nitrous Preparations are justly preferable to Acids, which act by fixing and coagulating the Fluids; for Nitre is not only refrigerating, but, also, relaxes the rigid and spasmodically constricted Parts, whilst, at the same time, it promotes a Discharge of the Urine and Excrements. As other refrigerating and acid Substances rather condense and coagulate the Fluids, so Nitre rather colligates, rarefies, and attenuates, the thick and viscid Humours. Hence Nitre reduced to a Powder, or previously dissolved in Water, when mix'd with black coagulated Blood, renders it more fluid and florid: For this Reason, it is not only far more proper than other Acids, in Inflammations, and inflammatory Fevers, arising from black, coagulated, and incarcerated Blood; but, also, highly beneficial in defending the Body against Inflammations, because it effectually fuses and dissolves the tenacious and thick Matter of the Serum, a large Quantity of which appears in the Blood of Persons subject to Inflammations.

In chronical Fevers, such as those of the slow and hectic Kind, which generally draw their Origin from some Fault or Corruption of the Viscera, and especially when they are attended with a Cough, or a Spitting of Blood, or when the Lungs are any way affected, we are not to exhibit Acids, but nitrous and diluting Substances, especially those furnished from the Animal Kingdom, such as Whey, together with the Waters, Decoctions and Gellies of Hartshorn. Where a febrile Heat accompanies Diarrhoeas, Dysenteries, or a Cholera, we are, also, to abstain from acid and refrigerating Medicines, and rather to use diluting, gelatinous, and mucilaginous Substances, with an Addition of the temperating and absorbent Powders, and a Grain or two of Nitre. *Frederic Hoffman.*

TEMPERIES. The same as TEMPERAMENTUM.

TEMPLUM SOSTRATI. The Name of a Bandage described by *Galen*, in his Treatise of Bandages.

TEMPLUM PARVUM APOLLONII TYRII. The Name of another Sort of Bandage, described by the same Author, in the above-quoted Treatise.

TEMPORA. The Temples. *Tempora Morborum* are the Times of Diseases, that is, their Beginning, Increase, State, and Decline.

TEMPORALIS MUSCULUS. The Temporal Muscle. See CAPUT.

TENACULA. A Chirurgical Instrument, contrived for laying hold of any thing, of which there are many described by Chirurgical Authors.

TENCHA. The Tench. See TINCA.

TENDO. A Tendon. See MUSCULUS.

For Sutures of the Tendons, see SUTURA.

For Wounds of the Tendons, see VULNUS.

For the Method of treating a Tendon prick'd in Bleeding, see PHLEBOTOMIA.

TENESMUS. A Tenesmus is a too frequent, and almost continual, tho' ineffectual, Desire of going to Stool; since either nothing at all, or only a small Quantity, of mucous, viscid, bloody, or purulent Matter is discharged. This Disorder may be produced by a Dysentery; a Diarrhoea; the Hæmorrhoids; that Species of Worms call'd *Ascarides*; the Stone in the Bladder; a Weakness, or Ulceration, of the Sphincter Ani; or an irritating Humour in the Intestinum Rectum. In a Tenesmus, the Inclination returns more frequently than in a Dysentery, and the Pain is principally confined to the Intestinum Rectum. A Tenesmus is generally less dangerous than a Dysentery, except when it is accompanied with an Ulcer of the Intestinum Rectum, a Fistula in Ano, or a falling down of the Rectum. The Regimen, and Method of Cure, proper in a Tenesmus, are the same with those prescribed in a Dysentery. In this Disorder, great Relief is afforded by a Fomentation of warm Milk, in which Elder-flowers

have been boil'd; as, also, by a Clyster of Mutton-broth, or an emollient Clyster, in which Earth-worms have been boil'd. The Medicines, at present most generally used, for the Cure of a Tenesmus, are these following.

Take of the Pulvis Sanctus, and Rhubarb, each one Scruple; of the Oil of Cinnamon, one Drop; of *London Laudanum*, half a Grain; and of the Syrup of Violets, a sufficient Quantity, for making into a Bolus, to be taken in the Morning, and repeated, as the Situation of the Patient requires.

At Night, a Purgative may be exhibited, and Clysters afterwards used; for which Purpose,

Take of Whey, or Mutton-broth, four Ounces; of Canary Wine, two Ounces; of Gum Arabic, half an Ounce; of Gum Tragacanth, one Dram; and of crude Opium, two Grains. Make into a Clyster, to be injected twice or thrice a Day.

Or,

Take of the Decoction of Mallow-leaves, and Canary Wine, each three Ounces; of Suet, impregnated with the Juice of Melilot, an Ounce and an half; of Sperma Ceti, and the Confection of *Fracastorius* without Honey, each one Dram and an half; one Yolk of an Egg; and of *London Laudanum*, four Grains. Make up into a Clyster.

Or,

Take of the Roots of Tormentil, Bistort, and Pomegranate-peel, each one Dram; and of the Leaves of red Roses and Balaustines, each half an Handful. Boil in a sufficient Quantity of Spring-water; and to three Ounces of the Liquor, when strain'd, add three Ounces of red Wine, two Yolks of Eggs, and of *London Laudanum*, five Grains. Make all into a Clyster.

Afterwards, continue the following Medicine for some time.

Take of the Confection of *Fracastorius* without Honey, one Scruple; of Sperma Ceti, fifteen Grains; of the Species Hyacinthæ, *Japan Earth*, red Coral, and *Armenian Bole*, each eight Grains; of the Oil of Nutmegs, one Drop; and Syrup of red Roses, a sufficient Quantity for making a Bolus, to be taken twice a Day, in a small Quantity of the Tincture of red Roses.

In a Tenesmus, the last Refuge is to Opiates.

The Disorder which the *Greeks* call *τενσμός*, and the *Latins* *Tenesmus*, bears a great Affinity to what we commonly call Gripes, which it often precedes and follows. In a Tenesmus, as well as in Gripes, there is a Pain of the Anus, and a frequent Desire of going to Stool; whilst a mucous Substance, full of Phlegm, and somewhat bloody, is discharged. And as the Ulcer of the Intestinum Rectum increases, a purulent Matter is eliminated. In this Disorder, it sometimes happens, that the Excrements resemble undigested Aliments. When pregnant Women are seized with a Tenesmus, it frequently causes a Miscarriage. This Disorder is easily cured, and, of itself, rarely proves mortal, especially when the Patient is free from a Fever, and retains his natural Appetite for Food. A Tenesmus happening in the Autumn is generally contagious, and, for the most part, terminates in Gripes. And as this Case is generally dangerous in Adults, so it proves mortal to Children. An inveterate and long-standing Tenesmus sometimes terminates in the Iliac Passion; or, when it proceeds from Phlegm, in a Pain of the Colon: But, if it proceeds from Bile, it is generally succeeded by Gripes. A neglected Tenesmus often leaves behind it a fordid and purulent Ulcer, which degenerates into a Fistula, not to be cured without the greatest Difficulty. *Lomii Medicinal. Observat.*

TENGA. See *Palma*; *Indica*; *coccigera*; *angulosa*.

TENON, *τένον*, a Tendon. See TENDO.

TENONTAGRA, *τενοντάγρα*, from *τένον*, a Tendon; and *άγρα*, a Seizure. A Species of Arthritis, seated in the larger Tendons; for Instance, in the tendinous Ligaments of the Nucha. The Word occurs in *Celsus Aurelianus*, Lib. 5. Chronic. Cap. 2. near the Beginning.

TENONTOTROTI, *τενοντότροτι*, from *τένον*, a Tendon, and *τροπή*, of *τίστρομα*, to wound. Such as are wounded in the Tendons. *Galeni de C. M. P. G. Lib. 3. Cap. 2.*

TENOR, *τένος*. See TONOS.

TENSIO, *τάσις*, the same as DISTENSIO, or DISTENTIO; which see.

TENSIVUS, *τενώδης*, tensive. An Epithet of a Pain accompanied with a Tension, and proceeding, as *Galen* says, *de Loc. affect. Lib. 3. Cap. 9.* from a Flatus, or Spiritus.

TENSOR

TENSOR *Digitorum*. See **EXTENSOR DIGITORUM COMMUNIS**.

TENTA, in Surgery. A barbarous Word for a Tent.

TENTHRENIODES, *τενθρηνιάδης*, in *Hippoc. περί ἀνὰ*. Is an Epithet apply'd to the Lungs, and signifies, full of small Perforations, or, of a very rare Contexture. The Word comes from *τενθρην*, an Insect furnish'd with a Sting, and like a Wasp, by *Aristotle* call'd *τενθρηνίδης*, and render'd, by *Gaza*, *Teredo*, "a Perforator." Hence *τενθρηνίον*, in the same Author, is an Hive, or Nest, of these Animals, and very properly render'd by *Gaza*, a Person universally esteem'd for his Learning, *Teredinarius*. The Lungs, then, are said to be *Tenthreniodes*, that is, tenedinous, as it were, and full of Pertusions, or of a rare Substance by Nature; or, as *Galen*, *de Usu Part. Lib. 7. Cap. 9.* describes it, a soft, porous, and spirituous Flesh, made for Concoction of the external Air, the proper Aliment for the Spirit.

TENTIGO. See **PRIAPISMUS**.

TENTIO. The same as **TENSIO** before.

TENTIPELLUM, from *tendo*, to stretch, and *Pellis*, the Skin. A cosmetic Medicine for smoothing the Skin from Wrinkles.

TENUANS, the same as *Attenuans*, attenuating. See **ATTENUANTIA**.

TENXIS, *τέγξις*, from *τέγω*, to moisten, dip, or tinge, in some Liquid, is expounded in *Erotian* by *διάβρεξις*, an Humectation, or Moistening. The Word is read, 6 *Epid. Sect. 8. Aph. 15.* and is opposed to *ξηρότης*, *Xerotes*, Driness.

TEPHRICON, *τεφρίκον*, from *τέφρα*, Ashes, is the same as **SPODICUM**; which see.

TEPHRION, *τέφριον*. The Name of a Collyrium, so call'd from *τέφρα*, Ashes, because it was of an Ash-colour. It was otherwise call'd **CYTHION**, *κύθιον*, and is described by *Aetius*, *Lib. 7.* and, after a different Manner, by *Celsus*, *Lib. 6. Cap. 6.*

TEPIDARIUM, a Part of the Bath in which they sat awhile, and sweated gently, during the Time they put off their Cloaths, and made themselves ready for entering the *Caldarium*, *Celsus*, *Lib. 1. Cap. 4.* It was much the same with the **APODYTERION**; which see.

TEPIDUS, *χαλιερός*. See **CHLIAROS**.

TERAGOLINICA, prepared, or made up with the Hand. *Rulandus*.

TEREBELLA. A Name for any Chirurgical Instrument, with which Bones are perforated.

TEREBINTHINA. Turpentine. See **BALSAMUM**, and **TEREBINTHUS**.

TEREBINTHUS.

The Characters are;

The Leaves are pinnated to a common Rib, ending in an odd Leaf. The Flower on the male Plant is apetalous, and consists of apiculated Stamina. The Fruit on the female Plant is an unilocular, or bilocular Shell, full of oblong Seed.

Boerhaave mentions three Sorts of *Terebinthus*; which are, 1. *Terebinthus*; vulgaris. C. B. P. 400. *Tourn. Inst.* 579. *Boerb. Ind. A. 2. 173. Terebinthus*. *Offic. Ger.* 1245: *Emac.* 1433. J. B. 1. 278. *Raii Hist.* 2. 1577. *Terebinthus angustiore folio vulgarior*. *Park. Theat.* 1526. **THE TURPENTINE-TREE**.

This grows to be a pretty large Tree in the Eastern Countries; but in the Western Parts of the World it grows only to be a large Shrub: The Leaves are large, consisting of several oval, round-pointed Pinnæ, set opposite, with an odd one at the End; the Flowers appear early in the Spring, before the Leaves, in large Clusters of purple Stamina only; after which, come longish hard Nuts, whose Kernels are of a viscous and resinous Taste. The true Turpentine is the Resin of this Tree, the best of which comes from the Island of *Chio*, and is of a whitish Colour, clear, and almost transparent; thicker, and more tenacious, than *Venice* Turpentine; of a pleasant Smell: That which comes from *Cyprus* is browner, and fuller of Dross. *Miller's Bot. Off.*

This Turpentine is of the Consistence of Honey, of a very pleasant resinous Smell, and the best of all Turpentine for internal Use. It gives a violet Smell to the Urine, even when given in a Clyster. It is an excellent Diuretic, and very proper in Ulcers of the Kidneys, Bladder, and Uterus. In Gonorrhœas, it is commonly made into a Bolus with prepared Crabs-Eyes, or any other Absorbent. It may, likewise, be taken in the Yolk of an Egg, from half a Dram to a Dram. All these Precautions are necessary only to shun the disagreeable Taste; and Sugar, and powder'd Liquorice, may be used for the same Purpose. It is, likewise, often given in Clysters; being first dissolved in the Yolk of an Egg, and then mix'd with the Decoctions. It is thus administer'd in Stone Colics; but the Intestines ought previously to be unloaded by purgative Clysters. The Dose, in this manner, is from an Ounce to an Ounce and an half. Turpentine, like all other Balsams, is to be avoided in inflammatory Dispositions of all Kinds. *Geoffroy*.

The Compilers of the *Adversaria*, following, I suppose, *Theophrastus*, have made the *Terebinthus* an Evergreen; but we are well assured by *Bellonius*, *Rauwolfius*, *Casalpinius*, and *Clusius*, Persons of Veracity, and Eye-witnesses, that the Leaves are ca-

ducous. The *Terebinthus* delights, as *Matthioli* says, in dry and stony Places, which are exposed to the Sun. *Dioscorides* says, it grows in *Judea*, *Syria*, *Cyprus*, *Africa*, and the Islands of the *Cyclades*; and we are told by *Clusius*, that it grows spontaneously in many Parts of *Spain*, *Portugal*, and *Languedoc* and *Provence* in *France*, where, sometimes, it shoots up to the Bigness and Perfection of a Tree, but can generally be reckon'd no other than a Shrub. He might have mention'd *Italy*, says *Ray*, among the Places where it grows; for I have observed it in that Country myself. *Clusius*, for his Part, never knew that Resin was extracted from the *Terebinthus*, in the before-mention'd Places; but *Lobel* assures us, that the Turpentine-trees in the Wood of *Valena*, near *Montpelier*, will sometimes discharge a good Quantity of Turpentine from small Wounds made in the Tree. *Bellonius* says, that it grows plentifully in *Syria* and *Cilicia*, and that they gather a Gum from it, which is carried to *Damascus*, and sold there; but what is sold at *Cairo*, is brought thither from the Country which the *Turks* call *Asamia*, that is, *Mesopotamia* and *Assyria*. The Tree flowers at *Montpelier* in *April*, and *J. Bauhine* gather'd the Fruit in *September*.

The Leaves, Fruit, and Bark of the *Terebinthus* are, according to *Dioscorides*, of an astringent Quality; and are effectual for the same Purposes as those of the *Lentiscus*, being prepared and taken after the same Manner. The Fruit is esculent, but hurtful to the Stomach, is heating, and provokes Urine. It is, also, well adapted to excite to Venery. Taken in Wine, it is good against the Bite of the *Phalangium*; and the Seed, as *Pliny* says, is taken inwardly for a Pain of the Head.

Bellonius says, that the ancient Custom of eating the Seeds of the *Terebinthus* still remains in *Syria* and *Cilicia*; and that he once met an *Arabian* Peasant, leading a Camel laden with the Seeds of the *Terebinthus*, that he might sell them at *Damascus*.

There are a Kind of Galls, of the Size of Filberds, hollow within, and produced from Excrescences of the Leaves of the male *Terebinthus*. These, about the End of *June*, are gather'd by the Peasants of *Thrace* and *Macedonia*, and sold, at a dear Rate, to the Silk-dyers of *Prusa* in *Bithynia*. They take care to gather them, as soon as they are grown to the Size of Galls; otherwise, if let alone, they would run out to the Length of half a Foot, in the Shape of an Horn. Six thousand Weight of them are, every Year, consumed only by the Dyers aforesaid.

What we call Turpentine, as *Cordus* describes it, is the Resin of the *Terebinthus*, white, yellowish, vitreous, or white inclining to ceruleous, and sometimes pellucid; and, being rub'd, falls abroad into a Multitude of small Grains, and, soon after, becomes viscid and glutinous. It has an acrid, pleasant, tho' somewhat strong Smell, and not unlike the Resin of the *Larix*, especially when handled, or thrown upon the Coals; it is of a bitterish Taste, and becomes slimy under the Teeth, and sticks to them: It distils, at first, liquid, and grows dry by degrees. Impostors call the dry Sort, *Thus*, *Frankincense*, or *Incense*, and sell it for *Thus*; but the true *Thus* they call *Olibanum*, not knowing that this *Greek* Word, and the *Latin* Word *Thus*, are Names for the same Thing.

Turpentine, in the Opinion of *Dioscorides*, exceeds all other Resins; and, next to Turpentine, is *Mastic*, which *Galen* prefers before it.

All Resins, says *Dioscorides*, are mollifying, heating, dissolving, dissipating, and cleansing. In an Eclegma, whether alone, or with Honey, they are proper in Coughs and Consumptions, and promote Expectoration. They, also, provoke Urine, concoct Crudities, and render the Body soluble. They are of Service in agglutinating the Hairs of the Eye-lids; and, with *Verdegriſe*, *Vitriol*, and *Nitre*, cure the *Lepa*; and, with Honey and Oil, are effectual in cleansing the Ears, when overflowing with Sanies; and remove an Itching of the Pudenda. They are Ingredients in Plaisters, Malagmas, and Acopa; and are good for Pains of the Sides, being used alone, by way of Application, or Inunction.

Turpentine, according to *Galen*, has a kind of Bitterness, in Conjunction with a moderate Astringence; on which Account, it is more digestive than *Mastic*; and the same Quality renders it absterſive to such a Degree, as to cure the *Pſora*; and, for the like Reason, it loosens the Belly.

The Moderns ascribe to it the Virtues of cleansing the Thorax, Liver, Spleen, Kidneys, and Bladder, from all Impurities. It is of Service, also, in inveterate Coughs, Difficulty of Breathing, a purulent Spitting of Blood, Vertigo, Stone, and peculiarly for the *Sciatica*, and the Gout in the Feet and Hands; it opens, cleanses, warms, and strengthens the Nerves.

In particular, Turpentine is very useful in the Stone, and other Disorders of the Kidneys. Hence it is usual in Practice for the Cure of the Gravel, after mitigating the Symptoms, by way of Precaution, to use Turpentine, but boil'd, as they call it, to render it less heating, and more astringent. The same is practised in the *Sciatica*, Palsy, and Gout; in which Cases, it is exhibited twice in a Week, either unwash'd, or wash'd in Water of Succory. The Quantity of an *Halle-nut*, taken every Morning fasting, is highly commended, as we are told by *Avicenna*, in the Arthritis, and all other Diseases of the Joints; and no wonder it should help the Gout, since it is good for the Stone; and

and these Diseases are near akin, so as to have the same continent Cause, or Matter, and often to pass, by Metathesis, one into the other.

Turpentine may be exhibited, 1. By itself, which they call *Oblates*. 2. In some aqueous Liquor, with a very small Quantity of the Yolk of an Egg, by which Addition it will represent a milky Liquor. 3. It may be a little inspissated, and reduced into Pills; but the two former Ways are best, because of the Evaporation of the Spirit. *Schroder*.

Observe here, first, that the true Turpentine is unknown in the Shops; and that the official Turpentine is either the Resin of the Larix, or the Resin of Fir, gather'd from the Tubercles of young Fir-trees.

Secondly, that the Smell of the true Turpentine remains in the Urine of those who take it; and is, in some manner, like the Smell of Violets. I have heard, says *C. Hoffman*, a Person affirm, that it was an Anodyne, of immediate Efficacy in Pains of the Pudenda.

In the Spring-time, the tender budding Shoots of the small Branches of the *Terebinthus* being broken off, as it is the Custom about *Montpelier*, and other Parts of *Languedoc*, as well as in other Countries, these distils from them a Milk, like that of the Fig-tree, which, being received and preserved in proper Vessels, becomes a most limpid, tenacious, and resinous Liquor; which, while it is new, or, to use *Pliny's* Expression, in Must, if spilt upon a woollen Garment, makes no Stain, and, when wash'd off, leaves no Mark or Spot behind it; but it grows thick with Time, and cannot be wash'd off, without an Addition of the Yolk of an Egg. *Lob. de Balsamo*.

Turpentine distil'd, or Oil of Turpentine, is next to Oil of Balsam, or a little hotter; and is of Service in all cold Diseases, especially of the Nerves.

The distil'd Oil of Turpentine, taken inwardly, is of singular Efficacy in nephritic Pains. It is of extraordinary Service, also, in Contractions, Tensions, and Relaxations of the Nerves, being apply'd by way of Unction, and rub'd on the Parts affected, for a good while together, with an hot Hand; especially if it be mix'd and shaken together with some highly rectify'd Spirit of Wine.

Some there are, as *Schroder* tells us, who put Turpentine in their Beer, and let them ferment together, for their ordinary Drink, under Afflictions from the Stone, or Obstructions of the Viscera.

Dioscorides teaches a Method of preparing a Wine of Turpentine, from the bacciferous Branches of the *Terebinthus* being bruised and boil'd in Must, which, being grown out of Use, is, therefore, omitted. The Antients, also, had so great a Value for the Asparagi, or young Shoots of the *Terebinthus*, as to reserve them for Use in Winter. *Raii Hist. Plant.*

The Bark and Leaves of the *Terebinthus* are very astringent, and useful in a Diarrhoea, provoke Urine, and stimulate to Vener. From this Tree distils that most laudable Kind of Resin, call'd *Turpentine*, being a resinous, transparent, sofish Substance, thicker than the Resin of the Larix, and brought from *Cyprus*, and *Chios*, or *Scio*. The common Turpentine is gather'd in *Germany* and *Norway*, from the wounded Trunks of young Pines and Firs, and is depurated by frequent Washings with Water.

The Turpentine of *Cyprus*, or *Chios*, is but seldom used, having its Place supply'd by what they call

Terebinthina Veneta, or Venice Turpentine, which is extracted from the Larch-tree. See *LARIX*. This Kind of Turpentine is a liquid Substance, of the Consistence of new Honey, of a yellowish Colour, an acrid and bitterish Taste, and a grateful and fragrant Smell.

Venice Turpentine is of Efficacy in the nephritic Colic, a Cough, Asthma, Ulcers of the Bladder and Kidneys, the Strangury, Gonorrhoea, Fluor Albus, and Wounds internal and external; taken in a larger Quantity than ordinary, it frequently gives a Stool. Externally, it is of Service in Diseases of the Nerves, and for discussing Tumors. It is, also, an Ingredient in Clysters vulnerary, anticolic, and antinephritic, to be injected into the Bladder, Uterus, or Intestines; and enters the Composition of most Plaisters; for it promotes Suppuration; maturates and cures the Scabies, and other cutaneous Defecations. *Hist. Plant. adscript. Boerhaav. Schroder*.

2. *Terebinthus*; peregrina; fructu majore; Pistachius similis, eduli. *C. B. P.* 400.

3. *Terebinthus*; Indica; Theophrasti; Pistachia Dioscoridis. *Turn. Inst.* 380. *Boerb. Ind. a.* 2. 173. *Nux Pistacia*. *Offic. Park. Theat.* 1417. *Pistacia*. *Ger.* 1248. *Emac.* 1436. *J. B. I.* 275. *Raii Hist.* 2. 1682. *Pistacia peregrina fructu racemoso sive Terebinthus Indica Theophrasti*. *C. B. P.* 401. THE PISTACHIO, or FISTIC NUT-TREE.

This is the Fruit of a large Tree, with winged Leaves, like an Ash-tree, but rounder-pointed. It bears Bunches of small white Flowers, to which succeed long-pointed Nuts, cover'd with a brown wrinkled Bark; under which is a white brittle Shell, including, in a redish Skin, a greenish Kernel, of a pleasant sweet Taste. It grows in the Eastern Countries of *Persia* and *Turky*.

The Fruit is accounted nourishing and restorative, and good for weakly consumptive People; it opens Obstructions of the

Liver and Spleen, and is said to be a Provocative to Vener. *Miller's Bot. Off.*

Pistaches are grateful to the Stomach. *Dioscorides* and *Pliny* both affirm, that whether they are eaten, or bruised and taken in Wine, they are effectual against the Bites of venomous Reptiles; in other respects, their Virtues, they say, are the same with those of Pine-kernels.

Galen says, that Pistaches are of fine Parts, with something bitterish and scented; whence they open Obstructions, chiefly of the Liver, but, in some measure, of the Thorax, also, and Lungs; and that they afford but little Nourishment. But the Generality of the Moderns will have them to be highly nutritive, and stimulant to Vener; on account of which, they are recommended by the *Spanish*, *French*, and *Italian* Physicians, to be mix'd in Desserts, with other Things, of a comforting and restorative Nature: And so much is attributed to them, that there is scarce an analeptic Medicine without Pistaches.

The Oil of Pistaches, taken inwardly, is said, by *Matthioli*, to ease internal Pains, proceeding from viscid Phlegm and Flatulencies. The same Author tells us, that it is effectual against Convulsions and the Palsy; and, taken inwardly, improves the generative Faculty. *Raii Hist. Plant.*

Pistaches are heating, moistening, attenuant, and aperitive. They are principally used in mucilaginous Infarctions of the Lungs, and Obstructions of the Liver; they strengthen the Stomach, repress a Nausea and Vomiting, excite an Appetite, and afford good Nutrition. *Dale from Schroder*.

Miller takes Notice of eight Species of the *Terebinthus*.

TEREBOTIN. By this Word, *Paracelsus*, probably, means Turpentine.

TEREBRA. A Chirurgical Instrument for perforating Bones, or for extracting extraneous hard Bodies, as Bullets, out of Wounds.

TEREDO. *Offic. Schrod.* 5. 347. THE WOOD-EATER.

There is a great Dispute among Authors about the *Teredo*, some making it one thing, some another. *Aldrovandus* makes four Kinds of *Teredo*; one Kind is found in Wood, another is called *Vermiculus*, a third *Thris*, and a fourth *Cossus*; to these, *Johnson*, from *Agricola*, adds a fifth, which, from its copper Colour, is call'd *Kupfer-worm*. But we suppose that Worm with six Legs, from which is produced the *Scarabeus minor arborum*, commonly found in Trees, to be the *Teredo* of the Shops.

The Parts of this Insect in Use are the farinaceous Excrements, call'd POWDER OF POST. This Powder is drying, whence it is sprinkled, with good Success, on humid and watry Ulcers; and, for the same Reason, is in much Request among the good Women, for drying up the Excoriations of Infants. *Dale from Schroder*.

TEREDO is, also, a *Caries* of a Bone.

TEREGAM. H. M. The Name of a Fig-tree, which grows in *Malabar*, call'd *Ficus Malabarica foliis rigidis, fructu rotundo, lanuginoso, flavesciente, Cerasi Magnitudine*. *D. Comelin*.

It is a large Tree, thirty Feet high, the Root of which, confused with Vinegar, prepared of the Coco-nut, and taken in a Morning fasting, is said to cool the Viscera. The Fruit is, also, extremely refrigerating.

TERENGIBIL, or TERENIABIN. The *Arabic* Name for Manna.

TERES MUSCULUS. There are two Muscles of the Os Humeri, which are call'd by this Name; the first is the

TERES MAJOR.

This is a long, thick, flat Muscle, situated a little obliquely between the inferior Angle of the Scapula, and the upper Part of the Arm. This Muscle, and the *Teres Minor*, are call'd round, though they are considerably broader than they are thick; because they come much nearer to that Figure, than any other Muscle which moves the Os Humeri on the Scapula.

It is fixed by its posterior fleshy Extremity in all the large angular Surface, on the Outside of the Scapula, in the inferior Costa of that Bone, and near the Angle. From thence it advances, with longitudinal Fibres, toward the upper Quarter of the Os Humeri, terminating in a broad flat Tendon, intermixed with some fleshy Fibres, which, at the upper Edge, are continued all the Way to the Insertion, lying in the same Place with the Tendon.

It is inserted, by its anterior Extremity, at the lower Part of the bony Ridge of the small Tuberosity, along the Edge of the Channel, almost opposite to, and sometimes a little lower than, the Insertion of the *Pectoralis major*. It lines the Cavity of the Channel by a tendinous Elongation, which joins that from the *Pectoralis*, and seems to be continued with it. This Insertion is below that of the *Latissimus Dorsi*, with which it communicates by a small Aponeurosis.

The Tendons of these two Muscles, the *Teres major* and *Latissimus Dorsi*, lie almost in the same Plane, as has been already observed; the upper Edge of the first running up a little Way on one Side the lower Edge of the latter, and the two Edges crossing each other in a small Degree. The Tendon of the *Latissimus Dorsi* lies behind, and covers that of the *Teres Major*.

These two Tendons, near their Insertions, have a ligamentary Frænum belonging to them, which runs down from the Insertion of the *Subscapularis*, and is inserted below that of the *Teres major*. It covers the two Tendons, and keeps them close to the Bone.

The *Teres major*, by being inserted in the Os Humeri, in a Direction parallel to the *Latissimus Dorsi*, becomes a Congener to the superior and posterior Portion of that Muscle; and, accordingly, moves the Os Humeri in the same manner with it. It turns the Bone round its Axis, when the fore Arm is carried behind the Back.

It, also, pulls the Arm directly backward, without moving it round its Axis. But neither this Muscle, nor the *Latissimus Dorsi*, can perform this simple Motion, because of the incurvated Direction of their Tendons, without the Assistance of other Muscles, which, like Antagonists, prevent the Rotation already mention'd; and of this Number is the *Teres minor*.

The Nearness of the Tendon of this Muscle to that of the *Latissimus Dorsi* deserves our Attention. They are both inserted, according to their Breadth, in the same Line, along the Edge of the bony Chanel of the Os Humeri, opposite to the Insertion of the *Pectoralis major*, in the other Edge of the same Chanel. These two Tendons cross each other in the same Plane; that of the *Teres major* running obliquely from above downward; and that of the *Latissimus Dorsi*, obliquely from below upward.

By this Disposition, these two Tendons resemble, in a great measure, the Duplication, or Fold, of the Tendon of the *Pectoralis Major*; and, therefore, the *Teres Major* may become a particular Antagonist to the superior Portion of the *Pectoralis Major*; and the *Latissimus Dorsi* to the inferior Portion; and both these Muscles, taken together, may be a common Antagonist to the *Pectoralis major*, when that whole Muscle acts at the same time.

I before observed, that these two Tendons were bound down by a ligamentary Frænum, which, from the Insertion of the *Subscapularis*, runs down below that of the *Teres major*; and that this Frænum covers the two Tendons, and braces them down close to the Bone. The Use of this Frænum seems to be, to prevent the Separation of the two Tendons from the Edge of the Groove, in violent Rotations of the Arm.

The *Teres major* may, also, move the *Scapula* on the Os Humeri, by drawing the inferior Angle downward, and bringing it nearer the Arm; but, in order to this, the Arm must be kept immovable, by some considerable Force or Resistance; as when, in standing with the whole Arm hanging down, the Hand supports a great Weight. By this Action, the *Teres major* may, also, assist in raising the Shoulder, or in hindering it from sinking.

The second is the

TERES MINOR.

This is a very fleshy Muscle, resembling the *Teres major*, but narrow and shorter. It lies above the last-named Muscle, between the Costa inferior of the Scapula, and the Head of the Os Humeri.

It is fixed by one End to all the middle Part of the inferior Costa of the Scapula, and to the long particular Surface immediately above that Costa, reaching from the great angular Surface near the Neck of the Bone. From thence it runs wholly fleshy, till it changes into a flat Tendon, which is inserted in the posterior or inferior Surface of the great Tuberosity of the Head of the Bone, and, also, a little lower down.

It adheres very closely to the lower Edge of the *Infra-spina-tus*, and the Tendons of these two Muscles are united; for which Reason the Antients confounded them together, and did not look upon this as a particular Muscle. It is covered by the *Deltoideus*.

The *Teres minor* may turn the Arm, when depressed round its Axis, from before outward, as it happens, when the fore Arm, being bent, and applied to the lower Part of the Breast, is removed from thence, without moving the Elbow from the Side: This Rotation is in a contrary Direction to that performed by the *Subscapularis* and *Teres major*.

This Muscle may, also, pull the Arm directly backward, whether raised or depressed; but, in order to this, the *Subscapularis* must act at the same time as a Moderator, to prevent the Rotation. *Winflow's Anatomy.*

TERETRON, τέρετρον. The same as **TEREBRA**, or **TEREBELLA**.

TERFEZ. A Sort of white Truffle found in the Numidian Sands. It is said to be very nourishing, if roasted in the Embers, or boiled in Milk; to be good for the Stomach; to restore decay'd Strength; and to increase the seminal Juices.

TERMINTHI, τέρμινθοι, are expounded in *Galen's Exegetis*, in τῶν τε τέρμινθων καὶ τῶν παραπλησίων καὶ τὰ δέξματα συνιστάμενοι ὡς οὖσιν ὄγκοι, "preternatural Tumors seated in the Skin, and nearly resembling the Fruit of the Turpentine-tree." In these Words *Galen* seems to have an Eye to 2 *Epid.* where it is said κατεῖλε ἐν κνήμῃ τέρμινθος ἐγένετο, "and afterwards Terminthi arose in his Legs." *Hippocrates* uses the Word, also, *Lib.* πρὸς χυμῶν, where he says, καὶ τέρμινθους ἀλίσκουσαι, "nor are seized with Terminthi;"

which Words are repeated 6 *Epid. Sect.* 3. *Aph.* 28. where *Galen*, on the Place, says, καὶ τὸ τὸν τέρμινθον δὲ ὄγκμα μελάνων τινῶν ἐκφυμάτων, &c. "By the Name *Terminthi*, we are to understand a kind of black Tubercles arising chiefly in the Legs, in Colour and Size like the Fruit of the *Terebinthus*. The Comment. in *Lib.* 3. de *Humor.* ascribed to *Galen*, says, *Terminthi* are round Eminences seated in the Skin, of a black Colour inclining to green, and like the Fruit of the Turpentine-tree; which Definition seems to be taken from *Dioscorides Alexandrinus*, as quoted by *Paulus*, *Lib.* 4. *Cap.* 24. when he calls these Tumors *Terebinthi*, τέρεβινθοι. The *Terminthus* is, by some, described as follows; τέρμινθος ἐστὶν ἀπόστημα περὶ τὴν ἐπιφάνειαν γινόμενον, μελὰ φλυκτανώσεως, ἥς ῥα γίγνεται ἰσχυρὸς τις ἀπόρρῃς, καὶ ἡ ὑποκειμένη σὰρξ καὶ ἀλίσχεται ἐκείνης. "A *Terminthus* is an Abscess formed in the Skin with a Pustule, which Pustule breaking, an Ichor is discharged, and the subjacent Flesh appears perforated." This Description is taken from a Scholium annexed to a manuscript Copy of *Hippocrates*, in the King's Library at *Paris*; and comes very near to that of *Oribasius*, *Synops. Lib.* 7. *Cap.* 36. transcribed by *Paulus*, in the Beginning of his Chapter before-quoted: "Oribasius, he there says, makes the *Terminthus* a kind of Tubercle with a black Phlyctæna (Pustule), which breaking, the subjacent Part appears as if abraded." Τέρμινθος is defined by *Pollux*, *Lib.* 4. *Cap.* 25. φῶμα φλύκταιναν ἔχον, "a Tubercle with a Pustule." The Cure of a *Terminthus* is directed by *Aetius* to be managed in the same manner as that of the *EPINYCTIDES*. See *EPINYCTIS*.

There are two Sorts of painful Tubercles, says *Wiseman*, which I have met with in my Practice; they are taken notice of by the Antients, under the Names of *Epinyctis* and *Terminthus*, a Couple of angry Pustules, affecting the Skin in the Arms, Hands, and Thighs. They do not differ much one from another; so may well be joined together.

The *Epinyctis* is of the Bigness of a Lupin, of a dusky red, and sometimes of a livid pale Colour, with a great Inflammation and Pain. It dischargeth, first, a Sanies, then a bloody Matter. The *Terminthus* is somewhat less, of a blackish Colour; it breaks and gleans, and within a Day or two the Pustule separates, and comes away in a Slough, and from that time it digests and heals.

They both proceed from an excessive Heat in the Blood; but are without Malignity and Danger, and cure with little Difficulty, if there be no Error committed in Surgery.

The Cure consists in Evacuation by Bleeding, Purging, and Regulation of Diet, as in a Phlegmon.

The external Applications, commended to us by the Antients, are Leaves of Hemlock, Nightshade, and Plantain, with fine Flour; or apply Raisins cleaned and bruised; they may, also, be washed with Salt-water, to dry up the Matter, and prevent Erosion; afterwards dress them with a Mixture of equal Parts of native Sulphur, and Litharge of Silver with Wine. I never was consulted in these, till they were arrived at their Height; and then found Anodynes of most Use, and afterwards healed them with Ointment of Turty.

A Maid, came recommended to me with an *Epinyctis*, on the Inside of her Arm, of the Bigness of the greater Sort of Lupin, of a livid Colour, with a small acute Pustule rising up in the Middle. It was accompanied with great Inflammation, affecting the Tendons with Hardness in the Joint. I prescribed her a Cataplasm of the Mucilage of Psyllium, Marshmallows, and Linseed; and embrocated the Parts with Oil of Roses and Chamomile. By this the Tubercle was brought near Suppuration, the Pustule first broke, and discharged a thin Sanies. I dressed it with the Yolk of an Egg, and, about two Days after, the Tubercle itself thrust out a bloody Matter. I dressed it with Basilicon, added to the Yolk of an Egg, and applied Cerate of Marshmallows, and continued the Embrocation. The Matter, from that time, was daily better digested, and the Pain diminished; it was healed with Unguentum Diapompholygos, and the Plaster of Bole.

A young Gentleman, having such another on the Outside of his Wrist, was recommended to somebody who opened it by Incision; but from that time it became exceedingly painful. He came to me with it hard and dry, and it had communicated its Anguish all along the Tendons and Nerves, to the Arm-pit, with several Glands. I embrocated the Arm from the Arm-pit, to the Knuckles of that Hand, with Oil of Roses and Vinegar, and applied Plaster of Bole upon those Glands. To the Tubercle I applied Basilicon, with Oil of Roses, spread indifferent thick in the Form of a Plaster, and dressed it so twice a Day. I proposed the next Morning, to have let him Blood; but he was easier; and the same Night I felt the Tubercle softer, and saw a bloody Matter thrust out. From that time it digested better, and the Accidents diminished; in four or five Days, the Glands resolved, and the Ulcer was cured by the Application of Ointment of Turty, &c.

A Gentlewoman, about forty Years of Age, had a *Terminthus* on the Knuckle leading to the fore Finger, which I was called to see. It was a small Tubercle inflamed round its Basis, having a black Head, and a long inflamed Streak passing from it to a Fontanel, which she had on that Arm. Whether it ran upward from the Pustule to the Fontanel, and affected it, or descended from it

it to the Pustule, I know not: However it was, there were Marks of Communication from one to the other, and both were painful, and the Patient was indisposed with a Fever. In the Fontanel there was a small Orange-pea, which I cast out, and put in a common one, and dressed it with Liniments, and a Plaster to retain them on. I dressed the Pustule with Basilicon with the Yolk of Egg, and applied the Cerate of Deer's Suet. It suppurated the next Day, and the Head of it cast off in a Slough. I clipped off the loose Skin from it, and dressed it with Ointment of Tutty, and in five or six Days cicatrized it. During the Cure, the Patient was afflicted with a Diarrhoea, which was purged off: After which she was hot and feverish, and troubled with a Rheumatism; for which she was let Blood, and cured. *Wife-man's Surgery.*

TERNA. The same as **IMPETIGO**, or **MENTAGRA**. *Castellus from Fallopius.*

TERNATEA.

The Characters are,

It hath a papilionaceous (or Pea-bloom) Flower, whose Standard almost hides the Keel, and the Wings; the Pointal afterwards becomes a Pod, which opens two Ways, and is filled with Kidney-shaped Seeds. To these Notes should be added, that the Leaves are winged, and are terminated by an odd Lobe.

Miller mentions four Sorts of *Ternatea*; which are,

1. *Ternatea flore simplici, cœruleo.* *Acad. Reg. Scien.*

2. *Ternatea flore pleno, cœruleo.* *Acad. Reg. Scien.*

3. *Ternatea flore simplici albido.* *Acad. Reg. Scien.*

4. *Ternatea Americana, perennis, flore cœruleo.* *Hoult.*

The Name which Dr. Tournefort has given to this Genus of Plants is, from the Place whence these Plants were first brought, which is one of the *Molucca* Islands, called *Ternate*.

The Flowers of the first and second Sorts are of a very deep-blue Colour; and if put in Water, and macerated, will dye the Water almost as blue as Indigo.

The third Sort differs from the first, only in the Colour of the Flower.

The fourth Sort was discovered by the late Dr. William Houstoun, in *Jamaica*, from whence he sent the Seeds to England. *Miller's Dictionary.*

TERNIABIN. The same as **TERENGIBIL**.

TERRA, γῆ. Earth. See **ANALYSIS**.

ἡ κεραμικὴ, *Ge ceramica*, from κεραμικός, a Potter, in *Hippocrates, Lib. de intern. Affect.* is *Terra figularis*, or *figulina*, Pottery Clay. *Lib. 1. de Morb.* he calls it γῆ κεραμική, and in the Beginning of *Lib. 3.* reckons it among Refrigerants. *Galen*, in his *Exegesis*, expounds it by ἀργίλλη, **ARGILLA**, Clay.

ἡ σμικτή, ἢ σμικτική, *Ge smectis*, sive *smectica*, from σμύχω, to absterge, is expounded in *Galen's Exegesis*, and, also, in *Erotian*, by κίμωλα, *Cimolia (Terra)*. The Words occur, *Lib. 2. περὶ γυναικ.* and *Lib. de Fistulis*, where he advises anointing the Arms with this Earth.

ἡ μέλαινα ἢ Σαπίν, *Ge melana he Samie*, black Earth of *Samos*, is advised by *Hippocrates, Lib. περὶ γυναικ. που.* to be taken inwardly for cleansing of the Uterus.

ἡ χαλκίτις, *Ge Chalcitis*, according to *Galen*, in his *Exegesis*, means no more than simply **CHALCITIS**. He seems to have regard to that Place, *Lib. de Fistulis*, where we read συμμειχίας τῇ [for γῇ] χαλκίτιδι ἰσών, "mixing with it an equal Quantity of *Chalcitis*."

ἡ ἐρετρίς ἢ ἐρετρία, *Ge Eretris seu Eretrias*, *Terra Eretria, Eretris*, *Eretrias*, is directed by *Hippocrates, Lib. 3. de Morb.* to be rubbed on the Breast, in order to discover in what Part of the Thorax the Pus is seated.

ἡ ψιλή, *Ge psile*, *Lib. de Aer. Loc. & Aq.* is a bare Soil, opposed to γῆ δασύια, a Soil overgrown with Trees and Bushes.

ἡ ἐν κοίλῳ καὶ ἀνιγνύρῃ, *Ge en calo et anigere*, an hollow, depressed, and scorched Soil, as opposed to γῆ περὶ ὀρέων καὶ ψυχρῇ, *Ge meteoros et psichre*, an high, or elevated, and cold Soil.

Of the Differences of Earth.

By *Terra*, or *Earth*, is universally understood that Substance alone, which, being worked or kneaded with Liquor, becomes a Clay. For what *Earth* is found among Metals, will not admit of *Liquefaction*; by which Term I mean a Dissolution of the whole Substance into a Liquor; as, by *Madefaction*, an Irrigation only of the Superficies, the Humour not penetrating to the Depth of the Body.

All *Earth* is of a drying Quality, because the Substance of it is naturally hard; and where it is wholly free from any Mixture of igneous Particles, it dries in a very gentle manner, without the least Corrosion. To render it thus qualify'd, Washing is conducive; but some *Earths* need no Washing; others, on the contrary, require two or three Washings. Now, if you are acute and well-skilled in the Sense of Tasting, you may judge yourself, whether an *Earth* requires Washing, or not, from its Degree of Acrimony, or Astringency. But, since it is impossible to find a Substance absolutely simple and unmixed, we are to consider this compounded Matter, with regard to its Qualities, such as various Degrees of Lightness or Ponderosity, and, also, the Differences of Tastes. If, for Example, it appears to be

astringent, the more it participates of Astringency, the more it has of Coldness; if it betrays an acrimonious Quality, its Degree of Heat will be found, in proportion to its Acrimony. An *Earth* is light, when, through all its Contexture, it participates much of an areal Substance; on the contrary, it is found to be ponderous, more or less in proportion to its consisting more or less of mere *Earth*. An *Earth* of an hot Quality has an heating Effect; a cold and astringent *Earth* refrigerates and repels; what is endued with an absterive Virtue, without any manifest Heat, dries in a gentle manner. An *Earth* possessed of a considerable Degree of Glutinousness is not abstergent, but is the better qualify'd by its Glutinosity for an Emplastic, tho' by no means for an Abstergent, without an Addition of Acrimony to correct its Viscidness, as we see in an Egg.

These are necessary Observations, and such as will take place throughout the whole *Materia Medica*; for many imagine, that all burnt Things become colder than they were before; and some, on the other hand, think the Heat in burnt Things to be increased; whereas both are in an Error. All acrimonious Things, indeed, lose much of their Heat by Burning; but all which are not acrimonious, acquire a Heat by Burning. But nothing, after Burning, becomes perfectly cold; for there still remain some igneous and very fine Particles; and these Particles are what are deposited by burnt Substances in Washing; for what remains afterwards is a cold earthy Substance, which has a Virtue of drying without Corrosiveness; but the Water in which the Drug is washed, acquires the heating Quality of those igneous and fine Particles.

The Method of washing all Kinds of *Earth* is first to work it in Water, in which is no manifest medicinal Quality; and, when the Mud is subsided, to pour off the Water; and, after that, to cleanse it from the Gravel and Sand, which sink to the Bottom. *Aetius, Tetrab. 1. Serm. 2. Cap. 1.*

Of the Medicinal Uses of the Earth of Fields.

The *Earth* of all cultivated Fields, which are of a fat Soil, is effectual for the Cure of all Parts which require Drying, for which Purpose they use it in *Alexandria* and *Egypt*; and I have seen, in *Alexandria*, Persons labouring under the Dropsy, and Disorders of the Spleen, making use of the Mud of the *Egyptian* Soil. Many, by applying Cataplasms of this Mud to the Calves of their Legs, to their Thighs, Elbows, Arms, Back, Sides, and Breast, have found Relief. The same cures inveterate Inflammations, and lax Tumors; and I know some, who, from an immoderate Evacuation by the Hemorrhoids, were become aqueous and hydropical in the whole Habit of their Body, manifestly and greatly benefited thereby. Some, by the same means, have been perfectly cured of inveterate Pains, which have been fixed in one Place. Thus far *Galen*: What follows, is from *Strato*.

For an inveterate Pain of the Head: Take the Sordes of Baths, or of hot Water, and mix them with black *Earth* washed; or work the *Earth* in a Decoction of Heads of Roses; or add to the *Earth* a Shard or Fragment of a Vinegar-pot, triturated with a Decoction of Bay; or mix the *Earth* with the Tile of a Clibanus (see **CLIBANUS**); and pour thereto a Decoction of *Sampfuchus*.

For an Eruption of Pustules from the Scabies and Impetigo: Take black *Earth*, and work it with a Decoction of Almonds, or bitter Lupines; or wash out a Vinegar-pot with a Decoction of Rue, and with the same work the *Earth*; or pound the Globules of Salt, which are found in the Bottom of Vessels which hold Garum, and mix them with the *Earth*, and use it as an effectual Remedy; or mix the Dung of Pigeons with the *Earth*, and work them with a Decoction of the *Halicacabus*.

For an inveterate Cough, with a vitiated Habit of Body: Take *Earth*, and work it with a Decoction of Calves Bones, and therewith anoint the Breast; or wash out an Honey-pot with the same Liquor, and with it work the *Earth*: You may, also, work it with a Decoction of Cumin, Nigella, and *Sampfuchus*; and so use it.

For Disorders of the Spleen: Take Ashes of Vine-branches, and the grumous Lees of Wine, and work them with *Earth*; or work the *Earth* with a Decoction of Leaves of the *Capparis*; or mix the Recrements, or Dross, of Silver, with Clay; and so use it: Or work the Clay with a Decoction of the *Serapis Tritesticularis*.

For the Dropsy: Pound the old Shards or Fragments of a Vessel which holds Brine, and mix them with *Earth*; or mix the *Earth* with Garum of Pork or Veal; or boil *Sampfuchus* in Seawater, and work the *Earth* with it; or beat Salt-meats in a Decoction of bitter Lupines, and mix them with the *Earth*; or mix burnt Alum, and the Ashes of Penroyal, with Clay, and work them in Oxymel: Or take dry'd Cow-dung; triturate it, and mix it with the *Earth*, and work them in like manner in Oxymel.

For the Sciatica, and all Coldnesses of the nervous Parts: Boil *Sampfuchus* in a Decoction of Calves Bones; then work in it white *Earth*, and so use it; or boil an Eel in Salt and Nitre, and mix the *Earth* with the Decoction; or mix it with strigmentitious Sordes, (see **STRIGMENTUM**) and Quick-lime; or work the *Earth* in a Decoction of Garlick or Leeks, and then use it; or take Costus, Casia, *Juncus odoratus*, *Aspalathus*, *Xylobalsamum*, and *Sampfuchus*; bruise them, and boil them in Water and Oil, and then mix them with Clay, and so use them; or pound

pound Goats-dung and Cow-dung, with the Sordes of Ceratum Rhafricanum, and mix them with the Earth.

For the Gout: Let the Patient be covered from the Head to the Groin, with the forementioned Compositions; and from the Groin to the very Nails of the Toes, with what follows: Burn the hinder Feet of a Calf, together with the Hoofs; triturate them, and mix them with Earth; or bruise the Stone *Leucographis* in Water in which red-hot Iron has been often quenched; add thereto an Ounce of Alum, and work them with Earth; or work the Earth in a Decoction of the Leaves of *Cyprus*; or boil Galis till they are dry, and work the Earth with the Decoction. Another Prescription, for the same Purpose, is as follows: Take of liquid Alum, one Ounce; scissile Alum, one Ounce; six Ounces of Gum Arabic; nine Ounces of Cerus; five Ounces of Melantheria; six Ounces of Misy; twenty-four Ounces of Oil of Myrtles, or *Oleum Sicinum*; bruise them together; then work them with Earth, and so use them: Or take of Acacia, Copperas, each two Drams; bruise them in Vinegar, then dry them, and mix them with Earth: Or take of Alum, Spuma Argenti, Misy roasted, each four Drams; mix them with liquid Cerate of Myrtle, and work the Whole with Earth: Or take of Cerus, Spuma Argenti, of each twenty-four Drams; Oil of Myrtle, thirty-four Drams; Water, a sufficient Quantity: Work the Whole with Earth, and so use it. Another Prescription by which the Governor *Philinus* was cured, is as follows: Take of Juice of Mulberries, scissile Alum, Eastern Privet, the Vitex, Galls, Saffron, the Fruit of the Tamarisk, Frankincense, of each six Ounces: Reduce them all to a very fine Powder, and, when it is necessary to use it, dilute the same in Water, and work it with Earth. All that is to be said farther of this Kind of Earth is, that it requires not to be washed, but only to be watered and cherished with the Decoction of unripe Peaches. *Aetius, Tetrab. 1. Serm. 2. Cap. 3.*

TERRA JAPONICA.

Cachou, or *Terra Japonica*, according to Mr. *Caen*, Doctor of Physic, of the Faculty of *Paris*, suitably to what was communicated to him by one of his Friends, is an Earth that is found in the *Levant*, where it is called *Masquiqui*, which is usually met withal upon the highest Mountains, where the Cedars grow, under the Roots of which this Earth is found; which of itself is very hard, and in a Lump. To lose nothing of this Earth, the Natives, call'd *Algonquains*, gather it up, Sand and all together, and wet it with River-water, and make it into a Paste, drying it in the Sun to the Hardness we see it of. The Natives always carry it about them, and use it for the Pain of the Stomach: They, also, apply it outwardly like an Ointment upon the Region of the Stomach.

Tho' this Description of *Cachou* appears not very conformable to Truth, because there is no Probability of its being an Earth; yet, as the Person, who gave this Description to Mr. *Caen*, assured him that it was so, and so far as 'tis called in *Latin*, *Terra Japonica*, I was oblig'd to rank this in the Class of Earths, and leave it to those to determine what it is, who understood more of it than I do: All I shall say is, that you ought to chuse *Cachou* of a tawny Red without, and of a clear Red within, the brightest and least burnt that can be.

Cachou is a very bitter Drug, and of an unpleasant Taste when taken in the Mouth. It is usual to reduce it to a fine Powder, and to mix it with Ambergrise, which, with the Mucilage of Gum Tragacanth, is made up into a Paste, and formed into little Pellets, in Colour and Figure having the Resemblance of Mousse's Dung; and the smaller these Troches are made, the more valuable are they.

The Use of *Cachou*, whole or prepared, is to strengthen the Stomach, and to make the Breath sweet; and, in short, it is one of the best Drugs we have, and yet at this time the least used; which proceeds from the great Use of Tea and Coffee, tho *Cachou* is of much greater Virtues than either of them.

As *Cachou* is very unpleasant to the Palate, especially when first put into the Mouth; therefore some People, besides the Ambergrise, mix Sugar with it. *Pomet.*

Terra Japonica, according to another Account, is the inspissated Juice of the *Areca* or *Faufel* [See ARECA]; and is, also, called *Catechu* in the Shops. This is a gummy, indurated Substance, of a redish Colour, inclining to black; of an astringent and austere Taste at first, but afterwards sweet and grateful, and void of Smell. There are two Sorts of it; one purer, which, slightly tasted, melts, as it were, on the Tongue; the other harder, and less pure, and consequently of but little Use; and this perhaps led *Schroder* into an Error to mistake it for an Earth.

It is astringent; corroborates the Stomach; removes a Nausea; excites an Appetite; represses Vomiting; and stops Fluxes of the Belly, of the Menes, and Hæmorrhages.

The Learned are not agreed about the exotic Drug, called *Terra Japonica*, and *Catechu*, or *Caetchu*: Some, who take it for a true and genuine Species of Earth, as its Name imports, rank it among Minerals; others will have it to be a compound Substance, participating of a vitriolic Nature; and others there are, who, and indeed rightly, reckon it in the Class of vegetable Substances, and take it for an inspissated Juice.

This *Catechu* is easily dissolved in Water, incorporates with it, and communicates to it a red Tincture, as do many other vegetable inspissated Juices and Extracts: Besides, it is not separated by Filtration, as Earths usually are; but passes the Filtre with the Water; and is, moreover, by Calcination, perfectly converted into Ashes, which Earths are not. That it participates not of a vitriolic Nature, will abundantly appear from the following Experiments: The first is, that no vitriolic Salt can be separated from it. Secondly, The Mixture of an Alcali with it excites or produces not the least Effervescence or Precipitation. And, lastly, a Solution of the same, with the Addition of any kind of vitriolic Substance, becomes an Ink.

Garcias, and others after him, will have the *Catechu* to be the *Lycium* of *Dioscorides*; but are contradicted by *Clusius* and *Veslingius*, because the Trees which yield the *Lycium*, and the *Catechu*, are different in the Shape and Size of their Leaves and Fruits. Some assert it to be the inspissated Juice or Extract of the Fruit called *Anacardium Occidentale*, or *occidental Anacardium*, because of the seeming Affinity of the Names, that Fruit being called *Cajou*, and *Catzu*. *Cleyer* affirms it to be the Extract of the oriental Acacia, a Plant much like the Tamarind. *Paulus Ammannus* says, it is an artificial Composition, prepared of an Extract of *Indian Liquorice*, *Indian Calamus Aromaticus*, and the Juice of the *Areca*, which gives it its purple Colour. And, lastly, *J. Otto Helbigius*, a Person very well-skilled in *East Indian* Simples, informs us, that it is extracted from a kind of small, hard, resinous, astringent Fruit, which hangs in a sort of Clusters. This Fruit, he says, with the Leaves of *Be-el*, and *Lime*, are used over all *India*, in Chewing, for cleansing the Mouth; and is no other than what the Inhabitants of *Java* call *Faufel*, and those of *Malaya Pynang*. *Dale* declares himself of this last Opinion. The Fruit of this Tree is, also, of singular Use in curing the Scrophula, correcting the Blood, and altering noxious Humours; it rectifies a disordered Liver and Spleen, restores the digestive Faculty, and changes the whole Habit of the Body for the better.

It is to be observed, first, that the immature Fruit induces a Vertigo, like an Ebriety contracted from Wine. Secondly, that our *London Druggists*, by the Name of *Terra Japonica*, understand the Extract by itself, as it is imported among us; but, by *Catechu*, they mean a Composition of this Extract, Musk, Ambergrise, and other Ingredients.

TERRA SIGILLATA. There are a great Number of sealed Earths mentioned by Pharmaceutical Writers.

1. *Terra Silefiaca. Offic. Terra Sigillata vulgo, five Terra Strigensis. Terra Sigillata Germanica lutea Strigensis dicta. Schrod. 3. 317. Sigillata Strigoniensis. Charlt. Foss. 5. Terra Silefiaca sigillata qui Chymicis Axungia Solis dicitur. Ejusd. 6. Terra Sigillata Silefiaca, five Terra Sigillata Germanica, Sigillum Strigoniense, Axungia Solis Chymicorum. Worm. 12. Terra Sigillata Silefiaca. Hoffm. Paral. Offic. 664. Terra Sigillata Silefiaca. Imp. Hist. Nat. 128. Terra Sigillata Strigoniensis. Schwenck. Fossil. 395. Bolus Silefianus. Calc. Mus. 110. SEALED EARTH OF STRIGA.*

It is of a luteous, inclining to a bright-yellow Colour, fat, viscous; and runs abroad like Butter in Water, or in the Mouth. It is generated in the Gold Mines of *Mens Acutus*, or *St. George*, near *Strigonium*, a Town in the Duchy of *Swidnitz*, among very hard Rocks.

Rocks. Hence it is digged, and prepared with the greatest Care, by Direction of the Magistrates; and reduced into little orbicular Masses, which are impressed with a Seal, having the Figure of the different Prominences of the Mountain, two cross Keys, a Buckler, and on the Right a Star. Under the Mountain are the Words, *Terra Sigillata Montis Acuti*. Wormius mentions this Earth under the Distinction of red-coloured Earth.

It is effectual in an Hæmoptoe, Phthisis, Ulcers of the Lungs, and Hæmorrhages of all Kinds; and represses a Dysentery, and all other Fluxes of the Belly. *Schwenckfeld*. It is highly commended by *Sennertus*, *Lib. de Peste*.

2. *Terra Sigillata alba & rubra magni Ducis*. Mont. Exot. 13. WHITE AND RED SEALED EARTH OF TUSCANY.

It is said to be an Astringent, and an Edulcorant, or Sweetener. *Monti*.

3. *Terra Vitriolata sigillanda*. M. Hoffm. Flor. Aldorff.

This Earth is taken out of a subterraneous Place, called DAK SEIKLOCK, in the Territory of *Welden*. It is like the *Terra Silesiaca*, and has been found by a Multitude of Experiments to be of the same Virtue in malignant Fevers, as we are assured by *C. Hoffman*.

4. *Terra Turcica*. Offic. *Terra Sigillata Turcica*. Schrod. 317. *Pastilli Turcici Characteristicis insigniti*. Worm. 9. TURKEY EARTH.

The Inside of the Mass is all of an Ash-colour, the Outside red, answering in no respect to the *Terra Lemnia*, tho' it is supposed to have the same Virtues; and is commonly sold for *Terra Lemnia*.

5. *Terra Sigillata Livonica*. Offic. Worm. 12. Charlt. Foss. 6. SEALED EARTH OF LIVONIA.

It is redder than the *Silesian Earth*; and is very astringent, whence it is recommended in Dysenteries, Diarrhoeas, and other Kinds of Fluxes.

In the German Shops, some other sealed Earths are to be met with; of which the *Terra Strigoniensis*, and *Lignitzenfis*, are the principal. The former, termed by the German Writers, *Axungia*, and *Medulla Solis*, is of a yellow Colour, fat like Soap, and melts in Water, or when held in the Mouth. It is dug in the Clefts of hard Rocks, in the Hill of *St. George*, among the Gold Mines near *Strigonium*, in Hungary. The Magistrates take a great deal of Care, that it be duly prepared; and, being formed into little Balls, it is marked with the Seal of the Town, and believed to be impregnated with the Sulphur of Gold. The *Terra Lignitzenfis*, or *Goldabengensis*, called *Axungia*, and *Medulla Lune*, is of a whitish Ash-colour, and imagined to arise from Silver. Both these Earths are said to be useful in malignant Fevers, the Plague, Dysentery, Diarrhoea, and the Bites of venomous Animals. They operate by Sweat; and the Dose is between half a Dram, and two Drams. *Geoffroy*.

TERRIFICATIO. A Coalition of the earthy Particles, in Fermentation.

TERROR. A Fright. This is the Cause of many Distempers, as Faintings, Epilepsies, Convulsions, Palpitations, and sometimes of Death. And it is esteem'd a Remedy for some Disorders, as the Hiccup, and Chin-cough; and *Horace* mentions a Fright as a Remedy for a Lethargy.

TERTHRON, *τέρθρον*. *Hippocrates*, who was an Islander, travel'd much by Sea, and was, in all Probability, well acquainted with Shipping, sometimes makes use of naval Terms, and takes Metaphors from the Terms of Seamen. Of this we have an Instance in the Word which is the Subject of this Article.

Terthron, *τέρθρον*, "properly signifies, as *Galen* says in his *Exegesis*, the extreme Part of the Sail-yard; whence the Ropes which reach to the Extremities of the Sail, are call'd *Terthroi* *τέρθροι*. But *Hippocrates*, in his second Book de Morb. Mu. heb. where he says, *ἐν τέρθρῳ τὸ τέρθρον ἢ τὸ πᾶν*, since here is the *Terthron* of the Disease, means as if he should say, "Here is the utmost Pitch and Extremity of the Disease, and what requires all our Care." In the Place here indicated by *Galen*, all the Copies most corruptly read *τὸ σπέρν* (*stereon*), "the Solidity;" for tho' the Strength and confirmed State of the Disease may be included in the Expression, yet the Elegance of the Expression is eluded. *Erotian*, also, hints at this Place, when he says, that, "the *Terthron* of a Disease is put ἀπὸ τοῦ τέλους," "instead of the End;" and he adds, that the Antients call the End or Extremity of a thing *Terthron*, and confirms it by the Authority of *Euripides* and *Apollodorus*. According to *Hesychius*, *Terthron* is a Name for the Mainfall; but some, he says, so call the End of the Sail-yard [*Virgil* calls the Ends *Antenna Cornua*], and the Roof of an House: And with some it signifies the Extremity and Height; and this last Sense agrees with *Galen's* Explication.

TERTIANA FEBRIS. A Tertian Fever.

No Fever so exactly manifests the Nature and Genius of that general febrile Commotion, which preys upon the Vessels, and

nervous Parts, and is, by way of Eminence, called *ἥν* by *Hippocrates*, and the *Greeks*, as that commonly called a Tertian Fever; which rages so frequently, spares no Sex, Age, nor Constitution, and seizes the Patient, every other Day, with a kind of Rigor and Horror, which are succeeded by a quick Pulse, which is known from its Frequency, as, also, by an uneasy and burning Heat.

A Tertian Fever, when of the regular and legitimate Kind, is accompanied with these Symptoms: The Head is first seized with Pain; the Joints become languid; about the first Vertebrae of the Back, a Pain of the Loins is perceiv'd, which ascends along the Back, to the Epigastrium, and is accompanied with Costiveness, and a painful Sense of Tension in the Hypochondria. To these Symptoms are added a Refrigeration of the external Parts, especially of the Nostri and Ears; a Pandiculation, Oscitation, and Horror, which often produces a Trembling of the Limbs, a small, contracted, weak Pulse, and sometimes an insatiable Thirst. These Symptoms are succeeded by a Nausea, attended with a fruitless Desire of vomiting, or a real Vomiting of bilious, peccant, and sometimes greenish Matter, frequently accompanied with a troublesome Cough, with a Discharge of Phlegm, arising from acid and viscid Crudities of the Stomach; then an uneasy burning and dry Heat seizes the whole Body, and the Face, before collapsed and pale, the Skin contracted and rigid, and the Vessels in the Hands and Feet emptied, rise, and begin to become red and tumid: The Pulse, is also, larger, fuller, and quicker; the Restlessness of the Patient is increased; his Respiration becomes more difficult; and his Eyes being hardly clos'd, he speaks many improper and incoherent Things. Afterwards these Symptoms gradually decrease; the Heat is allayed; the Skin is relaxed and moistened; high-coloured Urine is discharged, resembling the Liquor obtained in the Distillation of Spirit of Nitre, or Aqua-fortis, though without a Sediment. The Pulse, in the mean time, becomes softer; and a Sweat breaking out, the Paroxysm is removed, though at the same time its Duration varies according to the Difference of Constitutions, and morbid Causes; so that in some Patients it is protracted to ten or eleven, and in some to twenty Hours. On the subsequent Day of Intermission, the Body is languid, somewhat cold, and easily seized with an Horror; and the Pulse, though quick and vehement under the Paroxysm, is now slow, weak, and undulating; the Urine is, also, thicker, and deposits a Sediment, or at least contains a Cloud, which discovers a Disposition to a Sediment.

Thus the Course of the febrile Paroxysm, from the very Nature of the Symptoms, may justly be class'd among those spasmodic and convulsive Motions, which affect almost the whole nervous Parts of the Body. Hence it happens, that all those Things, which irritate the nervous Parts to anomalous Motions, such as the Passions of the Mind, strong Cathartics, acrid, caustic, and poisonous Substances, received into the Body with Aliments, or the Air, Substances of a Nature astringent, cold, and unfriendly to the Nerves, and acrid Clysters, with drastic Purgatives for their Ingredients, greatly contribute not only to the Generation, but also to a Relapse, or at least an Exacerbation, of Tertian Fevers.

The Antients imagined the Cause of these febrile Commotions in Tertian Fevers, to be an intemperate Bile, separated from the other Humours, extravasated and lodged in the lower Belly. But the Cause which excites and sustains these Commotions, is rather an excrementitious Matter, of a saline, sulphureous and active Nature, which, in my Opinion, is principally lodged in the Primæ-Viæ, partly in the biliary Ducts of the Liver, and partly in the Duodenum; for in this Cavity the bilious and salivary Humours, especially the pancreatic Juice, being vitiated by their mutual Fermentation with the Crudities arising from bad Digestion, by their Continuance and Stagnation generate a virulent Matter of this Kind, which, being successively convey'd hence, through the lacteal Vessels, to the Blood, and with it in a sufficient Quantity to the nervous Coats of the Head, spinal Marrow, Stomach, Intestines, and other secretory and excretory Ducts, excites such an universal Spasm; during which the Blood is first forced to the interior and larger Vessels, and afterwards, when the systaltic Motion of the Heart and Arteries is increased, the Circulation of the whole Mass of Blood and Humours is accelerated; the Obstructions in the minute Vessels of the nervous Parts are remov'd; and when the Spasm remits, and the excretory Ducts are relaxed, the febrile Matter is eliminated either by Sweat or Perspiration, after which the Paroxysm ceases, till a sufficient Quantity, of the like excrementitious Matter, being again convey'd from the Primæ Viæ to the Blood, and nervous Coats, excites and brings on a fresh Paroxysm.

The Generation of this Matter, and consequently of a Tertian Fever, is very easy, in Persons of delicate and choleric Constitutions, and in those disposed to Spasms or Commotions of Mind; it is, also, more quickly generated in Persons in the Flower of their Age, than in Infants, and Persons far advanced in Years: It is, moreover, speedily generated in hot Summers, when Southerly or Easterly Winds blow, especially, when cold Liquors are largely drank, or the Body long exposed to a nocturnal Cold, or moist Air, or an Atmosphere impregnated with minute Insects, about

about Lakes and Ponds; but much more, when the Stomach is full of Crudities, or when heavy or astringent Aliments are taken, especially with a Nausea.

'Tis, also, certain from Experience, that in the Spring, after copious Venesection, Persons of spongy Habits easily fall into spurious Tertian, or Catarrhus Fevers, especially when, at the very Time Fevers are already raging, they are exposed to a moist and rainy Air, and the Stomach is loaded with Aliments of hard Digestion. I have, also, known a Tertian Fever, sometimes of the continual, and sometimes of the double and anomalous Kind, produced by the Repulsion of the Purples by external Cold, by the Itch preposterously and unseasonably cur'd by means of mercurial and sulphureous Liniments; by an unskilful Drinking of medicinal and mineral Waters, neglecting at the same time a proper Regimen; as, also, by the hot *Caroline* Waters, which are or an astringent Quality, especially in Habits which are plethoric, impure, and full of Crudities.

Tertian Fevers, arising from these Causes, do not always proceed in the same manner, but widely differ: For which Reason Physicians have distinguished them into various Species. Thus a Tertian Fever is either of the legitimate or spurious Kind: the former principally attacks Persons of a bilious Habit, and those of delicate Constitutions, especially in the Heat of the Summer; and is accompanied with violent Symptoms, such as an Horror, Heat, Head-ach, Thirst, Vomiting and Uneasiness, and an intensely high-coloured Urine, but it is soon terminated and removed. *Hippocrates* indeed asserts, that this violent Disorder, lasts for twelve Hours, and is remov'd by the seventh Paroxysm; but these exact periodical Fevers are not found in our Northerly moist and cold Climates. Hence *Hieronymus Mercurialis*, in *Prælect. Bonon.* uses these Words: "The Tertian Fever of *Hippocrates* very rarely occurs; and I have hardly seen it, tho' I have practised Medicine for forty Years." This I can also affirm from my own Experience. But in a spurious Tertian Fever, the Symptoms are indeed milder, the Heat not so burning, the Vomiting not so frequent, the Urine not of so high a Colour, and on the Day of Intermision, a Languor of the Strength, a Weariness of the Joints, and a Want of Appetite, remain with the Patient. This Species of Tertian is most incident to Persons of languid Habits, Women, and those of spongy Constitutions, especially in the Autumn.

A Tertian Fever may be, also, either regular or irregular, or anomalous, or confused. The former preserves an equal Type, both with respect to the Time of its Invasion and Termination, the Length and Shortness of the Paroxysm, and is accompanied with the usual Symptoms; whereas, in the latter, the Time of the Accession is irregular, sometimes in the Fore, and sometimes in the Afternoon, sometimes in the Evening and sometimes in the Middle of the Night; the Paroxysm is sometimes shorter and sometimes longer; the Urine, at the time of Remission or Intermision, deposits no Sediment; the Sweat is either too small, or too profuse, and affects the Patient on the Day of Intermision. It is, also, accompanied with different Symptoms, according to the Diversity of Constitutions; such as Fluxes, Hæmorrhages of the Nose, violent Subversions of the Stomach, intolerable Head-achs, Alienations of Mind, excessive Cardialgias, Pains of the Joints, and Gripes of the Intestines. And these irregular Fevers, which preserve no Type, are generally epidemical, arise from a præter-natural and unusual Constitution of the Summer and Autumn; and are generally of the continual Kind. In the Year 1727, Fevers, of this Kind, were epidemical almost all over *Germany*, after an intense Dryness, and Heat of the Atmosphere for several Months.

Tertian Fevers are also sometimes simple and sometimes double. In the former, the Paroxysms recur every other Day; but in the latter daily, and sometimes twice a Day, with one Day of Intermision. A double Tertian is however to be distinguish'd from a Quotidian, which daily keeps equal Times of Accession; but in the former, the Return of the Paroxysm corresponds to the alternate Days.

There is also a Tertian of the continual Kind, which may be known by these Signs; It attacks the Patient with Horror, Anxiety, Vomiting, Heat and excessive Languor: Nor on the following Day do these Symptoms totally intermit, but only remit; the Frequency of Pulse also remains, and is accompanied with Heat, Languor, and Weakness; but on the Day of the Paroxysm, after a previous but gentle Refrigeration of the external Parts, all the Symptoms are again increased and augmented. Such Fevers when epidemical, sometimes continue for two or three Weeks, before they terminate in a legitimate Intermittent. But it frequently happens, that a Tertian is for some Days of the continual Kind, and afterwards passes into an Intermittent, which is a good Sign; whereas 'tis a bad Sign, when from an Intermittent it changes to a Continual.

Generally simple and regular, as well as double and anomalous Tertians are epidemical, and arise from a præternatural Constitution of the Weather, especially in Summer. Epidemical Tertians are familiar, and, as it were, peculiar to certain Places; those, for Instance, which are situated low, cloudy, surrounded with Lakes, and Ponds, and infested with Gnats or Insects, so that the Inhabitants of such Places rarely escape a Tertian every Year, and

Strangers are oftener afflicted with such a Misfortune, and with Difficulty totally freed from it.

All these Species of Tertians are at first mild, but are increased as the Paroxysms are repeated; a sure Proof, that under the Impetus of the Disorder, by the inordinate Motions of the Solids and the Fluids, the Juices of the Body are more and more contaminated, and rendered intemperate; and these Juices, on the Days of Intermision, when Perspiration and Excretion is diminished, gradually acquire a still worse Quality.

Every Paroxysm, is terminated by a Relaxation of the Compages of the Skin, by Moisture, or Sweat. The Urine on the Day of Intermision is thicker, contains a Cloud, or deposits a Sediment, which is the more copious, the more the Body abounds in Blood and Juices. But if in the Decline, the Sweat does not break forth, if the Urine is, also, thin and aqueous on the Day of Intermision, and the Patient intensely costive, as is very usual with hypochondriac Patients, these Signs are strong Proofs that the nervous System is greatly affected by Spasms, arising from an obstinate and rebellious febrile Matter.

Generally about the third or fourth Paroxysm, small Ulcers arise about the Lips, and the Urine is discharged with a kind of Heat, after which the Symptoms are remarkably mitigated. But this Species of Fever is best, most securely, and totally terminated, when either by Nature alone, or the Assistance of Art, a copious bilious Flux is procured, and Perspiration increased; on the Day of Intermision; which may be known from the Largeness and Vigour of the Pulse, and the Increase of the Strength. But those who labour under epidemical and anomalous Tertians; after the Termination of the Fever, recover Health and Strength in a slow and difficult manner, for which Reason they require an accurate and proper Regimen.

No Fever by its Heat and intense internal Motion under the Paroxysm, so quickly dries a succulent, or emaciates a corpulent Habit, and generates so large a Quantity of bilious Recrements, which are voided by Vomit, Urine and Stool, as a Tertian, accompanied with an intense and long protracted Heat. And this was certainly the Reason, why the Antients derived this Fever from an intemperate and redundant Bile, tho' this Redundance is rather the Effect, than the Cause of the Disorder.

Tertians are longer and more obstinate in Autumn and Winter, than at other Seasons, especially when the Viscera are in a bad Condition, the *Prima Via* spasmodically constricted, and infarcted with Flatulencies, the Patient costive, or voracious; or when he has eaten too much, especially before the Paroxysm, as, also, when, in consequence of the Neglect of a proper Regimen, under, and after the Paroxysm, the Sweat is suppressed, or when the Cure is preposterously instituted, which generally happens in poor Persons, and those who labour for their Bread. This Doctrine is confirm'd by *Hippocrates*, in *Secl. 1. Aph. 9.* But Tertians are shorter, and less dubious when they happen in the Summer, when the *Prima Via* and Viscera are disposed to a sound State, and a proper dietetic and diaphoretic Regimen, are skilfully used, during the Times of Intermision.

Tho' every Intermittent is not of a very dangerous Nature, yet hardly any Fever requires a stricter Regimen, and a more cautious Method of Cure, than those of the Tertian and Quartan Kind; since these, if proper Measures are not taken, bring on violent and incurable Diseases, such as slow and hectic Fevers, sudden Swellings of the Feet, Dropsies, Contractions and violent Pains of the Limbs, flatulent and hypochondriac Disorders, and various spasmodic and convulsive Diseases; and in Children Epilepsies; all which Disorders succeed the preposterous and too liberal Use of Astringents, before a due Correction and Evacuation of the excrementitious Matter. Hence *Alexander Trallianus*, in *Lib. 12. Cap. 6.* justly observes, "that a Tertian is easily cured; but when it is treated by those Physicians who have not Judgment enough to take proper Measures, it is not only cured with Difficulty, but also sometimes rendered incurable."

A Tertian in consequence of some Error, either of the Patient or Physician, may easily change into some other Disorder, a simple Tertian, for Instance, into one of the double; and sometimes of the triple Kind; or into a quotidian, and slow, or even into a continual or choleric Fever.

Tertian and Quartan Fevers return more frequently and easily than other Disorders, especially when they are preposterously suppressed. For when a Patient, lately recovered from such Fevers, is exposed to a moist and cold Air, or a penetrating North-Wind; when his Stomach is over-loaded with too great a Quantity of Food, or full of Aliments of an unsalutary Quality; when his Mind is discomposed by any Passion, especially Anger, or a Fright; or when any acrid Purgative is exhibited, forthwith the febrile Spasms, the Head-ach, the Refrigeration of the external Parts, such as the Ears and Nostrils, the Oscitation, Pandiculation, the Pain about the first Vertebra of the Loins, the Languor of the Limbs, the uneasy Stricture and Tension of the Hypochondria and Intestines, the Horripilation and Refrigeration together with the concomitant Heat return; tho' in the first Paroxysm of the returning Disorder, just as in the Beginning of all Intermittents, all these Symptoms are mild, but increased and augmented in the subsequent Paroxysms.

The Method of preventing Tertians.

Since Tertian Fevers are generally epidemical, and their antecedent productive Cause principally consists in some Fault, or long Intemperance, of the Air, a Suppression of Perspiration, and a Load of Crudities in the Primæ Viæ, 'tis sufficiently obvious, that, when such Fevers rage, an imtemperate, impure, and vapid Air is to be avoided; but, above all, a nocturnal and moist Air: Nor is the Patient to overload his Stomach with too large a Quantity of Aliments, or those of hard Digestion: Neither is he to drink large Quantities of Liquor, especially of the spirituous or acedent kind; nor to indulge himself in the Gratification of his Passions.

Among the Medicines proper for preventing Tertians in an excessively hot Summer, the most considerable are, gently nitrous, absorbent, and diaphoretic Powders; temperate and diluting Decoctions, prepar'd of the Roots of Succory and Vipers-grass, the Shavings of Hartshorn, and clean Barley, and us'd for ordinary Drink; as, also, the cold *Selteran* Waters, or those of *Wildungen*, which at the same time render the Body sufficiently soluble. It is, also, expedient every Morning after Sleep, to promote Perspiration by Infusions of such Herbs as purify the Blood, such as Scordium and Paul's Betony: For a Tertian Fever does not readily seize the Person, whose Body is sufficiently soluble, and whose Perspiration is free: On the contrary, when he is preternaturally costive, and his Body languid, and somewhat cold, 'tis a pretty infallible Sign, that a Tertian is not far off.

Intentions of Cure in a Tertian.

In the Cure of all Disorders, the principal Intention of the Physician is to be directed to the Removal of the proximate Causes. Since, therefore, Tertians principally arise from a thin, acrid, moveable, and bilious Humour, stimulating the whole nervous System, and Coats of the Vessels, to Spasms and Strictures, hence 'tis obvious, that the great Intentions to be pursued in their Cure are,

1. To temperate and correct that subtile and caustic Acrimony.
2. Gently to dissipate and evacuate, especially by Perspiration, the corrected and prepar'd peccant Matter, generated and left in the Body in consequence of an obstructed Perspiration.
3. To mitigate the violence of the Spasms, which especially under the Cold and Horror excite terrible Symptoms.
4. Seasonably to dislodge and evacuate the acid, viscid, and bilious Crudities, which are principally lodg'd in the Duodenum, and afford a *Nidus* for the febrile Matter.
5. After the Paroxysm to restore Strength to the Body, and preserve the Excretions in due Order, left, as is usual, after every violent Shock of any Disorder, and Spasms of the muscular and nervous Parts, a want of due Tone in the Parts, and Languor of the Motions, should succeed, in consequence of which the Circulation of the Blood and Humours, together with the Secretions and Excretions, would become languid, and, by this means, the febrile Matter be afresh generated, cherish'd, and accumulated. And
6. When such a Fever is remov'd, since it easily recurs, carefully to hinder and prevent the Generation of fresh Matter fit for producing a Relapse.

In order, then, to answer the first Intention, which is to correct the bilious Acrimony, which, in consequence of the intense Heat, gradually contaminates all the Juices, nothing is more efficacious than common Nitre duly depurated, since by fixing the volatile Sulphur, by which the intestine Motion is excited, it extinguishes the Heat, and produces a far better Effect than Acids, which indeed allay the Heat, but at the same time inspissate the Humours; whereas Nitre rather preserves them fluid and thin. The sulphureous and bilious Acrimony is, also, excellently obtund'd by drinking Liquors of a diluting and moistening Nature, such as Pilsans prepared of Barley-roots, of Vipers-grass, Shavings of Hartshorn, Juice and Peel of Citron duly boil'd in pure Water; as, also, Water-gruel, sweet Whey, the *Salteran* Waters, or Small-beer well boil'd, and of a diuretic Quality: And these are principally beneficial under the Paroxysm.

The second Intention, which is, after the Paroxysm, gently to eliminate, especially by Perspiration, the thin excrementitious bilious Humours now prepared and corrected, is principally answer'd by gentle Diaphoretics, such as Cerus of Antimony, burnt and Philosophically prepar'd Hartshorn, Infusions prepar'd of Scordium, or Carduus Benedictus, and Citron-peel; as, also, the Essence of Scordium, or Carduus Benedictus, sufficiently saturated, tho' not very spirituous, and mix'd with the anodyne mineral Liquor.

The third Intention of Cure is, to mitigate the Violence of the Spasms, under the Paroxysm. This Purpose is excellently answer'd by the Use of nitrous, refrigerating, gently diaphoretic, and diluting Substances, together with such things as excite a moderate breathing Sweat: But, among all other Medicines, this Intention is best answer'd by the anodyne mineral Liquor, or, which may be used as a Succedaneum for it, by the dulcify'd Spirit of Nitre well prepar'd; since by its mild anodyne Sulphur,

which is friendly to Nature, it checks the exorbitant Commotions, not only of the nervous Fluid, but, also, of the solid, nervous, and muscular Parts, especially when it is mix'd with fix'd Powders, or diaphoretic Essences, and exhibited with Waters of a sedative Virtue, such as those obtain'd from the Flowers of Elder, the Lime-tree, Primroses, Lilies of the Valley, common Chamomile, Roses, the *Egyptian* Thorn, Meadow-sweet, and that obtain'd from black Cherries.

In order to answer the fourth Intention, which is to dislodge and evacuate the acid, viscid, and bilious Sordes lodg'd in the *Primæ Viæ*, the Physician is carefully to endeavour to correct and eliminate the peccant and imtemperate Juices, convey'd thither from the whole Body. Hence, in Cases where there is a Redundance of acid Crudities, the Cure is perform'd by Absorbents alone, whether alkaline or saline earthy Substances. The safest and most efficacious of these are the Eyes and Claws of Crabs, and the Shells of Eggs, which, as they are tender, and easily dissolv'd, are for that Reason justly preferable to Shells, which are hard, cannot be easily dissolv'd, and which with an Acid acquire an astringent Quality.

We have already mention'd, that nothing is superior to Nitre, in Cases where there is a bilious Acrimony; but where the Juices are thick, viscid, and tenacious, no Medicines are more efficacious than neutral Salts, such as vitriolated Tartar, the digestive Salt of *Sylvius*, prepar'd of the Caput Mortuum of Spirit of Sal Ammoniac, made of equal Parts of Salt of Tartar, and Sal Ammoniac, as, also, depurated Sal Ammoniac itself: These Medicines are certainly highly beneficial and efficacious in robust Persons, accusom'd to a coarse heavy, Food and Aliments obtain'd from the Sea, such as the *Swedes*, the *Dutch*, and the *Westphalians*, with whom these Fevers generally last very long. But these Salts must be diluted in a sufficient Quantity of some aqueous Vehicle; for these Medicines, when duly repeated, or exhibited in a large Dose, besides their inciding Quality, also, prove purgative, and effectually eliminate the Sordes. For this Reason, in our Days, the Salts prepar'd of medicinal Waters have acquir'd a just Reputation for their Salubrity, such as the Salts obtain'd from the Waters of *Sedlitz* and *Egra*; and, in Imitation of them, *Epsom* Salts; half an Ounce or more of which, dissolv'd in a Pint of Water, by deterring and evacuating the viscid and excrementitious Sordes of the *Primæ Viæ*, is of excellent Service against Intermittents, and the Disorders arising from the Stomach. The same Effect is produc'd by the bitter *Sedlitz* Waters, which I discover'd; for I have known Tertians cured only by drinking half a Pint of them three or four times on the Days of Intermission. But sometimes the Weakness of the Stomach, and the Frequency of Spasms in it, together with acid, saline Juices, which are usual in Infants, old Persons, hypochondriac Patients, and those labouring under Cardialgias, contra-indicate the Use of Salts: For which Reason in such Cases, it is rather expedient to exhibit an Ounce or two of Manna, with or without Rhubarb, with the Addition of a Dram, or half a Dram, of the *Terra foliata Tartari*, and a few Drops of the Oil of Cedar.

When the *Duodenum* is full of a bilious Humour, or the biliary Ducts infarct'd with tough and contaminated Juices, it is expedient to make an Evacuation, by means of Emetics. For this Purpose we may, to weak Patients, exhibit *Ipecacuanha*-root, but, to more robust Persons, this Root mix'd with a Grain or two of Emetic Tartar, Emetic Tartar by itself, also, or, which is still better, the emetic Julap prepar'd of spirituous Citron-peel-water, Julap of Roses, and dissolv'd Emetic Tartar; but if 'tis necessary, not only to purge the superior, but, also, the inferior Viscera from recrementitious Sordes, in Persons who indulge themselves in Gluttony, both those Ends may be commodiously obtain'd by an Infusion of Manna, prepar'd of an Ounce or an Ounce and an half of Manna, a Dram of the *Terra foliata Tartari*, and one or two Grains of emetic Tartar.

The peccant Humours being thus corrected, and evacuated thro' the several Emunctories of the Body, the Physician is next to pursue the fifth Intention of Cure, which consists in restoring the Strength of all the solid Parts, especially of the Stomach and Intestines, which are weaken'd by the long-continued Spasms and Paroxysms. This is a Circumstance of such Importance in the Cure of Intermittents, that tho' alternative, aperient, bitter, and evacuating Medicines are ever so long us'd; yet the Paroxysms are not remov'd, whereas it remits, and at last ceases, by the due Use of proper Corroboratives; for when the Strength of the nervous vascular and muscular Parts is restor'd, they are not subject to Stagnations of the Humours, which are the Causes of the spasmodic Paroxysms; but the Circulation of the Blood, and all the Juices, rather becomes more free, the Pulse quicker, and the Respiration, together with the Secretions and Excretions, stronger; so that the Paroxysms not only cease, but, also, the fresh Fomes of the febrile Spasms is dispel'd, which otherwise gains Strength, when, on the Day of Intermission, the Patient's Respiration is languid, and his Pulse small.

But, among all the antifebrile Specifics of an astringent Quality hitherto known, such as the astringent Barks and Roots, Per-

Perspiration of Steel or Alum, or even the somewhat hotter Medicines, none is more temperate, safe, or better accommodated to Persons of all Ages, Temperaments, and Sexes, or answers more Intentions of Cure, than the Peruvian Bark, as is evinc'd by numberless Experiments; for when this Medicine is us'd at a proper Season, and in Conjunction with a due Regimen, so as not to suppress, but rather to promote, the natural Excretions, it, on account of its mild earthy astringent Principle, and balsamic Bitterness, surpasses all other Medicines; and, when a few Doses of it are only exhibited, miraculously allays febrile Paroxysms: But 'tis far more efficacious in Powder and Substance, than in Decoctions, Infusions, Essences, or Extracts; and, if all other Circumstances are alike, if it is exhibited in the time of Intermission, the Pulse becomes more brisk, the Heat and Perspiration greater, and the Body, especially in choleric Patients, more soluble; all which are certain Proofs of its happy and successful Operation. I often prescribe an Electuary, by which I have seen a great Number of Patients labouring under Tertian Fevers cur'd, and which is prepar'd in the following manner.

Take of Elder-rob, half an Ounce; of Peruvian Bark, six Drams; of the Powder of common Chamomile-flowers, two Drams; of the Extract of the lesser Centaury, and Powder of Cloves, each half a Dram; and of the Syrup of Citron-juice, an Ounce and an half: Make into an Electuary.

I sometimes, also, in order to facilitate Perspiration, mix with it half a Dram of diaphoretic Antimony, old Theriaca, or Sal Ammoniac; and, after the Paroxysm is over, every two Hours I exhibit half a Dram of this Electuary. But for those who have tender Constitutions, and weak Stomachs, the Bark is to be reduc'd to a liquid Form in the following manner.

Take of Peruvian Bark, an Ounce; of Calcarilla, Cinnamon, and Salt of Tartar, each one Dram; of the Water of Chamomile-flowers, one Pint and of Wine, the like Quantity: Digest in a gentle Heat; and to the Liquor, when strain'd, add half an Ounce of the Syrup of Orange-peel: Mix for an antifebrile Potion, an Ounce or two of which are to be taken every two Hours.

In order to prevent, which is the Design of the sixth Intention, the frequent Relapses of Intermittent, and especially of Tertian Fevers, there is no more effectual Method, than to avoid all such Things, as have a Tendency to generate such Fevers, carefully observing the Cautions before inculcated in the Method of Prevention: And since, when the Body is exhausted by the Fever, the Appetite, on its Departure, is generally very keen, whilst the Stomach and Nature are as yet but weak and languid, it frequently happens, that new Crudities are regenerated in the *Primæ Viæ*, which lay a Foundation either for a slow Fever, or a Relapse into the former, which was before remov'd. Hence 'tis absolutely expedient, that those who are just recover'd from a Fever, should eat light Suppers, and Aliments of easy Digestion, and use proper Measures to support the Strength of their Stomachs, eliminate the Sordes from the *Primæ Viæ*, and deterge the Remains of the Disorder, if there are any. For this Purpose I recommend the moderate, tho' frequent, Use of the *Balsamic Cordial Pills*, nine or eleven of which may be swallowed every other Day, either at Morning or Night; for by their means the whole Body acquires Strength, the Flatulences are easily discuss'd, the Body render'd gently soluble, the Pulse increas'd, and the Perspiration render'd brisker. In this Case, excellent Effects are, also, produc'd by Stomachic corroborative Elixirs, of which thirty or forty Drops are to be taken before Dinner. This Intention is, also, excellently answer'd by the Balsamic Elixir, the Stomachic Elixir of *Michaeli* to be found in the *Thesaurus Pharmaceuticus* subjoin'd to the *Clavis Schraderiana*, or the Stomachic Essence prepar'd in my manner; or the Essence of red Gentian, mix'd with Sal Volatile Oleosum, as, also, my visceral Elixir.

The Methods of Cure in particular Cases.

When a Load of peccant Humours in the Stomach and Duodenum calls for an effectual Depletion, which may be conjectur'd from a previous Course of Gluttony, an Anxiety of the Præcordia, Nausea, Eructations, and Bitterness of the Mouth, we are, immediately after the first or second Paroxysm, to exhibit, on the Day of Intermission, such an Emetic as we have above recommended; or, if the Stomach is strong, and peccant Matter to be evacuated by Vomit and Stool, the following Formula may be prescrib'd.

Take of *Sedlitz* or *Epsom* Salts, half an Ounce; and of emetic Tartar, two or three Grains: Reduce to a Powder, to be dissolv'd in half a Pint of pure tepid Water, to be drank two Hours after the Paroxysm is ended; afterwards

facilitating the Evacuation by large Draughts of thin Water-gruel, with a large Quantity of Butter in it.

But as soon as the Strength is, in some measure recover'd, after the Evacuation, some Doses of the above describ'd antifebrile Electuary are forthwith to be exhibited; by which means it has often happen'd, that the Fever has been remov'd in its very Beginning, and by the Use of a proper and moderate Regimen never return'd.

On the contrary, if any thing hinders the salutary Excretions, and many serous and crude Juices remain within, which require a sufficient Evacuation, the Cure is to be begun by purging with deterfive Salts: For which Purpose,

Take of *Sedlitz* Salts, half an Ounce; of Sal Ammoniac, or the digestive Salt of *Sylvius*, and of Crabs-eyes, each two Drams; and of purified Nitre, one Dram: Make into a Powder, of which half a Dram is to be taken every two Hours, in an Ounce of pure Water, or common Chamomile-water or Pisan, drinking, immediately after, a Cup of Tea.

With this, after I have, for some of the intermittent Days, mildly and gradually purged the whole Intestines, and the Fever yet remains, or is not diminish'd with respect to its Vehemence, I either order equal Quantities of the Peruvian Bark and Salts, or my Electuary alone, to be interpos'd; and by this Method I have soon and happily cur'd epidemical and autumnal Tertians.

But if the Patient is subject to the hypochondriac Disorder, is of a delicate Constitution, is costive, or afflicted with Inflammations of the Stomach, is impatient, and readily dispos'd to Commotions of Mind, we are neither to use Emetics, nor purgative Salts; but the most happy Effects are produc'd by Clysters prepar'd of temperate, carminative, and emollient Substances, as, also, the balsamic Pills exhibited in a small Dose, nine, for Instance, or eleven, at the time of Intermission, giving some Hours, either before or after, a digestive Powder, prepar'd of Crabs-eyes, the *Terra foliata Tartari*, vitriolated Tartar, and depurated Nitre.

In the Accession of the Fever, and under the Paroxysm, especially during the Rigor, nothing is to be attempted by the Physician: The Patient is at that time, also, to abstain from drinking, especially cold Liquors, even tho', under the cold Fit, he should be rack'd with Drought. But as the Heat gradually increases, and arrives at its Height, a sufficient Quantity of Drink is to be allow'd, tho' not in large Draughts, but small Quantities frequently exhibited, taking care, at the same time, that it be not ungrateful to the Palate. For this Purpose, we may use the Decoctions and Infusions already recommended, and especially Pisans, or Water-gruel, with Vipers-grass, adding the Syrup of Lemons, or Raspberries, as, also, the dulcify'd Spirit of Nitre, and Oil of Cedar. In order to extinguish the Heat, nothing is more proper than a tempering Powder, consisting of two Parts of Crabs-eyes, and one Part of Nitre, frequently exhibited with Pisan.

When the Heat remits, and the Paroxysm is terminated, the appearing Moisture or Sweat on the Skin is to be gently promoted, not only by the Heat of the Bed and Stoves, but, also, by internal Medicines: For which Purpose, besides the Things already mentioned, Infusions of the Roots of Vipers-grass, Scordium, and Citron-peel, are excellent. But, after the Fever is totally remov'd, the Body is to be carefully defended against all Refrigeration internal or external, whilst we are rather to keep it in a perpetual Perspiration; which may be obtain'd by proper Exercise, and the frequent Drinking of warm Liquors.

Practical Cautions and Observations.

In order to the skilful Cure of Tertians, whether simple, double, or continued, the Beginning and End of the Paroxysm are, above all things, to be observ'd by the Physician, who may judge of it from the Refrigeration of the Extremities, the Pandiculation, the Oscitation, the Horror, and a Change of the Pulse into one of a more quick and contracted Kind. But he is to judge of the Termination of the Paroxysm from the increas'd Softness of the Pulse, the Remission of the Heat, and the Moisture or Sweat on the Body; for, either before or during the Paroxysm, 'tis not expedient either to let Blood, or exhibit a Vomit, a Purgative, Peruvian Bark, or any other corroborating and astringent Medicine. But, when the Paroxysm is over, the Sweat, when 'tis expedient, is to be commodiously promoted; and in the Time of the total Intermission, it is proper to exhibit Diaphoretics, Evacuants, or Specifics, accommodated to the peculiar Circumstances of the Patient.

As a Tertian in the Beginning, especially in hot Constitutions, often resembles a continual and burning Fever, we are only at that time to use tempering, diluting, gently saline, digestive and nitrous Preparations, abstaining from Emetics, and acrid, hot Sudorifics, till it has assum'd the Type of a Tertian.

If a Tertian is obstinate, as in the Autumn, or passes into a Quotidian, the antifebrile Potion, described by *Crollius*, from him recommended by *Riverius*, and consisting of the distilled Water of Carduus Benedictus, Salt of Wormwood, and Spirit of Vitriol, drank twice or thrice a Day, afford great Relief, especially when the balsamic Pills are interposed. But 'tis to be observed, that the Spirit of Vitriol is not to be immediately mixed with the Salt of Wormwood, but the Mixture is to be made in the Water. I, also, generally substitute Oil of Tarsar per Deliquium in the room of the Salt of Wormwood, observing, in the Mixture, exactly to hit upon the Point of Saturation. And such a Potion is possessed of a similar, or even a superior, aperient Virtue, to the medicinal and mineral Waters above-mentioned.

The same Potion is highly beneficial in a too bilious Tertian, or one produced, in choleric Patients, by Anger. We are, in such Cases, carefully to abstain from bitter, sudorific, alexipharmic, acrid, aromatic Medicines, and much more from volatile Salts; but we are rather to use highly temperate, saline, nitrous, and precipitating Medicines.

Peruvian Bark is certainly an excellent Antifebrile, and I have found it both safe and efficacious in epidemical Fevers. But it is always more safe in Patients of delicate hot and brisk Constitutions; as, also, when the Urine deposits a Sediment, and the Perspiration is freely carried on, than in languid, melancholic, and phlegmatic Patients, Women who labour under a Suppression of the Menstrues, and those in whom the Excretions are defective, or the Urine crude. Hence, after the Exhibition of the Bark, Motion of the Body is carefully to be enjoined; and not cold, but hot, Liquors prescribed for Drink.

'Tis sometimes necessary, by means of the Peruvian Bark, and other Specifics, to check the Paroxysms, before the morbid Matter is corrected, and sufficiently evacuated, that the Physician may afterwards more successfully correct and eliminate the Fomes of the Fever by proper Remedies.

When the Heat, and other Symptoms are so violent as to exhaust the Strength, I have found from many Instances, that happy Effects are produced by Peruvian Bark mixed with Nitre, and exhibited in the Form of an Electuary; by the Use of which, I have seen the Symptoms immediately mitigated, and the Patient's Strength increased: Only 'tis to be observed, that, even after this, the febrile Matter is to be corrected and evacuated by proper Medicines.

As acrid Purgatives increase the Spasms, they are never to be exhibited in a Tertian, much less when by the Peruvian Bark, or other Medicines, the Paroxysms are removed, because they easily produce a Relapse. But if the Patient is costive, his Body is to be rendered soluble by Clysters, or the balsamic Pills, interposing the Use of the Salts.

Emetics, when indicated, are, in the very Beginning, to be used without Delay; nor are we to wait, till the Matter is concocted; but rather eliminate it by the nearest Way, before it diffuses its hurtful Influences farther. But, if the Patient has already laboured under a Tertian for some time, the preternatural Heat disposes the Stomach to an Inflammation, which is afterwards easily brought on by an Emetic. However, when the Paroxysm returns frequently, tho' mildly, and when the Fever, thro' a Neglect of a proper Regimen, or a bad Method of Cure, continues for some Months, a Vomit is often exhibited with Success: Only 'tis to be observed, that at this time a smaller Dose is to be exhibited, than at the Beginning; and that, by means of such an Emetic, so large a Quantity of bilious Humours is evacuated from the Duodenum, that tho' the Fever does not totally cease, yet 'tis afterwards easily cured by antifebrile Specifics, especially the Peruvian Bark, with the Addition of a due and proper Regimen.

In Tertian Fevers, Venesection is not to be used without the greatest Caution. In the Beginning of the Fever, when it resembles one of the continual Kind, when the Heat is intense, and accompanied with a Delirium, when the Disorder happens in the Summer, when the Patient is in the Flower of his Age, of a bilious Constitution, easily provok'd to Anger, and addicted to luxurious and high Living, opening a Vein is of great Service; only the *Prima Via* are to be previously cleansed, and the Time of Intermission chosen for that Purpose. A few Hours before or after the Venesection, the Patient may drink a few Cups of an Infusion of common Chamomile-flowers, which is of singular Efficacy against Fevers; partly because the Blood, being by it attenuated, circulates more freely; and, partly, because the spasmodic Motions, which constitute the very Nature of these Fevers, are, by its means, in some measure allay'd: On the contrary, when the *Prima Via* are full of Crudities and Sordes, the Patient not plethoric, and other Symptoms not present, Venesection is injurious, because the salutary Excretions, especially Perspiration, are, by its means, suppressed; and the Fever, as we find from Experience, increased and protracted.

In Intermittent Fevers, we are absolutely to abstain from Opiates and Anodynes, among which are, the *Pilula de Cynoglossa*; for tho' they mitigate, and sometimes suspend, the Paroxysm, they yet impair the Strength, and disturb the whole Progress and salutary Crisis of the Fever; so that the Cause of the Disorder becomes stronger, and the Paroxysms far more violent. But the

Pilula Wildeganfii, or the *Theriacal Caelestis*, are far more proper and expedient in this Disorder.

Preparations of Alum and Vitriol, also, stop the Paroxysms of Fevers. But, if these vulgar Medicines are exhibited, 'tis necessary, after they are used, to promote Sweat by Exercise, or by warm Decoctions and Infusions, that their noxious Qualities may be, in some measure, prevented; for, after the preposterous Use of these and other more powerful Astringents, I have observed many Misfortunes, especially a total Suppression of salutary Discharges of Blood, in those accustomed to them.

Cascarilla-Bark is, also, an excellent Medicine in Intermittent Fevers, on account of its balsamic, sulphureous, anodyne, earthy, and astringent Principle. But, because it generally throws the Blood into preternatural Commotions, and excites a violent Heat, it is not much used in bilious Patients, and those subject to impetuous Motions of their Fluids; and, if it is prescribed for such, a very small Dose of it must only be used. But for languid and phlegmatic Patients, as, also, for Women, it is more prescribed; upon which Occasions, it is most commodiously mixed with Peruvian Bark.

Tho' Absorbents are of singular Efficacy in the Cure of Fevers, yet they ought to be used moderately, and chosen judiciously; for when large Quantities of them are exhibited, they are not subdued by the Solvent or Menstruum of the Stomach; but, remaining entire, overload it, or which is worse, by uniting into a kind of Paste, create Anxieties, and a Nausea. The coarse Absorbents, principally obtained from Sea-substances, are not only with Difficulty dissolved, but, also, afterwards, acquire an astringent Quality.

It frequently happens, that in the Paroxysm, especially its Beginning, in consequence of a Congestion of Blood to the Head, particularly in plethoric Patients, there arises a violent Head-ach, accompanied with a Perturbation of the Senses and Imagination. But this Head-ach is not to be promiscuously removed by Topics; for, I have observed, that the common Family Epithems, prepared with Wormwood, Rue, Cumin, Juniper-berries, common Salt and bruised Bread, do more Harm than Good, in consequence of the Vapour with which they fill the Head. Much less are we to use cephalic and nervous Substances, such as, my *Balsam of Life*; which are, on other Occasions, highly beneficial in Head-achs.

In the Paroxysm, hot Liquors, such as Tea and Coffee, are highly improper, because they too much exagitate the acrid and bilious Humours of the Blood, and surprisingly increase both the Heat and Anxieties; for *Hippocrates*, in *Lib. 3. de Morb.* informs us, "that hot Liquors are not expedient in Tertians, but rather such as are cold." But out of the Paroxysm, these warm Potions are of singular Service, especially when the Body is sufficiently soluble.

When a Tertian Fever is removed by means of Specifics, the proper Methods of preserving Health, are not to be neglected; but Refrigeration of the Body is to be carefully avoided, Moderation in Eating and Drinking observed, and the Use not only of the balsamic Pills, but, also, of the Stomachic Elixirs, for some time persisted in.

But if, in consequence of drinking large Draughts of cold Liquor, or the preposterous Use of Astringents in Tertians, cedematous Tumors succeed, we are, by no means to use acrid Purgatives, Chalybeates, or volatile Salts, but the Cure is rather to be attempted by absterfent Salts, balsamic Pills, and temperate Decoctions of the Woods. When the Patient labours under an *Anasarca*, great Relief is, also, afforded by an Emetic, mixed with a due Quantity of the Extractum Parchymagogum Crollii, since by this means a large Quantity of Water is evacuated.

I have often observed, that plethoric old Persons, and those accustomed to Venesection, by Refrigeration, have fallen into a violent Colic, succeeded by a continual epidemic Tertian, and in these, Venesection proves highly beneficial; but the Peruvian Bark, too soon exhibited, generally proves so prejudicial, as to induce a Quotidian, resembling an Hætic.

To Children of eight or ten Years of Age, labouring under Tertians, I have with Success exhibited an emetic Potion, and afterwards, ordered Clysters of antifebrile Ingredients, such as the lesser Centaury, and Peruvian Bark to be injected, by which means the Fever ceases totally, and never returns.

Women become Cachectic from a Suppression of the Menstrues, when seized with a tertian Fever, are to be treated very cautiously, rejecting all drastic Medicines, Evacuants, Corroboratives, and even Emmenagogues; which, however, if temperate, may be successfully used, when the Fever is wearing off. But great Relief is afforded by Clysters of gently laxative, bitter, and carminative Ingredients; as, also, by gently laxative Infusions, which contain bitter Ingredients, Peruvian Bark, and Filings of Steel.

Childbed Women, labouring under intermittent Fevers suffer very much, and are afflicted with hysteric Symptoms, unless their *Lochia* are duly attended to, especially when this Evacuation, together with the Fever, is too soon suppressed, by Absorbents obtained from Sea-substances, or precipitating Substances of a gross Texture, such as Shells and Coral, with or without an Acid. In this Case, great Relief is afforded by the *Pilula Balsamica*.

jamica tonica, which are highly beneficial in Diseases arising from any Fault of the Uterus. *Frederic Hoffman.*

TERTIANARIA. A Name for the *Scutellaria*. See **CASSIDA**.

TERTIAS.

The Latin Phrase *ad tertias*, though frequently used in Medicine, is capable of a double Interpretation, for it may either signify two Thirds, or one Third; that is, when applied to Decoctions: For Example, it may either signify, that the Boiling should be continued till only one Third of the original Liquor remains behind; or till only one Third of the Whole is wasted, and two Thirds are left: But the latter seems to be the more common and approved Acceptation; and so, likewise, *ad tertias implere*, or *ad duas tertias*, is not to fill one Third, but two Thirds of a Vessel. *Edinburgh Dispensatory.*

TERTIUM SAL. A neutral Salt.

TESSELLÆ. The same as **ROTULÆ**, or **TABELLÆ**, Lozenges, or Troches.

TESSERÆ OS. The *Os Cuboides*.

TESTA. The Shell of a Fish, or Snail; or an earthen Vessel.

TESTES. The Testicles.

TESTICULI. The Testicles. See **GENERATIO**.

THE METHOD OF TREATING A CANCER, OR SPHACELUS, IN THE TESTICLES.

If a Scirrhus of the Testicle should degenerate into a Cancer, or an Inflammation into a Sphacelus, or if from any other Cause the whole Testicle should be affected with Putrefaction, one, and that a miserable Remedy only remains, by extirpating the Testicle, in order to prevent the Disorder from extending itself to the Groin, and the interior Part of the Abdomen, and at last, killing the Patient. The Method of performing this Operation is explained under the Article **CASTRATIO**.

But when the Testicle is only in part corrupted by an Abscess, there is no Necessity of extirpating it entirely, but only of opening the Abscess, and afterwards cleansing and healing the Ulcer. *Garengeot* observes, that it is extremely necessary in every Castration, that an Incision should be made at the Ring of the Abdomen, and that the spermatic Vessels should be divided from the Parts to which they adhere, and a Ligature be made about them, at the Ring, or even above it, before the Testicle be touched; which Method, he says, will not only be milder to the Patient, but even promote the Cure: But for what Reason, he does not say. On the contrary, it is rather to be feared, that such an Incision would weaken this Part of the Abdomen, and make it liable to be affected with a Rupture; not to mention the Pain, which the Patient must undergo, in suffering this Incision, which appears, at least to me, unnecessary; besides the Danger of an Inflammation being produced by the Ligature, which might proceed to the internal Parts. But if the Corruption lies in the spermatic Vessels to the Ring, or above it, Castration ought rather not to be attempted.

OF AN INFLAMMATION OF THE TESTICLES.

Sometimes one, or both the Testicles are attacked with an Inflammation, which is attended with excruciating Pains, especially if the Disorder comes to any considerable Height.

This Disorder may proceed from two Causes: 1. From external Violence, as a Fall, Bruise, or Contusion, which may readily happen from mounting an Horse hastily, or carelessly. 2. From a Venereal Cause, by the too early or imprudent Checking of a Gonorrhœa.

An Inflammation of the Testicles may be distinguished from any other Disorder, particularly a Rupture of the Scrotum, when the Patient, after any of the above-mentioned Causes, complains of a Swelling, Heat, Redness, and Pain in the Testicles, and when the Tumor and Inflammation are apparent on Inspection. Besides, upon feeling the affected Testicle, it will be found preternaturally enlarged, and sometimes equal to the Size of a Fist.

This Disorder is far from being trivial; for frequently an Abscess or Sphacelus is induced, and the Patient is either deprived of his Virility, or his life; or it degenerates into a Scirrhus, or a Cancer, the consequence of which, also, is generally Death; or lastly, it is succeeded by a Sarcocœle, or Hydrocœle, not without extreme Uneasiness to the Patient.

The same Medicines are required for resolving an Inflammation of the Testicles, which are used for the same Intention in Inflammations of the Breasts (see **MAMMA**); particularly Vinegar of Litharge, and Lime-water, mixed with camphorated Spirit of Wine, Cerus, Turty, and Lapis Calaminaris: But in the Night-time, when Fomentations are inconvenient, apply the Plaster of Frogs, with a double Quantity of Mercury, or the Diachylon-plaster. Nor are internal digerent Medicines to be neglected: If the Tumor proceeds from external Violence, or an Inspissation of the Blood, the Powders of prepared Crabs-eyes, Oyster-shells, Mother of Pearl, Cinnabar, and *Arcanum Duplicatum*, are to be frequently exhibited; Sorbitions, also, of Tea, and Decoctions of digestive Roots, Woods, and Herbs; every thing which heats the Blood, and all Foods difficult of Digestion, or taken plentifully, are to be carefully avoided. When

the Heat is very violent, it may not be improper to mix a little Nitre with the above-mentioned Powders, and some Drops of the Spirit of Vitriol, or of Sulphur, with the Patient's Drink; and if he be plethoric, Blood may be taken from the Arm.

If the Disorder arises from a Venereal Infection, Purgatives, mixed with *Mercurius Dulcis*, seem necessary, and all those Remedies which are proper against the Venereal Disease. Nor are warm Drinks of Tea, or Pisans made of Barley, Liquorice, and Anise boiled in Water; to be omitted, which not only serve to temper and attenuate the Blood, but, also, to dissipate the Inflammation.

If the Surgeon be called too late, or if the Inflammation be too violent to yield to the above discutient Remedies, a Suppuration, or Gangrene is generally the Consequence. Therefore, the Application of the same suppurative Medicines, which are directed under the Article **MAMMA**, become necessary. When the Pus is ripened, and the Abscess does not quickly burst spontaneously, it must be carefully opened with the Knife, and the Matter being discharged, let the Wound be derged with some digestive Ointment, and some spirituous Injections which resist Putrefaction; then heal the Wound with some vulnerary Balsam. But in digesting the Matter, and diminishing the Pains, the Plaster of Henbane, and, also, of Diachylon, with the Gums, are very efficacious; and, in the mean time, particular Care must be taken to remove the Venereal Taint. Altho', in these Cases, the *Scrotum* is often so consumed, that the Testicle is exposed to View, yet, if digestive and balsamic Medicines be properly apply'd, the lost Substance of the Scrotum may be restored, as I have often observed. *Heister's Surgery.*

See the Method of removing Tubercles of the Testicles, and that of Castration, under the Article **HERNIA**.

TESTICULUS MORIONUS. A Name for the *Orchis*; *morio*; *mas*; *foliis maculatis*; and for the *Orchis*; *morio-femina*.

TESTUACEUS, or **TESTUACEUS PANIS.** Bread bak'd on a Tile, or in an earthen Vessel.

TESTUDO TERRESTRIS. Offic. Schrod. 5. 333. Ind. Med. 116. Bellon. de Aquat. 52. Aldrov. de Quad. Ovip. 705. Gefn. de Quad. Ovip. 107. Charlt. Exer. 30. Jonf. de Quad. 144. *Testudo terrestris vulgaris.* Raii Synop. 3. 243. **THE LAND TORTOISE.**

The recent and crude Blood is prescribed in an hectic Fever; and the same, dry'd, is recommended for the Epilepsy.

TESTUDO MARINA. Offic. Schrod. 5. 333. Bellon. de Aquat. 50. Schonef. Ichth. 74. Gefn. de Quad. Ovip. 113. Aldr. de Quad. Ovip. 712. Charlt. Exer. 30. Jonf. de Quad. 147. *Testudo marina vulgaris.* Raii Synop. A. 254. **THE SEA TORTOISE, or TURTLE.**

The Parts in Use are the *Legs*, the *Penis*, and the *Gall*. The Legs are worn as a most approved Amulet against the Gout; and the Gall is good for the Eyes. *Schröder. Ligon. de Insula Barb.* commends the Penis in nephritic Disorders.

Ovip. 710. *Testudo quæ in Aqua dulci vivit.* Gefn. de Quad. Ovip. 110. **THE WATER TORTOISE.**

The Blood and Gall agree in Virtues with the other Tortoises: The Tortoise is so named from *Testa*, a Shell; this Animal being covered with an hollow Shell of a peculiar Kind, and remarkable for the Largeness of its Size, Solidity, and Beauty, which is shaped like a Shield, and diversified with Variety of Colours. Its Head and Tail resemble those of a Serpent, and its Feet are like the Feet of a Lizard.

Tortoises are of four Sorts. 1. Land Tortoises. 2. Sea Tortoises. 3. Fresh-water Tortoises. 4. Mud Tortoises, which live in muddy Places. They are mostly amphibious; but some Authors except the Land Tortoises.

The Land Tortoise is found in Mountains, Forests, Woods, Fields, and Gardens. It lives upon Fruits and Herbs, Worms, Snails, and other Insects; and may be fed in Houses, with Bran and Flour. In Winter they conceal themselves in Holes, like Serpents and Lizards, where they continue without any Food, as several other Animals do. They live long, move very slowly, and are said to have a natural Aversion to the Eagle, which sometimes seizes them, and carries them off, in order to devour them. *Aristotle* says, they fight with Serpents and Vipers, and that they are always provided with the Plant called *Cumila*, or Savory, for curing the Stinging of those Animals. *Pliny* says, that this kind of Turtle is very plentiful in *Africa*, and is much used for Food. Some Authors recommend the eating of it in *August* and *September*, when it is fattest.

The Sea Tortoises sometimes go ashore, where they fall asleep; and, if they continue long there, they die. In the Sea they feed upon Shell-fish, and, when upon Land, they eat Herbs. It is said, that, when their Heads are cut off, they will live some time, and they will bite very hard.

Pliny says, there are Sea Tortoises in the *Indies* so large, that the Shells of each of them are big enough to cover small Houses,

and the Inhabitants make some of them into Barks, with which they sail into the Islands of the Red Sea.

There is but little Difference between the Fresh-water Tortoises, and those which live in muddy Places; they feed upon Herbs, and watery Insects; they live more by Water than Land; and, it is said, a long time without Food.

The Flesh of the Tortoise is very good, and like Veal. It is strange, that *Galen*, and others, who have treated of Food, should never mention this Animal; for it is much used.

The Flesh of Tortoises is very nourishing, and is solid and durable Food; for it contains an oily, balsamic, and saltish Juice. Upon account of this Juice, also, it is restorative and pectoral; and, for phthical and hectic Patients, a Syrup is made of the Flesh, which is excellent for qualifying the sharp Humours of the Breast. In the mean time, it is hard and viscous, and not easily digested, breeding viscous and gross Humours, and producing Dulness and Laziness; therefore, it ought to be well boiled, and seasoned with such Things as help Digestion.

Cardan, in his ninth Book, assures us, that the Flesh of the African Tortoises, being eaten with Bread for several Days together, is an excellent Remedy against the Leprosy. The Blood of the Tortoise, being dried, is reckoned good for curing the Falling Sickness, giving a Dram of it for a Dose.

In some Countries, an Oil proper for burning is extracted from the Tortoise. *Lemery on Foods*.

TETANUS.

The Neck is subject to some very violent Disorders, than which none are more troublesome and acute, than that in which, by reason of a certain Rigor of the Nerves, the Head is immovably reclined to the Scapula; that in which the Chin is fixed to the Breast; and that in which the Neck is straight, but yet immovable. The first was, by the *Greeks*, called *Opisthotonos*, the second *Emprosthotonos*, and the third *Tetanus*; tho' some, without any regard to Accuracy, confound these Words together. These Disorders prove mortal within the fourth Day; and, if they continue beyond it, they are without Danger.

'Tis universally agreed upon, that all these Disorders are to be cured in the same manner; and, for this Purpose, *Asclepiades* ordered Venesection, which, according to others, was not to be used, because, under these Disorders, the Body was destitute of a due Degree of Heat, which, residing in the Blood, would, of course, be lessened by a Diminution of that Fluid. This Doctrine is absolutely false, since the Blood is not naturally hot, but quickly becomes either hot or cold, in consequence of what happens in the Animal Oeconomy. But whether Venesection is expedient, may be collected from the Circumstances and Situation of the Patient. In these Disorders it is proper to exhibit Castor in Conjunction with Pepper or Lafer. Dry and moist Fomentations are, also, necessary; for which Purpose many, now-and-then, pour large Quantities of warm Water on the Necks of Patients afflicted with these Disorders. But though this Practice affords immediate Relief, it is not to be used, because it renders the Nerves more susceptible of the Injuries of the Cold.

It is, therefore, more expedient, first, to anoint the Neck with a liquid Cerate, and then to apply Oxens Bladders, or small Phials full of warm Oil, or a Cataplasm of warm Meal, or of Figs and Pepper beat up together. But, among all the Measures taken for the Cure of these Disorders, none is more effectual, than to hold the Patient's Neck over a Vessel full of warm Water, in which a considerable Quantity of Salt is included in a Linen Bag. When these Steps have been taken, we must place the Patient before the Fire; or, if it is Summer, expose him to the Influence of the Sun, and carefully rub his Neck, Scapula, and Spine, with old Oil, and if that cannot be had, with Syriac Oil; or, if that is, also, wanting, with the oldest Fat that can be had.

As Friction is serviceable to all the Vertebrae; so 'tis, in a particular manner, beneficial to those of the Neck; for which Reason this Practice is to be used both in the Day and Night, only allowing some Intervals, during which we are to apply a Malagma, consisting of heating Ingredients. The Patient is, also, to be carefully preserved from Cold, for which reason his Room ought always to have a Fire kept in it, especially about the Twilight, when the Coldness of the Air is generally augmented. It is, also, expedient to shave the Head, which being anointed with the *Oleum Irinum*, or the *Oleum Cyprinum*, is to be covered with a warm Cap. It is, also, sometimes proper to bathe the whole Body, either in Oil by itself, or in warm Water, in which Fennugreek has been boiled, adding a third Part of Oil. By rendering the Body soluble, the Strictures of the superior Parts are, also, frequently relaxed.

But if the Pain becomes very intense, Cupping with Scarification, is to be apply'd to the Neck; and the Incisions made in the Skin are to be burnt either by Synopsims, or proper Instruments. When the Pain is alleviated, and the Head begins to move, we are sure that the Disorder yields to the Influence of the Remedies. But the Patient is long to abstain from all Kinds of high Food, and only use Sorbitions, poach'd Eggs, and Broths prepared of young Fowls, and other soft and light Fleshes. If these Measures succeed happily, and the Patient's Neck begins to

seem totally restored to its natural State, he is first to use, only, Pap, or thin Spoon-meat; but he may much sooner eat Bread than drink Wine, which, being highly dangerous, is therefore to be the longer abstained from. *Celsus, Lib. 4. Cap. 3.*

Various Disorders arise from Contractions and Convulsions, of which there are various Species, such as the *Emprosthotonos* and *Opisthotonos*; the former of which is a convulsive Inclination of the Head forwards, and the latter an Inclination of it backwards. The antecedent Causes of these Disorders are Blows and Contusions of the large Tendons, lying long upon them in one Posture, lying with them applied to hard Substances, laying any weighty Thing upon the Neck, drinking strong Liquors, excessive Cold, or, which frequently happens, Wounds of the Nerves and Muscles, and the Drinking Wine before such Wounds are cured. These Disorders, also, most frequently happen by the Use of cold Water, especially at that Time, when such Wounds, being free from Sordes, seem to be deterged, and coming to a Cicatrix; they, also, sometimes happen sooner, and when the Wounds are as yet tumid, or in their worst State. That Species of Contraction, which the *Greeks* call *Spasmus*, is an involuntary Tension and Contraction of the Parts, accompanied with violent and acute Pain, in consequence of the excessive Stricture. But that Species of Convulsion, which they call *Tetanus*, is, by the Followers of *Asclepiades*, defined an Extension of the whole Body, or of some of its Parts. But, in giving this Definition, they seem to have forgot that some Parts may be extended by the Influence of the Will; and Persons afflicted with a *Satyriasis*, or Gour, have in the former an Extension of the Penis, and in the latter of the Feet, without being afflicted with that Species of Convulsion which the *Greeks* call *Tetanus*. Others define a *Tetanus*, a Convulsion of those Muscles of the Neck and Cheeks, called *Stagomites*, in consequence of their violent Tension and Pain. Other Authors of the Methodic Sect, in defining this Disorder, have, instead of Convulsion, used the Word *Conclusio*; but this is only giving different Names to one and the same Thing, for these Writers imagined, that this was the Cause of the Disorder. But in general we may answer all these Writers, by telling them, that there is a great Difference betwixt a Disorder, and its Cause: We must, therefore, ascertain, not what the Cause of Convulsions is, but what Convulsions are; for as the Cause is latent and occult, it must vary according to Opinion and Apprehension. But the Phenomena peculiar to Convulsions or Contractions are obvious, manifest, and perceptible by every one; and it is but reasonable, that, as far as is possible, we should found our Doctrine upon consistent Principles. According to our Sect therefore, that Species of Distension or Extension, which the *Greeks* call *Tetanus*, is an involuntary, rigid, and inflexible Tension of the Neck, in an erect Position, occasioned by a violent Stricture or Tumor of the Parts. An *Opisthotonos* is an involuntary spasmodic Retraction of the Neck, also produced by the Stricture or Tumor of the Parts; and an *Emprosthotonos*, an involuntary Inclination of the Head forwards, produced by the same Causes. Those Disorders are called involuntary, in Opposition to those Motions of the Head, by which, in consequence of the Concurrence of the Will it is held in these Positions. They are also said to proceed from the Stricture or Tumor of the Parts, in Contradistinction to those Positions and Directions of the Head, produced in such as are hanged. Persons about to fall into these Disorders, are generally seized with the following Symptoms; a difficult Motion of the Neck, a continual Oscitation, especially, in the Parts about to be affected: This State is succeeded by an uneasy and painful Posture of Lying; a slight Tension and Hardness of the large Tendons; an uneasy and troublesome Punction between the Spine and the Occiput; a small Difficulty in Drinking; a Pain of the Temples, which is particularly exasperated when the Patients yawn, or open their Mouths; a Dulness of Hearing; a Stammering of the Tongue, and Slowness of Speech; a continual Discharge of the Saliva; a painful Sensation in the Calves of the Legs, and Soles of the Feet. The Countenance is, also, seemingly smiling, without any apparent Cause, and there is a kind of Palpitation in its Parts. When the Disorder seizes, there is a violent Convulsion and Hardness of the Parts of the Neck, and Muscles of the Cheeks, accompanied with excessive Pain; there is a Redness of the Countenance and violent Contraction of the above-mentioned Muscles; the Teeth, also, are strongly clos'd, the Patient is thrown into a profuse Sweat, whilst there is a cold Torpor of the Joints, an obscure Pulse, an Extension of the Neck, a Difficulty of Breathing, a Contraction of the Legs and Arms, and a Regurgitation of any Liquor put into the Mouth through the Nostrils; some are, also, afflicted with an Alienation of Mind, a quick Respiration, and a Rattling of the Throat and Breast. In a *Tetanus*, the Neck is strait, rigid, and inflexible. In an *Opisthotonos*, there is a Reclination of the Head to the posterior Parts, accompanied with an excessive Pain and Tension of the Back and Buttocks; such Patients, also, have their Legs contracted, tho' their Arms are not seized with convulsive Motions; their Fingers are contracted and folded, as *Hippocrates* affirms, and it often happens that they keep their Thumb clenched in the rest of their Fingers; neither can they retain themselves in one

one Posture, but shift about with a kind of Palpitation, when the Pain seizes them. An Opisthoronos is more dangerous than a Tetanus; and all these Disorders are dangerous, when they are accompanied with Wounds of the more noble Parts, and such as are more immediately subservient to Life. In an Emprosthoronos, the Head is spasmodically inclined forwards, and the Chin fixed to the Breast, the Hypochondria and Præcordia are distended, there is a frequent Inclination to discharge the Urine, and the Patient cannot without Difficulty bend his Fingers. These Disorders are not cured without great Difficulty, if the Spasms should be produced by Wounds, or if there should be a natural Hardness of the Spine; but if the Spasms should happen without a Fever, the Patient is more easily cured. A Fever, according to Hippocrates, succeeding the Spasm is salutary; but a Spasm succeeding a Fever, dangerous. This Opinion is, however, rejected by some, who tell us, that according to Hippocrates himself, a Fever gives a violent Shock to the Constitution, and produces violent Symptoms accompanied with excessive Pain; for, say they, a natural and moderate Heat relaxes the Tumor of the Parts, whereas the Heat of a Fever, being intense, preternatural, and immoderate, increases and augments it. Hence a Diminution of the concomitant Symptoms of the Disorder, lays a Foundation for the Hopes of future Recovery. *Cælius Aurel. Lib. 3. Acut. Morb. Cap. 6.*

The Emprosthoronos, Opisthoronos, and Tetanus, may be produced by various Causes; for they generally happen after Wounds, when either the Membranes, Muscles, or Nerves are punctured, in which Cases they generally prove mortal; for by Wounds of the Nerves, mortal Convulsions are excited. Women in consequence of Abortion, are also sometimes seized with Convulsions, which frequently prove fatal to them. Others have these Disorders brought on by violent Blows of the Neck; excessive Cold may, also, prove the Cause of them, for which Reason they rage more in the Winter, than in the Spring and Autumn; but very rarely in the Summer, unless a Wound is previously inflicted, or when foreign Diseases rage epidemically. Women are more subject to Convulsions of the Nerves than Men, because the former are of a colder Nature, but they are also more frequently freed from them, because they are of moiſter Constitutions. As for Persons of different Ages, Children are most infested and afflicted with these Disorders; but they are not generally destroyed by them, because they are in a manner peculiar and familiar to them. Young Persons are less subject to these Disorders than Children, but then they are more frequently taken off by them. Those arrived at the Years of Maturity, are by no means subject to these Disorders, tho' old Persons are greatly infested with them, and are frequently taken off by them; the Reason of which is to be ascribed to the Coldness and Dryness of Old-age, in Consequence of which, they in some measure approach to the State and Condition of a dead Body; for in cold and moist Habits, Convulsions are far less violent and dangerous.

All these Disorders are accompany'd with a Pain and Tension of the Tendons, Spinæ and Muscles of the Jaws and Breast; for these Muscles so fix the superior to the inferior Jaw-bone, that they cannot be easily separated even by Wedges; and when they are violently separated, if any Liquor is poured into their Mouth, they cannot swallow it, but either retain it in their Mouths, suffer it to flow out, or it regurgitates thro' the Nostrils; because the Fauces being compressed, and the Tonſils hard and tense, cannot admit of the Protrusion and Deglutition of Aliments. The Face is red and variegated by Spots of various Colours. The Eyes are almost immoveable, and their smallest Motions accompanied with Pain; there is a great Suffocation and Difficulty of Breathing; the Arms and Legs are seized with Convulsions, and the Muscles palpitate; the Face is distorted in various Manners; there is a Tremor of the Jaw-bones and Lips; a shaking of the Chin, and a Grinding of the Teeth. In one Patient, I, also, had an Opportunity of observing, with Admiration, a Concussion or Shaking of the Ears, accompanied with a Noise. The Urine is either suppressed, or flows spontaneously, in consequence of the Compression of the Bladder. These Symptoms occur in Convulsions of all Kinds; but the Symptoms, peculiar to each Species, are these: In a Tetanus, the whole Body is straight, immoveable and inflexible, the Arms and Legs are, also, straight.

In an Opisthoronos the Patient is reclined backwards; his Head is drawn back between his Shoulders; his Throat starts out; his Jaws are generally open, and they are rarely united; he snorts in Respiration; his Belly and Breast are prominent; his Urine is generally discharged spontaneously; and his Abdomen, being tense, rebounds, when struck; his Arms are spasmodically drawn backwards; the Legs are, also, distorted and incurvated in a Direction opposite to the Hams.

In an Emprosthoronos, the Back is gibbous; the Hips become prominent, so as to lie in a straight Line with the Back; the Spine is strait; the Head is inclined to the Breast, to which the Chin is fixed; the Hands are clenched, and the Legs extended. All Patients labouring under this Disorder, are afflicted with violent Pains; a mournful Voice, resembling that of a Person weeping, Sighs, and deep Groans. If the Disorder affects the Breast and Respiration, Death is not far off; and it is a great Happi-

ness to the Patient to be delivered from his Pains, his Distortions, and the deplorable State he was in; so that the nearest Relations can, with a kind of Pleasure, see their Friends exchange their Condition for Death. If Life should still remain, and Respiration continue to be carried on, though in a deplorable manner, the Patient is so incurvated forwards, as to resemble not only a Bow, but a Sphere; so that he has his Head fixed to his Knees; and his Back and Legs so drawn forwards, that the Joint at the Knee seems thrust into the Ham. This Disorder is not only intolerable to the Patient, and moving in the Eyes of Spectators, but, also, incurable; so that those labouring under it, are, on account of their Distortion, disowned by their Friends; and though it would have formerly been Impiety, yet it is now Charity and Compassion, to wish for their Death, even though it should be of the most cruel Kind. Nor can the Physician, when present, either restore Health, mitigate his Pain, or rectify his distorted Figure; and since he might cut him to Pieces, before he could render his Limbs strait, all he can do is to be grieved at this deplorable State. *Aræus, de Causis & Signis Acut. Morb. Lib. 1. Cap. 6.*

THE CURE.

In order to cure a Tetanus, the Bed of the Patient is to be soft, grateful, smooth, commodious, and warm; for this Disorder renders the Nerves rigid, hard, and tense; the Skin, also, being every-where dry and rough, becomes tense; the Eye-lids, naturally moveable, wink with Difficulty; the Eyes are fixed, and as it were turned inwards; the Limbs are, also, rendered immoveable, on account of the Tension of the Parts. The Patient's Room, also, even in the Summer-time, is to be kept warm by Fire, though not to such a Degree as to excite Sweats or Languor; because a Tetanus inclines to a Syncope. Other Remedies must, also, be used without any Delay. Whether, therefore, a Tetanus is produced without any manifest Cause, or whether it arises from excessive Cold, Wounds, or Abortion in Women; Venesection is to be instituted in the Arm; but the Ligature must not be too tight, and the Incision must be made gently and expeditiously, otherwise Convulsions of the Nerves will be produced. Let moderate Venesection be only once used, though not to such a Degree as to produce *Deliquium*; and a Refrigeration of the whole Body. The Patient is not to be harassed by Hunger, which dries and refrigerates the Body. Let him, therefore, drink coarse, strong Muls, and Cream of Pistach mixed with Honey; for when these are protruded by the Tonſils, they create but little Pain, are easily swallowed, fit for rendering the Body soluble, and effectual for restoring the Strength. The whole Body is, also, to be wrapt up in woollen Cloths, wet in the Oleum Gleucinum, or the Oleum Crocinum, in which Rosemary, Flea-bane, or Mugwort, have been boiled; let every thing be used hot, not only in its Quality, but, also, to the Touch. The Patient is, also, to be anointed with an Ointment prepared of the Limnestides, Euphorbium, Nitre, and Pellitory of Spain, to which a large Quantity of Castor is to be added. The Tendons are, also, to be well covered with woollen Cloths, and the Parts about the Ears and Chin well anointed, since these are most affected, and excessively tense. The Tendons and Region of the Bladder are, also, to be cherished with gently warm Substances; such as Bags full of roasted Millet, or Oxens Bladders half full of warm Oil, applied to the Parts affected. 'Tis sometimes necessary to foment the Head; and, though this Practice is somewhat prejudicial to the Senses, 'tis nevertheless salutary to the Nerves; for though by the Elevation of the Vapours it, in some measure, clouds the Senses, yet it fills the Nerves. The Patients are to be fomented in the softest manner, with a Matter that is not fetid, and which is to be used alone. This Matter may be either inodorous Oil boiled in a double Vessel, and put in Bladders, or fine Salt contained in a Bag: For, though Millet and Linseed are grateful to the Touch, yet fetid Vapours are exhaled from them. The Method of fomenting is this; Laying the Patient on his Back, the Fomentations are to be placed under him, as far as the Crown of the Head, and no farther; but their Influence is not to be permitted to act on the Forehead, which, being the common Sensory, is, therefore the Source of all the favourable, and unlucky Turns of Disorders. If Cataplasms are applied to the Tendons, let the back Part of the Head be elevated; for, if these Cataplasms are applied to the superior Parts, they will fill the Head with the Vapours of the Linseed and the Fenugreek. After the Use of the Cataplasms it will be expedient to apply Cupping-glasses to the Occiput, on each Side of the Spine; but very little Fire is to be used; for the strong Impression of the Lips of the Cupping-glass excites Pains and Convulsions: We must, therefore, make rather a slow and gentle than a sudden and violent Exhaustion of the Air; for by this means the Skin will without Pain be raised into a convex Tumor; and may afterwards have proper Incisions made in it. The Quantity of Blood to be taken from such Patients is to be estimated from their Strength. These are the Measures to be taken in a Tetanus not attended with Wounds.

But if a Convulsion of the Nerves is produced by a Wound, the State of the Patient is deplorable, and almost desperate; the Cure

Cure ought, however, to be attempted, since some by the Use of proper Remedies have been recovered. Besides the other Measures, therefore, the Ulcers are to be cured by anointing them with warm and proper Substances, by Fomentations, Cataplasms, and Medicines which easily excite Heat, and form Pus copiously; for in a Tetanus the Ulcers are dry. For this Purpose take a sufficient Quantity of the Manna of Frankincense, of the Tops of Poley-mountain, of the Resins both of the Pitch and Turpentine-tree, of Marshmallow-roots, and of the Herbs Rue and Henbane; make all into a Cataplasm by melting such as are susceptible of it, adding the Powders of such as are capable of being pulverized; but some of the Ingredients must be macerated in Oil, and the Marshmallows must be previously boiled in Muls. Let Castor be, also, sprinkled on the Ulcers, since that Medicine is very efficacious in exciting Heat in all the Parts of the Body; for Horrors arising from Ulcers are of a very malignant Nature. Let the Nostils be, also, anointed with Castor, or the Oleum Crocinum. Three Oboli, also, of Castor-oil may be daily exhibited; and if the Stomach loathes it, we must interpose the same Weight of the Root of Laspitium, or half the Weight of Myrrh; and all these are to be exhibited in Hydromel. But if Cyrenaic Laspitium can be had, the Bulk of a bitter Verch of it may be exhibited wrapt up in boiled Honey, by which means it is rendered more palatable; for it is of an acrid Taste, and produces disagreeable and ferid Eructations. But if the Patient cannot take it in this Form, let it be dissolved in Hydromel; for it is of all other Medicines the most efficacious. These Medicines are fit for heating, moistening, relaxing Convulsions, and softening the Nerves. But if the Patient can swallow nothing, inject a Clyster, prepared with Castor and Oil, with which, also, mixed with some proper Ointment, or with Honey, the Anus is to be anointed. With the same Clyster, also, mixed to a due Consistence, with melted Wax, the Region of the Bladder is to be anointed. If there is a Necessity for procuring an Evacuation of the Fæces and Flatulences, a Clyster prepared of two Drams of Hiera, with a sufficient Quantity of Hydromel and Oil, is to be injected, which not only procures the designed Evacuation, but, also, cherishes the lower Belly; for Hiera is an heating Medicine suited to various Intentions. *Areteus de Curat. Acut. Morb. Lib. 1. Cap. 6.*

TETARTÆUS, τεταρταῖος. The same as **QUARTANA**.

TETHALASSOMENOS, τεθαλασσομένος. An Epithet for Wine, importing its being mix'd with Sea-water.

TETHYIA, or **TETHÆA**. This is a Shell-fish, sometimes found adhering to Oysters. Its Shell is of a spherical Figure, rough, unequal, and less hard than the Shells of other Fishes. There are various Species of this Animal, which are found either adhering to the Rocks, in the Wrack, or on the Shore. Its Flesh is fungous, carminative, proper to cure the windy Colic, Pains of the Kidneys, and the Sciatic Pain. It is, also, proper to excite a Discharge of the Urine, and to eliminate the Stone of the Kidneys and Bladder. *Lemery, Traité des Drogues.*

TETLATIAM, seu *Arbor Urens*. Nierenberg. An Indian Tree, which agrees in Qualities with the *Manchineel*.

TETRABIT. A Name for the *Sideritis*; *birsuta*; *procumbens*.

TETRADRACHMON. The Weight of four Drams.

TETRAGNATHUS, τετραγνάθος, from *τέσσαρες*, four, and *γνάθος*, a Jaw, is a Species of *Phalangium*, of a whitish Colour, with scabrous Legs, and near the Head two Eminences, one strait, the other broad, so that you would think it had two Mouths; it has four Jaws, (whence the Name *Tetragnathos*) and an even Line through its Mouth.

They who are stung by this Spider, labour under the same Symptoms in general; as they who are stung by the Scorpion; and besides, are affected with a tensive Pain in the wounded Part, which becomes whitish. The Head and Face, also, swell; and the wounded Parts, as far as the Joints, become extenuated; the Members, also, receive no sensible Nourishment, and the Patient, even after Recovery, is molested with obstinate Watchings.

Remedies in this Case are Calamint, Trefoil, Rue, Panax, Polium, taken in Wine, and all such Medicines as are proper for those who are stung by the *Phalangium*. *Aetius, Tetrab. 4. Serm. 1. Cap. 17.*

TETRAGONIA. A Name for the *Euonymus*; *vulgaris*; *granis rubentibus*.

TETRAGONOCARPOS.

The Characters are;

The Leaves are dispos'd in a scattering manner: The End of the Pedicle becomes an Ovary, on whose Apex grows a Flower or Calyx, which is quadrifid, rarely quinquefid, expanded, and furnished with a Multitude of Stamina, that is to say, eighteen or twenty. The Ovary is furnished with four erect Tubes, and becomes a quadricapular Fruit, with a single Seed in each Capsule. In some Plants the Calyx is seated under the Ovary and Flower.

Boerhaave mentions three Sorts of *Tetragonocarpus*; which are,

1. *Tetragonocarpus*; *Africana*; *fruticans*; *foliis longis*, &c. *angustis*. *H. A. 2. 205.*

2. *Tetragonocarpus*; *præcedenti similis*; *fructu rotundo*, *tetragono*, *umbilicato*.

3. *Tetragonocarpus*, *Afra*, *folio Porruacæ longo*; *flore herbaceo*. *Boerb. Ind. alt. Plant. Vol. 2.*

I find no Virtues ascribed to any one of these.

TETRAGONON, τετράγωνον, from *τέσσαρες*, four, and *γωνία*, an Angle, in *Hippocrates de intern. Affect.* seems to be a Medicine for purging the Head; as where he says, *ἡ τὴν κεφαλὴν καθαίρειν τῷ τετράγωνῳ*, "and purge the Head with *Tetragonum*;" and directs the same in another Place of that Treatise. *Galen* seems to expound this in his *Exegesis* as follows: *Τετράγωνον τινὲς μὲν ταῖς ἐνιστοιμέναις καὶ τὸ σίμμι πλατὶ τινὲς αὐτὸ τὸ σίμμι*. "Some by *Tetragonum* understand the Crusts" which are found about Antimony, some Antimony itself. The same Author expounds *τετράγωνα βέλη*, "quadrangular Arrows," by *τὰ τέσσαρας ἔχοντα γλαγχίνας*, (Arrows) "having four Points, or Edges." *Foesius*.

Tetragonon in *Hippocrates*, is a very obscure Word; for we are not certain whether he means by it a Medicine or Instrument; the Meaning thereof was unknown even in the Time of *Galen*, as appears above; and it is still a Question whether Antimony were known to *Hippocrates*. *Schaltzius*.

TETRAMYRON, τετραμύρον. The Name of an *Acopon*, describ'd by *Galen*, *L. 7. de Comp. M. P. G. Cap. 12.*

TETRAO. The Name of a large Bird of the Bustard-kind. *Aldrovandus*.

TETRAPHARMACON. A Name for any Medicine compounded of four Ingredients. Thus the *Emplastrum Basilicon*, and the *Diatefferon*, are both call'd by this Name.

TETRESARIUS. Half an Ounce. *Marcellus Empiricus*.

TETROBOLON. The Weight of four Oboli.

TETROROS, τέτρορος. The same as **QUATRIO**.

TETY-POTE-IBA, *Vitis arbutifolia* Pisonis, is said to be produced from the Dung of the Birds called *Tetys* deposited by Orange-trees, with which it closely unites, and in time over-spreads and kills.

Of the Roots and Branches bruised together, and then fry'd in common Oil, is prepared an excellent Medicine for Inflammations of the Belly and Feet, contracted from Cold. *Raii Hist. Plant. Index.*

TEUCHOS, τεῦχος. *Hippocrates* uses this to express the whole Body.

TEUCRIUM.

The Characters are;

The Calyx is tubulated, quinquefid, or Bell-shaped, and inclosing in its Bottom roundish Seeds. The Flower, which has nothing of a Galea, is unfolded from a very short Tube into five large Segments. In the Place of a Galea arise Stamina; the Beard is quinquefid, the middle Segment being excavated, and the other seated opposite to one another in the Neck of the Flower; the Flowers proceed from the Wings of the Leaves.

Boerhaave mentions eight Sorts of *Teucrium*; which are,

1. *Teucrium*; calyce tubulato; flore pallide luteolo. *Boerb. Ind. A. 181. Teucrium*. Offic. C. B. P. 247. *Raii Hist. 1. 526. Teucrium multis*. J. B. 3. 290. *Teucrium latifolium*. Ger. 532. Emac. 654. *Teucrium majus vulgare*. Park. Theat. 103. *Chamedrys frutescens*; *Teucrium vulgo*. Tourn. Inst. 205. **TREE-GERMANDER**.

It grows in Italy and Sicily, and flowers in Summer, and the Leaves are in Use.

Teucrium heats and dries, cures Disorders of the Liver and Spleen, and is effectual against the Bites of Serpents. As it has the outward Appearance of the *Chamedrys*, so it resembles it in Virtues. *Dale*.

2. *Teucrium*; calyce tubulato; flore purpureo. *Chamedrys; erecta Teucrii Folio, purpureo*. Flor. 2. 83.

3. *Teucrium*; Boeticum; calyce campanulato. *Chamedrys; fruticosior, flore violaceo, foliis subtus incanis*. M. H. 3. 422.

4. *Teucrium*; Boeticum; calyce campanulato, folio elegant-ter variegato.

5. *Teucrium*; calyce campanulato; Stoechados facie. *Boerb. Ind. A. 181. Polium Creticum*. Offic. *Polium angustifolium Creticum*. C. B. P. 221. Park. 25. *Raii Hist. 1. 523. Teucrium frutescens, Stoechadis Arabica folio & facie*. Tourn. Cor. 14. *Rosmarinum Stoechados facie*. Alp. Exot. 103. **POLEY OF CANDIA**.

This Species of *Polium* is very rarely to be met with in the Shops: It is a smaller tenderer Plant, having lesser and narrower Leaves, not at all indented about the Edges, but as woolly as the *Polium montanum*, and having the like Heads of Flowers, of a finer and more agreeable Smell. It grows in the Island of *Crete* or *Candy*.

It is much of the Nature of the *Polium montanum*, but is rather stronger; and if it could be procured, is what ought to be used when *Polium Creticum* is prescrib'd; but, as it is hardly to be met with, the other may be used without much Detriment to any Composition. *Miller's Bot. Off.*

6. *Teucrium*

6. Teucrium; calyce campanulato; laciniatum; flore magno subcocculeo.

7. Teucrium; calice campanulato; laciniatum; flore parvo subcocculeo.

8. Teucrium; calyce tubulato; Creticum, purpureum. *Chamaedrys fruticosa*, *Cretica*, purpureo flore. T. 205. Boerb. Ind. alt. Plant.

TEUTHROBANON. A Name for the *Polygonum*, in *Oribasius*, *Collect. Medicinal*.

TEUTLON, τεῦτλον, τεῦτλων. A Name for the *BETA*. *Blancard*.

TEUTLOPHACE, τευτλοφακή, from τεῦτλον, a Beet, and φακή, a Lentil. A Sort of Food consisting of Beets and Lentils, and prescribed by *Heraclides Tarentinus*, as *Galen*, L. 1. de Al. Fac. C. 18. says, not only to sound, but sick Persons.

TEXOCTLIFERA *Mexicana* *Nieremberg*. Is a Tree of a moderate Bigness, growing spontaneously in hilly Places, very thick set with Thorns, and with Leaves like those of our Apple-trees, but rougher, and serrated. It bears Apples resembling ours, but small, and no bigger than Walnuts, of a yellow Colour, and very hard before they are ripe; but afterwards soft, in a manner, like Fat, of an unpleasant Taste, tho' grateful to many Palates. The Seeds, of which there are three in each Apple, are lunated, large, and distinguish'd by two Angles, and a Ridge, and as hard as a Stone. The *Mexicans* first suffer them to putrefy, and then bring them to Market. To preserve them the longer from Corruption, they sprinkle them with Water of Nitre. The Buds, bruised, and apply'd with Water, cure Exanthemata. *Raii Hist. Plant.*

TEXTURA, Texture, is properly spoken with respect to the *Art textoria*, or *Art of Weaving*; but is apply'd by Metaphor to the organical Structure of the Body, in which Sense we, also, use the Word *Contexture*.

Θ, the first Letter of the Word θάνατος, "Death," and used by *Hippocrates* in the *Epidemics*, as a Sign or Mark of Death; as T, the first Letter of the Word υγία, Health, was a Mark to signify Recovery. *Galen. Com. 1. in 3 Epid.*

THACOS, θάκος, the same as θάκος, *Thacos*, a Seat, a Place to sit on. *Hippocr. 7 Epid.*

THAIS, θάις, a Name for a cosmetic Cerate, to give a beautiful Red to the Face, described by *Aegineta*, Lib. 3. Cap. 25. Also, a Bandage for the Head, of which *Galen de Fasciis* reckons three Kinds.

THALAME, θαλάμη. A Bed, or Hole, where Fish lie; θαλάμη in *Erotian* are expounded καλὰ δ' οὖτοι, Dens, Nests, Burrows. The Word occurs in *Hippocrates*, Lib. περὶ τέχνης, where you read, καὶ τῶν ἐδὲν ἐπὶ τῇ ὑπαρξὶ ἐστὶ, καὶ ἔχον περὶ αὐτῆς θαλάμους. "And of these (Joints) there is none but what is somewhat spumeous, and furnished with Cells." He is here speaking of the internal Cavities about the Joints, which are full of a sort of Spume or Mucus. Some Copies, however, for ὑπαρξον read ὑπόρρον, and *Erotian* reads ὑπερρον, which signify, with not much Variation of the Sense, occult, cavernous, or full of Cells and Perforations; but ὑπαρξον seems to be the true Reading.

THALAMUS, θάλαμος. A Bed, in Anatomy, is the Place from which the Optic Nerves proceed; so called by *Galen de Usu Part. Lib. 16. Cap. 3.*

THALASSERON, θαλασσηρόν. The Collyrium of *Hermophilus* so called; a Remedy adapted to Catarrhs, and Dimness of Sight; and described by *Galen*, de C. M. S. L. Lib. 4. Cap. 7. and *Aeginet. Lib. 7. Cap. 16.*

THALASSITES, θαλασσίτης. The same as TETHALASSOMENOS; which see.

THALASSOMELI, θαλασσομέλι, from θάλασσα, the Sea, and μέλι, Honey, is, as *Dioscorides* says, supposed to be a potent Cathartic. It is composed, he tells us, of equal Portions of Rain-water, Sea-water, and Honey, strained, and exposed to the Sun in a pitch'd Vessel, during the Heat of the Dog-days. Some take two Parts of Sea-water, and one Part of Honey, and put them in a Vessel; and this Composition is milder, and more gentle in Operation, than Sea-water alone. *Dioscorides, Lib. 5. Cap. 20.*

THALEROS, θαλερός, from θάλλω, to bud, or blossom; florid, as apply'd to πνεῦμα, Respiration, can mean nothing, as *Galen* says, *Com. 2. in 1 Prorrh.* 39. but σφόδρα μέγα, "vastly great." The same Author, *ibid. Text. 92.* tells us, that the Interpreters of *Hippocrates*, who read θαλερόν, (for he himself, with the Generality, reads θαλερόν with an ο, in both the Places mention'd) expound it by θάλλον, καὶ ἀκμάζον, καὶ μέγα, "flourishing, vigorous, and great." See THOLON. Θαλερόν πνεῦμα, in *Galen's Exegesis*, is however, expounded, by θερμὸν ὡς ἀπὸ ἡλίου, παρὰ γὰρ τὸ θερμαίνει γέγονε τοῦτομα, "heated as by the Sun; for the Name is derived from θερμαίνω, theromai," (signifying to be heated). But some Copies read the Place θαλερόν πνεῦμα, μέγα καὶ διεγερμένον, "a florid Respiration, that is, a great and heighten'd Spirit or Respiration." Thus θαλερόν δακρυ, *Hom. Il. B. v. 266.* when we read θαλερόν δέ δὲ ἔκπεσεν δακρυ, is expounded by the Scholiast θερμὸν καὶ ἀκμάτον, "hot and vigorous," importing that the hot Tears gushed out in a violent and plentiful manner, as from a Source that would

never dry. In this Sense θαλερόν δακρυ, in *Hesychius*, is expounded by τὸ πολὺ, καὶ ἡ ἐκραινόμενον, ἀλλ' ἐπὶ τῶν ἐρεθισμῶν αὐτὸ βάλλω, "plentiful, and never dry'd, but always springing up in the Eyes." Θαλερός is, also, expounded in *Hesychius* by ταχύς, quick, and ισχυρός, strong; but θαλερόν προσώπου, "a florid Countenance," is explain'd in *Galen, Com. 2. in Prorrh.* τὸ εἶναι εὐκλείαν καὶ εὐχρυσήν, "such as is of a good Habit and Colour."

THALICTRUM.

The Characters are;

The Root is fibrous, except in the last Species; the Leaves are lobated, tripartite, and resemble those of umbelliferous Plants. The Flower is naked, tetrapetalous, or pentepetalous, rosaceous, with caducous Petals, furnished with Multitudes of Stamina, dispos'd round the Basis of the Ovary in form of an Umbella. The Ovary consists of a Multitude of small Capsules, winged or not winged, furnished with a long Tube, and containing each a single Seed, which is generally of an oblong Figure.

Boerhaave mentions fifteen Sorts of *Thalictrum*; which are,

1. *Thalictrum*; Canadense. *Corn. 186.*
2. *Thalictrum*; Canadense; majus; caulibus viridantibus. *Flor. 2. 9.*
3. *Thalictrum*; Canadense; caule viridescente & purpurascens; staminibus saturatus purpurascens.
4. *Thalictrum*; majus; florum staminibus purpurascens. *C. B. P. 327.*
5. *Thalictrum*; foliis amplissimis; rugosis; florum staminibus albis.
6. *Thalictrum*; majus; siliqua angulosa, aut striata. *C. B. P. 336. Boerb. Ind. A. 44. Tourn. Inst. 270. Thalictrum. Offic. Thalictrum seu Thalictrum majus. Ger. 1060. Emac. 1251. Raii Hist. 1. 403. Synop. 3. 203. Thalictrum majus vulgare. Park. Theat. 263. Thalictrum nigrum caule & semine striato. J. B. 3. 486. MEADOW-RUE.*

It delights in watry Places, and is commonly found on the Banks of running Streams, and flowers in June.

The Leaves, mixed with other Greens, are somewhat laxative, according to *Dodonæus*; but a Decoction of the Root is more so. It may very well be substituted for Rhubarb. *D. Palmer.*

In some Parts of Italy, as we are assur'd by *Camerarius*; they use the *Thalictrums* against the Plague; in Saxony, for the Jaundice. *Raii Hist. Plant.*

It cicatrizes old Ulcers, *Dioscorides*. It is aperitive, inciding, and provokes Evacuation by Stool and Urine. An Ounce or two purge like Rhubarb, whence it is called in Germany the *Poor's Rhubarb*, and *Tartary Rhubarb*. *Dale.*

7. *Thalictrum*; montanum; album; altius. *C. B. P. 337.*
8. *Thalictrum*; majus; flavum; staminibus luteis vel glaucis folio. *C. B. P. 336. Boerb. Ind. A. 244. Tourn. Inst. 270. Pseudo-Rhabarbarum. Offic. Thalictrum speciosissimum glaucum semine & caule striato. J. B. 3. 486. Raii Hist. 1. 403. Thalictrum majus album Hispanicum. Park. Theat. 264. Thalictrum majus Hispanicum. Ger. Emac. 1252. SPANISH MEADOW-RUE.*

It grows in Meadows, and is cultivated in the Gardens of the Curious, and flowers in Summer; the Part in Use is the yellow bitter Root, which agrees in Virtues with the former, and is sold in the Herb-shops for Rhubarb. *Rupp.*

9. *Thalictrum*; pratense; angustifolium. *C. B. P. 337. Rata, pratensis, major, angustifolia. Tab. Germ. 121.*
10. *Thalictrum*; pratense; angustissimo folio. *C. B. P. 337.*
11. *Thalictrum*; minus. *C. B. P. 337.*
12. *Thalictrum*; minimum; foetidissimum. *C. B. P. 337.*
13. *Thalictrum*; minimum; montanum; arboribus; foliis splendentibus. *Raii Syn. 100.*
14. *Thalictrum*; Canadense; minus.
15. *Thalictrum*; minus; grumosa radice; floribus majoribus. *Flor. 29. Ranunculus, Thalictri folio, Aphodeti radice. M. H. 2. 438. Oenanthe foliis Hederae. C. B. P. 163. Boerb. Ind. alt. Plant. Vol. 1.*

The Name is antient, and is found in the Copies written two ways, δαλιχτρον (*Dalichtron*) and θαλιχτρον (*Thalichtron*); but now the Name *Thalictrum*, universally obtains, being deriv'd of θάλλω, (*thallo*) to be green, and flourishing; whence it was used at Weddings, and regarded as an Ornament to Gardens. It was, also, called πηγανον (*Peganon*), Rue, because some Botanists have reckon'd it a Species of Rue.

I do not remember any medicinal Uses of this Plant, except of the sixth Species; whose Root, which is very large, being taken up in Season, and given to the Quantity of one or two Ounces, purges like Rhubarb; penetrating through all the Passages with its salutary Juice. Hence it communicates both Colour and Smell to the Urine, which it renders of a golden Colour, tinged, also, the Fæces and Saliva. This Plant therefore, is an excellent Aperitive, corroborating and strengthening the Intestines like Rhubarb; but then the Dose ought to be triple that of Rhubarb. It is commonly said to purge Bile. The Flowers are effectual in Spitting of Blood, the *Fluxus Albus*, and other female Disorders; externally they are of Service, in the Scabies, all cutaneous Diseases, Wounds, and Ulcers. The

Flower of the thirteenth Species is invisible to the naked Eye, but appears through a Microscope tetrapetalous. *Hist. Plant. adscript. Boerhaav.*

THALLIA, *Thallos*, θαλλία, θαλλός, a Bud of any Vegetable, but especially of an Olive-tree. *Aginet. Lib. 5. Cap. 66. Rhod. in Scribon. N° 142.* expounds it by an Olive-branch, of which they composed Garlands on Festivals.

THALPOS, θαλπος, from θαλπω, to cherish, foment. The same as θερμότης, *Thermotes*, Heat. The Word occurs 3 *Apb.* 1. and 5.

THALPSIS, θαλψις, of the same Original with the preceding. A Fomentation. *Moschion de Morb. Mul. Cap. 126.*

THAMAR, an Arabic Word for *Dactylus*, a Date; whence the Name of a Confection, *Diatbamaron*, corruptly *Diacamaron*. *Blancard.*

THAMARINDUS. The same as **TAMARINDUS**.

THAMATICA. See **THAUMA**.

THAMES, **THAMINOS**, θαμνός, θαμινός, and the Adverbs, θαμνίως, θαμινά, *Thameos*, *Thamina*, import Frequency, and often occur in *Hippocrates*.

THAMNA. The same as **LORA**; which see.

THAPHNEUS, a Medicine cleansed and purified. *Rulandus.*

THAPSIA.

The Characters are;

The Root is generally thick and milky, but in some Plants is fibrous; the Leaves are, for the most part, finely cut. The Seed is long, striated, and surrounded with a very large foliaceous Wing, emarginated on both Sides.

Boerhaave mentions nine Sorts of *Thapsia*; which are,

1. *Thapsia*; latifolia; villosa. *C. B. B. 148.*
2. *Thapsia*; foliis Libanotidis; foetidissima. *C. B. P. 148.*
3. *Thapsia*; foliis Apii; Lusitanica; foetidissima; flore albo. *T. 322.*
4. *Thapsia*; foliis Apii; foetidissima; flore luteo.
5. *Thapsia*; tenuiori folio; Appula. *T. 322. Panax Asclepium, semine folioso. C. B. P. 158.*
6. *Thapsia*; Orientalis; Anethi folio; semine eleganter crenato. *Tourn. Cor. 22. Boerb. Ind. A. 60. Gingidium. Offic. Gingidium Faniculi folio. C. B. P. 151. Gingidium verum Syriacum. Park. Theat. 890. Anetho similis planta semine lato laciniato. J. B. 3. 2. Raii Hist. 1. 416. ORIENTAL PICKTOOTH.*

It grows in the Eastern Countries, and flowers in Summer, and the Leaves are in Use.

The *Thapsia* provokes Urine; and the Decoction of it taken, with Wine, is good for the Bladder; and, eaten as other Greens, whether raw, boiled or pickled, is very beneficial to the Stomach. *Dale from Dioscorides.*

7. *Thapsia*; Alpina; lucida; Thalictri aut Carotæ folio; flore albo. *Bocc. Mus. p. 2. 84. Tab. 77.*
8. *Thapsia*; five Turbith Garganicum; semine latissimo. *J. B. 3. 2. 50. Tourn. Inst. 322. Boerb. Ind. A. 60. Raii Hist. 1. 418. Thapsia. Offic. Turpethum Garganicum. Schrod. 4. 250. DEADLY CARROTS.*

The Roots of this Plant are long, but not very thick, with many large winged Leaves, not much unlike common Carrot, but having the Segments each set opposite to one another, somewhat rough and hairy; the Flowers are small, yellow, and five-leav'd, growing in Umbels at the Top of the Stalks; and are succeeded by flat broad Seeds, having a thin scaly Skin on each Side, of an hot Taste. It grows in *Italy* and *Spain*, and flowers in *July*.

The Root only is used, and that very rarely, being accounted of a poisonous Nature, working upwards and downwards with great Violence, and has been formerly sold in the Shops for the *Radix Turpethi*. *Miller's Bot. Off.*

This Plant is sometimes cultivated in the Gardens of the Curious; and the Part used is the long and acrimonious Root, which is black without, and white within. *Mesue* calls it black *Turbith*, and employ'd it to evacuate thin Humours. The old Women of *Salamanca* in *Spain* used the Root to provoke the Menfes, and with Emollients to promote other Evacuations, as we are assur'd by *Clusius*.

9. *Thapsia*; maxima; folio latissimo. *C. B. P. 148. Boerb. Ind. alt. Plant. Vol. 1.*

Thapsia takes its Name from the Island *Thapsos*, where it was remarkably plentiful.

The Antients expressed a Juice from this Plant, which they made use of when they thought violent Purging necessary; for the Juice of the Root, inspissated, and given to the Quantity of an Ounce, purges upwards and downwards, so as sometimes to produce an Inflammation of the Stomach and Intestines; whence a Dysentery is occasion'd. The same is so highly acrimonious as to cause Convulsions, succeeded by very bad Symptoms, as *Clusius* very well observed; which are not to be removed but by a Draught of Vinegar, Oil and Water, for which Reason I would not have this Plant used inwardly. The Root has been sold for the *Turbith* of the Antients, but with very mischievous Consequences; for the Roots of the first, third, fourth, and ninth Species, are no less caustic than that of the eighth. Externally they are of Use in Ointments for the Itch, and the like Diseases. *Hist. Plant. adscript. Boerhaav.*

THAPSIA is, also, a Name for the *Seseli*; *que Ferule facit*, *Thapsia, five Turbith Gallorum.*

THAPSUS. The same as **TAPSUS BARBATUS**; which see.

THARRAS. The Name of an Inventor of a digestive Magma for a Dropsy of the Uterus, which is to be apply'd under a triple Cloth, and secur'd with a Bandage, but not too tight.

This was pretty much in Use in *Celsus's* Time, as he observes, *Lib. 3. Cap. 21.* but he no-where describes it.

THAUMA, θαῦμα, properly a Miracle; but it is taken in a special Sense for an automatus Machine used in Plays and Representations; whence *Ars Thaumaturgus*, corruptly *Thaumetica*, is the Art of constructing or managing these Machines; and *Thaumaturgus* or *Thaumatopeus*, the Contriver or Manager of the same.

THEA. *Offic. The Sinenfium five Tisia Japonensibus.* *Breyn. Cent. 1. cap. 52. 111. The Sinenfium five Tisia Japonensibus. Breynii. Raii. Hist. 2. 1619. Euonymo affinis Arbor Orientalis nucifera flore roseo. Pluk. Phytog. Tab. 88. Fig. 6. Almag. 139. The Chinenfium, five Tschia Japonensium. Hort. Amst. 346. Chaa Herba in Japonia. C. B. P. 247. Syraci & Euonymo media affinis. THE THEE or TEA PLANT.*

Tea, so much in Use of late Years, is a shrubby Bush, seldom growing above four or five Feet high, full of Branches clothed with dark-green serrated Leaves, set on the Branches without any Order, somewhat of an oval Shape, but sharp-pointed at the End: Among these come forth several pretty large Flowers, made of five round white, or pale-yellow Leaves, with several Stamina in the middle; and in their Places come the Fruit, containing, for the most part, three round Berries or Seeds, though sometimes only two, and sometimes but one, covered with a brownish Husk; they seldom gather the Leaves from the Shrubs, till the Plants are three Years old, and always in dry Sunshiny Weather. The Leaves, thus gathered, are put into a Chinese Pan, made of cast Iron, clean, and red-hot, but placed obliquely, wherein they are stirred about, and shaken together, till they shrivel up, and are crisp; and then they are laid on Mats, and fan'd with Fans to cool them; and so put into Tubs or Canisters.

We have three Sorts of Tea; the Green, the Bohea, and the Imperial Tea; but all gathered from the same Kind of Plant, and only differing in the Age of the Leaves, the Time of gathering, or Way of curing.

The Liquor made of this Plant by Infusion in warm Water, though so much in Use at present, was hardly known an hundred Years ago, and hath not half so long been in much Use in *Europe*. It is extolled by some Persons as a Purifier of the Blood, promoting Digestion, strengthening the Head, provoking Urine, and preventing the Stone and Gout: The Bohea Tea is reckoned balsamic, analeptic, and accounted nourishing, and good for Consumptions; but either of them, drank in too great Quantity, are subject to bring on Tremblings, and hurt the Stomach. *Miller's Bot. Off.*

Tea is a Leaf brought from *China* and *Japan*, an excellent Account of which is given by *Kempfer*, in his *Amoenitates Exotica*. The fresh Leaf is said to affect the Head, and to intoxicate, but it loses these Qualities when dried and prepared. The *Japanese* first bruise the dried Leaves in stone Mortars, and then throw a sufficient Quantity into boiling Water, and suffer it to infuse but a very little while. The greatest Advantage of Tea, considering the Quantity of it that is drank, seems to be, that it prevents the hot Water from relaxing the Stomach to too great a Degree, because it is a little astringent: All the other Effects of this fashionable Liquor seem to proceed from the hot Water. Tea boiled in Milk, in the Quantity of two Drams to a Pint, has been found to stop a Looseness, the Dose being repeated two or three times. Green Tea, being drank too freely, is prejudicial to weak Lungs. They who are subject to this Disease, ought therefore to chuse Bohea, and to mix Milk with it, in order to make it more laxative. *Geoffroy.*

There are six Sorts of Tea used in *England*: The first is called *Bohea*, which is a small blackish Leaf, which tinges the Water with a brown or redish Colour, and renders it of a Taste like an Infusion of *Sena*; the second Sort is called *Congo*; the third *Peco*; and the fourth *Green Tea*, and, by some, *Singlo*. This last is of two Kinds; one consists of an oblong narrow Leaf; the other has lesser Leaves, but both are equally good, and of a bluish-green Colour, seem very crisp when chewed, and tinge the Water with a Pale-green. The fifth Sort is called *Imperial Tea*; this has a large loose Leaf, whereas that of the other two last-mentioned is convolved, or shrivelled up; this Species is, also, most sightly to the Eye, of a green Colour, crisp in the Mouth, and of a pleasant Smell. The sixth Sort is call'd *Hey-sham Tea*.

All these Sorts of Tea are brought from *China*, and are supposed to be Leaves of the same Tree, and distinguished only by the Time of Gathering, and the Method of Preparation, or, as they call it, *Curing*. *Dale.*

The following Account is from *M. Wilhelms ten Rhyne*, Physician to the Emperor of *Japan*:

THE

The Virtues which the *Chinese* ascribe to Tea, are: That it purifies the Blood, prevents frightful Dreams, and defends the Brain from malignant Vapours; cures a Verrigo, and Pain of the Head; especially when it proceeds from a Crapula; is good for hydropic Persons, for it is a potent Diuretic; dries up Rheums of the Head; corrects the Acrimony of Humours; removes Obstructions of the Viscera; and restores a decayed Sight; for the *Japanese*, I believe, make use of a Decoction of Tea, which they call *Tebia*, as their principal Antidote against a Weakness of the Eyes, contracted chiefly from the frequent and constant Use of hot Rice, and drinking their Liquor *Sargui*. It tempers adust Humours, corrects an hot Liver, mollifies an Hardness of the Spleen, and prevents Sleep, especially in those who are not accustomed to it. Moreover, it renders the Body brisk and lively, quickens the Senses, prevents a Torpor and Drowsiness, exhilarates the Heart, repels Fear, cures Gripes and Flatulences, discusses Wind in the Uterus, comforts and strengthens the Viscera, revives the Memory, sharpens the Wit, and tempers Bile. It is a noble Lithontriptic; at least I think I have Reason to say so, since I never found among the *Japanese* the least Sign, or hear the least Complaint, of any Stone or Gravel in the Kidneys or Bladder, though I was diligent enough in my Inquiries about it; and, to say no more, it renders the nuptial Embraces more acceptable and endearing.

Ettmuller says, that Tea is a Specific for the Stomach, and not only corroborates that Part, but is a Preservative from the Stone and Gout, and is especially beneficial to the Head. It preserves from Drunkenness, prevents Drowsiness, and is particularly adapted to the Stomach.

That the Drinking of Tea is not so effectual in curing or preventing some Distempers in our *European* Countries, as in *China* and *Japan*, may reasonably be imputed to the constant Use of this Liquor, and the temperate Way of living in those Eastern Parts.

That a Tincture is extracted from the Leaves of Tea by means of hot Water, every body knows. That the drinking of this Liquor may be useful in some Cases, I shall not deny; but, that it is good for all, I cannot be persuaded to grant, since some of the good Effects, which are thought to proceed from Tea, are rather to be ascribed to the hot Water. That this Liquor has been pernicious in some Cases, has been often proved by Experience, of which the following is an Instance: A Woman of a sound and vigorous Constitution, but addicted to the Use of Tea, complain'd of a Concussion of her internal Parts from a kind of acrimonious Coldness, which molested her chiefly by Night, and which she thought was owing to Tea, because she was principally seized with this Disorder after a free Use of that Liquor. And I remember, that some Years ago a robust Man complained of the like acrimonious Coldness in the Abdomen, which he also imputed to the daily Use of Tea. *D. Hulse*, from *Muy's Podalirius redivivus, de Potu Thea et Coffee*.

But what shall we judge of the Drinking of Tea and Coffee? When I was a Student at *Leyden in Holland*, I was miserably afflicted for a whole Year with the Headach; but after I began to drink freely of Tea, and especially of *Coffee*, every Day, I lived free not only from the Headach, but from all other Disorders; though before that time I had a lingering Life, more like Death, having conflicted with a long Series of Distempers for five Years past. *Ibid*.

I know some of my Acquaintance, who laboured under no small Inconvenience from the Stone and Gravel in the Kidneys, wholly freed from all painful Sensations of that kind by drinking plentifully of *Coffee*. *Ibid*.

Some who have travelled into those Eastern Parts, assure us, that Persons of Quality in *China* and *Japan*, boil the Buds and Flowers of the Tea, ascribing more Virtues to them, than to the Leaves. *Raii Hist. Plant. See PURPURA*.

THECA, *θήκη*, from *τίθημι*, to place; in general, is a Receptacle in which any thing is lodged; but is frequently appropriated to a Surgeon's Chest, wherein he keeps his Apparatus of Instruments, and other Necessaries. *Rhodius* attempts to prove from *Martial*, that *Theca* signifies, also, a Kind of Fibula, contrived not only for the sake of Chastity, but Modesty. *Castellus*.

THEE, the same as THEA.

THEATRICOS, *θητρικός*, from *θεάω*, to behold, sightly, entertaining to the Eye, is an Epithet applied by *Hippocrates*, *πρόβλητος* to such Bandages, as are contrived more for Shew and Ornamentation, than real Use and Service.

THEION, *θεῖον*. The Divinity, or Divine Nature, the principal Cause, and prime Agent, in human Affairs, according to *Hippocrates*, in the Beginning of his Book *de Natura Mulieris*, *μάλιστα τὸ θεῖον ἐν τοῖς ἀνθρώποις ἀσθενείας ἐκείνη*, "the Divinity is the chief Cause in Men [in human Affairs]". And, a little after, *δαί δὲ τὸν ὁρθὸς τὰς αἰτίαις αἰσθάνεται*, "He who intends to manage these things aright, must take his Beginning from divine Things." *Τὸ θεῖον* signifies, also, any thing divine, which proceeds from God, or is incomprehensible, as God is, and the Cause of it beyond the Reach of Sense or Thought. This is the Meaning of *τὸ θεῖον* in

THE

the Beginning of the Book *de Morbo Sacro*, and in many other Places. In the same Sense some understand the following Expression in the *Prognostics*, *ἔτι θεῶν ἐνέσι ἐν τῇ νόσῳ*, "Whether there be any thing divine in Diseases;" but *Galen*, on the Place, after rejecting some other Interpretations, confidently asserts, that it means *τὴν τὴν πνευματικὴν ἡμῶν καὶ σώματος*, "the Constitution of the Air which surrounds us;" which is the Cause of epidemic Diseases; or the Knowledge of the Stars, which conduces much to the Prediction of Diseases, and the Constitution of the Seasons throughout the Year. This Part of *Physiology Hippocrates* would have a Physician to be acquainted with, as we learn from the Books of the *Epidemics*, and the Book of *Air, Water, and Situations*. *Gorræus* and *Fernelius* understand by *τὸ θεῖον* such a Constitution of the Air, as offends more in Substance, than Qualities, which *Hippocrates*, *Lib. de Nat. Humana*, calls *ποσὸν σκόνειον*, "a morbid Secretion," or, according to *Galen's* Exposition of *σκόνειον*, by *ἀναθυμίασις*, a morbid Evaporation, or Exhalation. *Gorræus*. *Foefius*.

THEKA, *H. M. Kyati seu Quercus Indica Bontii*, is a very tall and beautiful Tree of *Malabar*, with a very thick Trunk, covered with a thick, scabrous, and ash-coloured Bark, furnished with very numerous, green, geniculated, and quadrangular small Branches. The Wood is whitish, hard, smooth, striated, and not unlike that of the Oak. The Root is redish, of an astringent and bitterish Taste, and has somewhat of an acid Smell. The Leaves adhere by Pairs to the Branches in parallel Order, and are oblong, round, acuminate, dense, thick, shining above, but not beneath, two Spans or more in Length, and a Span abroad, of an acid, and oftentimes austere Smell; rubbed together in the Hands, they yield a Gum, which immediately becomes of a black-purple Colour like Blood. The Flowers are small and sweet-scented, and are disposed about the tender Branches, at the Origin of the Leaves, in long, quadrangular, and sulcated Pedicles; and, gradually extending their Columns, are expanded in form of an Umbella. They consist of five or six roundish, white, and outwardly reflexed Petals, and are seated in a small and acuminate Calyx. Between the Petals stand a like Number of small white Stamina, with yellow Apices, the Middle being occupied by a greenish acuminate Pointal. At length appear large green Vessels, open above, in which are lodged, though separated from one another by a ligneous Partition, three or four roundish, green, lanuginous, and hairy Fruits, of a greenish Pulp, without Smell, and of a bitter and astringent Taste, inclosing a square Stone, of a white Colour inclining to red, and containing a small whitish Kernel.

Whole Woods of these large evergreen Trees are found in *Malabar*. The Pagans, from some unaccountable Superstition, use no Wood but this in building and repairing their Temples; of the tender Leaves they prepare a purple Colour, with which they dip their Silks and Cottons; they are, also, eaten as a Delicacy, and they boil them with Sugar into a Syrup, which cures the *Aphthæ*. Of the Flowers boiled with Honey they prepare a Medicine, which evacuates the Bodies of hydropic Persons of the Water: The Root dried, then pulverized, and exhibited, dissolves concreted Blood where-ever seated; and of the tender Fruits bruised is prepared an Ointment, which is very serviceable in curing an Herpes. *Raii Hist. Plant.*

THELE, *θήλα*. The Nipple of the Breast; or Breast.

THELYGONOS. A female Plant.

THELYPTERIS. Female Fern.

THENAR, *θέναρ*. The Palm of the Hand, or Sole of the Foot. But *Thenar* is the Name of a Muscle of the Hand, and another of the Foot.

The *Thenar* of the Hand is a very thick, fleshy Muscle; in some measure pyriform, lying on the first Phalanx of the Thumb, toward the Palm of the Hand, the large Eminence in which is principally formed by it. Its Name is taken from a *Greek Word*, which signifies *to strike*.

It is fixed to the Bone which supports the Thumb, and to the neighbouring Part of the great internal, annular, or transverse Ligament of the Carpus. It is, in some measure, bipartite, two distinct Portions answering to the two Insertions already mentioned. As it runs along the first Phalanx, these two Portions unite, and, diminishing in Thickness, are both inserted by one Tendon in the lateral internal Part of the Head of the first Phalanx; in the lateral Part of the Basis of the second, and in the lateral Ligament of that Joint.

The void Space between the two Portions of this Muscle gives Passage to the Tendon of the *Flexor Pollicis Longus*. That Portion, which lies nearest the Hollow of the Hand, is the largest; and its tendinous Extremity is inserted in the first sesamoid Bone, situated at the Basis of the second Phalanx.

The *Thenar*, by its Insertion in the first Phalanx of the Thumb, serves to draw it from the first Bone of the Metacarpus, more or less directly, as one of its Portions acts more than the other, or as they both act equally.

By the Insertion of the large Portion in the Basis of the second Phalanx, by the Intervention of the sesamoid Bone of the same Side, it may bend this Phalanx laterally on the first, and thereby bring the Thumb to a greater Distance from the Index.

Neither

Neither does this Distance hinder it from sometimes bending, and sometimes extending the Thumb, in the ordinary manner.

When the small Portion acts alone, it may give the second Phalanx a small Degree of Rotation on the first, these two Bones not being articulated by a Ginglymus.

Near this is another Muscle, called, by *Winslow*, the *Mesothernar*, which is a flat and nearly triangular Muscle lying between the first Phalanx of the Thumb, and the Bottom of the Palm of the Hand.

It is inserted by a very broad Basis in the Ligament which connects the Os Magnum of the Carpus to that which supports the Thumb: It is, also, inserted along the internal or angular Part of that Bone of the Metacarpus, which supports the middle Finger, and in the small Extremity of that which answers to the Index.

From thence the Fibres contracting to an Angle, terminate in a flat Tendon of different Breadths, which is inserted in that Side of the Head of the first Phalanx of the Thumb, which is turned to the Hollow of the Hand, and in the neighbouring Part of the Basis of the second Phalanx, by means of the second sesamoide Bone belonging to that Joint.

The *Mesothernar* moves the first Phalanx of the Thumb towards the Hollow of the Hand, more or less obliquely, as it acts either alone, or with the large Portion of the *Thenar*, or even with the *Antithernar*. By its Insertion in the sesamoide Bone of the second Phalanx, it, likewise, moves that Phalanx on the first, and thereby assists the *Flexor Longus*.

The *Thenar* of the Foot is a Muscle made up of several Portions, and lies on the inner Edge of the Sole of the Foot.

It is fixed, by three or four fleshy Fasciculi, to the lower and inner Part of the Os Calcis, Os Scaphoides, and Os Cuneiforme majus. It is, also, fixed a little in the annular Ligament under the inner Ankle, which belongs to the Tendon of the *Flexor Longus*.

From all these different Insertions the fleshy Fasciculi approach each other, as they advance forwards under the first Bone of the Metatarsus; and are fixed partly in the internal sesamoide Bone, and partly in the Inside of the first Phalanx near its Basis.

There is another Fasciculus fixed by one End to the Os Scaphoides and Os Cuneiforme majus, and by the other to the external sesamoide Bone, and Outside of the first Phalanx of the great Toe.

The *Thenar* bends the first Phalanx of the great Toe. When the Portion nearest the inner Edge of the Foot either acts alone, or acts more than the rest, the great Toe is separated from the other Toes, especially if it be at the same time extended. This Separation may be greater or less, according to the Degrees of Action of the other Portions of the *Thenar*. *Winslow's Anatomy*.

THEODORETOS, Θεοδωρετός. The Name of an Antidote described by *Paulus Aegineta*, L. 7. C. 11. and by many other medicinal Authors. The principal Ingredient is *Anacardium*; and it is intended for strengthening the Memory. The Word imports *divine*.

THEODORICON. This Word, like the preceding, imports *divine*; and is used as an Epithet for many Compositions, two of which occur in *Mesue*.

THEODOTIA, Θεοδοτία. The Name of several *Collyria* described by *Galen*, *Aetius*, and *Paulus Aegineta*.

THEOPEMPTOS. Sent from God. This is a pompous Title for an Antidote, or Tincture of Antimony, made with Antimony and Gold, and described by *Schroder*, L. 3. C. 17.

THEOPHILION, Θεοφίλιον. The Name of a *Collyrium* described by *Aetius*.

THEOPHRASTICI. A Name for the Disciples or Followers of *Theophrastus Paracelsus*.

THEORIA, from θεωρέω, to contemplate. The contemplative, or speculative Part of Medicine. See the PREFACE. The wild Imaginations of the Whimsical and Conceited have in all Ages suggested, and still continue to suggest, innumerable Theories of Physic, highly detrimental to the Art of Healing, of which a thousand Instances might be given. Thus *Hippocrates* directs Bleeding under the Tongue in a Quinsey; but *Celsus Aurelianus* condemns this Practice, without consulting Experience, the only Test; because it is not consistent with his favourite Theory.

THEOXENI MALAGMA. The Name of a *Malagma* against Pains of the Feet, described by *Celsus*, L. 5. C. 18.

THERÆUS, Θερᾶιος. An Epithet for a Species of *Cretan* Wine, mentioned by *Galen*, which was sweet, black, and thick, but not astrigent.

THERAPEIA, θεραπεία, from θεραπεύω, to heal, or cure, according to *Galen's* Definition, *Com. 1. in R. V. I. A.* is ἡ τῶν νοσημάτων ἀνέγχεσις ὅταν γενημένη, ἢ γινόμενη ᾖ, that is to say a Removal of Diseases already done, or completed, not what is still in its Progress. It is usually distinguished into perfect and palliative; the first is when the Disease is totally subdued; the other, when the Symptoms are only mitigated.

THERAPEUTICE, θεραπευτικά, is that Part of Medicine, which is particularly concerned in the Cure of Diseases.

THERENIABIN, Tereniabin. Oriental Manna, called also by the Greek Names *Drosomeli* and *Abromeli*.

THERIACA, θηριακά, from θήρ, a wild Beast, are properly such Medicines as cure the Bites of venomous Animals; and are supposed to differ from *Alexipharmics*, in that these latter are a Remedy for Poisons, which are taken inwardly; the other for such as affect the internal Parts from the Bites of Animals, as appears from *Nicander*, who has very elegantly treated of both, in two Books in heroic Verse. But he seems to make two Sorts of *Theriaca*; one by which the Bites of Animals are prevented, either by way of Suffumigation, or by rubbing or covering the Parts exposed; the other, by which the Bite itself is cured, and rendered of no ill Consequence. These Remedies are called *θηριακά ἀπὸ τῶν θηρίων*, from wild and venomous Animals, and not from any particular Species of them; tho' the Viper, which is properly called *ἔχιδνα*, (*Echidna*), or *ἔχis*, (*Echis*), is by the Greeks called *θηρίον*, (*Therion*) by Way of Eminence; as the Lion, also, is sometimes called *θηρ*, (*Ther*).

THERIACE, θηριακή, is an Antidote effectual against all Sorts of Poisons; and tho' every thing endowed with this Property may be called by this Name, since *Galen* calls *Garlick* the Countryman's *Theriace*, yet it is principally given to that most celebrated Medicine, composed of a Multitude of Simples with the Flesh of Vipers, and of Efficacy against all Manner of Poison convey'd into the Body, whether from a Bite, or through the Mouth. For the Antients often meeting with Poisons, and finding it no easy Matter to avoid either the Bites of Serpents, or a treacherous and poisonous Draught; and also considering that the Natures of Men were so different from one another, that what was good for one Man was oftentimes of no Use to another, they set themselves to invent some manifold and exquisitely compounded Medicine, which should be an universal and present Remedy in all Cases where Poison was concerned, and such was what we commonly call *Theriace*. The Invention of this Medicine is not very antient; but about the Time of *Nero*, when *Andromachus*, a very celebrated Physician, while the Professors of Medicine were consulting with one another, how to render this Antidote the most speedy as well as effectual, first thought upon adding Viper's Flesh. The Composition of the *Theriaca*, therefore, which bears the Name of *Andromachus*, is very antient, and in *Galen's* Opinion very good. This *Theriaca* is described by *Andromachus* himself, in some Verses dedicated to *Nero*, and inserted by *Galen*, in his Treatise of *Theriaca ad Pisonem*. [See the Description under the Article *ANDROMACHUS*]. To this Antidote *Andromachus* did not give the Name of *θηριακή* but *γαλήνη*, (*Galene*), that is, *Sereneness*; he also called *ἡλάρη*, (*Hilare*), and *εὐδία*, (*Eudior*), Words importing Cheerfulness and Serenity of Mind; but *Crito*, and others after him, gave it the Name *θηριακή*, on account of the Viper's Flesh which entered its Composition. In Imitation hereof several other Physicians composed Antidotes against Poisons, which they, also, called *θηριακά*, an Account of which you have, as here follows, under the Names of their Authors, or some noble and illustrious Persons.

Θηριακή Ἀλλίς Γάλλου, "the *Theriaca* of *Alus Gallus*," which he is said, after his Return from *Arabia*, to have presented to *Cesar* with this Recommendation, that it had saved the Lives of many Persons under him. It is as follows: Take of the Root of the white Vine, sixteen Drams; Seeds of Trefoil, *Opopanax*, each eight Drams, *Aristolochia Tenuis* twelve Drams; Root of *Libanotis*, *Iris Illyrica*, Ginger, Opium, each eight Drams; Seeds of wild Rue, twelve Drams; of *Ethiopian* Cumin, sixteen Drams; of Myrrh, Cassia, Castor, Sefeli, *Eringo-root*, *Serpyllum*, *Succus Cyrenicus*, each six Drams; of *Medica*, twelve Drams; *Sagapenum*, six Drams; Saffron, five Drams; Meal of *Ervum*, twenty-four Drams: Make them with Water into Troches of the Weight of three Oboli, and exhibit them in Wine.

Θηριακή Ἀσκληπιοφίλου, "the *Theriaca* of *Asclepiades Philometor*," is thus prepared: Take of the Roots of Meum, *Serpyllum*, *Opopanax*, each two Drams; Seeds of Trefoil, one Dram; Seeds of Anise, Fennel, Ammi, Apium, each one Acetabulum; very fine Flower of *Ervum*, two Acetabula; old Wine, as much as is sufficient to mix them together, in order to make Troches to be dry'd in the Shade. The Dose is three Oboli in three Cyathi of Wine. *Eudemus* gives us the Composition in Verse, as we have it in *Galen*, Lib. 2. de Antidotis.

Θηριακή Δημοκράτους, "the *Theriaca* of *Democrates*," who was an excellent Physician, and describ'd his *Theriaca* in Iambic Verses, recorded by *Galen*, Lib. 1. de Antid. It contains the same Simples as the *Theriaca Andromachi*, but differs in the Weights; for of these, where *Andromachus* directs four Drams, he orders but two; and where *Andromachus* takes two Drams, he directs four; as may be observ'd in many of the Simples which enter that Composition. You have this *Theriaca* in *Aetius*, *Tetrabib. 4. Serm. 3.*

Θηριακή Δημήτριος, "the *Theriaca* of *Demetrius*." This Author was chief Physician to the Emperor in the Time of *Galen*; and in the Composition of his *Theriaca* agreed with *Andromachus*, except in the Weight of the Troches of Squils, which has but an inconsiderable Difference; for whereas *Andromachus* prescribes forty-eight Drams of those Troches, he directs but forty-six in the Composition of the *Theriaca*.

Θηριακή Εὐκλείδου, "the *Theriaca* of *Euclid*," surnamed *Palatianus*, which was thus prepared: Take of Castor, six Drams; *Opo-*

Opopanax, Sagapenum, Sefeli, Cachrys, Chamædrys, Chamæpitys, Marrubium, each sixteen Drams; Stryx, Bitumen Judaicum, Myrrh, each seven Drams; Juice of Poppy, eight Drams; Honey, one Pound. It is given in the Juice of the Fraxinus, or in Wine, to the Quantity of a Dram, or more, at Discretion; it is good, also, in Quartan Fevers.

Θηριακὴ Ζήνωνος, "the Theriaca of Zenon" of Laodicea: It contains of Cardamoms husked, Serpyllum, Seeds of Apium, Root of the white Vine, the Seeds of Trefoil, Anise, Parsley, the Root and Seeds of Fennel, Ammi, Aristolochia tenuis, Meal of Ervum, Opopanax, of each an equal Weight: Bruise each of them separately; then mix them together, and work them up in Wine into Troches, to be dry'd in the Shade.

Θηριακὴ Μιθριδάτης, "the Theriaca of Mithridates." This Antidote is otherwise called *Μιθριδάτιος*, "Mithridate," because King Mithridates always used it, to preserve himself against Poison; and that so effectually, that when he was besieged by the Romans, and had twice attempted in vain to poison himself, he was obliged to fall upon his Sword, and thus dispatch'd himself. It consists of a great Number of Simples, and is described by Galen, *Lib. 2. de Antid.* [See the Preparation under MITHRIDATIUM]. This Theriaca is the same which Aetius unaccountably describes for the Theriaca Andromachi.

Θηριακοὶ ἅλας, Theriaci Sales, Theriacal Salts, are prepared of Vipers in the following manner: They put four Vipers alive into an earthen Pot, which has its Outside well cover'd with Clay, and upon them they cast an *Italic* Modius, that is, twenty Pounds of Sal Ammoniac, or common Salt, to which they add Troches prepared in the following manner: Take of Gentian-root, one Pound; Tops of the lesser Centaury, Marrubium, each six Ounces; Mountain Scordium, Apium, Chamædrys, Seeds of Garden-rue, each one Pound: Bruise them, and make them up with Attic Honey into Troches, half a Pound of which is to be put into the Pot with the Viper, and the rest is to be mixed with the Salt, together with five tender and fresh Squils cut very small. This done, they put Fire under the Pot, which is to have four or five Perforations in the Cover, through which the exhaling Vapour, when it appears no longer gross and foul, but like a thin and pure Flame, shews the Burning is completed. Martianus, besides the Pastils, adds another *Italic* Modius of Salt. The Pot, being taken from the Fire, is suffer'd to cool for a Day and a Night; then they open it, and, taking out the burnt Contents, carefully triturate them, and put them into a Sieve with the following Mixture: Take of Seeds of wild Rue, Hyssop, each nine Ounces; Fennel-Seeds, Gallic Nard, Stachys, each six Ounces; Macedonian Parsley, four Ounces; the Tops of Origanum and Thyme, each nine Ounces; the Berries of Amomum, and the Seeds of Horminum roasted, each three Ounces; Juniper-berries, black and white Pepper, each two Pounds; the Root of Laserpitium, ten Ounces; the Seed of Coriander, Ginger, the Seed or Root of Saryrion, Pennyroyal, Sefeli, Mountain Tordylium, Mint, each six Ounces; Casia Fistula, two Ounces, Cinamon, one Ounce: Bruise them, and mix them all together with the rest; and, having passed them through a Sieve, set them aside in glass Vessels in a dry Place, and use them not till the End of forty Days. I, says Galen, *Lib. ad Pisonem*, burn not the Vipers; but take as many Theatrical Troches, as contain four Vipers; that is, says Martianus, about two Ounces and an half of dry Troches; and mix with those Things which are burnt with the Vipers, that they may lose the Bitterness, with which they are endu'd, in the Burning; and by this Method prepare the best of Theriacal Salts. These Salts are highly efficacious in cutaneous Diseases, as the Leuce, Lepra, Impetigo, and Phthiriasis, provoking a copious Sweat, by which means the excrementious and morbid Juices latent under the Skin are expelled.

These Theriacal Salts are described by Galen, *Lib. de Theriaca ad Pisonem*; but the Reader is to take notice, that the Copy of Galen is very much corrupted in this Place; but, may however, be corrected from Aetius, *Tetrab. 4. Serm. 1. Cap. 97.* by Help of which we may, also, restore Paulus, who describes these Salts at the End of his seventh Book.

Θηριακοὶ ἀπὸ κρέατος ἰσχυροὶ, "Theriacal Pastils, or Troches." These are Troches prepared of the Flesh of Vipers for the Composition of the Theriaca; and are made in the following manner: They take female Vipers caught in the End of the Spring, take off their Skins, and carefully cleanse them; then, after giving the Flesh two or three Washings in Water, they put it in a clean Pot with a sufficient Quantity of Water, and boil it over a Fire made of the Wood of the Vine, till the Flesh be wholly separated from the Spine. Afterwards they carefully press the Flesh with their Hands, and pound it very well in a Mortar, instilling every now-and-then some of the Broth. This done, they take of the finest Bread, new, dry, pounded, and sifted, three Parts for one-fourth, or at least four Parts for one-fifth of the Flesh; and pound them very carefully together, instilling at proper Intervals some of the Bread, till they are exactly united. Of this Mass they form fine Troches of a moderate Size, adding a little Opopalsamum in the Formation, and dry them in the Shade. They are then rubbed over with the best

Opobalsamum, and kept in a glass-Vessel; and if at any time there appear about them any Dustiness, or Whiteness, on account of Mouldiness, it is carefully wiped off with a Linen Cloth.

Θηριακὴ, Theriaca, is, also, the Name of a Plaister of Centaury commended by Oribasius for Wounds and Punctures of the Nerves and Muscles; and for the Bites of wild Beasts, and a mad Dog: It is described by Aetius, *Tetrabib. 4. Serm. 3.*

THERIACA ANDROMACHI.

THE TREACLE OF ANDROMACHUS, commonly called VENICE TREACLE. See ANDROMACHUS.

THERIACA COELESTIS.

Take of the Theriaca Benedicta of Quercetan, a Preparation not much different from Venice Treacle, a Pound and an half. Extract with Treacle-water; pour the Whole into another Vessel; and abstract to the Consistence of Honey. Then, keeping the Essence separate, pour the abstracted Spirit to what before remain'd in the Vessel. Then extract and pour off a second time. To what remains pour a sufficient Quantity of rectified Spirit of Wine, and extract its remaining Essence, then decant again, and mix this Essence with the former. Then extract what still remains in Treacle-water, and at last in distill'd Vinegar, fortified with Spirit of Nitre: With these last Extracts precipitate the former, and coagulate the former to the Consistence of Honey. Then mix with the Whole, of the Magisteries of Coral and Pearls, each one Ounce; of the Magisteries of Iacynth, Rubies and Emeralds, each six Drams; of Animal and Mineral Bezoar, and Salts of Coral and Pearls, each half an Ounce; of oriental Bezoar, Seal'd Earth, true Unicorn, and of the Bone of a Stag's Hart, each three Drams; of Ambergrise, two Drams; inspissated in a double Vessel to the Consistence of an Extract, or a Mass fit for Pills. Schroder.

THERIACA DIATESERON:

An Electuary of four Ingredients.

See DIATESERON. The THERIACA PAUPERUM is the same.

THERIACA EDINENSIS:

The Edinburgh Treacle.

Take the Roots of Angelica, Contrayerva, Masterwort, Virginian Snakeroot, wild Valerian, Zedoary, and Bayberries, of each two Ounces; the Leaves of Rue, and Scordium, of each an Ounce and an half; of the Powder of Diambra, three Ounces; Camphire, Saffron, Rosin of Guaiacum, Myrrh, and Opium, each an Ounce; clarified Honey, thrice the Weight of the Powders; and as much Canary-wine as will serve to dissolve the Opium: Mix all together, and make it into an Electuary, according to the Rules of Art. *Edinburgh Dispensatory.*

THERIACA GERMANORUM.

The Rob made of the expressed Juice of green Juniper-berries is so called.

THERIACA LONDINENSIS:

London Treacle.

Take of the Four greater and lesser hot Seeds, each an Ounce; of the Roots of Angelica, Virginian Snakeroot, Tormentil, Elecampane, Zedoary, Contrayerva, Calamus Aromaticus, and Gentian, each two Drams; the Leaves of Cretic Dittany, Scordium, Rue, Laurel, and Juniper-berries, each half an Ounce; Nutmegs, Mace, Saffron, Myrrh, and Cloves, each three Drams; Ginger and Opium, each two Drams; Syrup of white Poppies, boiled to an higher Consistence than ordinary, three times as much as the Weight of the rest; and of Canary a sufficient Quantity to make the Whole into an Electuary.

This is much altered from what has been in all the preceding Dispensatories; and as an Alexipharmic, which is plainly its main Intention, much for the better; for many Ingredients, very weakly conducive to such an End, are now rejected; and one of the most efficacious we have in the Shops, of that Class, added, which is the Contrayerva; but, as this has hitherto been mostly used by the Surgeons, where warm Cataplasms are required, how far it is improved for such Purposes, and especially by the Exchange of Honey for Syrupus de Meconio, I will not pretend to be a Judge.

Quercetan ascribes surprising Virtues to this Preparation, in subduing Poisons, and contagious Disorders; in allaying Comotions of the Spirits and Humours; in mitigating Catarrhs, Pains,

Pains, and Watchings; in corroborating the natural Balsam, and preventing Putrefaction. *Schrod. Pharmacop.*

THERINOS, *Θήρινος*, is an Epithet apply'd to a sort of Wine, which was moderately thick and black, and of the Growth of *Asia*. *Galen, Lib. πρὸ ἐνυχυρίας*. *Θήρινος* is an Epithet of a Collyrium in the same Author, *Lib. 4. de C. M. S. L. Cap. 7.*

THERIODES, *Θηριώδης*, from *Θήρ*, *Fera*, a wild Beast; wild, savage, is applied to Things of a ferine or malignant Nature, and particularly to Diseases which take their Names from wild Beasts, as the *Elephas*, and *Cancer*, or under which Animals, as large Worms, or *Ascarides*, are generated; or even to a *Phthisis*, under which the Nails are incurvated, like the Talons of wild Beasts. *Hippocrates* applies it, also, to the Autumn, as being the Season of the Year, in which malignant and destructive Distempers are most predominant. Thus *Galen*, commenting on τὸ *Θηριώδες ἐκδινοτάτω*, 6 *Epid. Sect. 1. Aph. 13.* says, that whether the Author, by τὸ *Θηριώδες* of the Autumn, means the large Worms or *Ascarides*; or the *Elephas* or *Cancer*, or, as some will have it, a *Phthisis*, all those Disorders are chiefly generated in the Autumn. *Θηριώδες* may be apply'd to the Autumn on account, also, of those ferine and melancholy Disorders proceeding from black and highly adust and torrefy'd Bile, under which the Patients fall upon every one they meet, and attempt to worry them after the manner of wild Beasts. *Galen*, in his *Exegesis*, expounds the τὸ *Θηριώδες*, of Animals, such as the large Worms, or *Ascarides*, in the Intestines; or by τὸ *ἐκδινοτάτω*, "rabific," because the Autumn is a Season disposed, from the Corruption of the Humours, for the Generation of many severe and dangerous Disorders, which often terminate in Consumptions; which are, also, very mortal in Autumn. *Arctaus*, also, who almost equal'd *Hippocrates*, in Grandeur of Style, bestows the same Epithet *Θηριώδες* on the Autumn. And *Erosian*, expounding the τὸ *Θηριώδες*, 6 *Epid.* before-mention'd, tells us that some understand by it malignant Ulcers, called *Θηριώματα* (*Theriomata*) which are most rife in Autumn, because of the Inequality of the Air; others refer it to small Worms, which are then principally generated; and others will have it meant of a *Phthisis*.

Θηριώδης βήξ, 6 *Epid. Sect. 2. Aph. 11.* a ferine and malignant Cough, is explained by some Interpreters, as *Galen* tells us, by a dry Cough excited by Worms creeping upwards to the Mouth of the Stomach, and lancing the same; others, he says, accommodate the Expression to the Cough of those in a *Phthisis*, because their Nails are incurvated, as was said before. Others, again, expound *Θηριώδης* by *κακοῦς* (*Cacothēs*) malignant, which is the Opinion of *Galen* himself; so that *Θηριώδης βήξ* is a malignant and pernicious Cough, which is no Indication of an Abscess; nor gives any Hopes of a Concoction. The same Author, in his Comment on 6 *Epid. Sect. 2. Aph. 16.* where *Hippocrates* speaks of such dry Coughs in a burning Fever, as are not very troublesome, nor excite a Thirst, nor dry the Tongue, because they are owing, he says, ἢ τῷ *Θηριώδει*, ἢ τῷ *νεύματι*, "not to any (thing expressed by) *Theriodes*, but to the Wind (or Air)," as appears in that the Patient never coughs, but when he speaks, or his Mouth is open, explains the τὸ *Θηριώδες* as follows: *γινόμενον δὲ βρυχῶν ἐν πύλαις καὶ διὰ τὴν κακοῦσιν τὸ νεύματι, &c.* "Since dry Coughs proceed, also, from some Malignity of the Disease, in order to distinguish them from those of which he is now speaking, he says, that these latter are not excited by any thing signify'd by *Theriodes*, but by the Air. Some will have it, that by *Θηριώδες* here *Hippocrates* does not mean simply all Malignity in general, but, as some of them interpret it, a *Phthisis*, because the Patients under that Disease resemble Beasts in respect of the Crookedness of their Nails; others understand it of a *Therion*, which is properly an Ulcer of the Lungs; others, again, will have it spoken with respect to Worms, ascending into the Mouth of the Stomach, and by Irritation of that Part provoking a Cough; though they can neither prove this by Reason nor Experience. The best way, therefore, is to understand *Theriodes* of some Malignancy, whether the Cough, arises from some Defluxion from the Head, or an Ulcer in any of the Organs of Respiration, or an Abscess in those Parts, or what they call an *Empyema*. Now there are other kinds of Coughs besides this, which are not malignant, and are owing to a Distemperature of the Organs of Respiration, or of the Fauces, or of the *Aspera Arteria*, or to exasperating Meats and Drinks, and even sometimes to the ambient Air." In the like Sense, by *Θηριώδης τὰ ἐκίμνητα* (*Theriodes ta Emumena*) *Coac. 623.* we are to understand malignant Vomitings, by which the great Corruption and Malignancy of the Humours are indicated; or by which, perhaps, Worms are, also, ejected.

Θηριώδης παραφρένις (*Theriodes Paracrusies*) in *Hippocrates*, 1 *Prorrhet. 26.* and *Coac. 85. 55.* are Disorders of the Brain from Deliriousness, or Loss of Reason; wherein the Patients behave like wild Beasts, or, as *Galen* says, *Com. 1. in Prorrhet.* kick, bite, and rage at those who come near them, as if they were their mortal Enemies. Also, *Θηριώδης παραφρένις*, (*Theriodes Paracrusies*) 1 *Prorrhet. 123.* import a ferine and savage Madness, more vehement than Melancholy, and very malignant

[see *DELIRIUM*]: Or, as *Galen* explains it, "by this Expression is to be understood an Epitasis (Intenseness) of the melancholy Disorder; for as they who are melancholy, and highly delirious, are prone to do those who stand near them a Mischief, so, when they are mischievous and raging beyond measure, he gives the Disorder the Name of *Theriodes*."

Θηριώδης διαίτη (*Theriodes Dieta*) is such Diet as is common to Men with Brutes, and such as was used in the first Ages, *Lib. πρὸ ἀρχαίων ἰσχυρίων*.

Θηριώδης (*Theriodes*) are Patients molested with Worms; or such Fevers as by a peculiar Malignity and Depravation of the Humours, which naturally happens in Autumn, afford Matter for the Generation of Worms. Thus, 4 *Epid. Θηριώδης ἐν τῷ χρόνῳ* are those who conflict with Worms about the Time of a Crisis; or those who, labouring under a Fever, towards the time of its Decline and Solution, discharged Worms or *Ascarides* by Stool or Vomit, by the Benefit of Nature, making Efforts to free itself from whatever offended or opposed it.

THERIOMA, *Θηριώμα*. See the preceding Word.

THERION, *Θηρίον*, in *Hesychius*, is pounded *πάθος τοῦ σώματος*, a kind of bodily Disease; which is, as *Galen* in his *Exegesis* expounds it, either Worms, or a ferine (*ἀγρευ*) Ulcer; as it signifies, he says, in the Book *de Locis ad Hom.* where you read, *Θηρίον ἐν τῷ σώματι ἐπὶ χέλει*, "a ferine (or malignant) Ulcer arises on the Body." It has the same Signification. *Coac. 467.*

THERIOTOME, from *Θηρίον*, a wild Beast, and *τέμνω*, to cut, or dissect. The Anatomy of Brutes.

THERMÆ. Natural warm Springs, of which the celebrated *Frederic Hoffman*, in his Dissertation on the *Caroline Waters*, has given us the following Account.

Nothing has more perplex'd the Minds of Men, and laid a more effectual Foundation for different Opinions among Physicians, than that actual and continual Heat, which in some Medicinal Springs is obvious to the Senses. We shall not enumerate all these Opinions, but only specify some of the most considerable: Many, therefore, especially among the Antients, accounted for the continual Heat of these Waters from the *Platonic Barathrum* and Centre of the Earth, where they suppos'd a perpetual Fire lodg'd, and thence diffus'd thro' Chinks and Apertures to particular Parts. But this Notion is rather the Creature of a wanton Fancy, than a Theory capable of being supported by solid Arguments. Others have accounted for the Heat of such Springs, from that of the Sun. But the Rays of the Sun do not penetrate into the Bowels of the Earth; and these Waters always retain the same Heat, when the Sun has retir'd from our Hemisphere, where he shines faintly in the Winter, and when the Earth is constricted and harden'd by Frost. Nor, if the Heat of these Waters was produc'd by the Influence of the Sun, could any Reason be assign'd, why other Springs, equally expos'd to the Solar Rays, should not be, also, hot.

Some Chymists derive the Origin of the Heat in these Waters, from the Effervescence of an Acid and an Alkali, as, also, from a Congress of Quick-lime with the Water. But if the Heat of these Waters was produc'd by the Conflict of an Acid and an Alkali, a neutral Salt, which is always produc'd by a Mixture of these, must necessarily be found in the hot Springs; which, however, does not happen. And there are Limestone Mountains in the Earth, yet the Matter of them conveys no Heat to the Waters, till it is previously burn'd; but Quick-lime is rarely found in the Bowels of the Earth. Others think they embrace a more rational Opinion, when they assert, that in the Production of the Universe, these Waters were furnish'd with their Heat: But this Notion seems to be as repugnant to Truth as the others; for, if this Heat was innate, I do not see why it should be so soon lost: So that we may conclude, that this Heat depends upon the Communication and Access of an igneous Substance, in the same manner as Water is heated by the Fire, and becomes cold when remov'd from it.

'Tis not, therefore, to be doubted, but that these Waters, naturally cold, contract their Heat in the Bowels of the Earth thro' which they pass; so far is the Earth from being render'd warm by the Heat of the Waters. As Water out of the Earth is render'd hot by Fire, so in the Bowels of the Earth a latent Fire renders the Waters flowing by it tepid or hot. That the Existence of such Fire is not precariously asserted, but that it is really lodg'd in the Meanders of the Earth, is sufficiently certain, from the burning Mountains found in different Countries, the violent subterraneous Commotions and Thunders, the Eruptions of Flames, and the burning of Rocks and Mountains. We must, therefore, inquire, by what means this subterraneous Fire is generated in the Bowels of the Earth; and how it is so long, and so constantly supported and maintain'd.

In order, therefore, to explain this difficult Phenomenon, we must, from the Principles of Natural Philosophy and Chymistry, account for the Origin of Fire, and the Production of Flames. We, therefore, affirm, that the Matter, Matrix, or Food of Fire is supplied by pinguious and sulphureous Substances. These not only give Origin to Flames, but are, also, quickly carried into

into an igneous Motion. Sulphurs are converted into Fire, by their highly accelerated and quick intestine Motion; so that Fire is only a Species of brisk intestine Motion, which destroys the Union and Mixture of Bodies. Hence, the Person who from cold Bodies attempts to produce Fire and Flame, must take sulphureous Substances, and by a violent Attrition and Collision put them into a brisk igneous Commotion.

Thus, for Instance, Iron is a very sulphureous Metal; and for that Reason, of all other Metals, the most susceptible of Heat. Hence, when it stands in Fusion, it throws off numberless Sparks; and its Filings, when blown into the Flame of a Candle, forthwith diffuse lucid Sparkles. This Sulphur of Iron, by Collision, put into an accelerated Motion, produces manifest and visible Fire. Hence it is that a Piece of Iron, by a quick and repeated Percussion with a Hammer, appears igneous, and is rendered so hot, as to burn and kindle Sulphur. This Origin of Heat and Fire is sufficiently proved by that curious Experiment, in which, the most lucid Flame is in a Moment produced, by duly mixing highly concentrated fuming Spirit of Nitre with Oil of Cloves; for this Oil, which is replete with a large Quantity of thick Sulphur, is, by an Admixture of this Spirit, thrown into a brisk intestine Agitation and Motion, which is Fire.

When, therefore, it is asked, What is the first Origin of subterraneous Fire, and by what it is supported? I think we may assert, that these Things happen, because the sulphureous Substances, lodged in the Bowels of the Earth, being by their mutual Action put into a violent Motion, first produce Fire; which afterwards easily diffuses and propagates itself, by means of the adjacent sulphureous, and, especially, the bituminous and easily inflammable Materials. We must, also, inquire, what Substances, hid in the Bosom of the Earth, are fit for taking Fire; and these, in my Opinion, are principally iron and sulphureous Ores. For that large Tracts of Ground are full of iron Ore, is sufficiently certain; nor is it less true, that profound subterraneous Caverns abound with sulphureous and vitriolic Ores; as is obvious from the digging Sulphur and Vitriol, almost for a thousand Years past, from mount *Ramelshurg* near *Goslar*.

Some Parts of *Italy*, also, abound with Sulphur; which is the principal Cause of the burning Mountains, and frequent Earthquakes in that Country. Hence, *Tschirnhausen*, in *Lib. de Medicament*, tells us, that in Mount *Etna* in *Sicily*, and Mount *Vesuvius* in *Campania*, he principally observed four Things: First, common inflammable Sulphur: Secondly, a porous Earth: Thirdly, Air: And fourthly, Sea-Water; for, the Sulphur kindled in these Mountains, not only produces these terrible Eruptions, but also by heating the Earth intensely, renders the Waters, which flow thorough them, warm.

This is, also, the Reason, why in *Italy*, where the Sulphur burns in the subterraneous Spaces, hot Springs are so numerous. Thus, *Laurentius Grullus*, in *Orat. de Peregrinat. Studii Medicinal. ergo suscepta*, tells us, that in *Siena* there are above fifteen medicinal Springs; and, a little after, he speaks in the following manner: "Afterwards, at *Puzzolo*, I saw whole Mountains of native Sulphur, which is much esteemed in the Shops; these were formerly called the *Phlegraan* Mountains. Near *Baia*, I, also, saw various Mixtures of hot mineral Waters; and in the Bay of *Naples*, near the Lake *Avernus*, the Vapours arising from the Earth almost surpass the Virtues of the hot Springs." There is, also, found a Sulphur of the same Kind, in some of the hot Springs of *Germany*, especially those of *Aix la Chapelle*, which not only tinge Silver with a brownish Colour, but, also, in the *Cæsarean* Bath produce a pure Sulphur in the Form of Flowers.

We have already shewn that Sulphur is the Matter, as of all Fire, so, also, of that which is lodged in the Bowels of the Earth. But in what manner this Sulphur should be spontaneously kindled, and take Fire, is not as yet explained. In my Opinion, therefore, this happens by the mutual Congress, and violent intestine Motions, of the sulphureous Bodies, when the disengaged Sulphur acts upon chalybeate Earths and Substances, or upon a bituminous Earth. We may, therefore, conceive the Thing to happen in the following manner: When, in the Bowels of the Earth, Sulphur is mixed with Bitumen, or a Fossile abounding with an acid Salt, as, also, with chalybeate and sulphureous vitriolic Marcasites, when these are collected in large Quantities, and when the Water approaches them, then the Acid of the Vitriol contained in the Sulphur is dissolv'd, and by its Action on the bituminous Earth, and the sulphureous chalybeate Ores, not only excites an intense Heat, but, also, if the Earth is porous, and a free Access afforded to the Air, produces a bright Flame.

This Doctrine will be further illustrated by the following chymical Experiment: When one Pound of native Sulphur, reduced to a Powder, is mixed with an equal Quantity of the fine Filings of Iron, and put into a Glass, sprinkling as much Water as will render the Mixture moist, like a Poultice; this Mass after twelve Hours, is raised in a Froth, and such an hot internal Conflict is produced, that the Glass is broken by the Heat, whilst the Colour of the Mass, which was before yellow, degenerates into black; this Magma, when taken out of the Glass, broken into small Pieces, laid in a Heap, and for a short time exposed to the free Air, not only becomes more intensely hot than before,

but, also, produces a manifest Flame, attended with a sulphureous Smoke.

The Origin of subterraneous Fire, may be farther illustrated by a common Experiment, by which it is shewn, that the Marcasites, and sulphureous Portions of Earth, of which Vitriol is made, when exposed to a moist and rainy Air, soon conceive an intense Heat. The same happens when the Fragments of the black Caput Mortuum, remaining after the Sublimation of Sulphur, from sulphureous Marcasites, are laid in a Heap, and exposed to a moist Air; for on this Occasion, they contract so violent an Heat, that the Hand cannot be put near them, without the Danger of being burnt. This is sufficiently obvious to the Senses, at *Alt-Sattel*, a Town in *Bohemia*, a Mile distant from the *Caroline* Springs, where Allum, Sulphur, and Vitriol, are prepared.

The Origin, and true Cause, of subterraneous Fires, is still further illustrated by a remarkable Phenomenon, daily observable in those Places, where Alum is prepared; such as *Dieben* in the Marquisate of *Meissen*, and *Commoden* in *Bohemia*. For we know that in the Preparation of Alum, a Sort of fossile Coals is dug out of the Bowels of the Earth, or a black, inflammable, bituminous Earth, in which the sulphureous and aluminous Salt is lodged: This Earth is afterwards laid in an Heap, and being moistened by the Rain it not only becomes violently Hot, but also sends up a Smoke, and sometimes an open Flame; from no other Cause but that the sulphureous Acid of the Alum, being dissolved, attacks the sulphureous and bituminous Earth; Thus by the mutual Action and Reaction of their Parts, the Sulphur is not only rendered warm, but also upon a Commotion from the Air, is plainly converted into Fire. Our Doctrine is also confirmed by a curious Experiment, in which, if burnt Alum is mixed with any sulphureous inflammable Substance, a Mass is obtained, which when exposed to the free Air, spontaneously becomes hot, takes Fire, and burns.

After an Enumeration of these Observations and Experiments, relating to the Origin of Fire, it will be no hard Task to ascertain the Origin, and genuine Causes, of that subterraneous Fire, which is the Cause and Source of the Heat in hot Springs, of Earthquakes, and of burning Mountains; for when the Sulphur, by the mutual Action of the various bituminous, chalybeate, vitriolic and sulphureous Minerals, is agitated by a violent internal Motion, and the Air contained in the Caverns of the Earth, by blowing upon it, increases the Heat, and excites a greater intestine Collision and Motion, a violent Fire may be produced, which spreading further through the subterraneous Passages, often shakes large Tracts of Land, excites subterraneous Lightnings and Thunders, and sometimes raises into the Air large Quantities of Earth and Rocks. These Phenomena are most frequent in Places washed by the Sea, and in which the Sea-water, by secret Conveyances, rushing into the subterraneous Cavities, forces the Air, contained in them, into a smaller Space, and thus excites a Wind. Thus 'tis known, that Waters, by their Fall into Caverns, may excite a Discharge of Winds, through certain Passages, which in many Parts correspond to Bellows. On the contrary, where a strong Gale is wanting, and the Places are remote from the Sea, as the middle Parts of *Germany* are, a great Heat is, indeed, produced, but the Fire pent up, never breaks out into an open Flame. It nevertheless diffuses far and near hot Exhalations, which passing through the Pores and Chinks of the Earth, render the Waters, which flow along them, hot.

It may possibly at first seem hard to explain, by what means the continual Heat, for so many Ages, communicating the same Degree of Warmth to these Waters, can subsist in the subterraneous Cavities. But this is not so hard to be accounted for as some imagine; since we are not to suppose that there is a scanty penurious Store of these Minerals in the Bowels of the Earth; but rather an inexhaustible Fund of Sulphur, Bitumen, and vitriolic Marcasites. A memorable Instance of this, is found at *Alt-Sattel* in *Bohemia*, where for above two Centuries, Sulphur, Bitumen, and Vitriol have been obtained from the Earth; as also at *Puzzolo* in *Italy*, where for many Centuries, Alum and Sulphur, have been prepared; and yet there still remain large Quantities of these Ores. Besides, when in the subterraneous Passages by the Access of the Water, producing the mutual Action, and Reaction of these Minerals, the Sulphur is once put into a violent igneous Motion, this intestine Motion readily finds similar Materials to act upon; and thus it easily propagates itself, and communicates the like Motion, to the pinguious inflammable Substances, the most considerable of which is the bituminous, inflammable Earth of fossile Coals.

'Tis also certain, from frequent Observation, that all Fire pent up, and preserved from the free Access of the Air, is not easily dissipated, but burns for a long time, without any considerable Waste of its *Pabulum*. They, who have been present at the Burning of Houses, know that in the Joists, buried under the Rubbish, the Fire has remained very long, even many Days after the Burning has been begun. The same happens to fossile Coals, which, if once set on Fire, it retains it for a long time under the Ashes. It is also curious to observe, that in *Papin's* Machine, which is so closely shut up, that neither the Air, nor the Steam of warm Water can get out, the hardest Fleashes may be boiled by the Help

of a very few live Coals, over which when this brazen Machine is placed, it not only conceives the Heat soon, but retains it long. And, to draw an Instance from the human Body, this noble Structure, when the Pores are closed up, and Perspiration obstructed, is, in Fevers, far more afflicted with intense Heat, than when the hot Vapours are freely dissipated and eliminated thro' the cutaneous Pores. In like manner the hot subterraneous Exhalations, when not dissipated in the free Air, but, as it were, re-forbed by themselves, in consequence of a repeated Gyration, last long, and are not soon consumed.

We are furnished with a memorable Instance of long-concealed Fire in the Coals of a Mountain near *Zwickavia*, in the Marquisate of *Meissen*; for the People of the Neighbourhood inform us, that, above a Century ago, this Mountain was set on Fire by the *Swedes*, and burned so long, that there was a Necessity for filling up its gaping Chinks and Cavities with Earth, and by that means suffocating the Fire. But about fifteen Years ago, when these Cavities were again opened, their internal Parts were found burning, and there was a second Necessity for filling up the Chinks. Above an hundred Years ago, *George Agricola*, in his Treatise de *Ortu & Causa Subterranea*, mentions this Mountain, and in his Treatise de *Natura eorum qua effluunt ex Terra*, Lib. 4. Cap. 17. he speaks in the following manner: "There is a Mountain near *Zwickavia*, in the Marquisate of *Meissen*, which burns continually, whilst Cavities are gradually formed on its Surface, at which if any one looks, they resemble burning Furnaces; and any combustible Substance which comes within four Feet of them, is set on Fire." He, also, informs us, "that in many Parts of *Germany*, burning Vapours are emitted in the Night, especially in *Meissen*, near the River *Muldah*, through all the Fields between *Zwickham* and *Glauca*." *Laurentius Gryllus*, also, mentions this Mountain in the following manner: "Near *Zwickavia*, is a Mountain which burns perpetually, just as Mount *Vesuvius* did in the Days of *Trajan*, and discharges a sulphureous Substance useful in Medicine."

Neither is it to be doubted, but in the Place where the *Caroline* Springs appear, there were formerly apparent Fires, which, being now latent and concealed, by dissipating and dispersing their hot Vapours thro' the Surface of the Earth, render the Waters descending from the high Hills warm. *Agricola*, in his Treatise de *Re Metall.* confirms this in the following manner: "These Places seem scorched, because Fires once burned in them, and the Remains of these Fires are generally found in the Bowels of the Earth, as is observable in the Fields of *Elbog*, between *Lessau* and *Culma*; for in these Fields, testaceous Earths, somewhat burn'd, are dug up: Nor is this to be wondered at, since in these Parts the Earth is sulphureous, and a Bitumen is dug up near *Sattel*, and the *Caroline* Springs are only eight Miles distant from that Town, which receives its Denomination from the Plain of *Falcons* [*Planities Falconum*], in that Part which is called the *Burning Hill*."

But there is a still more memorable Proof of this in *Bogisl. Balbini Histor. Regni Bohem. Cap. 32.* where the Author speaks in the following manner: "The District of *Elbog* abounds with fossile Coals; but they are not used by the Inhabitants, who are provided with large Quantities of Wood. At *Falkenaw*, near the River *Egra*, hard by *Konigsweber*, where *St. Cunigund's* Church stands, is a Mountain, or rather a Cavity, or large Hollow, which formerly did much Harm to the Neighbourhood. The subterraneous Fires prey upon the Bowels of the Mountain, and if a Person applies his Ear to the Ground, which I did, he hears within such a Noise of Winds, or Flames, that Fear represents to the Mind a Picture of a lesser *Vesuvius*. This Mountain burns in the Night, and even in the Day-time, when there is any considerable Change of the Atmosphere; and the People of the Neighbourhood have frequently perceived a kind of Earthquake, and a Roaring in the Bowels of the Earth. The Persons who live near this Part, tells us, that formerly there were iron Mines in it. There are, also, mix'd fossile Coals, but black, and already, as it were, consumed by the Flames; such as *Boetius* informs us, are sometimes found in the other Parts of *Bohemia*." This Passage sufficiently evinces, that there were formerly subterraneous Fires in these Parts.

'Tis, also, to be observed, that the Earth near the *Caroline* Springs is found warm. This is, also, the Reason why, at *Carlesbad*, on account of the subterraneous Heat, Cellars cannot be dug under Ground, but must be made in the adjacent Mountains. Hence the Reason is obvious, why, in the Town of *Carlesbad*, the Snow is melted as soon it falls, and all around is soon dissolved; so that 'tis plain, that there is a subterraneous Fire under all the Ground on which *Carlesbad* is built, which, when near the Waters, warms them; and when farther distant from them, diffuses its Exhalations, which, mixing with the Waters, impregnate them with an excellent medicinal Virtue; for that these Waters receive their Heat from the Earth thro' which they pass, is sufficiently proved from this, that there are many sweet warm Waters impregnated with no mineral Substance, but exquisitely pure and light, such as *St. John's Bath* at *Lucca*, the Bath at *Pisa*, that of *Siena*, and that of *Cornello*. Of the same Nature

are the celebrated *Piperan* Springs in the Country of the *Grisons*; the Waters of which consist of Snow melted on the Tops of the Hills by the Sun, which passing thro' hot subterraneous Places break out warm.

As the constituent Principles of cold and hot medicinal Waters are the same, so they must of course produce the same Effects in the human Body. Now as the various Intentions of Medicine are to remove Obstructions, correct peccant Humours, restore the Strength of the weakened Fibres, and eliminate whatever is noxious and prejudicial to the Constitution, so all these Intentions are excellently answered by warm Springs; for they incide, resolve, colligate, and carry off the stagnant Humours, and by that means remove old Obstructions; they obtund and correct the acid and saline Humours lodged in the *Prima Via*, and resolve the viscid Mucus of the Blood; they dilute crude and ill concocted Juices, and imbibe, sheath up, and disperse the saline Spiculæ with which they are mixed; they restore the Tone of the weakened Solids, and by that means promote the Circulation of the Blood; they, also, promote Excretions of all Kinds, by Stool, Urine, Perspiration, a Discharge of the Saliva, and Vomit, and all this without any considerable Irritation, or Loss of Strength; they have, also, a Tendency to remove Plethoras, Cachymies, and preternatural Commotions of the Humours, the fruitful Sources of Diseases; they are excellently adapted to Disorders of the Stomach, such as an uneasy Inflation of it producing an Anxiety of the *Præcordia*; they extinguish Thirst, excite the Appetite, remove a Sense of Weight in the Stomach, and check the Vomiting of a viscid Matter in the Morning; they remove a Lubricity and Falling down of the Anus, and cure a *Tenesmus*, by restoring Strength to the Fibres; they are, also, of singular Efficacy in Cachexies, Scurvies, a Jaundice, Melancholy, hypochondriac Disorders, Dropsies, obstinate Quartans, and other intermittent Fevers; they are, also, proper for checking all immoderate Hæmorrhages, whether from the Stomach, Uterus, or Veins of the Anus; though in such Cases they are to be used with great Caution, and when the Menfes or Hæmorrhoids, either are not duly discharged, or totally suppressed, nothing is more effectual for restoring them to their natural State, than hot mineral Waters. These Springs, by cleansing the urinary Passages, prevent Gravel and Dysuries; they free the pulmonary Vessels from Infarctions, and by that means render Respiration freer in a moist Asthma; nor are they prejudicial to phthisical Patients, especially if their Disorder proceeds from Obstructions of the Viscera; for which Reason, *Morton*, in *Phthisis. Lib. 2. Cap. 2.* recommends the *Islington* Waters in a Phthisis. They, also, produce happy Effects in arthritic, rheumatic, and gouty Patients. When used externally in Bathing, they soften hard Tumors, open the Pores of the Skin, strengthen the nervous and muscular Parts, whose Tone is weakened by Defluxions of Humours, and relax Parts affected with Spasms or Rigors; for which Reason they are highly beneficial to paralytic Patients, and those afflicted with Contractions, Imbecillity, Languor, Pains, or Tumors; they, also, remove Defecations of the Skin, and cure the Itch, Impetigo, and Leprosy. But as the most salutary Remedies are not proper on all Occasions, so the Use of hot Springs is dangerous in Cases where the Viscera are indurated and scirrhus; where the Humours are extravasated in the Cavities of the Head, Thorax, or Abdomen; where the Stomach, Lungs, Mesentery, and Intestines, are exulcerated, or affected with an Empyema, or Abscess. The Use of these Waters is, also, prejudicial to those who are disposed to an Apoplexy, an Epilepsy, an inveterate Hemiplegia, and a Privation of Memory, or of the internal or external Senses. Nor are these Waters proper for those afflicted with a convulsive Asthma, a Polypus of the Heart, a Dropsy of the Breast, a confirmed Phthisis, Cancers, spreading Venereal Ulcers, or a Gleet. These Waters are, also, to be cautiously used in all Kinds of Inflammations, whether external or internal, till the Force of the Disorder is allay'd.

Before any Cure is attempted by the Use of hot Springs, if the Body is full of Blood and Juices, a Vein is previously to be opened, that the Waters to be drank, may meet with no Resistance. Then the *Prima Viæ* are to be cleansed from the Sordes, lest the Waters passing quickly thro' those Parts, should carry the recrementitious Matter along with them; or lest that Matter should prevent the medicinal and salutary Operation of the Water. Purging is by no means to be attempted by drastic Remedies, which destroy the Tone of the Stomach and Intestines, but rather by mild Preparations of Manna, Rhubarb, and proper Salts, which operate without impairing the Strength. And this Evacuation is to be used not only in the Beginning of the Cure, but, also, during its Progress, and after it is over. Nor is the Stomach to be loaded with too large a Quantity of these Waters, but they are at first to be drank sparingly, and afterwards, more liberally. A proper Regimen and Exercise are, also, necessary, always avoiding tumultuous Commotions of Mind, and the Occasions of Sorrow and Sadness, lest by neglecting these, the salutary Effects of the Waters should be prevented. In drinking all medicinal Waters, the Stomach ought to be fortified with Corroboratives and Balsamics, by which means salutary and laudable Fluids are generated and distributed thro' all the Parts of the Body.

Body. As the *Therma* are actually hot, and the *Acidula* actually cold, so they are to be duly distinguished, and judiciously prescribed, both with respect to the particular Disease, and the Constitution of the Patient. They differ, also, in this, that the *Acidula* contain a volatile, and the *Therma* a fixed Salt. There is, also, more of a subtile Virioli in the cold, than in the hot Springs; tho' some of the latter, such as those of *Aix la Chapelle*, contain common Sulphur in Substance. Cold Springs, also, contain a larger Quantity of mineral Spirit, than the hot Springs, which, by reason of their Heat, are easily deprived of it.

From a Knowledge of these Differences, arise some very useful Rules in Practice. Thus, for those who have small Vessels, tender and delicate Fibres, and weak nervous Systems, subject to frequent Spasms, the hot Springs are more beneficial and proper, than such as are cold. But Persons of more robust Constitutions, in whom the Texture of the Fibres is more firm, and the Obstructions and Disorder obstinate, require stronger Waters, both of the cold and hot Kind, since they can bear them better than Persons of tender, delicate, spongy and lax Habits, to whom the fine, light, and subtile Waters are more beneficial. As for the external Use of hot Springs, those which have an heavy hard Water, strongly repel, and for that Reason easily excite Fevers, Head-achs, and Thirst, by forcing the peccant Matter inwards from the Surface of the Body; for which Reason they are to be cautiously used: Whereas those hot Springs, whose Waters are mild and soft, soften the hard Parts, open the Pores, promote the Excretions, and draw the peccant Matter from the Centre to the Circumference of the Body.

With respect to the Nature, Difference, and Use of these Waters, 'tis to be observed, that the cold Springs are possessed of a more noble and efficacious Quality, than the hot, on account of the large Quantity of mineral Spirit it contains. Cold Waters are, also, lighter, and more subtile, than those of the hot Kind, which, by their Heat, dissolve and carry off many coarse Substances lodged in the Bowels of the Earth. 'Tis, however, certain, that more Harm is done by cold, than by hot Springs. But this, in my Opinion, is owing to their being drank cold, especially upon an empty Stomach in the Morning. Hence I would advise all *Acidula* used in the Morning, to be drank not cold, as they come from the Fountain, but tepid. But as by the Heat, the subtile Spirit with which they abound, may be evaporated, I would advise them to be put in close-stopped Vessels, which are to be immersed in boiling Water.

With respect to the external Use of hot Springs, a great Error is very frequently committed in using the Bath too hot; for by the external Heat, the Blood and Humours are thrown into a violent intestine Motion, and preternatural Expansion, by which means a Palpitation of the Heart, Anxiety of the Præcordia, Head-achs, Inquietudes, and Loss of Strength, are produced. And the Injury is the greater, the more the Body abounds with impure Blood and Juices, since by this means the redundant Blood acts more forcibly upon the Parts, and vitiates them; and the Sordes are, by the Heat, rendered more subtile and acrid. *Frederic Hoffman*.

THERMANTERION, from θερμαινω, to render hot. A Chafing-dish.

THERMASMA, θερμασμα, from θερμαινω, to render hot. A warm Fomentation, recommended by *Hippocrates*, for easing Pains in a Pleurefy: Or, as *Galen* explains it, any thing which warms the Body.

THERMEMERIA, θερμμερία, from θερμός, warm, and ημέρα, a Day; in *Hippocrates*, *Lib. de Natura humana*, is the kindly Warmth of a vernal Day.

THERMINTHUS. The same as **TERMINTHUS**.

THERMOCOELIOS, θερμοκοίλιος. A Person who has an hot Stomach. *Hippocrates*, *Epidem. L. 6*.

THERMOLE, θερμωλή, the same as θερμότης (*Thermotes*) or θερμή (*Therme*), Heat, Warmth; in the *Ionian* Dialect, signifies the same as πυρετός (*Pyretos*), a Fever, as is observed from *Corinthius*. *Erotian*, also, expounds θερμωλή by πυρετός; but observes, at the same time, that the Word, in *Hippocrates*, signifies all manner of Heat. The Word occurs several times, in *Lib. de Locis in Homine*, where, indeed, it signifies Heat, but such as is immoderate and preternatural.

THERMOLITHUS. Offic. *Lapis Schistos*. *Charit. 17. Lapis Schistus Cornubiensis diu Calorem retinens*. *Mer. Pin. 214*. **THE WARMING STONE**.

It is found in the County of *Cornwall*. I meet with this Stone, says *Dale*, in the Catalogue of Officinal Simples, at the End of *Shipton's Pharmacopœia*, but nothing of its medicinal Use occurs in Authors.

THERMOMETRUM, from θερμός, hot, and μέτρον, a Measure. An Instrument contrived for measuring the Degrees of Heat in any Body; of these there are many Sorts. See **IGNIS**.

THERMOPOLIUM, θερμopolιον, from θερμός, hot, and πωλειν, to sell. A publick House, where warm Liquors were sold among the Antients, as they are at the modern Coffee-houses.

THERMOPOSIA, θερμωποσία, from θερμός, hot, and πίνειν, to drink. The drinking of warm Liquors.

THERMOS, θερμός, from θέρω, to heat. Hot, warm. *Θερμός*, *Thermon*, in the Neuter Gender, is sometimes spoken of a Quality, sometimes of a Substance, as *Galen* observes, *Com. ad 1 Aph. 14*. *Thermon*, in the latter Signification, Heat, in *Hippocrates*, is, also, of two Sorts; one ἐμφύτον (*emphyton*) native, or natural; the other igneous, mordaceous, and preternatural, according to *Galen*, *Com. in 6 Epid. Sect. 4. Aph. 23*. The θερμὸν ἐμφύτον, or natural and innate Heat, was deny'd by *Asclepiades*, *Praxagoras*, *Philotimus*, and *Erasistratus*, who asserted it to be acquired, and not innate. It is defined, A Substance in its Nature always moveable the first in an Animal, as being generated, and innate from the Beginning; for Nature itself, and the Soul, are nothing but innate Heat. The Motion of the natural Heat, both internal and external, is perpetual; and is, therefore, always moveable while it is moderately kindled, and while it is moderately extinguished, as *Heraclitus* said. The natural Heat is compounded of Heat and Cold, otherwise it would not be perpetually moveable; for since it is the Nature of Heat to be always expanding and mounting, it would soon be dissipated, were it not restrain'd, and repelled inwards, by the Cold, and so prevented from destroying itself by Extension. Thus *Galen*, *Lib. de Tremor. Palpis. &c.*

THERMOSCOPIUM. The same as **THERMOMETRUM**.

THERMOSPEDIA, θερμωσποδία. Hot Ashes. *Dioscorides*.

THEROS, θέρω. The Summer.

THESIS, θέσις. The Position, Situation, or Connection of the Parts of the Body.

THESPIANA, or **THESPESIANA**, θεσπιάνη, or θεσπιαίνω. The Name of an Antidote, or Confection described by *Galen*, *L. 7. de Comp. M. S. L. Cap. 3*. and by *Aetius*, *Tetrab. 2. Serm. 4. C. 65*. It is intended for Suppurations in the *Thorax*, and internal Abscesses.

THESSALICUS. A Physician of the Sect of *Thessalus*; that is, the *Methodic*.

THESSALICUM SEDILE, the *Thessalian* Chair, so called from *Thessaly*, the Country where Chairs of this Figure were most in Use, is recommended by *Hippocrates*, *Lib. de Artic.* in place of a Machine for reducing a recent Luxation of the Shoulder-bone. The Back of this Chair is perpendicular to the Séat, as *Galen* tells us; by which Construction it is distinguished, and accommodated to the Operation; which see described from *Hippocrates*, under the Article **AMBE**.

THEOU CHEIR, Θεοῦ χεῖρ. The Hand of God. The Name of an Antidote prepared of Goats Blood, and recommended in the Stone and Gravel by *Aetius*, *Tetrabib. 3. Serm. 3. Cap. 12*. from *Philagrius*.

THEXIS, θήξις, from θήγω, to pierce with a Needle, or the like Instrument, or, as *Hesychius* expounds the Verb, to whet, or sharpen; is a Puncture with a Needle. Hence κατὰ θήξιν θεραπεία, is the Greek Phrase for the Treatment of Wounds by Suture, or the Operation of the Needle, mentioned by *Archigenes* in *Galen*, *Lib. 2. κατὰ τήξιν*. There are two other Ways of uniting the Lips of Wounds there mentioned, one by ἀγκύλησις (*Ankylosis*), or by Help of the *Anker* [see **ANCTER**]; the other by a **SYSSARCOSIS**, that is, by filling up the Interval with new Flesh.

THISMA. Beds, and subterraneous Veins of Minerals.

THLASIAS, θλασίας. An Eunuch made by the Compression or Contusion of the Testicles.

THLASIS, **THLASMA**, θλάσις, θλάσμα, from θλάω, to contuse. A Contusion, or Collision, a Wound in the Flesh, or Muscles, from a blunt, or heavy Weapon. *Thlasma* is defined by the Author of the *Definit. Medicæ*, "A Recess of the Cranium inwards, without a Fracture, and principally incident to Children; it may be the more clearly conceived by observing what happens to tin Vessels." The same is called *Thlasia* in *Galen*, *Lib. 2. de Caus. Morb.* The same Author, in his *Exegesis*, expounds θλάσιν, by τὸν ἐμβρυοθλάστην, ὅστις ἐν πύελῳ καλεῖται, "an Embryo-thlastes [an Instrument contrived for the Contusion of the dead Fœtus] which, *Lib. 1. περὶ γυναικ.* is, also, called *Piestron*." See **PIESTRON**.

THLASPI.

The Characters are;

The Fruit is roundish, flat, generally surrounded with a foliaceous Border, and, for the most part, cloven on the upper Side, and divided into two Capsules full of flat Seeds; the Leaves are not divided, but entire.

Boerhaave mentions thirteen Sorts of *Thlaspi*; which are,
1. *Thlaspi*; arvense; siliquis latis. *C. B. P. 105. Tourn. Inf. 212. Boerb. Ind. A. 2. 7. Thlaspi*. Offic. *Thlaspi Dioscoridis*. *Ger. 204. Emac. 262. Raii Hist. 1. 831. Synop. 3. 305. Thlaspi Drabæ folio*. *Park. Theat. 835. Thlaspi cum siliiculis latis*. *J. B. 2. 923*. **TREACLE MUSTARD**.

This Kind of *Thlaspi* has a small, white, fibrous Root, sending forth firm Stalks about a Foot high, beset with smooth, jagged Leaves from a broad Base, ending in a sharp Point. On the Tops of the Stalks grow small, four-leaved, white Flowers, succeeded by large, broad, flat, and round Seed-vessels, having foliaceous Borders divided into two Cells, with a Slit on the Top, containing small, round, reddish-brown Seed, of an hot biting Taste. It grows

grows in Corn-fields in some Parts of Essex, and flowers in May. The Seed is used.

It is hot and dry, and somewhat diuretic, provoking Urine, and helping the Dropsy, Gout, Sciatica, and forwarding the menstrual Evacuations.

The Seed of this Plant is what ought to be used in the Theriaca and Mithridate; but, being very scarce, the Seed of the next may be used as a Succedaneum for it. *Miller's Bot. Off.*

It is found in Corn-fields, tho' rarely, and flowers in June. The Parts used are the small, black, oblong, acrimonious Seeds, which are drying and abstergent; and principally used in breaking internal Abscesses, provoking the Menes, and curing Ichthiaca Affections, and the like. *Dale.*

2. *Thlaspi*; arvense; *Vaccariae folio incano*; majus. C. B. P. 206. *Boerb. Ind. A. 2. 7. Thlaspi vulgare. Offic. Thlaspi vulgatifissimum. Ger. 204. Emac. 262. Thlaspi vulgatus. J. B. 2. 2612. Rati Hist. 1. 830. Synop. 3. 305. Tourn. Inst. 212. Thlaspi Mithridaticum seu vulgatifissimum, Baccariae folio. Park. Theat. 835. MITHRIDATE MUSTARD.*

The Root of this *Thlaspi* is small and woody, from which arise Stalks scarce a Foot high, single, or but little branched, thick set with long, narrow, soft, and hairy green Leaves, broad at Bottom, with two sharp Ears, and sharp-pointed at the End; the Flowers are small and numerous, growing in little Spikes on the Tops of the Stalks, four-leaved, and white; and are succeeded by little round Seed-vessels, much less than the former, containing dark-brown Seed. It grows frequently in Corn-fields; and flowers in May.

The Seed of this *Thlaspi*, as was before observed, is generally used instead of the former, being, like that, heating and drying, and supposed to have the same Virtues. *Miller's Bot. Off.*

The Seed enters the Composition of the Theriaca; and, externally used, cleanses all Sorts of running Ulcers; and is, also, a Ptaric, but not very common. It is reckoned an Enemy to pregnant Women, because it kills the Fœtus. *Schroder.*

3. *Thlaspi*; spicatum; Perficum; perfoliatum; maritimum; foliis inferioribus tenuiter incis; superioribus à caule Perfoliatis modo penetratis. M. H. 2. 294. *Nasturtium Orientale, foliis inferioribus Millefolium, superioribus Perfoliatum referentibus. T. 214.*

4. *Thlaspi*; capitulis hirsutis. J. B. 2. 922.

5. *Thlaspi*; capsulâ cordatâ; peregrinum. J. B. 2. 927.

6. *Thlaspi*; parvum; saxatile; flore rubente. C. B. P. 107.

Lithothlaspi quartum, carnosum, rotundo folio. Col. 1. 279.

7. *Thlaspi*; montanum; sempervirens. C. B. P. 106.

8. *Thlaspi*; Creticum; quibudam; flore rubente & albo.

J. B. 2. 924. *Draba, five Arabis, five Thlaspi Candia. Dod. P. 713.*

9. *Thlaspi*; Cappadocicum; flore albo. H. Eyst. Æst. o. 7.

F. 11. Fig. 3.

10. *Thlaspi*; umbellatum; arvense; amarum. J. B. 2. 925.

11. *Thlaspi*; Virginianum; foliis Iberidis amplioribus & serratis. T. 213. *Iberis, humilior, annua, Virginiana, ramosior. M. H. 2. 311.*

12. *Thlaspi*; arvense; perfoliatum; majus. C. B. P. 106.

Bursa Pastoria, foliis Perfoliatis. J. B. 2. 938.

13. *Thlaspi*; Rosa de Hiericho dictum. M. H. 2. 328. *Rosa Hierichuntina vulgo dicta. C. B. P. 484. Boerb. Ind. alt. Plant. Vol. 2.*

The *Thlaspi* has the highly penetrating Taste of Garlick, diffusing itself over all the Mouth.

The first and second Species, in particular, have the Savour of the strongest and most penetrating Garlick, nor are the rest destitute of it; whence the Seeds of this Plant are an Ingredient in alexipharmic and theriacal Medicines, in which they so promote Perspiration, as by their aromatic Virtue to expel any Poison by Sweat or Diaphoresis; for the same Reason it is commended against the Pestilence; it is, also, an Antiscorbutic, Diuretic, and stimulates to Veneri.

The third has the Appearance of the *Millefolium*, with the Leaves of the *Perfoliata*; and would justly be prefer'd by M. Tournefort to *Nasturtium*, were it not for its Taste.

The tenth Species is extremely bitter, and of a most penetrating Quality; for, if chewed, it provokes Plenty of Spit; and all Plants which have this Effect, are very good Aperients; for they act after the same manner on the Stomach.

The eleventh, also, is highly penetrating; two Ounces of the Seed of the *Thlaspi*, bruised, are a noble Diaphoretic in Case of Poison, being taken in *Rhenish* Wine; or in the Plague, being exhibited in Vinegar. It is a very good Remedy in cold Diseases, and the Seeds are used in breaking internal Abscesses, and provoking Urine; and the Menes; but they are to be given with great Caution to Women with Child, lest, by exciting too great a Commotion in the Uterus, they should cause Abortion. Externally used by way of Insersion; they cleanse and absterge Ulcers; they are applied, also, in Pains of the Sciatica, and are Ingredients in the Theriaca.

All tetrapetalous Siliquous Plants, from the *Crambe* to the *Cakile*, if chewed, affect the Mouth with a kind of biting Acrimony, have something of Heat, and a feid Smell, that is, not the Smell of an Herb, but the Fetidness of an Onion, and always putrefy in the same manner. Hence these Plants abound with an alkaline

volatile Salt, of which others are not so full; and hence, also, they are all Antiscorbutics; and of Service in a Coldness and Viscidity of the Humours. Since, therefore, these Plants stimulate to Veneri, and provoke Lust, they appear to be heating, sudorific, and diaphoretic; by which Qualities they act in Opposition to an Acid. But then these Plants are not to be used in hot Diseases, whence it is that they grow in cold Countries, a few excepted. If the aromatic Particles in them excel in Subtily, they shew a diaphoretic Quality; if in Acrimony, the Plant is sudorific. None of them are poisonous, but all equally good, and of Service, where an inert Phlegm, or Acid, are very predominant. *Hist. Plant. adscript. Boerb.*

THLASPI is, also, a Name for several Sorts of *ALYSSON*, and *THLASPIDIUM*; which see.

THLASPI CLYPEATUM. A Name for the *Ionthlaspi*; *minimatum*; *spicatum*; *lunatum*.

THLASPI FATUUM. See *BURSA PASTORIS*.

THLASPI SAXATILE. A Name for the *Ionthlaspi*; *luteo flore*; *incanum*; *montanum*; *diurosides*.

THLASPI UMBELLATUM. A Name for the *Nasturtium*; *sylvestre*; *Dalechampia*.

THLASPIDIUM. Bastard Mithridate Mustard.

The Characters are;

The Fruit is, in a manner, double, smooth, consisting of two Parts, separated by an Interclosure, and containing each a single Seed, which is generally of an oblong and flatish Figure.

Boerhaave mentions seven Sorts of *Thlaspidium*; which are,

1. *Thlaspidium*; fruticosum; folio Leucoii; semper florens.

T. 214. *Thlaspi, latifolium, platycarpon, Leucoii folio. Rar. 55.*

2. *Thlaspidium*; fruticosum; Leucoii folio variegato; sempervirens. T. 215.

3. *Thlaspidium*; hirsutum; calyce floris auriculato. T. 214.

Thlaspi bifurcatum, villosum, flore calcaris donato. C. B. P. 107.

Prod. 49. Leucoium montanum, flore pedato. Col. p. 2. 61.

4. *Thlaspidium*; Raphani folio. T. 214. *Thlaspi, bifurcatum, Raphani, aur. Irionis, folio. Bocc. Rar. 45.*

5. *Thlaspidium*; Monspelienae; Hieraci folio hirsuto. T. 214.

Thlaspi bifurcatum, asperum, Hieracifolium, & majus. C. B. P. 107.

Lunaria bifurcata. J. B. 2. 935. Leucoium bifurcatum, asperum, Hieracifolium, majus. M. H. 2. 249.

6. *Thlaspidium*; Apulum; spicatum. T. 215. *Thlaspi bifurcatum, asperum, minus. C. B. P. 107. Fendrabia Apula, alyssoides, spicata. Col. p. 1. 285. Leucoium, bifurcatum, asperum, minus. M. H. 2. 249.*

7. *Thlaspidium*; annuum; flore pallide luteo. T. 214. *Thlaspi bifurcatum, annuum, asperum. H. R. Par. Boerb. Ind. alt. Plant. Vol. 2.*

It is called *Thlaspidium*, from the *Thlaspi*, which, in some measure, it resembles; and is an oleraceous Plant, without any medicinal Use. *Hist. Plant. adscript. Boerhaave.*

THLIBIÆ, from *θλίβω*, to compress. Persons whose Testicles are consumed.

THLIPSIS, *θλίψις*, from *θλίβω*, to compress, a Compression.

Θλίψις σφαγῆς, in *Galen's Isagoge Pulsuum*, is a Compression of the Stomach from Food, which is offensive only by its Quantity, and not endued with any remarkable Quality, or from a Conflux of Humours void of Acrimony into the Part.

THOCOS, *θῶκος*. See *THACOS*.

THOLEROS, *θολερὸς*, from *θῆλω*, Mud; turbid, foul, muddy.

Θολερὸν πνεῦμα, "a turbid Respiration," is expounded in *Galen's Exegesis*, by *μέγα & διεσπασμένον*, "a great and raised (or quickened) Respiration." The Expression occurs, *Lib. de Humoribus*, and in several Places in *1 Prorrhetic* and *Coac*. As to its Meaning, we find *Galen, Conn. 2. in Prorrhetic*, thus discouraging, *τὸ δὲ θολερὸν πνεῦμα τί ποῖα ἐνδοὶ τῶν ἀσθενῶν ἐστὶ, &c.*

"As for the *θολερὸν πνεῦμα*, what it imports, remains an Obscurity; and the more, because it no-where occurs in the *Prognostics*, nor in the *Aphorisms*, nor in any genuine Book.

"If it be said, that *Hippocrates* used *θολερὸν πνεῦμα*, in the same Sense as *θολερὸν ὕδωρ*, 'turbid Urine,' we understand the Meaning of the latter very well from those who use the Expression of

"turbid, or foul Water, every Day, and from *Hippocrates* himself, who says, it is like that whose Sediment is disturbed, or

"like the Urine of Dray-horses. But what we are to understand by a *turbid*, or *foul* Spirit, (Respiration) is by no means

"obvious, since no Person calls the Air turbid (*θολερὸς*) in the same Sense as he calls the Water so, unless he be told, that it is

"filled with Vapours; which, indeed, is the Sense in which some take the Expression, telling us, that, as we observe an Effusion

"of Sweat under a Syncope, so, in a Resolusion of the internal

"Parts, there is an Efflux of the Humours within; and for that Reason a Multitude of Vapours is discharged in Expiration;

"and this is the *θολερὸν πνεῦμα*, 'the turbid Respiration.' He

says the same in another Place, and endeavours to prove, that

θολερὸν πνεῦμα was not written by *Hippocrates*. Again, at the

End of his second Comment, (on *Prorrhetic. T. 92.*) he says,

"that this *θολερὸν πνεῦμα*; as he observed before, was of ambiguous Signification; but in that Place it seems reasonable to

"be understood of Expiration; but here some will have it meant

"of Eructations, others of Flatuosities. We said before, that

"*θολερὸν*

"*σπέρμα* was, by some, expounded *συνέπας*, fetid; by others, *ατμός*, vaporous" [See *THALEROS*]. The same Author, *Lib. de Trem. Palpit. &c.* calls by the Name of *σπέρμα πνέυμα*, a gross, thick, dark, and cloudy Spirit or Wind contained in the Muscles, or within the Skin, and proceeding from some refrigerating, condensing and emplastick Causes: To this gross Spirit is opposed what is thin, pure, and limpid.

Tholeros, *σπέρμα*, "turbid," is often apply'd by *Hippocrates* to the Urine, as, also, to the Stools, Menes, and Spir; in which latter Case it signifies sordid, muddy, feculent.

THOLOS, Mud: But in *Galen* it is a Name for a Species of Bandage for the Head.

THORA. A Name for the *Ranunculus*, *Cyclaminis folio*, *Alphodeli Radice*; *major*.

THORACICA. Medicines for Disorders of the *Thorax*, or Breast.

THORAX. The Breast.

By the *Thorax* we commonly understand all that Part of the Body, which answers to the Extent of the Sternum, Ribs, and Vertebrae of the Back; both outwardly and inwardly.

The *Thorax* is divided into the anterior Part, called commonly the Breast; the posterior Part, called the Back; and the lateral Parts, called the Right and Left Sides.

The external Parts of the *Thorax*, besides the Skin and Membrana Adiposa, are principally the Mammæ, and the Muscles which cover the Ribs, and fill the Spaces between them. In the Mammæ we see the Papillæ, or Nipples, and a small coloured Circle which surrounds them. The Muscles are the Pectorales majores and minores, Subclavi, Serrati majores, Serrati superiores postici, Latissimi Dorsi, and Vertebrales; and to these we may add the Muscles which cover the Scapula.

The internal Parts of the *Thorax* are contained in the large Cavity of that Portion of the Trunk, which the Antients called the middle Venter; but the Moderns name it simply the Cavity of the Breast. This Cavity is lined by a Membrane named Pleura, and divided into lateral Cavities by a membranous Septum, named Mediastinum, which is a Production or Duplication of the Pleura.

These Parts are the Heart, Pericardium, Trunk of the Aorta, great Arch of the Aorta, Trunks of the carotid Arteries, Subclavian Arteries, Trunks of the vertebral and axillary Arteries, the superior Portion of the descending Aorta, the intercostal Arteries, the Vena Cava Superior, Vena Azygos, Subclavian Veins, Trunks of the Jugular, vertebral and axillary Veins, a Portion of the Aspera Arteria, and of the Oesophagus, the Ductus lacteus, or Thoracicus, the Lungs, pulmonary Artery, pulmonary Veins, &c.

The Arteries and Veins, which particularly belong to the *Thorax*, are these:

- Arteriæ & Venæ Thoracicæ, superiores & inferiores.
- Arteriæ & Venæ Mammariæ, externæ & internæ.
- Arteriæ & Venæ Intercostales, superiores & inferiores.
- Arteriæ & Venæ Spinales, with the venal Sinuses of the Canal of the Spine.

The Nerves distributed to the *Thorax*, are these:

- Nervi sympathetici Medii, or the eighth Pair.
- Nervi sympathetici Universalis, commonly called Intercostales.

The last cervical Pair.

The twelve dorsal Pairs.

Nervi Diaphragmatici.

The Cavity of the *Thorax* is terminated downward by the Diaphragm, which parts it from the Abdomen.

The whole Extent of the *Thorax*, in a living Subject, is commonly determined, not only by the Sternum Vertebrae of the Back and Ribs; but, also, by all that Space contained between the Articulations of the two Arms with the Scapulae and Claviculae; and, in this Sense, the Outside of the *Thorax* is broader above than below, in an healthy Subject, who has a moderate Quantity of Flesh on his Bones.

This Breadth of the upper Part of the Breast proceeds from the Pectorales majores, and Latissimi Dorsi, viewed directly forward or backward. But when we take a direct lateral View of the Breast, it appears narrower above than below, not only in an entire Subject, but even after every thing has been removed, that cover the Sides of the *Thorax*, and in the Skeleton itself.

The common Integuments of the *Thorax* are the same with those of the Abdomen; and the convex Side of this Part of the Body is, likewise, covered by several Muscles. Anteriorly we find the Pectorales majores and minores, a large Portion of the Serrati majores, the Subclavi, a Portion of the Scaleni, and of the Obliqui Abdominis Externi: Posteriorly, we have all the Muscles which cover both Sides of the Scapula, the Serrati Postici, and a Part of the Sacro-lumbares, Longissimi Dorsi, Vertebrales, &c. Among all the external Parts of the *Thorax*, only two are peculiar to it in the human Body, I mean the two Eminencies called Mammæ.

The hard Parts which form the Sides of the Cavity of the *Thorax*, are the twelve Vertebrae of the Back, all the Ribs, and the Sternum. The soft Parts, which complete the Sides, are the

Membrane called Pleura, which lines the Cavity, and the Musculi Intercostales, Sterno-costales, and the Diaphragm.

All these hard and soft Parts, taken together, represent a kind of Cage, in some measure of a conical Figure, flatted on the fore Side, depressed on the back Side, and, in a manner, divided into two Nooks, by the Figure of the Vertebrae of the Back, and terminated below by a broad-arched Basis inclined backward. The intercostal Muscles fill up the Interstices betwixt the Ribs, and so complete the Sides of the Cavity: The Basis is the Diaphragm, and the Pleura not only covers the whole inner Surface of the Cavity, but, by forming the Mediastinum, divides it into two, one on the Right Hand, the other on the Left.

For the Breasts, see MAMMÆ.

For the Pleura and Mediastinum, see PLEURA.

For the Thymus, see THYMUS.

For the Heart, see COR.

For the Lungs, see PULMONES.

For the Oesophagus, see OESOPHAGUS.

The Ductus Thoracicus is under the Article CHYLUS. *Winslow*.

Mr. *Monro* tells us, that the Ribs, or Costæ, (as if they were Custodes or Guards to these principal Organs of the animal Machine, the Heart and Lungs) are the long crooked Bones placed at the Side of the Chest in an oblique Direction downwards, with respect of the Back-bone. Their Number is generally twelve on each Side, though frequently eleven, or thirteen, have been found: I never saw fewer or more than the ordinary Number; but in the Skeleton of a Boy about eight Years old, now in my Possession, the fourth and fifth Ribs of the Left Side are grown together at their Roots for near an Inch; and, afterwards dividing, have the same Appearance as the Ribs of the opposite Side, which are naturally formed.

The Ribs are all convex externally, and concave internally, where they are, also, made smooth by the Action of the contain'd Parts, which on this account are in no danger of being hurt by them. The Extremities of the Ribs, next the Vertebrae, are rounder than after these Bones have advanced forwards, when they become flatter and broader, and have a superior and inferior Edge, each of which is made rough by the Action of the intercostal Muscles, inserted into them. These Muscles, being all of near equal Force, and equally stretched in the Interstices of the Ribs, will resist these Bones, having their broken Ends, in a Fracture, removed far out of their natural Places to interrupt the Motion of the vital Organs.

The upper Edge of the Ribs is more obtuse and rounded than the inferior, which is depressed on its internal Side by a long Fossa, for lodging the intercostal Vessels and Nerves. This Channel is not observable, however, at either Extremity of the Ribs; for at the posterior, or Root, the Vessels have not yet reached the Ribs; and, at the anterior Extremity, they are split away into Branches, to serve the Parts between the Ribs; which plainly teaches Surgeons, how much safer it is to perform the Operation of the Empyema, towards the Sides of the *Thorax*, than either near the Back or Breast, tho' there were no other Reasons to determine them in the Choice of the Place, where this Operation should be performed.

At the posterior Extremity of each Rib, a little Head is formed, which is divided by a middle Ridge, into two plain or hollow Surfaces, the inferior of which is the broadest and deepest. The two Plains are joined to the Bodies of two different Vertebrae, and the Ridge forces itself into the intervening Cartilage. A little Way from this Head, we find on the external Surface a small Cavity; where mucilaginous Glands are lodged; and round the Head the Bone appears spongy, where the circular Ligament of the Articulation is fixed. Immediately beyond this, a flattened Tubercle, rises with a small Cavity at, and Roughness round the Root of it, for the Articulation of the Rib, with the transverse Process of the lowest of the two Vertebrae, with the Bodies of which the Head of the Rib is joined. Advancing still a little further on this external Surface, we observe another smaller Tubercle, into which the Tendons of the *Longissimus Dorsi* are inserted. Soon after this the Ribs make a considerable Curve, which some call their Angle; into it the *Sacro-lumbalis* is inserted. Then the Rib begins to turn broad, and continues so to its anterior Extremity, which is hollowed and spongy, for the Reception of, and firm Coalition with, the Cartilage which runs thence to be inserted into the Sternum, or to be joined with some other Cartilages. In Adults, generally, the Cavity at this anterior Extremity of the Ribs, is smooth and polished on its Surface, by which the Articulation of the Cartilage, with it would seem designed for Motion; which, however, is not allowed.

The Substance of the Ribs is spongy, cellular, and only covered with a very thin external lamellated Surface, which is thicker and stronger near the Vertebrae, than at the anterior Extremity.

To each Rib a long, broad, and strong Cartilage is fixed, and reaches thence to the Sternum, or is adjoining to the one next it: This Course, however, of theirs, is not a strait Line with the Rib; for generally the Cartilages make a considerable Curve, the concave Part of which is upwards; therefore, at their Intersection

tion into the Sternum, they make an obtuse Angle above, and an acute one below. These Cartilages are of such a Length, as never to allow the Ribs to come to a right Angle with the Spine, but keep them sinuated so obliquely, as to make a very considerable obtuse Angle above, 'till once a Force superior to the Elasticity of the Cartilages is applied. These Cartilages, as all others, are firmer and harder internally, than they are on their external Surface, and sometimes in old People, according to *Vesalius*, all their middle Substance becomes bony, while a thin cartilaginous Lamella appears externally, tho' the Ossification begins much oftener at the external Surface. The greatest alternate Motions of the Cartilages being made at their great Curvature, that Part, as *Havers* has remarked, remains frequently cartilaginous after all the rest is ossified.

The Ribs are, then, articulated at each Extremity, of which the posterior is doubly joined to the Vertebrae, for the Head is received into the Cavities of two Bodies of the Vertebrae, by a Species of Ginglymus; and the larger Tubercle is articulated to the transverse Process of the inferior Vertebrae, by what is commonly called Arthrodia. As soon as one considers this double Articulation, he must immediately see, that no other Motion can here be allowed than up and down, since the transverse Processes hinder it from being thrust back; the Resistance on the other Side of the Sternum prevents the Ribs coming forward; and each of the two Joints, with the other Parts attached, oppose their turning round: But then 'tis likewise as evident, that even the Motion upwards and downwards can be but small in any one Rib at the Articulation itself, tho' it may be very conspicuous at the anterior Extremity, which moves in a Circle, whose Radius is the Length of the Rib. If, at the same time, we consider, how obliquely the Ribs are situated with respect to the Vertebrae, we must be convinced, that the Ribs cannot be raised without removing farther from the Back-bone; and, as a considerable Resistance is made by the Sternum, to their anterior Extremities, these Bones must, in moving upwards, be, also, turned outwards, as *Winslow* has proved. The anterior End of the Ribs has no proper moveable Articulation, except so far, as the Cartilages between the Sternum and Ribs will yield, on which account, and because of the Resistance, such Ribs as perform large Motions under these Disadvantages, are commonly twisted towards their anterior Extremities.

Hitherto I have laid down the Structure and Connection, which most of the Ribs enjoy, as belonging to all of them; but must now consider the Specialities, wherein any of them, either collectively or singly, may differ from the general Description given, or from each other. In viewing the Ribs from above downwards, their Figure is still straighter, the uppermost being the most crooked of any. Their Obliquity, with respect to the Spine, increases as they descend; so that tho' the Distance of their posterior Extremities from each other is very little different; yet at their anterior Extremities, the Distances between the inferior ones must increase. In consequence, too, of this increased Obliquity of the inferior Ribs, each of the Cartilages of the inferior Ribs make a greater Curve in its Progress from the Rib towards the Sternum; and the Tubercles, which are articulated to the transverse Processes of the Vertebrae, have their smooth Surface gradually facing more upwards. The Ribs becoming thus more oblique, while the Sternum advances forward in its Descent, make the Distance between the Sternum and the anterior Extremity of the lower Ribs greater, than between the Sternum and the superior Ribs; consequently the Cartilages of those Ribs that are joined to the Breast-bone, are longer in the lower ones. These Cartilages are placed nearer to each other, as the Ribs descend, which affords to make the Curvature of the Cartilages greater. The Length of the Ribs increases from the first or uppermost Rib, as far down as the seventh, and from that to the twelfth as gradually diminishes.

The superior of the two plain, or rather hollow Surfaces, by which the Ribs are articulated to the Bodies of the Vertebrae, gradually increases from the first to the fourth Rib, and is diminished after that in each lower Rib; and the Distance of their Angles from the Heads always increases, as they descend to the ninth. This is remarked by *Winslow*.

The Ribs are commonly divided into True and False.

The true Costae are the seven superior of each Side, whose Cartilages are all gradually longer as the Ribs descend, and are joined to the Breast-bone: So that being pressed constantly between two Bones, they are flattened at both Extremities, and are thicker, harder, and more liable to ossify than the other Cartilages, which are not subject to so much pressure. These Ribs include the Heart and Lungs, and therefore are the proper or true Custodes of Life.

The five inferior of each Side are the False, or Bastard, whose Cartilages do not reach the Sternum; and therefore, wanting that Resistance at their anterior Extremity, are there pointed, and, for the same Reason, being less pressed, the Substance of these Cartilages is softer. The Cartilages of these false

Ribs are shorter as the Ribs descend. To all these five Ribs, the circular Edge of the Diaphragm is connected; and its Fibres, instead of being stretched immediately transversely, and so running perpendicular to the Ribs, are pressed so as to be often, especially in Expiration, parallel to the Plan in which the Ribs lie; one may even judge by the Attachments, which these Fibres have so frequently to the Sides of the Thorax, a considerable way above where their Extremities are inserted into the Ribs, and by the Situation of the Viscera, always to be observed in a dead Subject laid supine, that there is constantly a large Concavity, formed on each Side by the Diaphragm, within these bastard Ribs, in which the Stomach, Liver, Spleen, &c. are contained, which, being only reckoned among the Viscera Naturalia, have occasioned the Name of Bastard Custodes to these Bones.

Hence we may easily understand the Justice of *Hippocrates's* Rule, in simple Fractures of the false Ribs, without a Fever, to keep the Stomach moderately filled with Food, lest the pendulous Ribs, falling inwards, should thereby increase the Pain and Cough. The Truth of this Observation *Paré*, after his long Experience, confirms; but it is now-a-days much forgot, or entirely neglected.

The uppermost or first Rib has several proper Specialities, some of them contradictory to any Character yet delivered of the Ribs; for the Figure of it is much more curve, than any of the rest; whence the Name of *articularis retorta*, has been applied to it and the second. The Situation of the first is such, that the flat Sides are superior and inferior, while the Edges are anterior and posterior, or nearly so; therefore sufficient Space is left above it, for the Subclavian Vessels and Muscle; and the broad-concave Surface of it is opposed to the Lungs: But then, in consequence to this Situation, the Chancel for the intercostal Vessels is not to be found, and the Edges are differently formed from all the other, except the second, the lower one being rounded, and the other sharp. The Head of this Rib is not divided into two plain Surfaces by middle Ridge, because it is only articulated with the first Vertebrae of the Thorax. The Cartilage, at the anterior Extremity of the first Costa, is ossified in Adults, and is united to the Sternum at right Angles. Frequently this first Rib has a Ridge, rising near the middle of its posterior Edge, where one of the Heads of the Scalenus Muscle rises; and, nearer to the anterior Extremity, it is flattened, or sometimes depressed by the Clavicle.

The third and fourth Ribs have been distinguished by the Name *sapaei, solidae*; the fifth and sixth, by the Appellation of *sapirides, pectorales*, the seventh and eighth are called *maxillares, distantes*. But it must be acknowledged, there is no great Occasion, or good Reason, for these Names, since these Ribs scarce can claim any thing particular, but what comes under the general Description, or belongs to more than two of them. The fifth, sixth, seventh, or rather the sixth, seventh, eighth, and sometimes fifth, sixth, seventh, eighth, and ninth, Ribs have their Cartilages, at least, contiguous; and frequently they are conjoined by cross Cartilages; and most commonly the Cartilages of the eighth, ninth, and tenth, are connected to the former, and to each other, by firm Ligaments.

The eleventh, and sometimes the tenth, Rib has no Tubercle for its Articulation with the transverse Process of the Vertebrae, to which it is only loosely fixed by a Ligament. The Fossa, in its inferior Edge, is not so deep as in the superior Ribs, because the Vessels run more towards the Interstice between the Ribs. Its anterior Extremity is smaller than its Body, and its short small Cartilage is but loosely connected to the Cartilage of the Rib above.

The twelfth Rib is the shortest and straightest: The Head of it is only articulated with the last Vertebra of the Thorax; therefore it is not divided into two Surfaces. This Rib is not joined to the transverse Process of the Vertebrae, and therefore has no Tubercles, being often pulled necessarily inwards by the Diaphragm, which an Articulation with the transverse Process would not have allowed. The Fossa is not found at its under Edge, because the Vessels run below it. The anterior Extremity of this last Rib is smaller, than its middle, and has only a very small pointed Cartilage fixed to it. To the whole Length of this Rib internally the Diaphragm is connected.

The Ribs are all complete in a new-born Child; only their Cartilages are proportionally longer than in an adult Person.

Here I cannot help remarking the wise Providence of our Creator, in preserving us from perishing, as soon as we come into the World. The Extremities, by which the Bones of the Limbs are articulated, remain in a cartilaginous State after Birth, and are many Years before they are entirely united to the main Body of their several Bones; whereas the Condyles of the occipital Bone, and of the lower Jaw, and the Heads and Tubercles of the Ribs, are true original Processes, and ossified before Birth; and therefore the Weight of the large Head is firmly supported, the Actions of Sucking, Swallowing, Respiration,

ration, &c. which are indispensably necessary for us, as soon as we come into the World, are performed without any Danger of the Parts of the Bones, which are most pressed on in these Motions, being separated; whereas, had these Processes of the Head, Jaw, and Ribs, been Epiphyses at the Birth, Children must have been exposed to an evident Danger of dying, by such a Separation, whose immediate Consequences would be the Compression of the Beginning of the Medulla Spinalis, or want of Food, or of Respiration.

The STERNUM.

The Sternum, or Breast-bone, is the broad flat Bone, or Pile of Bones, at the anterior Part of the Thorax. The Number of Bones this should be divided into, has occasioned Debates among Anatomists, who have considered it in young Subjects of different Ages. In Adults of a middle Age, it is composed of three Bones, which easily separate, after the Cartilages connecting them are destroyed: Frequently the two lower Bones are found intimately united; and very often, in old People, the Sternum is a continued bony Substance, from one End to the other, tho' on the Surface of it we may still observe two, sometimes three transverse Lines, which mark out the former Divisions.

When we consider the Sternum as one Bone, we find it broadest and thickest above, and becoming smaller as it descends: The internal, or posterior Surface of this Bone, is somewhat hollowed for enlarging the Thorax; but the Convexity on the external Surface is not so conspicuous, because the Sides are pressed outwards by the true Ribs, the round Heads of whose Cartilages are received into seven smooth Pits, formed in each Side of the Sternum; and are kept firm there by strong Ligaments, which on the external Surface, have a particular radiated Texture: Frequently the cartilaginous Fibres thrust themselves into the bony Substance of the Sternum, and are joined by a sort of Suture. The Pits at the superior Part of the Sternum are at the greatest Distance one from another, and, as they descend are nearer, so that the two lowest are contiguous.

The Substance of the Breast-bone is cellular, with a very thin external Plate, especially on its internal Surface, where, with *Jac. Sylvius*, we may frequently observe rather a cartilaginous Crust spreads over it. On both Surfaces, however, a strong ligamentous Membrane is closely braced; and the Cells of this Bone are so small, that a considerable Quantity of osseous Fibres must be employed in the Composition of it: Whence, with the Defence the Muscles give it, and the moveable Support it has from the flexible Cartilages, it is sufficiently secured from being broke by any small external Force: For it is strong by its Quantity of Bone; its Parts are kept together by the Ligaments; and it yields enough to elude considerably the Violence offered.

So far in general may be said of this Bone: But, to descend to its particular Description, let us examine the three Bones, which, according to the common Accounts, go to the Composition of it in an Adult.

The first, all agree, is somewhat of the Figure of an Heart, as it is commonly painted; only it does not terminate in a sharp Point. This is the uppermost thickest Part of the Sternum.

The superior, middle Part of this first Bone, where it is thickest, is hollowed, to make place for the Trachea Arteria, tho' this Cavity is principally formed by the Clavicles pressing on one Side, and by the Sterno-mastoidei Muscles pulling the Substance of the Bone above, to both which it yields while it is soft; and therefore is raised into two Tubercles, while the middle is not protruded by such Powers. On the Outside of each Tubercle there is an oblong Cavity, that, in viewing it transversely from before backwards, appears a little convex: Into these *Glenae* the Extremities of the Clavicles are received. Immediately below these, the Sides of this Bone begin to turn thinner; and in each a superficial Cavity, or a rough Surface, is to be seen, where the first Ribs are received or conjoined to the Sternum. In the Side of the under Extremity of this first Bone, half of the Pit for the second Rib on each Side is formed. The superior Part of the posterior Surface is covered with a strong Ligament described by *Weitbreicht* and *Winslow*, which secures the Clavicles.

The second or middle Division of this Bone is much longer, narrower, and thinner, than the first; but, excepting that it is a little narrow above, is pretty equal all over as to its Dimensions of Breadth or Thickness. In the Sides of it are complete Pits for the third, fourth, fifth, and sixth Ribs; and half of the Pits for the second and seventh are formed in it. Near its Middle an unossified Part of the Bone is sometimes found, which, freed of the ligamentous Membrane, or Cartilage, which fills it, is described as an Hole; and in this Place, for the most part, we may observe a transverse Line running, which has made Authors divide this Bone into two. When the Cartilage between this and the first Bone is not ossified, a manifest enough Motion of this upon the first may be observed in Respiration, or in raising the Sternum, by pulling the Ribs upwards in a recent Subject.

The third Bone is by much the least, and has only one half of the Pit for the seventh Rib formed in it; wherefore it might be reckoned only an Appendix of the Sternum. In young Subjects it is always cartilaginous, and is better known by the Name of Cartilago Xiphoides or Ensisformis, than any other, tho' the Antients often called the whole Sternum, Ensisforme, comparing the two first Bones to the Handle, and this Appendix to the Blade of a Sword. This Bone is seldom of the same Figure, Magnitude, or Situation, in any two Subjects; for sometimes it is a plain triangular Bone, with one of the Angles below, and perpendicular to the middle of the superior Side, by which it is connected to the second Bone. At other times the Point is turned to one Side or other, or obliquely forwards or backwards.

Frequently it is all of near an equal Breadth, and in several Subjects the Extremity of it is bifurcated; whence some Writers give it the Name of *Farcella* or *Farcula inferior*; or else it is perforated in the Middle. In the greatest Number of Adults it is ossified, and tipped with a Cartilage; in some it is half or wholly cartilaginous.

So many different ways this small Bone may be constituted without any Inconvenience: But then some of these Positions may be so directed, as to bring on a great Train of ill Consequences; particularly, when the lower Extremity is entirely ossified, and is too much turned outwards or inwards, or when the Conjunction of this Appendix with the second Bone is too weak.

Rolfincius relates the History of an old Man, who could not bend his Body forwards, without a violent pungent Pain from the Ossification and sharp Point of this Bone. *Paaw* assures us, he has seen several Instances of a difficult Breathing from the same Cause; and enumerates several Diseases, such as a *Phthisis pulmonalis*, Obstructions of the Spleen, Liver, or Mesentery, which may depend on too great a Relaxation of this Cartilage; and sometimes this Relaxation may only be a Consequence of these Diseases. *Borrhius* confirms all this by some Examples. But, not to be tedious in relating such Histories, I shall refer you to *Bonetus*, who has several Examples collected; and will direct you to the Writers on this Subject, which in the last Century employed several Pens, tho' it is now much neglected. This Neglect is the more surprising, since the Connection of the Diaphragm here, the Situation of the large Lobe of the Liver, and of the Stomach, and the constant Pressure and Rubbing of our Clothes on this Part; leads us naturally to consider the Effects of a faulty Structure and Situation of this Bone.

The Sternum is joined by Synchronosis to the seven superior Ribs, unless when the first coalesces with it in an intimate Union of Substance; and it is articulated with the Clavicles by a Ginglymus of the second Kind.

The Sternum most frequently has four round small Bones, surrounded with Cartilage, in Children born to the full time; the uppermost of these, which is the first Bone, being the largest by much. Two or three other very small bony Points are, likewise to be seen in several Children. The Number of Bones increases for some Years, and then diminishes, but uncertainly, till they are at last united into those above described of an Adult.

The Uses of this Bone are, to afford Origin and Insertion to several Muscles; to sustain the Mediastinum; to defend the vital Organs, the Heart, and Lungs, at the anterior Part; and, lastly, by serving as a moveable Fulcrum of the Ribs, to assist considerably in Respiration: Which Action, so far as it depends on the Motion of the Bones, we are now at Liberty to explain.

When, then, the Ribs which are connected by their Cartilages to the Sternum, or to the Cartilages of the true Ribs, are acted upon by the intercostal Muscles, they must all be pulled from the oblique Position their Cartilages kept them in, nearer to right Angles with the Vertebrae and Sternum, because the first or uppermost Rib is by much the most fixed of any; and their large arched middle Part, will be turned outwards, to increase the Distance between the Sides of the Thorax, or to widen this Cavity; while, by raising the Ribs nearer to right Angles, the Distance between the parallel Lines, which comprehend their Extremities, is increased: And as the Vertebrae hinder the Ribs from receding back, this whole Increase must be by the Advance of these Extremities forwards. Hence, the intermediate Fulcrum, the Sternum, pressed strongly on both Sides, must be pushed forwards, and that, at its several Parts, in Proportion to the Length and Motion of its Supporters, the Ribs; that is, most at its inferior Extremity; which, thus forced forwards, will, with the Cartilages now in the same manner acted upon, draw the Diaphragm connected to them; consequently so far stretch it, and bring it nearer to a Plain: And the same Power which raises this Bone and Cartilages, will sufficiently fix them, so that they may resist the Action of that Muscle, whose Fibres contract at the same time, and thrust the Viscera of the Abdomen downwards. The arched Part of the Ribs being thus moved outwards, the anterior Extremity of the Ribs, and the Sternum,

Sternum, being advanced forwards, and the Diaphragm being brought nearer to a plain Surface, instead of being greatly convex on each Side, within each Cavity of the Thorax, 'tis evident how considerably the Cavity, of which the nine or ten superior of these Bones are the Sides, must be widened, and made deeper and longer. But while this is doing in the superior Ribs, the inferior, whose Cartilages are not conjoined, perform a very different Office, tho' it conspires to the same Intention, the Enlargement of the Thorax. For as they have no fixed Point, to which their anterior Extremity is fastened, and have the Diaphragm inserted into them, at the Place where that Muscle runs pretty strait upwards from its Origin at the Vertebrae; therefore these Ribs being exposed on the one Side to the direct Action of this strong Muscle, and of the Muscles of the Abdomen, which at this time are resisting the stretching Force of the Bowels, and are drawing these Bones down, while the intercostal Muscles are pulling them upwards, the Effect of either of these Powers, which are Antagonists to each other, is very little as to the moving the Ribs either up, or down. But the Muscles of the Abdomen, being pushed at this time outwards by the Viscera, carry these Ribs along with them; and thus the Thorax is not only to be shortened, but is really widened at its lower Part, to assist in making sufficient Space for the due Distention of the Lungs.

As soon as the Action of these several Muscles ceases, the elastic Cartilages, extending themselves to their natural Situation, depress the superior Ribs, and the Sternum subsides; the Diaphragm is thrust up by the Abdominal Viscera, and raises the inferior Ribs with it, in which it is assisted by any Action their intercostal Muscles have, while the oblique and transverse Muscles of the Belly serve to draw these Ribs inwards, at the same time: From all which the Cavity of the Breast is diminished in all its Dimensions. Thus, then, the Thorax is made wider, deeper, and longer; and is, again, straitened and shortened in a manner not generally so well understood. *Monro's Osteol.*

Disorders of the Thorax, which require the Assistance of Surgery:

- For Fractures of the Ribs; and Clavicles, see FRACTURA.
- For Luxations of the Ribs, and Clavicles, see LUXATIO.
- For Bandages proper for the Breast, see FASCIÆ.

Wounds inflicted in the Thorax, and not penetrating into its Cavities, are known by Sight; by the Probe; by the Impossibility of procuring a Discharge of the Air by any Art; by the Return of any tepid Liquor injected into the Wound; by placing the Patient in the Posture he was in when the Wound was received; and by the sure Signs of an Adhesion of the Lungs to that Part of the Pleura, thro' which the Wound is made.

The Thorax is that Part of the human Trunk, which, before, is terminated by the Sternum; behind, by twelve Vertebrae of the Back; on the Sides, by the arched Ribs; above, by the two superior Ribs; and, below, by the Diaphragm, which separates it from the Abdomen. But as the Thorax forms a kind of arched Vault, which rises in the Middle, and is lower at the Edges, 'tis obvious, that its Cavity must be far greatest towards the hinder or posterior Parts. Internally this whole Cavity is lin'd with an highly smooth Membrane, call'd the Pleura; which, as is shewn under the Article VULNUS, forming, as it were, two hollow Bladders, approaching to each other near the Sternum, divides the Thorax into two equal Cavities. Between these two Portions of the Pleura is situated the Pericardium, with the Heart, which constitutes the third Cavity of the Thorax.

In all Wounds of the Thorax, 'tis first to be inquired, Whether they have penetrated into its Cavities, or not? When the wounding Instrument has perforated the Pleura, or the Pericardium, then the Wound is said to penetrate into the Cavity of the Thorax; but otherwise not. Many Parts, however, may be very dangerously wounded, tho' the Wound does not penetrate into the Cavities of the Thorax; for the Pleura on both Sides, when it reaches to the Sides of the Bodies of the Vertebrae, separates from the last Extremities of the Ribs, and, rising thence, leaves a pretty large Space possessed by the cellular Membrane, thro' which the Oesophagus, the Aorta, and the thoracic Duct, pass. All the Parts, therefore, situated here, may be hurt, tho' the Wound does not penetrate into the Cavities of the Thorax; but 'tis sufficiently obvious, that this can rarely happen, because in the posterior Part the Bodies of the Vertebrae are pretty securely defended. That a Wound has not penetrated into the Cavities of the Breast, may be known from the following Signs.

By the Sight: When, for Instance, the Wound is sufficiently large, and has penetrated in a straight Direction.

By the Probe: For this Purpose, a Probe of Lead, or the softest Silver, is to be introduced, without any Violence, into the Wound. But 'tis sufficiently obvious, that a Change of the Situation of the Body, Fat obstructing the Wound, or a Throm-

bis, may make a Resistance to the Probe, even tho' the Wound has penetrated into the Cavity of the Thorax.

By the Impossibility of procuring a Discharge of Air by any Art; Under the Article VULNUS, 'tis shewn, that so long as the Cavity of the Thorax is close and entire, the Lungs are always exactly contiguous to the Pleura, and that there is no Air lodg'd between them; but when a wounding Instrument has penetrated the Pleura, the Air can enter, the Lungs on that Side, collapse, and the empty Space, form'd by that means, is fill'd by the Air that enters. And this Air, when rarefied by the Heat, will, again, in some measure, be discharg'd thro' the Wound, whilst fresh Air enters, and thus it goes and returns thro' the Wound; especially, if the Wound of the Pleura is not too large; for, in this Case, some Dilatation of the Lungs may be still produc'd by the Air, which is convey'd to them thro' the Glottis, as is shewn under the Article VULNUS. In Wounds of the Thorax, skilful Surgeons examine whether the Air is impetuously convey'd thro' the Wound, in the following manner: After they have, with their Thumb, or Fingers, so compressed the Lips of the Wound, that no Air can either get in or out, they order the Patient strongly to inspire the Air, and retain it in the Lungs, by closing the Larynx; then, before the Patient performs Expiration, the Surgeon places a small lighted Candle near the Wound, and suddenly separates the Lips of the Wound; in which Case, if any Air has enter'd the Cavity of the Thorax, it will be impetuously discharg'd from the Wound, so as sensibly to act on the Flame of the Candle; for when Air, in consequence of a Wound of the Pleura, is lodg'd in the Cavity of the Breast, when the Wound is clos'd, this Air will be rarefied by the Heat of the Body. If at the same time, by a strong Inspiration, the Lungs on that Side can be still but a little dilated, the Air retain'd in the Lungs by closing the Glottis, being rarefied, will expand the Lungs: Hence the Air, receiv'd into the Cavity of the Thorax, will be more press'd upon; and therefore, upon opening the Wound, be discharg'd impetuously, and with an hissing Noise. 'Tis sufficiently obvious, if the Air is thus discharg'd from such a Wound, that 'it has penetrated into the Cavity of the Thorax: It may, however, happen, that a Perforation of the Thorax is made, and yet no Air enter its Cavities; when, for Instance, Fat, especially after a Change of Situation in the Body, immediately fills up the Passage made by the wounding Instrument; or, when a little Air has enter'd in this manner, it cannot, for the same Cause, be easily discharg'd again: And this principally happens, when the Wound is small.

By the Return of any tepid Liquor injected into the Wound:

This Method seems, of all others, the most safe and infallible; for a Search made with the Probe may often prove fallacious, since sometimes by a Change of Posture in the Body, especially in fat Persons, the cellular Membrane obstructs the Probe, and hinders it from reaching to the Bottom of the Wound. Sometimes, also, the Probe may be introduc'd a great Way, and yet not penetrate into the Cavity of the Thorax; when, for Instance, the wounding Instrument, by means of the Fat, has pass'd along the Ribs, as is certain from chirurgical Observations. Thus, in fighting a Duel, a certain Student had his Antagonist's Sword pass'd into the Right Side of his Thorax, so far that its Point wounded the Left Side, without penetrating into the Cavity of the Breast, but only passing along the Ribs. Tepid Water is gently to be injected into the Wound, by means of a Syringe; and if a considerable Quantity of Water may be thus injected without Resistance, and if there is no Tumor in the adjacent Parts, produc'd by the Water collected in the *Membrana Cellulosa*, we then know, that the Water is convey'd thro' the Wound into the Cavity of the Thorax; but if there is a great Resistance, and the Water immediately returns thro' the Orifice of the Wound, we know, that it has not penetrated into the Cavity of the Thorax. Nor is any Harm to be dreaded from a Conveyance of the tepid Water into the Cavity of the Breast; since it may be easily evacuated again by a proper Posture of the Body, or other Measures, to be afterwards specified. And tho' the Water should even be left in the Cavity of the Breast, it will be resorb'd by the bibulous venous Vessels, distributed thro' all the internal Surface of the Thorax, and the Surface of the Lungs. That Fluids, contain'd in the Cavity of the Thorax, have been frequently dissipated in this manner, is certain from chirurgical Observations. In an Empyema, it has been found, that the Pus has been resorb'd by Expectoration, Stool, and Urine; and, also, that the Pus entering the Veins, and mixing with the Blood; has been, by a Translocation, convey'd to various Parts of the Body. *Paré*, in the tenth Chapter of his Works, informs us, that when he injected a bitter Liquor into the Cavity of the Thorax, in order to deterge the Parts from the extravasated and corrupted Blood, he was surpris'd to find his Patient complain of a violent Sense of Bitterness, and an Inclination to vomit; for which Reason he afterwards abstain'd from that Practice.

By placing the Patient in the Posture he was in when the Wound was receiv'd: Under the Article VULNUS, 'tis observ'd, of

of how great Importance it is in determining the Nature of Wounds, and forming Prognostics of the Misfortunes to be dreaded from them, to know the Posture of the Body at the time the Wound was received; for it would often be impossible to trace the Way of the wounding Instrument, unless the Patient was put in the same Posture with that he was in when wounded; for the various Actions of the Muscles may surprisingly change the Situation of the Parts, as *Eustachius* has beautifully shewn in his *Tabula Anatomica*; for, in the thirtieth Plate of that Work, he represents the Right Arm elevated, and the Elbow bended; and the Left Arm stretched downwards, with the Elbow unbended; so that, upon comparing the Right, with the Left Side of the Thorax, there appears a considerable Difference in the Situation of the Parts. And, lastly,

By the certain Signs of the Adhesion of the Lungs to that Part of the Pleura where the Wound is made: As the Lungs, both in Inspiration and Expiration, are always contiguous to the Pleura, as is certain from Physiology, yet they are naturally free in the Cavity of the Breast, adhering only by their Air-vessels to the *Aspera Arteria*, and by their Blood-vessels to the Heart, but nowhere else. The principal Cause why these Parts do not grow together, seems to be, that the small arterial Vessels of the Lungs and Pleura always exhale a fine subtil Dew, which hinders the Adhesion of the Lungs to the Pleura. This is beautifully expressed by *Hippocrates*, who, in his *Treatise de Arte*, Cap. 8. informs us, "that every Part of the human Body, not concrete, or adhering to another, whether covered with Skin, or whether its Surface is fleshy, is filled with Air, if sound; but with Ichor, if unsound and infirm." But when, in consequence of an Inflammation, the large Vessels are so distended, as to compress these small Vessels to that degree, that they cannot exhale their highly fine and subtil Fluid, the dry Surfaces of the Parts pretty soon grow together. Hence it is, that after Pleurifies, Peripneumonies, and Empyemas, the Lungs are so often found adhering to the Pleura. If it is, therefore, obvious, that the Patient has formerly been afflicted with these Disorders, the Surgeon is carefully to advert to such a Circumstance; for, if the Wound is inflicted in the Part where the Lungs adhere to the Pleura, the wounding Instrument may penetrate the Substance of the Lungs, without entering the Cavity of the Breast. This may be known to be the State of the Patient, when Water, injected into the Wound, excites a gentle Cough, and is thrown up through the *Aspera Arteria*; for then the Wound has penetrated into the Lungs, but not into the Cavity of the Thorax.

These are the Signs by which Surgeons generally conclude, that Wounds have only injured the external Parts, but not penetrated into the Cavity of the Breast. But it may sometimes happen, that all these Circumstances, tho' ever so carefully adverted to, may yet prove fallacious, especially if the Wound is inflicted with a very small Instrument; for, in this Case, upon withdrawing the Instrument, the Fat may so obstruct the Wound, that neither the Air, the Probe, nor warm Water, can enter; and yet the hurt pulmonary Vessels may discharge Blood into the Cavity of the Thorax. Hence the Surgeon is to consider, whether the Respiration is injured; for if the Cavity of the Thorax is lessened and oppressed, either by the Air that enters, or by extravasated Blood, the Respiration will always be difficult; and if this Symptom is observed after Wounds of the Breast, it always seems to indicate, that the Wound, tho' it should appear by no other Signs, has penetrated into the Cavity of the Thorax. Physicians, therefore, and Surgeons, ought to take care not to lose their Reputations, by looking on the smallest Wounds as inconsiderable, and void of Danger.

If Wounds of the Thorax descend obliquely upon or within the Ribs, the Pleura being, by this means, frequently corroded, they deposit Pus in the Cavity of the Thorax, especially if the Passage of the Pus to the external Parts is by any Cause obstructed. In this Case an Empyema is formed, and many Misfortunes produced.

Tho' 'tis certain, that a Wound has not penetrated into the Cavities of the Breast, yet many terrible Misfortunes may arise from it; for if the Condition of a Wound is such, that its Orifice is placed in a superior Part, whilst, at the same time, it descends pretty deep among the Muscles, the extravasated Humours will be here collected, become acrid by their Stagnation and Continuance, form various Sinuses, and at last, may, in consequence of a Corrosion of the Pleura, fall into the Cavity of the Breast. The collected Pus will daily fall from such a sinuous Ulcer; the Quantity of Fluids contained in the Cavity of the Thorax will be augmented; an Empyema will be formed; and the Lungs, being macerated in Pus, which daily becomes more acrid, will be consumed. Hence, a most insupportable Train of Miseries is succeeded by Death. These Misfortunes are most dangerous and troublesome, when such fistulous Cavities descend behind the Ribs; for then there is scarcely any Room left either for Dilatation, or Compression. Besides, if the bony or cartilaginous Substances of the Sternum and Breast are injured, many Misfortunes may arise from such a Circumstance; and the Cure will

be highly difficult, as is obvious from what is said under the Article Os. *Galen*, in *Treat. de Anatom. Administ. Lib. 7. Cap. 13.* confirms this by a memorable Instance. In the *Palestra*, a Boy receiving a Blow on the Sternum, was, at first, neglected, and afterwards not well cured. Four Months after, Pus appeared in the Part where he received the Blow; a Surgeon made an Incision in the Place; and, as he thought, brought it soon enough to a Cicatrix. Afterwards, a fresh Inflammation arising, a second Incision was made, nor could the Wound any more be brought to a Cicatrix. After this, *Galen*, and several other Physicians, being called, found the Bone of the Sternum carious; and when all refused to attempt the Cure, *Galen* cut out the corrupted Part of the Sternum, found Part of the subjacent Pericardium putrid, and saw the naked Heart; and yet the Boy was recovered in a short time. And *Galen* himself, in the Beginning of his first Book *de Placitis Hippocratis & Platonis*, seems to speak of this Case, when he tells us, that in a Boy he saw the Heart as distinctly, as in Animals dissected for that Purpose; and he adds, that this Boy recovered. But such Misfortunes are most of all to be dreaded, when either by the Situation of the Wound, or preposterous Measures, the Passage of the Pus to the external Parts is hindered.

Hence, in the Cure of Wounds of the Thorax, we are to abstain from all Tents, emplastick Substances, and Compression; and are, on the contrary, to use depurating and balsamic Substances, Pledgets, slight Bandage, and a proper Posture of the Body.

Since, in Wounds of the Thorax, so many terrible Misfortunes may arise from the extravasated Humours retained in their Cavities, and frequently making new Ways to themselves through the *Membrana Cellulosa*, 'tis sufficiently obvious, that a free Discharge of them ought to be procured. It was once the Custom of almost all Surgeons, to put Tents into most Wounds, especially those of the Thorax, in order to prevent the sudden Consolidation of the Orifice of the Wound, before its internal Parts are grown together; that there might be a free Discharge for the heterogeneous Bodies left in the Wound, and that vulnerable Remedies might have the freer Access to the Bottom of the Wound. *Belloste*, to whom we owe the beautiful Invention of making small Perforations in the Bones stript of their *Periosteum* mentioned in the Article CAPUT, in his *Hospital Surgeon*, opposes this Practice; and by solid Arguments demonstrates, that the Use of Tents is pernicious, especially in Wounds of the Thorax; and shews from Instances, that Experience has confirmed the Truth of his Arguments: For Tents, prepared of folded Lint, or any other similar Substance, and put into the Orifice of a Wound, become tumid, by absorbing the extravasated Humours; and are soon expelled, unless secured by an adhesive Plaster, or a Bandage. But if they are so secured that they cannot be expelled, becoming tumid, they, by a slow Dilaceration, dilate the Orifice of the Wound, with great Pain and Irritation of the Parts. At the same time, by blocking up the Orifice of the Wound, they hinder the Evacuation of the Pus, and other discharged Liquors, which will, therefore, find new Ways for themselves, and are capable of converting the Wound into a malignant sinuous Ulcer; or perhaps, when the Pleura is corroded, they may fall into the Cavities of the Thorax, a new Source of terrible Misfortunes. Besides, every Moment the Capacity of the Thorax is changed, since, in the mildest Respiration, the Ribs, and the Muscles affix'd to them, move. Hence such a Wound is never at Rest, and there is a continual Friction of its Lips on the Tent. Hence Pain, Inflammation, and at last, a Callosity, is produced in the Lips of the Wound; which Callosity must be afterwards remov'd, before a Consolidation can be obtained. Hence 'tis sufficiently obvious, that in Wounds of the Thorax, no Good is to be expected from the Use of Tents. Perhaps the only Case in which they are proper is, when the Orifice of the Wound, being too small, ought to be dilated; though, as is observed under the Article VULNUS, this is more easily done by the Knife. And if Tents are to be used for this Purpose, they ought only to be applied for a Day or two, and not thro' the whole Course of the Cure. Besides, as is observed under the last-mentioned Article, a Tent of Sponge duly prepared, and put into the Orifice of a Wound, is, in a few Hours, capable of making a very considerable Dilatation. For the same Reason 'tis obvious, why the most tenacious and adhesive Plaisters are injurious in Cases of this Nature, because they hinder the free Discharge of the Humours from the Wound. 'Tis, therefore, most expedient, in Wounds of the Thorax, to apply plain Pledgets, covered with vulnerary Balsam, or the softest Digestives, according to the Condition of the Wound. Over such Pledgets we are to apply a Plaster, which is not very tenacious, and cut into many small Holes; over this we may apply a proper Bandage, if it is thought necessary; observing this Caution, that by Bolsters, or some other Expedient, we hinder the Bandage from compressing the Aperture of the Wound, and by that means preventing the Discharge of the extravasated Humours.

Hippocrates, in *Coac. Praenot.* N° 430. observes, "that those who have the external Part of a Wound of the Thorax cured, and

“ and not its internal Part, are in Danger of having an Empyema formed; and if a weak Cicatrix is formed in the internal Part, it is easily broken.” Hence ’tis obvious, that great Care ought to be taken, that the internal Surface of the Wound should be consolidated, before its external Orifice is brought to a Cicatrix. Hence some may possibly conclude, that Tents would be beneficial in hindering the Concretion of the external Orifice of the Wound. But if we consider, that a Tent so blocks up the Wound, that the Pus cannot be discharged, it will be obvious, that it hinders the Concretion of the internal Parts of the Wound, since the Pus retained in the Wound, prevents the Contact of the Parts which ought to be united, and, being increased in Quantity, makes new Ways for itself, by which means the Surface of the internal Wound is enlarged. That Hippocrates condemned the Use of Tents, is certain from another memorable Passage of that Author, who, in *Traët. de Morbis, Lib. 1. Cap. 9.* tells us, “ that in those who have an Empyema formed, by Wounds of the Thorax, inflicted either by a Spear, Dagger, or Dart, so long as the Matter of the Ulcer is discharged externally by the original Wound, then the Pus is easily evacuated; and, if the internal and external Parts are healed together, the Patient is restored to Health. But if the external Part is healed, but not the internal, the Patient has an Empyema formed. But if both the internal and external Parts are healed together, and the Cicatrix within remains weak, rough, and livid, the Ulcer sometimes recurs, and the Patient is seized with an Empyema.”

From this Passage ’tis sufficiently obvious, that an equable and firm Consolidation of the internal and external Parts of the Wound ought not to be attempted by Tents; but by such a Posture of the Body, that the Fluids, contained in the Cavity of the Wound, may, by their own Weight, fall to the external Aperture of the Wound; and when the Bottom of the Wound is lower than its Orifice, and when this Misfortune cannot be corrected by the Posture of the Patient, then by Compresses applied to the Bottom of the Wound, and proper Bandage, the Humours are to be forced to its Orifice; and thus, by expelling the Fluids, the Parts in the Bottom of the Wound, being brought into Contact, easily grow together. The Pus, in the mean time, continually discharg’d from the Orifice of the Wound, will hinder it from closing, before the internal Parts are healed. But if the internal Surface of the Wound, being fordid, requires Depuration before a Consolidation can be expected, then the Remedies specified under the Article VULNUS for that Purpose, are to be used, and their Use is to be persisted in, till the Pus discharged is white, mild, viscid, smooth, equal, and without Smell. Then, by a gentle and gradual Compression from the Bottom to the Orifice of the Wound, its Consolidation is to be attempted.

That a Wound has penetrated into the Cavity of the Breast, may be known, first, by comparing the Cause with the Largeness of the Wound; secondly, by means of a Probe, after the Body is reduced to the same Posture in which the Patient received the Wound; thirdly, by a strong Inspiration of Air into the Lungs, whilst the Wound is clos’d, upon which, if the Mouth and Nostrils are shut, and the Wound suddenly uncovered, the Air in the Cavity of the Breast is discharged from the Wound, and frequently with a Noise; fourthly, by Injection; fifthly, by an Emphysema, when the Air, contained in the Cavity of the Breast, being continually increased by the Action of the wounded Lungs, rarefied, compressed by Inspiration, hinder’d from a free Evacuation thro’ the Wound, and at the Lips of the Wound forced into the cellular Membrane, occasions frequently, that the whole Body is raised into a livid, smooth Tumor, which renders him eleven Inches larger; but this Tumor does not affect the Soles of the Feet, and the Palms of the Hands; see *Acad. Reg. Sc. 1713. Hist.* where we have an Account of a mortal Emphysema, from a Fracture of the Ribs, without any Injury done to the Skin; and, sixthly, from a Discharge of frothy Blood.

Great Caution is requisite in determining, whether a Wound has penetrated into the Cavity of the Thorax, or not; for the Cavity of the Thorax, before, ascends much higher than in the posterior Parts. Hence shameful Errors have happened, when Wounds were thought to penetrate into the Cavity of the Thorax, whilst they only pass’d into that of the Abdomen. Of this we have a memorable Instance in Mr. *Ruyssch’s Observationum Anatom. Chirurg. Centur. Observat. 65.* from which Observation, ’tis certain, that the Situation and Disposition of the Diaphragm ought to be duly known, in order to determine, whether a Wound has penetrated into the Cavity of the Thorax, or not.

But Wounds may penetrate into the Cavity of the Thorax, when, being inflicted on the Abdomen, they pass thro’ the Diaphragm; but of this there are no certain Signs, since such Misfortunes are generally only discovered after the Death of the Patient; Instances of this are specified under the Article VULNUS. Or Wounds perforating the Thorax, properly so called, pass into its Cavities: These we are here treating of, and they may be known by the following Signs.

1. By comparing the Cause with the Largeness of the Wound: As almost all Instruments, with which Wounds are inflicted by Puncture, are of a conical Figure, ’tis sufficiently obvious, that the Largeness of the Wound, compared with the wounding Instrument, may inform us how far such an Instrument has penetrated. But this Sign may prove fallacious, if the Wound is among the Muscles upon the Ribs; for in this Case a great Part of the Instrument may penetrate into the Muscles, without entering into the Cavity of the Thorax.

2. By means of a Probe, after the Body is reduced to the Posture in which the Patient received the Wound: This Sign we have already considered both in this Article, and under the Article VULNUS, where ’tis shewn, that, by a Change of Posture, the Muscles change their Situation, and the Fat pressed into the Wound may easily obstruct the Probe.

3. By a strong Inspiration of the Air into the Lungs, whilst the Wound is closed: We have already, in the Beginning of this Article, considered this Sign; but in making such a Trial, we are to take care, that the Air do not enter the Cavity of the Thorax; for when the Lips of the Wound are separated, and the Thorax dilated by Inspiration, the Air may easily enter, tho’ it had not before found a Passage; for in fat Persons, when a Wound penetrates into the Cavity of the Thorax, the Fat, upon withdrawing the Instrument, so blocks up the Wound, that the Air cannot enter. Hence, when an Attempt is made this way, the Lips of the Wound are carefully to be compressed; then the Patient is to retain the Breath drawn in by a strong Inspiration; then, closing his Mouth and Nostrils, he is to make a strong Effort of Expiration; then the retained Air, expanded by the Heat, will violently dilate the Lungs. Hence they will compress the Air between the Pleura and the Lungs, which is, also, rarefied by the Heat of the Place; then, uncovering the Wound, there is no Fear, that the Air will, thro’ the external Wound, enter the Cavity of the Thorax, because the distended Lungs will be everywhere apply’d to the Pleura, if there is already no Air in the Cavity of the Breast: But if any Portion of Air has already entered, this Air, rarefied by the Heat, and pressed upon by the dilated Lungs, will be more than a Balance for the Pressure of the external Atmosphere, and be discharged imperiously from the Wound. But if the Wound is such, that there is a free Ingress of the Air into the Cavity of the Thorax, and is not, at the same time, much larger than the Aperture of the Glottis, see VULNUS, the Air will go and come thro’ the Aperture of the Wound, with a manifest Hissing.

4. By Injection: We have already treated of this Sign.

5. By an Emphysema: Under the Article CAPUT, this surprising Symptom is said sometimes to succeed Wounds of the Head; but happens far more frequently in Wounds of the Breast, which penetrate into the Cavity of the Thorax; in which Case the Emphysema may, in a short time, be diffused over all the Body; for when Air enters the Cavity of the Thorax through the Wound, and when the external Aperture is clos’d up by adhesive Plaisters, or Fat, the Air, rarefied by the Heat of the Place, often makes a Way for it self thro’ the Membrana Adiposa. But large Tumors of this Kind are most frequently produced, if the Air-vessels of the Lungs, injured by the Wound, have deposited the inspired Air in the Cavities of the Breast; for, in this Case, the Disorder is every Moment increased. In the Works of *Ambrose Paré, Lib. 10.* and in the Memoirs of the *Acad. des Sciences*, for the Year 1713, there are Instances which sufficiently confirm, that Emphysemas frequently succeed Wounds of the Breast, especially if the Wound admits Air into the Cavity of the Thorax, whilst, at the same time, the free Egress of the Air is by any means obstructed. But ’tis certain, from such Observations, that the largest Tumors of this Kind are formed, if the Lungs, being wounded, convey the inspired Air into the Cavity of the Breast, especially when there is not a great Hæmorrhage; for when there is, the Blood, falling into the Cavity of the Thorax, and filling it, prevents such an Accumulation of Air in the Cavity of the Breast, as is sufficient for inflating the whole Body. Hence, also, appears the Reason, why, if a Wound of the Thorax is suddenly succeeded by such an Emphysema, we may justly conclude, that it has penetrated into the Cavity of the Thorax. And,

6. By a Discharge of frothy Blood. This is a certain Sign that the Lungs are wounded; for when the Blood-vessels of the Lungs are wounded, the Blood, flowing out of them, and mixing with the Air of the Air-vessels of the Lungs, froths. Hence, in such a Case, the Patient either expectorates a frothy Blood through the Aspera Arteria, or such a Blood is copiously discharged. But the Lungs cannot be hurt, unless the wounding Instrument has penetrated into the Cavity of the Thorax, except the Lungs adhere to the Pleura in that Part where the Wound is inflicted, as is already observed. *Virgil*, in his *Æneid. Lib. 9.* has beautifully painted this Case, when he describes *Antiphates* as wounded by *Turnus*.

— volat Itala Cornu

Aera per tenerum, Stomachoque infixæ sub altrum
Pectus abit: reddit Specus arri Vulneris Undam
Spumantem, & fixo ferrum in Pulmone sepefcit.

For the same Reason, if in any Disorder a frothy Blood is expectorated, we conclude that it comes from the Lungs.

The Effects of such Wounds are frequently, first, a Pressure of the Air, which has entered upon the Lungs, which are, by that means, rendered unfit for carrying on Respiration, and the Circulation of the Blood; secondly, an Effusion and Accumulation of Blood in the Thorax; thirdly, a Putrefaction of the extravasated, heated, moved, and every way pent up Blood; fourthly, hence a Maceration, Corrosion, Corruption, and *Fætor* of the Pleura, Lungs, Mediastinum, Diaphragm, and Pericardium; fifthly, an infinite Number of Diseases arising from these Circumstances; and, sixthly, a Spitting of Blood.

In this Paragraph are enumerated the Misfortunes, sometimes, observed to succeed Wounds penetrating the Cavity of the Thorax; all which principally depend either on the Admission of the Air, or an Extravasation of the Humours.

1. *As for the Pressure of the Air, which has entered upon the Lungs*, under the Article *VULNUS*, 'tis shewn, that, in a sound Person, there is naturally no Air between the Lungs, and Pleura; and that this Circumstance was requisite, that the Lungs when the Breast is dilated, might be distended by the Air, which enters by the Glottis. Hence, as soon as, by a Wound of the Thorax, the Air is admitted into the Cavity of the Breast, the free Expansion of the Lungs is hindered, and, in large Wounds, totally destroyed. Under the last-quoted Article, 'tis, also, shewn how far, and under what Limitation, this is true; for if the Air can enter very freely into the Wound, the Lungs cannot be dilated at all. If thro' a smaller Wound, a less Quantity of Air enters, than that convey'd thro' the Aperture of the Glottis, there will be some Expansion of the Lungs, tho' not so great as in a natural State. *Galen*, in his *Treatise de Anatom. Administrat. Lib. 8. Cap. 3.* has beautifully expressed this in the following manner: "Now it is evident, that, in Inspiration by the Mouth of an Animal, so much is defeated or lost, by means of the Wound, as is equal to the Quantity of the circumambient Air, which flows into the Thorax thro' the Wound, instead of Inspiration by the Mouth; and that the less is drawn in by Inspiration, the less must, also, be discharged in Expiration; and the more the Expiration is decreased, the shorter the Voice must of course be." If the Air, convey'd into the Cavity of the Breast, cannot again, by whatever Cause, be discharged, thro' the Wound, this Air, being rarefied by the Heat, will be expanded, and, by strongly compressing the Lungs, hinder Inspiration, and the Dilatation of the Lungs by that means; which, after we are brought into the World, is requisite, that the Blood expelled from the Right Ventricle of the Heart, may pass freely thro' the narrowest Parts of the pulmonary Artery. The Reason of all these Circumstances is easily deduced from a Knowledge of the Properties of the Air, and those Things which in Physiology are shewn to be necessary to Respiration, and a free Circulation of the Blood thro' the Vessels of the Lungs.

2. *As for the Effusion and Accumulation of Blood in the Thorax*; if, for Instance, the intercostal Arteries are injur'd, a large Quantity of Blood may be collected in the Thorax; for the adjacent Heart, with great Force, throws the Blood into these Arteries. The Motion of the Thorax, in Respiration, hinders these wounded Arteries from remaining in a State of Rest, and being soon contracted. Now, if the Blood-vessels of the Lungs should be cut, 'tis sufficiently obvious, that a large Quantity of Blood must suddenly be accumulated; but if the large Blood-vessels, running from the Heart, should be wounded, Death would soon ensue. The Blood thus poured out from the Vessels, unless discharged thro' the external Aperture of the Wound, will be collected in the Cavity of the Thorax, and hinder the free Dilatation of the Lungs. Hence a violent Uneasiness and Impediment of Respiration will be produced.

3. *As for the Putrefaction of the extravasated Blood*; the Blood, thus extravasated, is lodged in a Part which is warm, moist, and continually moved by Respiration. Hence it must easily degenerate into a putrid Corruption; especially since, thro' Wounds penetrating into the Cavity of the Thorax, the Air almost continually enters; as, also, if the Air-vessels of the Lungs, being wounded, convey the inspired Air into the Cavity of the Breast, Chirurgical Observations sufficiently evince, that such extravasated Blood soon becomes putrid. Thus *Hippocrates*, in his *Treatise de Morbis, Cap. 2.* informs us, "that Blood, flowing from a Wound or Vein into the Thorax, must necessarily become corrupted."

4. *As for the Maceration of the Pleura, Lungs, Mediastinum, and Diaphragm*; the sudden Corruption of the extravasated Blood will every Moment be increased; for in these Parts there is a violent Heat, on account of the Vicinity of the vital Viscera: Hence the Blood will be changed into an highly putrid Ichor. The Lungs situated in this gangrenous corrupted Liquor will be macerated, and rendered putrid: So, also, will the Pericardium, Pleura, and other Parts mentioned. 'Tis shewn, in the preceding Paragraph, that Blood thus extravasated may be soon corrupted; and 'tis certain from Experience, that it is capable of acquiring

the greatest Degree of Corruption. Instances confirming this are found in *Scultet. Armament. Chirurg. Observ. 43. ibid. Obs. 50.* and in *Hildani Observat. Chirurg. Centur. 2. Observ. 27.*

As for the infinite Number of Disorders arising from these Circumstances; the extravasated Humours may, by compressing, or, if they have acquired a putrid Acrimony, by corroding, disturb, or even abolish, all the Functions of the Viscera situated here. Hence may arise violent Dyspnoeas, excessive Palpitations of the Heart, intolerable Anxieties, Inflammations, Exulcerations, and Gangrenes of these Parts. The extravasated Blood, also, by the Heat and Length of Time becoming putrid and attenuated, may be reformed by the bibulous Veins on the Surface of these Parts, mixed with the Blood, and induce a malignant Cacochymy. Hence arise acute putrid Fevers, surprising Translations of the putrid Matter to other Parts of the Body, a Phthisis, an Atrophy, and Death. Hence we justly conclude, that numberless Diseases, even of the worst Kind, may arise from an Extravasation of the Humours in the Cavity of the Thorax.

As for a Spitting of Blood; if, immediately after the Infliction of the Wound, Blood is spit, 'tis a Sign, that the Lungs are wounded, especially if the Blood is frothy. Hence, if the Vessels of the Lungs are wounded, the Blood may fall down into the Cavity of the Breast, unless the Lungs adhere to the Pleura in that Part where the Wound was inflicted. If, a few Days after the Infliction of the Wound, a bloody Matter is expectorated, this may happen, because the extravasated Blood, being, by the Heat and Length of Time attenuated, may be reformed by the Vessels of the Lungs. How this happens, we shall not pretend to determine: 'Tis, however, certain, that an Empyema has been cured by an Expectoration of purulent Spit. In a true Pleurisy, yellow Spit, mixed with bloody Streaks, has been often observed to remove the Disorder, as is certain from practical Observations. Hence 'tis obvious, that Blood extravasated in the Cavity of the Thorax may produce a Spitting of Blood.

The Signs of Blood extravasated in the Cavity of the Thorax are, first, an Orthopnoea; secondly, the Patient's lying most commodiously on his Back, with Difficulty on the wounded Side, and the absolute Impossibility of his lying on the sound Side; thirdly, the Consequences already said to attend such a Wound; fourthly, a Weight in the Septrum; fifthly, the Fluctuation of Matter; sixthly, the Nature and Situation of the Wound inflicted; seventhly, the great Weakness of the Patient, accompanied with Paleness, and a cold Sweat; and, eighthly, the continual Increase of almost all the Symptoms.

After it is determined, that a Wound has penetrated into the Cavity of the Thorax, it is next, with equal Care and Accuracy, to be examined, whether, in consequence of an Aperture of the Vessels, there is not a considerable Quantity of extravasated Blood, lodged in the Cavity of the Thorax. Nor is it always easy to determine this, since many of the Signs, to be afterwards specified, may prove fallacious: Hence a Concurrence of many of them is requisite to establish any thing certain in this Case. But that much Harm may be done by the Physician's or Surgeon's Error, in the Diagnostic, is sufficiently obvious, since the extravasated Blood ought to be evacuated either by the Wound already made, or by making a new Aperture. But if this is attempted, when there is no Blood in the Cavity of the Breast, the Air, which, in this Case, is always injurious, is admitted, and the Wound is irritated. Hence all Circumstances ought to be carefully adverted to, lest the Patient should be exposed to unnecessary Pain, and the Reputation of the Physician endangered.

As for an Orthopnoea; this is a difficult and snorting Respiration, which can only be performed with the Neck and Thorax in an erect Posture; and which always denotes, that the free Expansion of the Lungs, by the inspired Air, is hindered, by whatever Cause this happens. But as the Blood, extravasated in the Cavity of the Thorax, possesses that Space which the dilated Lungs ought to fill, 'tis sufficiently obvious, that a difficult Respiration must arise from such a Circumstance. But when the Patient remains in an erect Posture, the Diaphragm is, by the Weight of the extravasated Blood, depressed, and the Cavity of the Thorax by that means enlarged. Hence at that time there may happen some Expansion of the Lungs, at least a greater than in any other Posture of the Body. But this Sign, considered by itself, may prove fallacious; for the Air entering the Cavity of the Breast, and hindering the free Expansion of the Lungs, may produce an Orthopnoea. A spasmodic Constriction of the Lungs in asthmatic Patients, also, produces the same Disorder.

2. *As for the Patient's lying most commodiously on his Back*; this Sign is of great Importance; for the Diaphragm, descending very far towards the posterior Parts of the Body, greatly increases the Capacity of the Thorax. Hence the Blood extravasated in the Cavity of the Thorax, when the Patient lies on his Back, spontaneously falls to the inferior and posterior Parts of the Thorax, and that Part of the Diaphragm is more easily pressed downwards; for the middle and tendinous Part of the Diaphragm, to which the Pericardium adheres by a broad Basis, cannot be easily depressed, as is observed under the Article *VULNUS*.

Hence 'tis obvious, that, in this Posture, the extravasated Blood is most commodiously disposed of. Whilst the Patient lies on the wounded Side, that Posture is more uneasy, tho' still tolerable; but if he lies on the sound Side, the extravasated Blood will press the Mediastinum and Pericardium towards the other Cavity of the Breast: Hence its Capacity will be diminished, and the Difficulty of Respiration increased, which when the Patient perceives, he is forced to change the Posture of his Body, for fear of a Suffocation.

3. *As for the Consequences already described in the preceding Paragraph*; these principally depend on the Corruption of the extravasated Blood, and the Taint communicated to the Viscera, by such a putrid Gore. Hence, by the Signs, the Pressure of extravasated Blood is known, but often too late.

4. *As for the Weight perceived in the Diaphragm*; when the Patient is in an erect Posture, the extravasated Blood, by its Weight, presses the Diaphragm downwards. Hence a Sense of the incumbent Weight is perceived, and a Pain produced about those Parts to which the Diaphragm adheres. In consequence of the Depression of the Diaphragm, there, also, appears a Tumor of the Abdomen on the Side affected. Hence in an Empyema, sometimes the Diaphragm depressed, and gradually moved, and more distended by the collected Pus, renders the Abdomen so protuberant, that the Disorder resembles that Species of Dropsy, called *Ascites*.

5. *As for the Fluctuation of the peccant Matter*; when there is a Suspicion, that Pus is lodged in the Cavities of the Breast, *Hippocrates*, in his *Treatise de Morbis, Lib. 2. Cap. 6.* orders the Patient to be washed with a large Quantity of warm Water, and placed in a firm Chair; then, whilst an Assistant holds his Hands, and shakes the Trunk of his Body, the Physician is to listen on what Side the Noise is to be heard. In the same Part, *Cap. 24.* he prescribes the same Method, in order to discover a latent Dropsy of the Breast, and determine the particular Part, by opening which, the Serum accumulated in the Breast may be evacuated. But it is sufficiently apparent, that this Sign may, sometimes, prove fallacious, when extravasated Blood is collected in the Cavity of the Breast; for this Blood, by Stagnation, becomes grumous, in consequence of which its Fluctuation is, with Difficulty, perceived. Besides, if the Breast is full of Blood, no Sound, in consequence of the Plenitude, can be heard, upon shaking the Thorax. Hence, in *Coac. Prænot. N° 432.* he gives the following excellent Caution: "Those Persons labouring under an Empyema, in whom, upon shaking the Shoulders, a great Noise is heard, contain a smaller Quantity of Pus, than those in whom, when afflicted with a greater Difficulty of Breathing, tho' their Colour is better, only a small Noise is perceived. But those in whom no Noise is perceived, whilst there is a violent Difficulty of Breathing, and a livid State of the Nails, are full of Pus, and consequently in a dangerous Condition."

6. *As for the Nature and Situation of the inflicted Wound*; when, from Anatomy, we know the Place of the Wound, and the Direction of the wounding Instrument thro' the Parts, it is easy to determine, whether large Arteries or Veins are wounded or not. Thus the large Trunks of the intercostal Arteries run near the inferior Margin of the Ribs. The internal mammary Arteries are placed behind the Cartilages of the Ribs, on each Side of the Sternum, about a Finger's-breadth from that Bone; and the large Vein, distinguished by the Name *Azygos*, is situated on the Right Side of the Vertebrae of the Back: And from a due Acquaintance with this Disposition of the Parts, the greater or smaller Danger of the Wound is determined.

7. *As for the Weakness of the Patient, accompanied with Paleness, and a cold Sweat*; some Persons are so timorous and faint-hearted, as to fall into a Delirium, upon seeing the Wound of another; and such Persons, even when wounded very gently, are easily seized with all these Symptoms. But they are soon restored by sprinkling cold Water upon them, or by exhibiting a stimulating Cardiac. Nor does the Weakness, arising from this Cause, continue long. But when, after a Wound penetrating into the Cavity of the Thorax, there is a great Weakness, a Paleness and Contraction of the Face, a Paleness and Languor of the Eyes, a cold Sweat, appearing in Drops, especially on the Face and Breast, and a hardly perceptible Pulse, we then know that, from the wounded Vessels, so large a Quantity of Blood is discharged, that hardly any returns to the Heart, but almost the Whole is discharged from the Body, or lodged in the Cavities of the Breast. In this Case, the Danger is very great. Thus *Hippocrates*, in *Prophet. Lib. 1. N° 130.* tells us, "that Wounds of the Thorax discharging Blood, and accompanied with Sweats, are of the worst Kind, since such Patients unexpectedly die, whilst speaking." In *Coac. Prænot. N° 328.* he affirms the same thing; in which Passage, instead of *ἐκιδέσθαι*, the Word *ἐκρίπτεσθαι* occurs. In his *Prophet. Lib. 1. N° 153.* he informs us, that Rigors succeed large Hæmorrhages, and affirms, that the Rigor stops the Effusion of the Blood. But from what has been said, 'tis obvious, that in this Passage, he only treats of Hæmorrhages from the Nose. But when, in Wounds of the Thorax, the large Vessels, so contiguous to the Heart, are wounded, 'tis sufficiently obvious, that a Rigor may succeed a large Hæmor-

rhage, tho' the Effusion of the Blood cannot, in such a Case, be stopp'd by its means.

8. *As for the perpetual Increase of almost all the Symptoms*; in the Thorax are very large Blood-vessels, and those very contiguous to the Heart. Hence, if these Vessels are wounded, the Blood will be discharged into the Cavities of the Thorax. Hence the Compression of the Lungs, the Anxiety and Dyspnoea, will be continually increased, till, in consequence of a Diminution of the Patient's Strength, or a Contraction of the wounded Vessels, the Effusion of Blood ceases. Many Symptoms may, in such Cases be, also, produced by concomitant Dread or Anger, which, however, are gradually lessened; but the Symptoms arising from the Effusion of Blood will continue as long as the Hæmorrhage lasts; for which Reason, the perpetual Increase of the Symptoms is justly reckoned among the Signs, by which it is known, that there is an Effusion of Blood into the Cavities of the Thorax. But when the Signs evince, that the Wound has penetrated into the larger Cavities of the Body, and it is to be dreaded, lest the wounded Vessels should discharge large Quantities of Blood internally, tho' there should be no Hæmorrhage externally, great Caution is necessary in making a Prognostic, lest the Reputation of the Surgeon or Physician should be risked in pronouncing, that nothing was to be feared; for often such Patients die unexpectedly, and their Deaths will, by such as defend the Cause of him who inflicted the Wound, be imputed to their Ignorance. With how great Accuracy all Phenomena ought to be adverted to in order to determine, whether extravasated Blood is lodged in the Cavities of the Breast, is obvious from this, that the most skilful Surgeons have sometimes been deceived. Thus *Mr. Mery*, in the *Memoirs de l'Acad. des Scienc.* for the Year 1713. ingenuously confesses, that he was deceived in a Case of this Nature; since, in a young Man wounded with a Sword in the superior and anterior Part of the Right Arm, three Hours after the Infliction of the Wound, he saw so many, and so violent Symptoms, that he concluded the Cavity of the Thorax filled with extravasated Blood, and resolved to perform the Operation for the Empyema. But the Event shew'd, that he was mistaken, since in eight Days time the Wound was perfectly healed. 'Tis highly probable, that in this Patient a Wound in the Tendon of the pectoral Muscle produced the intense Pain, and the Difficulty of Respiration.

Blood extravasated in the Cavities of the Thorax is with all Expedition to be evacuated; first, by a proper Situation, Motion, and Effort of the Body; secondly, by Suction thro' a flexible Tube, perforated on the Sides, and blunt at the End; thirdly, by an Injection of diluting, resolvent, and depurating Liquors; fourthly, by a Dilatation of the Wound; and, fifthly, by another Aperture between the second and third of the inferior true Ribs, about four Fingers-breadths from the Vertebrae, and the inferior Angle of the Omoplatæ, made by a cutting Instrument, and making the Incision parallel to the Ribs in the middle Space between them, and directing the Edge downwards.

After 'tis certain from the Signs specified in the preceding Paragraph, that extravasated Blood is lodged in the Cavity of the Thorax, the great Intention of Cure is, with all Expedition, to eliminate it, lest it should prove injurious by its Corruption, or a Compression of the Parts. But 'tis to be observed, that this Evacuation of the Blood is not to be made, till 'tis certain, that the wounded Vessels discharge no more Blood; for it would be of no Importance to evacuate the Blood, if the as yet open Mouths of the wounded Vessels are so irritated by the Motion of the Body, the Suction and the Injection, as still to discharge Blood. But when the Pulse is pretty strong and equable, the Extremities of the Body warm, the Patient afflicted with no Cough nor Spasms; and if he enjoys a considerable Degree of Strength, we know, that the internal Spasm has ceased, and that the Measures for the Evacuation of the Blood lodged in the Cavity of the Thorax may be safely taken.

'Tis, also, to be doubted, whether the extravasated Blood ought always to be evacuated by Art; since, 'tis certain from Observation, that Blood, Pus, and Water, have been gradually removed from the Cavity of the Thorax, being reforc'd by the Veins, and afterwards eliminated by Sweat, Urine, and other Methods. Instances of this are found in *Fabricius ab Aquapendente, Opera Chirurg. Part. 1. Lib. 2. Cap. 22.* and in *Belloste's Hospital Surgeon*. 'Tis, also, certain from Experience, that in such Cases, copious Discharges of Urine, and profuse Sweats, have proved highly beneficial. Various Observations, of this Kind, occur in practical Authors, but these are sufficient to prove, that Nature, which is often sufficient for answering her own Ends, has, in very surprising Manners, cured such Wounds. But lucky Accidents of this Kind rarely happen; and the Physician ought carefully to observe whether he discovers any such Efforts of Nature: However, if this Work was always left to Nature alone, 'tis certain that many would die, in consequence of the corrupted and extravasated Blood, preying upon the vital Viscera, who might otherwise have been preserved, if that Blood had been evacuated. Now this Evacuation is to be attempted by the following Means.

1. *By the Posture, Motion, and Effort of the Body:* If the Blood, in the Cavity of the Thorax, is as yet fluid, and the Wound, being pretty large, does not run obliquely through the Integuments, but penetrates directly, the Blood will be spontaneously discharged, if the Patient is put in such a Posture, as that the Blood may, by its Weight, fall down to the Aperture of the Wound. Hence, in such Cases, the most skilful Surgeons, for some Hours, apply nothing at all to the Orifice of the Wound, that, thus the Blood may be freely discharged. *Dionis*, in his *Opérations de Chirurgie*, informs us, that, he treated, in this manner, a Man, who, with a Sword, received a Wound under his left Pap, which penetrated into the Cavity of the Thorax; for, when he found the Cavity of the Breast full of Blood, after dilating the Orifice of the Wound, he ordered the Patient to lie upon it all Night, and next Morning found the Cavity of the Thorax entirely empty, after which the Cure succeeded very happily. *Ambrose Paré*, in Book 10. informs us, that he ordered a Man wounded in the same manner, to be placed with his Feet high, and his Head low; after which passing his Fingers into the Orifice of the Wound, and removing a Thrombus of coagulated Blood, he evacuated the extravasated Blood, and preserved the Patient from imminent Suffocation.

But this Evacuation of the extravasated Blood, through the Orifice of the Wound, is much assisted, if by a broad Bandage, or the Application of the Hands, the Abdomen is compress'd, if the Patient long retains the inclosed Air, and closing the Glottis makes a strong Effort of Expiration, for thus the Lungs being greatly dilated, and the Diaphragm pressed upwards, the Blood contained in the Cavity of the Thorax, is expressed through the Aperture of the Wound.

2. *By Suction through a flexible Tube;* As it is often incommo-
dious, in many Wounds of the Thorax, to retain the Patient in such a Situation, that the extravasated Blood may, by its Weight, be discharged through the Aperture of the Wound, Surgeons have invented another Method: Thus *Scultetus*, in *Armament. Chirug. Tab. 12. Fig. 9, and 10*, has exhibited a flexible Tube of Gold, perforated on the Sides, and its Cavity filled with a golden Probe, that it might be commodiously introduced without an Angustation, or Lessening of its Diameter. This Tube is to be cautiously introduced, as far as possible, into the Cavity of the Thorax, and then withdrawing the Probe, the extravasated Blood is to be extracted, either by Suction of the Mouth, or the Application of a Syringe. The Point of the Pipe must be obtruse, lest it should injure the Lungs. Pipes, for this Purpose, may, also, be prepared of Lead, or flexible Leather, and a Whalebone Probe. *Scultetus*, in the same Work, *Obs. 42*, informs us, that by such an Instrument, bended into an Angle, after extracting the Probe, he without any Suction, evacuated a large Quantity of Blood from the Cavity of the Thorax.

3. *By the Injection of diluting, resolvent, and depurating Liquors.* 'Tis sufficiently obvious, that the two preceding Methods can only be used, where the extravasated Blood is as yet fluid; but, if it is formed into grumous Concretions, it cannot easily be discharged from the Wound, much less enter the Perforations of the Pipe introduced. 'Tis true, indeed, the coagulated Blood is afterwards spontaneously dissolved, but, at the same time, it becomes putrid; a Circumstance, which in this Case, would be highly injurious; and often on account of the Compression of the Lungs, there is so great an Anxiety, that this spontaneous Resolution of the concentered Blood could not be waited for. In such a Case, they inject tepid Water with Honey, and the Addition of a little Salt and Venice Soap. For this Purpose,

Take of common Honey, two Ounces; of Venice Soap, two Drams; of Sea-salt, four Drams; and of Rain-Water, twelve Ounces; mix all together.

Or,

Take of Sal Ammoniac and Nitre, each three Drams; of the recent Urine of a sound Person, twelve Ounces; and of common Honey, two Ounces; mix all together.

Or,

Take of Aloes, dissolved in Water, duly depurated from its resinous Fæces, and, again gently inspissated, four Drams; of Sal Ammoniac, two Drams; of Borax, two Drams; of pure Honey, two Ounces; of Rain-water, nine Ounces; and of French White-wine, two Ounces; Mix all together.

These Liquors, when injected, are by the Motion of Respiration agitated, and, as it were, triturated with the grumous Concretions, which are thus so resolved, that they may be discharged, through the Aperture of the Wound, together with the injected Liquor. According to various Intentions, the Liquor to be injected may be prepared of different Ingredients: For the Dilution and Resolution of the concentered Blood, tepid Water, with Honey, and a little Salt, is sufficient; but when the extravasated Blood, begins to become putrid, it is most expedient to inject Infusions of Sordium, Rue, Horehound and other similar antiseptic and gently detergent Substances, with the Addition of a little Vinegar.

4. *By the Dilatation of the Wound.* This Method is treated of under the Article VULNUS.

5. *By another Aperture made in the Manner directed.* When the State and Condition of the Wound is such, that the Matter collected, in the Cavity of the Thorax, cannot be evacuated, then, the only Measure to be taken, is to make a new Incision in a Part of the Thorax, to which, in consequence of its natural Figure, the contained Fluids may naturally fall. This is principally requisite, when the Wound is inflicted in the superior Part of the Thorax; for in this Case, 'tis hardly possible, that the extravasated Blood should be discharged through the Aperture of the Wound. But, as the Cavity of the Thorax, in the posterior Parts, descends very deep, in consequence of the Situation of the Diaphragm; hence, it is, that in such a low Place, the Cavity of the Thorax may be penetrated, without any Wound in the Diaphragm, which adheres to the inferior Ribs; and from the posterior Part of the Thorax, ascending towards the anterior Parts, is formed a pretty acute Angle, with the Bodies of the Vertebrae. But lest the strong Muscles, called the Sacrolumbalis, and the Longissimus Dorsi, which being placed at each Side of the Spine of the Back, and ascending through the Loins and Back, should be wounded, this Aperture of the Thorax ought at least to be three Fingers Breadths from the Vertebrae. This Aperture is generally made between the second and third, or the third and fourth of the inferior spurious Ribs. But, since, according to *Albinus*, in *Hist. Musculorum Hominis, Lib. 3. Cap. 81*, the Diaphragm on the Right Side, ascends higher into the Thorax than on the Left; hence, when the Operation of the Paracentesis, in the Thorax, is performed in the Right Side, the Incision is generally made between the third and fourth Rib; but on the Left Side, between the second and third of the spurious Ribs; as *Van Solingen*, in his *Manuale Operat. Cap. 1*, advises. Perhaps, for this Reason, *Hippocrates*, when inquiring on what Side the Operation for the Empyema ought to be perform'd, wished that the Pus was contained in the Left, as he informs us, in his *Treatise de Morbis, L. 2. C. 16*. *Dionis*, also, in his *Cours d'Operation de Chirurgie*, ordered this Operation to be performed between the third and fourth Rib: hence there seems to be an Error in the Text of *Boerhaave* in this Place, since the Operation is ordered to be perform'd between the second and third of the true Ribs, because afterwards the Operation is order'd to be performed far lower; and because under the Article *Empyema*, where the Perforation of the Thorax is treated of, the Part specified, is between the fifth and sixth, or fifth and fourth of the inferior Ribs; which Place, according to *Paulus Aegineta, Lib. 6. Cap. 44*, is by some open'd for the Cure of an Empyema, tho', as he tells us, the Operation is succeeded by sudden Death, or, incurable Fistulas: Hence I am of Opinion, that the Words of the Text ought to be *between the second and third of the inferior spurious Ribs*, unless in this Passage we were to suppose, that the Perforation was to be made in the anterior Part of the Thorax; in which Case the Operation is best perform'd between the second and third of the inferior true Ribs, as *Dionis*, also, informs us, in his *Cours d'Operations de Chirurgie*, where he only mentions this Advantage, as attending the Operation perform'd in this Place, that the Patient can in the Surgeon's Absence take care of his own Wound. But the greater Deepness of the posterior Parts of the Thorax, and the spontaneous Tendency of the extravasated Blood to the Aperture of the Wound, whilst the Patient lies, readily convince any thinking Person, that a Perforation of the Thorax in the posterior and inferior Parts is preferable. Tho' *Hippocrates*, in his *Treatise de Morbis, Lib. 2. Cap. 16*, when treating of the Cure of an Empyema, does not exactly specify the Part to be open'd; yet he determines, that the Operation ought to be perform'd in the posterior and inferior Parts; for, says he, "if, on account of the Thickness and Redundance of the Pus, there is no Noise perceiv'd, as it sometimes happens, which ever of the Sides is tumid and painful, is to be open'd in the lowest Part between the Ribs, rather on the posterior, than the anterior Part of the Tumour, that a more easy Discharge of the Pus may be procur'd." And, in the same Work, *Lib. 3. Cap. penult.* when treating of the same Disease, he tells us, "that we must make an Incision or cauterize the Patient, as near the Septum as possible, taking care however not to wound it."

When, in a Dropsy of the Breast, the Waters are to be evacuated, *Hippocrates*, in his *Treatise de intern. Affection. Cap. 24*, orders an Incision to be made in the Integuments lying above the third inferior Rib, which is then to be perforated with an acute Perforator, and a small Quantity of Water is to be evacuated: From which Passage 'tis sufficiently obvious, that *Hippocrates* made Choice of the lowest Part of the Thorax, as the most proper for an Evacuation of any Liquids contain'd in it.

The Place most proper for this Purpose is easily found by numbering the Ribs, when the Patient is naked; but 'tis not to be found without some Difficulty in fat Persons, and those labouring under an Emphysema; for which Reason Surgeons have fallen upon another Method of determining the Part. Thus *van Solingen*, in his *Manuale Operation, Cap. 1*, orders a Thread to be

be convey'd from the Cartilago Eniformis to the Spine of the Back; then he divides this Thread into three equal Parts, and determines the Part for the Operation to be two Thirds of the Length of the Thread from the Sternum. *Dionis*, in his *Cours d'Operations de Chirurgie, Demonstret*. 5. orders us to measure four Fingers-breadth from the lower Angle of the Omoplate, and the like Distance from the Spine of the Back, in order to find the proper Place for the Incision. But as the Scapula is moveable, and may change its Situation by the various Actions of the Muscles adhering to it, 'tis sufficiently obvious, that this Method is not always very certain. Hence 'tis more proper, when the Place is found, to examine with the Fingers, whether it corresponds to the Interstice of the Ribs.

The proper Place for the Incision, when found, is generally mark'd with Ink, that it may not afterwards be mistaken: But as the Ribs are moveable, 'tis sufficiently obvious, that, by a Change of Posture in the Body, the Situation of the Skin may be, also, alter'd. Hence *Hippocrates*, in his *Treatise de Morbis, Lib. 3. Cap. penult.* justly advises, "that, after the Part is mark'd, we are to take care, that in cauterizing, or making the Incision, the Figure of the Skin does not deceive us by a Change of its Situation, either upwards or downwards." The Aperture ought to be made with a cutting, but not with a pungent Instrument, as in the Paracentesis of the Abdomen, which is perform'd by a Steel Trocar, introduc'd into a Silver Canula; because by this Method there would be great Danger of wounding the Lungs. But that the cutting Instrument may penetrate the Cavity of the Thorax, the Skin, the Panniculus Adiposus, the Longissimus Dorsi, the intercostal Muscles, and the Pleura must be cut; and, that this may be done safely, the Patient's Body is to be a little reclin'd towards the posterior Parts, that the Skin may be loose: Then the Surgeon is with his Fingers to elevate all the common Integuments, and, if possible, along with them, the Latissimus Dorsi; and make an Incision in them about three or four Fingers-breadth long. After this let the Body of the Patient be bend'd forwards, and at the same time a little towards the opposite Side, that the Ribs may recede the more from each other, and the intercostal Muscles be stretch'd. Then with a Knife gently incur'd, and the Back and Apex of which are to be cover'd with the fore Finger, the Surgeon is to cut the stretch'd intercostal Muscle and Pleura, penetrating cautiously, and with a small Wound, into the Cavity of the Thorax, lest he should wound the Lungs. As soon as the Pleura is cut, the Lungs immediately collapse, and recede from the Ribs; after which the Wound may be safely dilated. The Incision to be made parallel to the Ribs, in the middle Space between them, and with the Edge of the Knife downwards, in order to avoid the intercostal Vessels, adjacent to the inferior Part of the superior Rib, which is fulcrated.

By an Observation of these Cautions, the Operation is most safely perform'd: In practical Authors, there are, however, some Directions of less Moment to be found. Thus *Fabricius ab Aquapendente*, in *operat. Chirurg. Cap. 45.* orders the Patient at the time the Pleura is cutting, to expire strongly, that the Lungs, by this means, receding from the Pleura, may not be hurt by the Knife. But from Physiology 'tis now known, that the Lungs, both in Inspiration and Expiration, are continually contiguous to the Pleura, and that they are expanded according to the Dilatation of the Breast. *Hippocrates*, in *Aphor. 27. Sect. 6.* informs us, that if dropical Patients, or those labouring under an Empyema, are cut or cauteriz'd, and the Water or Pus discharg'd all at once, they die. Hence some have ordered, that the extravasated Blood should not be evacuated all at once, but at different times. But in an Empyema, or Dropsy of the Breast, the Lungs are long macerated by the Pus, or extravasated Serum. Hence, if the Whole of this Sordes is at once evacuated, the Blood, suddenly dilating the almost consum'd Vessels of the Lungs, may burst them, and occasion a sudden Death. But in Wounds of the Thorax, when this Operation is perform'd, we rarely defer it so long, that this is to be dreaded; and 'tis certain from many Chirurgical Operations, that all the extravasated Blood has been in this manner safely and suddenly evacuated. It much facilitates this Operation, that the extravasated Humours, by compressing the Lungs, and by their Weight depressing the Diaphragm, occasion that upon cutting the Pleura these Parts are not so easily wounded.

We have already observ'd, that the Lungs sometimes adhere to the Pleura. Now, if the Paracentesis should be perform'd in the Part where such an Adhesion is, 'tis sufficiently obvious, that great Difficulty must arise from such a Circumstance. Most Chirurgical Authors, who have wrote on this Subject, inform us, that this has happen'd to them; in which Case they order the Surgeon, by introducing his Finger into the Wound, cautiously to separate the Lungs from the Pleura, to which they adher'd; and certainly nothing else remains to be done, tho' it seems cruel thus to lacerate concreted Parts in a living Person; for, unless this was done, the Paracentesis would be performed in vain. *Hippocrates*, in his *Treatise de Morbis*, has a surprising Passage relating to this; for he there de-

scribes the Disorders which arise when the Lungs fall upon the Side [*ὁ πλευρὸν προσπεσὼν ἐς τὸ πλευρὸν*] which sufficiently agree with those Phenomena, which appear after acute inflammatory Disorders, in which the Lungs adhere to the Pleura: And the Method of Cure he prescribes for such Disorders, also, confirms this; but he afterwards adds, "But if this Misfortune should happen by a Wound, or by an Incision for the Empyema, we are to fix a Bladder to a Pipe, introduce it into the Wound, blow it full, and force it forwards by means of a solid tin Probe."

From this Passage we may conclude, that *Hippocrates*, in order to divide the Lungs from the Pleura, introduc'd a folded Bladder into the Wound, and afterwards blow'd into it, that thus, being distended in the Cavity of the Thorax, the Lungs might be separated from the Pleura, to which they adher'd. Or, at least, we may hence deduce, that the Antients attempted the Separation of the Lungs from the Pleura, for fear of such a Concretion. Some advise the Integuments, and Intercostal Muscles, to be prudently cut without wounding the Pleura, and then carefully to examine the denudated Part of the Pleura, whether from its unusual Thickness or Callosity, 'tis to be dreaded, that in this Part the Lungs adhere to the Pleura; in which Case, it would be expedient to lengthen the Incision, till we come to a Part free from the Adhesion. But such an Operation is more easily demonstrated on a Carcass, than perform'd on a living Person, on whom it seems very cruel to perform, so slow an Incision thro' the Integuments and Muscles: But there are sometimes so surprising Concretions of the Lungs to the Pleura, as to render this Operation entirely useless. Thus, says *van Swieten*, in a young Gentleman who died of an Apoplexy after a Spitting of Blood, I saw the middle Lobe of the Right Side of the Lungs every-where so adhering to the Pleura, that the Right Cavity of the Thorax was divided into two distinct Cavities. If in such a Case a Wound had been made in the superior Part of the Right Breast, 'tis sufficiently obvious, that the Paracentesis must have been of no Service, if perform'd in that Part. But Cases of this kind rarely occur, and Errors of this sort are not to be ascrib'd to the Surgeon, since such a latent Circumstance could not be discover'd by any Signs.

After the Perforation of the Thorax, all the Measures before prescribed are to be us'd in order to evacuate the extravasated Blood. But if Liquors proper for dissolving concreted Blood are to be injected, they may be commodiously convey'd thro' the Wound first inflicted, because 'tis pretty high in the Thorax; after which they are easily discharg'd thro' the new Aperture.

If Wounds of the Thorax are distended by no Tents, and uncover'd rarely; if the Access of the Air is prevented; if by artificial Suction, and a due Effort of Respiration, the admitted Air is expel'd; and if Cold is avoided; they are soon and efficaciously cur'd, if they are curable.

We have already specified the Reasons, for which the Use of Tents is to be condemn'd, in such Wounds as do not penetrate into the Thorax; but when it seems expedient, not all at once, but at different times, to evacuate the Liquids contain'd in the Cavity of the Thorax, which rarely, tho' sometimes, happens in Wounds of the Breast, Water, or Pus, as *Hippocrates* observes, being collected in it, then a Tent is to be put into the Wound, that the Matter stagnating in the Breast may be evacuated at Pleasure. And *Belleste*, in his Hospital Surgeon, tho' in all other Cases he condemns the Use of Tents, yet advises the Use of them the first Day after the Paracentesis, lest the new Incision of the Pleura should be concreted; but after this they always seem to be hurtful, since by absorbing the Fluids they become tumid, and by the Motion of the Thorax, rub upon the Libs of the Wound, which by that means become callous, and render the Cure more difficult. Some pretend that, by means of Tents, the Access of the Air into the Cavity of the Thorax is prevented; but every time the dressing is renew'd, that Fluid enters freely thro' the open Wound; and when its Return is hinder'd by the Application of a new Tent, it is dilated by the Heat, often finds strange ways for itself, and may produce the worst of Emphysemas. 'Tis, therefore, better to cover the Wound with a plain Pledget, and leave a free Passage for the Humours to be discharg'd; and if the Wound is pretty large, we are to take care, that the Pledget do not fall into the Cavity of the Breast, which some practical Authors affirm to have happen'd with respect to Tents. Thus *Tulpius*, in *Observ. Medicin. Lib. 2. Cap. 15.* informs us, that a certain Danish Gentleman being wounded in the Thorax, and not duly taken care of by his Surgeon, a Tent fell into the Cavity of his Thorax, which he expectorated six Months after, and afterwards enjoy'd a State of perfect Health. Another Instance of the like Nature is found in *Hildanus, Obs. Chirurg. Cent. 1. Obs. 46.*

Another Step, necessary in this Case, is, to hinder the Air from entering the Cavity of the Thorax; and, if it has enter'd, to evacuate

evacuate it. So long as the extravasated Liquids are not evacuated from the Cavity of the Breast, 'tis impossible to hinder the Ingress of the Air, because a free Discharge of the extravasated Humours is requisite; but when no more Matter is discharged thro' the Wound, then the Air in the Thorax between the Lungs and Pleura is to be evacuated, and its future Ingress carefully prevented; for 'tis certain from Physiology, that, in order to a free Expansion of the Lungs, by the inspir'd Air, there must be no Air in the Cavity of the Thorax. This Evacuation of the Air may be obtain'd by Suction, but best of all in the following manner: The Lips of the Wound are to be clos'd by the Fingers, that no Air can enter; then the Patient is, by a slow and profound Inspiration, to draw in a large Quantity of Air, and retain it in the Lungs as long as he can. The Air thus retain'd, being rarefied by the Heat, will expand the Lungs, and by that means compress the Air between the Pleura and the Lungs. If, in this Case, before the Patient performs Expiration, the Lips of the Wound are separated, a large Quantity of the Air in the Cavity of the Thorax, will be express'd: Upon this, the Lips of the Wound are to be immediately clos'd; and then let the Patient perform Expiration, but not before. If this Method is several times repeated, all the Air in the Cavity of the Breast will be expel'd, and the Patient will immediately find his Respiration easier: When all the Air is thus expel'd, we suddenly apply an adhesive Plaster, at the time the Patient retains the inspir'd Air in his Lungs; for then the distended Lungs, being contiguous to the Pleura, will hinder the Ingress of the Air thro' the Wound. This Plaster is left on as long as possible; and if there is a Necessity for a new Dressing, a similar Plaster is to be applied, with the same Cautions; and certainly rare Dressing is in no Wounds more beneficial, than in those which penetrate into the Cavity of the Thorax. The Efficacy of this Method is prov'd by the Experiments made on live Animals, mention'd under the Article VULNUS; for when, by Perforating both Sides of the Thorax with a large Wound, Respiration ceas'd, and the Animal seem'd dead, upon extracting the Air from the Cavities of the Breast, the Animal reviv'd, and Respiration was immediately restor'd.

But, as, all the Parts contain'd in the Thorax, lying near the Heart, the Source of Heat, are continually cherish'd with a gentle Warmth, we are to take care, that they be not injur'd by an unusual Cold in dressing the Wound. Hence, the State of the Air is always to be kept warm, especially when the Dressings are renew'd.

By these Measures, Wounds penetrating into the Cavity of the Thorax, tho' of the most dangerous Kind, and accompanied with the most terrible Symptoms, have been sometimes cur'd; nor are we easily to despair, since Instances of very surprising Cures of this Kind are recorded by Authors, as is shewn under the Article VULNUS. That great Harm is always to be dreaded from such Wounds, is certain; since the vital Viscera, the Heart, the Lungs, and the largest Blood-vessels, are situated in the Thorax. But as Wounds of the Heart are not always absolutely mortal, [tho' Pliny, in his *Natural History*, Lib. 11. Cap. 37. affirms, that they are instantaneously fatal] 'tis obvious, that some Hopes remain in the most desperate Wounds, since Men, who, in consequence of Wounds, of the largest Blood-vessels, have been given over for dead, have yet recover'd, when no Methods were us'd for their Relief, nor any Cordials exhibited in order to recruit their Strength. 'Tis not only certain from Experience, that violent Wounds of the Thorax have been cur'd; but, also, that they have been cur'd in a very short time: Of this there is a memorable Instance in *Bellefleur's* Hospital Surgeon, Part 2. Cap. 8. The same Author, also, furnishes us with various Cases, which evince, that the most desperate Wounds of the Thorax, and such as are accompanied with the worst of Symptoms, have sometimes been happily cur'd, by rare Dressing without the Use of Tents.

Then, all the violent Symptoms before-mention'd are prevented: The worst Consequences which appear after Wounds of the Thorax, arise almost only from the Ingress of Air into the Cavities of the Thorax; or from the extravasated Liquors, which either lessen the Cavities of the Thorax, or by their Corruption injure the contain'd Viscera. When such Wounds are not clos'd up with Tents, the extravasated Blood is freely discharg'd. Rare Dressing and the Cautions already directed, prevent the Ingress of the Air, which, when admitted, may be evacuated in the manner before directed. Hence, a successful Cure is always obtain'd, unless such Parts as are absolutely necessary to Life are wounded; and it is at the same time obvious, that the History and Cure of Wounds of the Thorax afford great Light in many Diseases of the Breast, and Viscera contain'd in it. *Van Swieten*.

FROM HEISTER.

Wounds of the Thorax are of three Sorts; 1. External; 2. Penetrating into the Cavity of the Thorax, without injuring its Contents; or, 3. The Internal Parts are also injur'd.

The Wound may be known to be external only, by several Methods: 1. By the Sight; 2. If no Sound is perceived from the Wound in breathing; 3. If neither the Finger, nor a Probe, can be

introduced into the Cavities of the Thorax; 4. If, upon injecting warm Water with 2 Syringe, it immediately returns; or, 5. When no violent Disorders appear, such as Difficulty of breathing, Faintings, and other dangerous Symptoms. All these Circumstances being carefully examined, if it appears that the Wound is only external, it may be dress'd with a digestive Ointment, and vulnerary Balm, and treated in the same manner with other slight Wounds.

Sometimes indeed it happens, that external Wounds of this kind run deep and obliquely between the Muscles and Ribs, so that the Wound cannot without Difficulty be cleansed from the Blood and Matter: Hence, the contained Matter may putrefy, and corrode the neighbouring Parts; and produce Ulcers, and incurable Fistulas; or, by forcing its Way through the Pleura, into the Cavity of the Thorax, it may occasion an Empyema, Phthisis, or even Death.

In order to prevent these Disorders, particular Care must be taken to clear the Sinuses of the Wound of the Blood and Matter, either by Compression, by the Suction of an healthy Person, by extracting it with a Syringe, or, if necessary, by making farther Incision. The Remainder of the Cure is to be performed as we above directed. The most proper Bandage, for securing the Dressings, is the Napkin with the Scapular; which, however, must not be made too tight, that the Discharge of the corrupt Matter may be facilitated.

Various Sorts of Syringes, for extracting the Blood, are used in this Case. Some are straight, others crooked. Some Surgeons use a tin Syringe, about twice as large as that represented in *Tab. XXVII. Fig. 8.* whose Mouth B is larger than the Pipe AA, and may be either triangular, round, or oval; its true Size is exhibited at *Fig. 9.* In using this Syringe, its Mouth must be exactly fitted to the Orifice of the Wound, and the Blood extracted by drawing out the Sucker of the Syringe. It is therefore necessary to be provided with Mouths of different Sizes, accommodated to different Wounds. Concerning the Excellency and Use of these Syringes, it may be proper to consult *Anel* in his Treatise call'd *L'Art de sucer les Playes*.

When the Wound penetrates into the Cavity of the Thorax, it may be discovered, 1. By the Sight, when you can plainly see into the Cavity; 2. By Feeling, when the Finger or Probe may be introduced into the Cavity; 3. By Hearing, when the Patient makes a particular sort of Noise in drawing his Breath; 4. From the Agitation of the Flame of a Candle, or of Feathers, when held near the Wound, in Respiration, or in Coughing; 5. From the Injection of warm Water, when it appears to be received into the Belly; or lastly, from a Difficulty of breathing, Faintings, and other violent Symptoms; which may proceed from the Compression of the Lungs, or from the Blood collected in the Cavity, or from both these Causes.

When Blood is discharged into the Cavity of the Thorax, which, however, is not always the Case, the Expansion of the Lungs, Respiration, and the Circulation of the Blood in the Lungs, must be impeded; and the Blood being by these means inspissated in the Lungs, Death must be the Consequence. But, though the Quantity of Blood lodged in the Thorax should not be sufficient to obstruct the Breathing, or Course of the Blood in the Lungs, yet still there is great Danger, that this Blood should by Degrees putrefy, and consequently corrupt and consume the Diaphragm, the Pleura, or the Lungs, producing many violent Symptoms, and at last inevitable Death.

When Blood has been discharged into the Thorax, it appears from the following Symptoms; 1. When there is a Difficulty of breathing, and the Patient cannot draw his Breath, unless whilst sitting upright; 2. When the Patient lies easiest upon his Back, or wounded Side, and finds lying upon the sound Side, extremely troublesome, or even impracticable; 3. When the Patient feels the Diaphragm, as if it were, pressed with a Weight; 4. If the Fluctuation and Agitation of the Blood is perceived inwardly, upon turning the Body round; and, lastly, If little or no Blood flows outwardly from the Wound.

When from these Signs it appears, that Blood is collected in the Cavity of the Thorax, care must be immediately taken to procure its Discharge. 1. If, therefore, the middle or lower Part of the Thorax be wounded, and the Orifice be large, the Patient should be laid upon the wounded Side, and advis'd to draw his Breath vehemently, or endeavour to cough. *Dionis*, in his Surgery, relates, that, in a Case of this Kind, he left the Patient inclined all Night, upon the Wound without dressing, and afterwards happily completed the Cure; and *La Motte* gives us another Instance of this Kind in his *Observations Chirurgicae*. If the Passage should be obstructed by Clots of Blood, they must be remov'd with the Finger, or a Probe, or suck'd out with the Syringe. 2. If the Blood be already too thick to flow out of the Wound, a digesting and attenuating Injection becomes necessary; which may be made of a Decoction of Barley, common Honey, Honey of Roses, mixed with a little Soap, which must be several times injected, and again discharged, till all the Blood appears to be extracted out of the Cavity. For this Purpose, the Syringe of *Tab. XXVII. Fig. 8.* may be used, with the Pipes describ'd in *Fig. 10* and *11.*

T H O

3. If the Wound be so narrow, or oblique, as not to permit the Discharge of the contained Blood, it must be cautiously enlarged by Incision, either with the common Knife, and grooved Probe, or with such Knives as are represented in *Tab. V. Fig. 3. 4. and 5.* But particular Care must be taken, not to give the Patient too much Fatigue, by endeavouring to discharge the extravasated Blood all at once; and therefore, if he be weak, the Blood may be extracted at Intervals; especially, if he be subject to Swoonings. In the mean time it will be proper to introduce into the Wound, to keep it open, a Leaden or Silver Pipe, like those of *Tab. XXIII. Q, R, S;* or, if more convenient, a flexible one, like that of *Tab. XXVI. Fig. 9.* Some, instead of these Pipes, use Tents armed with a String, or a long narrow Bit of Linen, dressing with Plaisters and Compresses, securing the Whole with the Napkin and Scapular, till no Blood or Matter appears upon the Dressings; and then the Wound may be conveniently healed.

But if the Wound should be inflicted in the upper Part of the Thorax, or between the superior Ribs, then this Method of inclining the Body upon the Wound has generally but little Effect, in discharging the Blood contained in the Cavity, as the Patient must be turned upon his Head. If, therefore, the Suction of the Syringe should prove ineffectual, another Aperture should be made in the lower Part of the Thorax, by Incision, which Operation is called *Paracentesis*. This Aperture, is generally made between the second and third Rib, if the Blood is lodged in the Left Side; or between the third or fourth, if in the Right Side, about the Distance of an Hand's-breadth from the Spine of the Back, which should be marked with Ink. The Trocar is generally used on this Occasion, which must be introduced above the Rib into the Breast, very cautiously and gently; then retracting the triangular Part of the Instrument, leave the Pipe, for the Discharge of the confined Blood, which may, also, be extracted by the Suction of a Syringe. But as the Lungs may be readily injured by the Trocar, it may, therefore, be safer, first to open the Integuments with the Knife, and then gently to make an Incision through the Intercostal Muscles, and at last through the Pleura itself; taking particular Care, that the Lungs, which often adhere to the Pleura, be not at the same time wounded. This Operation being properly performed, proceed in the rest of the Cure as before directed; and the superior Wound must be healed expeditiously, with a vulnerary Balsam, and proper Plaisters.

As the Lungs frequently adhere to the Pleura, this Operation requires particular Circumspection in the Surgeon. The Pleura, therefore, must be opened with the greatest Tenderness; and then the Surgeon must examine, whether the adhesive Lungs can be separated with the Finger or Probe. For if the Lungs are too firmly connected with the Pleura, all the Pains taken to perforate the Thorax, in order to discharge the Blood, prove ineffectual.

If by these means the Thorax can be cleansed, the Wound needs only be dressed once a Day, and that with all Expedition, in order to prevent the Intrusion of the external Air. It will, also, be necessary for warming and attenuating the external Air, to have a Chafing-dish of hot Coals placed near the Thorax, at the time of Dressing; sometimes, likewise, it may be necessary to extract the Air, that has obtained Admittance into the Wound, with a Syringe; and the Patient should be advised to draw his Breath with more than ordinary Vehemence. Then the Wound must, without Delay, be dressed with a vulnerary Balsam, Plaisters and Compresses, and the Whole must be secured with a proper Bandage: This Method must be continued, till the Wound is almost entirely conglutinated.

When any of the Contents of the Thorax are wounded, as the Heart, the Aorta, the Vena Cava, the Pulmonary Vein or Artery, the Diaphragm, or a large Portion of the Lungs, Death is generally too sudden for all the Art of the Surgeon. But if the Lungs are only slightly wounded, that is, if only the smaller Ramifications of the Aspera Arteria, and pulmonary Vein, are divided, the Danger is indeed very great, though the Wound may be curable; and a Cure of this Kind is completed more by the Strength of Nature, than the Skill of the Surgeon.

We may conclude, that the Lungs are wounded, when a large Quantity of frothy Blood is discharged at the Mouth, and attended with a short Cough; when the Blood appears florid at the Wound; and when Breathing is performed with a particular Noise. The Duty of the Surgeon, in such Wounds, seems to consist in extracting the Blood collected in the Cavity of the Thorax, and treating the Wound externally, as we have already directed; for the internal Wound will admit of being dress'd. In such Cases, therefore, when the Effusion of Blood spontaneously ceases, the Patients may be preserved, though, after their Recovery, they are extremely subject to Ulcers of the Lungs, and Consumptions. But when the larger Blood-vessels of the Lungs are divided, the Violence of the Hæmorrhage either occasions immediate Death; or, if it ceases a little, it is liable to return, and cut off the Patient in a more lingering manner. In order to prevent such a Relapse, the Patient ought to keep himself quiet for some Days; to speak little or none; to take lenient internal Medicines, pro-

T H R

per for stopping an Hæmorrhage; to avoid every thing that is acrid or heating; and, if the Patient has Strength sufficient, Venesection should be performed.

Sometimes the divided Part of the Lungs is protruded into the Wound of the Thorax, where it firmly adheres, as *Fontanus, Tulpius, and Raysch,* have observed; nor is it proper to repress it, lest the Blood should be discharged into the Cavity of the Thorax. It will, therefore, be safer to allow this Part of the Lungs to remain in the external Wound, and to treat it with a vulnerary Balsam, scrap'd Lint, and Plaisters, earnestly advising the Patient to keep himself quiet; and thus will the wounded Part of the Lungs by degrees be conglutinated with the external Wound. But if the wounded Part of the Lungs should be protruded without the Thorax, it should be carefully wrapped up in a Piece of soft Linen, and a Ligature should be made with a strong Thread above the Linen, cutting off all that projects below the Ligature. The remaining sound Part of the Lungs should be gently returned by the Finger into the Cavity of the Thorax, leaving the Thread of the Ligature hanging without the external Wound, which must be kept open with a Tent, till the Ligature can be extracted; the Cavity of the Thorax must be carefully deterged; and the Wound must be treated as before directed. *Hildanus, in Cent. 2. Obs. 32.* relates a Case of this Kind, where the Part of the Lungs prolapsed without the Thorax, being become black and corrupted, was extirpated with a red-hot Knife; and the Patient, after the sound Part of the Lungs was returned, and the Wound healed, recovered his former Health.

The most proper internal Medicines, after the Hæmorrhage is stopped, are vulnerary Decoctions, adapted to promote the Cure, with frequent Doses of *Lucatellus's Balsam,* or that of *Mecibomius,* observing at the same time a strict Regulation with regard to Diet. By these means the Surgeon may sometimes preserve his Patient, at least as far as the Nature of the Circumstances will permit.

See the Method of performing the *PARACENTESIS* of the *THORAX* under the Article *EMPYEMA*; and the *BANDAGES* proper for this Part under the Article *FASCIA*.

THOREXIS, *Θάρηξις*, from *θάρηξ*, the Thorax, in *Hippocrates*, signifies either simply a drinking of Wine, or else a drinking of Wine purer than ordinary, because, as a Reason for the Etymology, it warms and strengthens the Thorax, and arms it; as it were, with a Breast-plate. *Θάρηξις*, in *Galen's Exegesis*, is expounded by *δινουσία ἢ οἶν ἢ μέθυ*, "Drunkennes with Wine." But *Erotian*, from 2 *Aph. 21.* and 7 *Aph. 48.* expounds it by *δινουσία*, "a drinking of Wine." *Galen*, also, *Com. ad 2 Aph. 21.* says that *Hippocrates* usually calls drinking of Wine *Thorexis*, and Drinkers of Wine *Thoreffomeni*; and, *Com. ad 7 Aph. 48.* he says *θάρηξις*, *ταῖς οἷν ἢ ἀπὸ οἷν ἢ ἀπὸ μέθυ*. "Thorexis" is either simply a drinking of Wine, or else of Wine purer than ordinary. The Word, also, as well as the Verbs *θάρηξαι*, *θαρήνομαι*, (*thoreco, thorecomai*) often signify and import Ebriety; for instance, *Lib. 2. de Morbis*, *θαρήξαι ἀπὸ οἷν ἢ ἀπὸ μέθυ*; "let him abstain from Ebriety and Venery." And, *ibid.* *ἢ γὰρ ἐν θαρήξει ταῦτα πάθη*, "if these Disorders proceed from Drunkennes." And, 4 *Epid. 3.* *ἐτοίμαθα θάρηξαι*, "they were inebriated." And, 2 *Prophet. 3.* *ἢ θαρήξω*, "or shall be inebriated." *Ἀκροθάρηξις* (*Acrothoreces*), from *ἀκρον*, the Top or Extremity, and *θάρηξ*, the Thorax, with the Ancients, were such as had drank but slightly, or were but just beginning to be inebriated; and *Erotian* says, that till his very time they called *τὰς μὴ ἐπιπλέουσιν δινομένους*, "those who were not much overcome with Wine," *Acrothoreces*. And in *Aristotle's Problems*, *sect. 3. Prob. 2.* the *Acrothoreces*, *Ἀκροθάρηξις* are opposed to *οἱς σφόδρα μεθύουσι*, "to those who are very drunk." *Hesychius* and *Varinus* write the Word, also, *θάρηξις*, *Thorixis*, and expound it by *δινουσία*, *Oenopsia*, a drinking of Wine. *Foefius*.

THOROS, *Θόρος*, from *θόρειν*, to gush out. Male Sperma.

THORYBOS, *Θόρυβος*, is a Perturbation excited in the Body. Thus *Progn. & Coac. 282.* *συνδυάζει ἐν τῇ ὑποχονδρίᾳ θόρυβον σημαίνει ἢ παραφροσύνην*, "a Pulsion in the Hypochondrium" indicates some Perturbation, or a Delirium. Here *Galen* on the Passage says, *θόρυβος μὲν σημαίνει σάει*, &c. "A Perturbation" is signify'd, which is one common Symptom of all dangerous Cases, in which not only the Patients, but the Physicians themselves are under a Perturbation, [*θόρυβος σημαίνει σάει*]. *Θορυβώδης γῆρυς* signify a disorder'd Mind, or a Mind very subject to Perturbation. And, 5 *Epid. T. 94.* we find *θορυβώδης γέλως*, "a disorderly Laughter," or a Laughter with a Perturbation, related as a Symptom of a Wound in the Breast, which proved mortal. The Word generally imports, as used by *Hippocrates*, a Perturbation of Mind. *Foefius*.

THRACIUS LAPIS. *Offic. Gæbal. 30.* **THRACIAN STONE**.

This Substance is produc'd in the River *Ponto* in *Scythia*, and, by *Dioscorides*, has the same Virtues with the Jet ascrib'd to it. Authors entertain various Opinions concerning this Stone. *Martholus*, from *Galen*, introduces *Nicander* the Poet, as informing us, that if this Stone after Ignition is immers'd in Water, it will be all in a Flame; but is effectually extinguish'd by

THU

by an immediate Affusion of Oil. But it is of no Use in Medicine, nor does Nicander ascribe any Virtues to it, except that its fetid Smell, when us'd by way of Fumigation, banishes wild Beasts. But *Matthiolus* concludes, that it is rather a fabulous than a real Stone, since neither he, nor any of his Friends, could find it in Italy. *Boetius de Boet* informs us, that some take it for the Jet, and others for the Pit-coal; and *Wormius* takes it for the same with the *Terra Ampelitis*. It is at present unknown in the Shops; but, as *Dioscorides* gives it the same Virtues with Jet, so Jet may be us'd in its stead. Dale.

THRANOS, *Θρανός*. A Seat, Chair, or Stool. *Galen. Exeg.*
THRASI. A Name for the *Cyperus*; *rotundus*; *esculentus*; *angustifolius*.

THRASOS, *Θρασός*. *Hippocrates* uses this Word to express a certain Fierceness and Audacity of the Aspect, or Eyes, in or on the Approach of a Delirium.

THRAUSMA, *Θραύσμα* from *Θραύω*, to break. A Species of Gum Ammoniac, which is friable, and broke into small Pieces.

THRINCOS, *Θρινκός*, is expounded by *περίβολος*, *περίσπαραγμα*, a Circumvallation; Palisade, Inclosure. The Word occurs in *Hippocrates's* Epistles, where he says of the Tongue, that *ἐκχυρὸς ὁδὸν τὸν σπινθῆρα περικύβηται*, "it is guarded by the strong Palisade of the Teeth."

THRISSA, *Θρίσσα*. The same as *ALOSA*. The Shad-fish.

THRIX, *Θρίξ*. An Hair.

THROMBOS, *Θρόμβος*. A Grume, or Clot of Blood.

THRONOS, *Θρόνος*, in *Hippocrates*, *Lib. περὶ ἐνυκν.* is a high Seat, or a Seat in an high Place; where he directs to observe the Decubitures of the Sick, as in the following Words: *ἐν μέν γὰρ αὐτῶν ἐς θρόνους, ἐν δ' ἐκασταίς καὶ σπλῆνός τε καὶ σπινθῆρας* "Some of them (lie sick) in high and airy, others in dark and subterranean Places, or Seats." *Foesius*.

THRONUS MARCELLIUS, in *Paulus Aegineta*, *L. 7. C. 12.* is the Name of a Pastil there describ'd.

THRYALLIS. A Name for the *Phlomis*; *fruticosa*; *Salvia folio longiore & angustiore*.

THRYMMA, *Θρύμμα*, from *Θρύλλω*, to break, is a Fragment, *Lib. 1. περὶ γυν.* *Hesychius* expounds the Word by *κλάσμα τῆς ἀρτίς*, a Morfel of Bread; *Suidas* by *τρυφός*, *Tryphus*, a Fragment. *Foesius*.

THUNUS. *Offic. Aldrov. de Pisc. 112. Schonf. Ichth. 75. Jonf. de Pisc. 4. Charlt. de Pisc. 6. Thynnus, Bellon. de Aquat. 106. Gefn. de Aquat. 967. Salv. de Aquat. 123. Thynnus seu Thunnus. Raii Ichth. 176. Ejusd. Synop. Pisc. 57. Orcynus. Rondel. de Pisc. 1. 249. THE TUNNEY FISH; or SPANISH MACKAREL.*

The Tunny, which the *Latins* call *Thunnus*, is a pretty large, heavy, big-belly Fish, which is plentiful in the *Mediterranean*, especially in *Provence*, and at *Nice*, from whence comes what we sell: There are, likewise, a great many of them upon the Coast of *Spain*. The Net being taken out of the Sea, the Fish die, not being able to live out of the Water; then they hang them up in the Air, open them, take out their Entrails, and take off the Head; and, having cut them in Pieces, broil them on large Gridirons, and fry them in Olive-oil; and, after having seasoned them with Salt and Pepper, and Cloves; and some Bay-leaves, they put them into little Barrels, thus dress'd, and ready to eat with fresh Olive-oil, and a little Vinegar, or to transport into several Parts, where this is call'd *Sea Tunny*.

There are two Sorts which have no other Difference; but that some have the Black-bone taken out; and for that Reason are call'd bon'd Tunny, and are usually put up in little white Wood-barrels, broad at the Bottom, and narrow at the Top; and that which is unbon'd, is in little round Barrels: Choose both Sorts new, firm, laid in good Oil, and the Flesh white like Veal. Its Use is very common in *Europe*, and several other Parts of the World; as well because it is ready to eat; as because it is of an excellent Taste like Veal. They commonly catch with the Tunny another Fish, which the *Provincials* call *Imperador*, or Emperor; and Dolphins are, also, there to be seen.

Aristotle observes, that this Fish sometimes goes up into Rivers. It is covered with large Scales closely united to one another, and feeds upon Weeds and Sea-plants. Some relate that this Fish sees better with the Right Eye, than with the Left; and, that it is so cruel as to devour its own Young. Some Authors assure us, that it lives but two Years; but it is difficult to conceive, how, in so short a Space of Time, it can acquire so large a Size.

The Tunny contains much Oil, and volatile Salt; is firm, short, and of an excellent Taste; and yields a nourishing, solid, and durable Food; and is reckoned to be good against Poison, the Stinging of Serpents, and the Bite of a mad Dog; but it is hard of Digestion. The most delicious and juicy Part is the lower Part of the Belly, but it is farthest; it adheres to the Stomach, relaxes and debilitates the Fibres, and therefore is not so wholesome as the rest. It agrees with those who are young, bilious, and sanguine; who have good Stomachs, and are us'd to Exercise. *Lemery on Foods.*

The pickled Flesh of the Tunny cures those who are bitten

THY

by the Viper called *Præster*; but the Patient is to vomit plentifully at every Turn with large Draughts of Wine; it is of great Efficacy, also, against the Bite of a Dog, being rubbed on the Wound. Dale from *Dioscorides*.

THUREÆ GLANDULÆ. The same as *TOLLES*.

THUS. Frankincense. See *OLIBANUM*.

THUYA. See *ARBOR VITÆ*.

THYE, *Θήνη* (the Plural of *Θύη*) from *θύω*, to sacrifice, in *Galen's Exegetis*, are expounded by *θυμιάματα*, *ἀρώματα*, "Perfumes, Spices." *Hesychius* gives much the same Explication; only he puts *θύματα* (*Thymata*) for *θυμιάματα* (*Thymemata*); and *θυμιάματα*, he says, are *τὰ ἐπιπροσέμμενα ἀρώματα εἰς θυσίαν*, "the Cake offer'd in Sacrifice," *Θύεα*, in *Homer, Il. 2, Vers. 270.* are expounded by the Scholiast *θυμιάματα*, *θυσίαι*, "Perfumes (or Incense) Sacrifices."

Thye, *Thyeia*, *Thyia*, *Θήνη*, *Θύεα*, *Θύα*, are also Names for a Mortar, *Lib. 1. & 2. γυναικ. Foesius*.

THYEMA, *Θύημα*. See the preceding Word.

THYITES LAPIS. *Offic. Marth. 1386. Thyites. Boet. 415. De Laet. 142. Aldrov. Mus. Metall. 670. THE GREEN STONE.*

This Stone is of a greenish Colour, resembling the Jasper; tho', when diluted, it renders the Liquor us'd for that Purpose of a milky Colour. It is produc'd in *Ethiopia*, is of an highly pungent Quality, and, according to *Dioscorides*, removes Specks and Dimness of the Eyes.

The Thyites of *Dioscorides* is now unknown to us; but we do not find, that the Writers of former Ages were better acquainted with it. *Fuchsius* thinks, that it is the Lapis Turcius; but this Opinion is excellently confuted by *Matthiolus*. *Agri-cola*, in *Lib. 6. de Nat. Fossil.* thinks, that it is not at all different from the *Marobillius*.

THYLACOS, or THYLACION, *Θυλάκος*, or *Θυλάκιον*. A Bag, or Pouch. *Thylacion* is us'd to express the Bag form'd by the Membranes of the *Fœtus* at the Orifice of the *Pudenda*, before the Birth.

THYMA, *Θύμα*. A pruriginous Pustule excited by Heat.

THYMALLUS. See *ASCHIA*.

THYMBRA. A Name for several Sorts of *SATUREIA*.

THYMBRA HISPANICA. See *MASTICHINA*.

THYMELÆA.

The Characters are;

The Leaves are entire, the Flower is monopetalous, as it were, Funnel-shaped, and quadrid. The Ovary in the Centre of the Flower becomes an oval Fruit, full of Juice, or dry, and containing an oblong Seed.

Boerhaave mentions four Sorts of *Thymelæa*; which are,
1. *Thymelæa*; *Lauri folio*; semper virens; seu *Laureola mas.* *Tourn. Inst. 495. Boerb. Ind. A. 2. 213. Laureola. Offic. Ger. 1219. Emac. 1404. Park. Theat. 205. Raii Hist. 2. 1587. Synop. 3. 465. Laureola semper virens, flore viridi, quibusdam Laureola mas. C. B. P. 462. Laureola semper virens, flore luteolo. J. B. 1. 564. Daphnoides & Laureola. Chab. 45. SPURGE-LAUREL.*

This is a low Shrub, seldom growing above two or three Feet high; with a woody Stem about a Finger thick, covered with an Ash-coloured Bark; it is divided towards the Top into several Branches, clothed with long, thick, smooth, and shining green Leaves, which are set round the Tops of the Branches. The Flowers grow among these Leaves, being oblong greenish Tubes, divided at the Ends into four Segments, with a few yellowish Stamina in the middle, of a sweet Smell; these are succeeded by small oval Berries, of a blackish Colour when ripe. It flowers in *March* or *April*, and the Berries are ripe in *September*. The whole Plant is of an hot caustic Taste, burning; and inflaming the Mouth and Throat. It grows in Woods and Thickets. The Leaves and Berries are used, though but rarely.

They purge Bile, cholerick and serous Humours, with great Violence, both upwards and downwards; and, by some adventurous Persons, are given in the Dropsy, and to evacuate tough Phlegm from the Lungs; but, being frequently attended with dangerous Consequences, it is rarely prescribed by judicious Physicians. *Miller's Bot. Off.*

This Plant has the Qualities of the *Daphnoides* of *Pliny* and *Dioscorides*; for the Leaves vellicate and inflame the Mouth and Fauces. The same, taken inwardly, whether green or dry, purge Phlegm by Stool; and provoke Vomiting, and the Menfes. Being chew'd, they attract Phlegm from the Head; and also, promote the menstrual Flux. Fifteen of the Berries (five or ten, according to *Pliny*) are a Dose for a Purge.

The Leaves taken inwardly are very hurtful to the Stomach, provoke Vomiting, and burn and injure the internal Parts. Some Empiricks venture to use the Leaves and Berries, in hydropical Cases, to evacuate serous Humours; but, says *J. Bauhine*, we should be very cautious of exhibiting this Plant, or any Part of it, because of its extraordinary Acrimony; which however, says *Ray*, may be corrected by macerating it in Vinegar.

This *Thymelæa*, first macerated in Vinegar, then dry'd and pulverized, and the Powder sprinkled upon a Cancer, is found to be of Service in that Disorder. Cold and repellent Remedies

are proper in an occult Cancer, but not in an ulcerated one. *D. Bowle. Raii Hist. Plant.*

The Plant flowers in February, and the Bark, Leaves, and black oblong Berries, are used.

It is of an igneous, very acrid, exulcerating, and stimulating Quality; exciting Fevers; weakening the Force of the Heart, and the noble Parts; and purging Bile and bilious, Serofities with great Violence: It is corrected by Maceration in Acids. *Dale* from *Schroder*.

2. *Thymelæa*; *Lauri folio deciduo*; five *Laureola* *fœmina*. *Tourn. Inst. 595. Boerb. Ind. A. 2. 213. Mezerion, Chamelæa. Offic. Chamelæa Germanica five Mezerion. Ger. 1216. Emac. 1402. Raii Hist. 2. 1587. Chamelæa Germanica, five Mezerion vulgo. Park. Theat. 201. Laureola folio deciduo, flore purpureo, Officinis Laureola fœmina. C. B. Pin. 462. Laureola flore deciduo, five Mezerion Germanicum. J. B. 1. 566. MEZEREON, or SPURGE-OLIVE.*

This is a low shrubby Tree, with many flexible Branches, seldom growing above four or five Feet high, shooting out Clusters of Flowers, all round the upper Parts of the Branches, early in the Spring, before the Leaves appear; they are of a pale Purple, or Peach-colour, of a single tubulous Leaf, cut into four Segments at the End; of a pleasant, sweet Smell, and are succeeded by small, longish, round Berries, of a red Colour. The Leaves grow thick together on the Tops of the Twigs, about two Inches long, and scarce half so broad at the End where they are broadest. The Root is full of Branches, and runs deep in the Earth; it is planted here in Gardens, but grows wild about Geneva, and the mountainous Parts of Germany; flowering in February and March. The Root, Bark, Leaves, and Berries, are used.

They all of them purge serous and choleric Humours very violently; and help the Dropsy, and inveterate Asthma; but, we having milder, gentler, and yet as prevalent Medicines, these are very rarely used. *Miller's Bot. Off.*

The Bark, Leaves, and red Berries, are used, and agree in Virtues with those of the former. *Dale.*

It is in great Esteem among us, on account of the beautiful Aspect, and pleasant Smell, of the Flowers; and is very studiously cultivated every-where in Gardens and Green-houses. The whole Plant, except the Flowers, has a strong Smell, and a very acrid and burning Taste. There is a Variety in the Colour of the Flowers, some being of a palish Red, others white; and the Berries are the *Cocci Cnidii*, or *Grana Cnidia*, of the Shops.

This Species is, like the other, of a very caustic and exulcerating Quality: Chewed in the Mouth, it burns the Fauces and Oesophagus, the troublesome Sensation and Impression from it lasting a long time, as we are assured by *Lobel*, and by Experience. It is corrected by macerating it four-and-twenty Hours in Vinegar, as the *Elleborus* and *Blusa* are, or in the Juice of Pomegranates or Quinces, or of Purslane, or in Mucilage of the Seeds of *Psyllium*. Some correct it by infusing it in Wine, and afterwards drying it, others macerate it three Days in Vinegar, every Day pouring fresh Vinegar on it, and at last giving it a thorough washing with Water.

But the Leaves, Bark, and Berries, in what manner soever corrected and prepared, very seldom come in Use, on account of their Malignity; and are not to be exhibited, but for want of safer Medicines, and in desperate Cases, and even then with great Caution and Consideration. *Raii Hist. Plant.*

3. *Thymelæa*; *Lauri Folio deciduo*; flore albedo; fructu flavescente.

4. *Thymelæa*; *Alpina*; *linifolia*; humilior; flore purpureo; odoratissima. *Tourn. Inst. 594. Boerb. Ind. A. 2. 213. Cneoron niger. Offic. Cneoron Matthioli. Ger. Emac. 1596. Cneoron Matthioli suffrutex. J. B. 1. 570. Thymelæa minor, five Cneoron Matthioli. Park. Theat. 201. Thymelæa affinis facie externa. C. B. Pin. 463. Raii Hist. 2. 1589. ROCK-ROSE.*

It is a beautiful Under-shrub, consisting of a Multitude of slender, flexible, furculous Branches, which shoot directly out of the Earth, and diffuse themselves on the Ground. The Leaves are disorderly disposed, nearly resembling those of the *Thymelæa vera*, at first of an unpleasant, afterwards of a better Taste, with very little orinoAcrimony, as far as I could perceive by the Taste. The Flowers grow on the Tops of the small Branches, six, seven, or more, close together, and are tetrapetalous, of a red Colour inclining to purple, almost like the Flowers of the lesser Centaury, of an ungrateful and bitter Taste, but of a very beautiful Aspect, fragrant, and affecting the Head, if long smelled to. These are succeeded by a small Fruit, not unlike that of the *Thymelæa*, tho' not red, but white, and somewhat oblong, containing a Seed mix'd with an Ash-colour'd Membrane, round, and of the Size of a Grain of the *Thymelæa*. The Root is long, generally of the Thickness of the little Finger, sometimes blackish, but commonly yellowish, tough and flexible, and sometimes slender in its upper Part: Whence proceed the flexible Branches, which are dispers'd on the Ground; and here-and-there, according to the Cavities of the *Ala*, shoot forth yellowish Fibres of a competent Thickness.

It grows on many of the Mountains about Vienna in Austria in so great Abundance, that the Country-women gather the Flowers by Handfuls, and sell them in the Market, where they buy it to adorn their Dining-rooms: It flowers generally in April, and the Fruit is ripe in June; sometimes it flowers thrice in a Year. *Raii Hist. Plant.*

It agrees in Virtues with the *Chamelæa. Dale.*

The Antients us'd the Leaves of the *Thymelæa* to evacuate serous Humours; it is a most violent Cathartic, and is corrected with Sugar. *Hist. Plant. adscript. Boerb.*

Besides the foregoing Sorts of *Thymelæa*, *Dale* mentions the two following; which are,

1. *THYMELÆA. Offic. Ger. 1217. Emac. 1403. Park. Theat. 201. Raii Hist. 2. 1588. Thymelæa foliis Lani. C. B. P. 463. Tourn. Inst. 594. Thymelæa Monspeliaca. J. B. 591. SPURGE-FLAX.*

This is a Shrub an Inch sometimes in Thickness, and a Cubit or more in Height, and divided into many slender, beautiful strait Twigs, a Cubit in Length, surrounded by evergreen Leaves, pretty well resembling those of Flax, but larger and broader, not blunt like those of the *Chamelæa*, nor so brittle, but mucronated, tough, and feeling somewhat gummy under the Teeth. The Flowers grow in great Plenty on the Ends of the Branches, and are tetrapetalous, white, nearly resembling those of the *Olea*, or Olive-tree, and generally hang in Clusters. The Fruit is sometimes of the Size of Myrtle-berries, but somewhat longer, green at first, but afterwards red as Coral, with a juicy Pulp, like that of Cherries, inclosing a Seed, cover'd with a black and frail Membrane, and containing a Medulla of a fervid Taste. The Root is hard and woody, and cover'd with a thick, but very tough and tenacious Bark, as is also the whole Plant.

It grows in Italy, and in Provence and Languedoc in France, in low Grounds, among other Shrubs, almost every-where. *Clusius* says, that it grows in rugged Places over all Spain.

The most skilful Botanists take the Fruit of this Plant to be the *Coccus Cnidius*, or *Grana Cnidium* of the Antients, tho' the Shops take the Berries of the *Mezereon* for the *Grana Cnidia*. The *Coccus Cnidius* is of a very caustic Quality, and burns the Fauces, whence we wonder, that Partridges and small Birds feed so greedily on the Berries of the *Thymelæa*. But the *Grana*, or Grains, are not the entire Berries, which perhaps are eatable, but the Seeds which are inclosed in the Berries. The Peasants of Spain catch vast Numbers of small Birds with this Seed, by Help of a crooked Rod, and some Lime, as we are inform'd by *Amatus* and *Clusius*. We are advis'd by *Camerarius*, to beware of eating the Root, because it proves mortal in a few Hours. *Raii Hist. Plant.*

It is cultivated with us in the Gardens of the Curious, and the Berries called *Grana Cnidia* are used, being of a caustic Quality. The English Shops, as well as some of the most skilful Botanists, take the Fruit for the *Coccus Cnidius*, or *Grana Cnidia*, but *Cordus* and *Schroder* will have the Berries of the *Mezereon* to be the *Grana Cnidia* of the Shops. *Dale.*

2. *SANAMUNDA. Offic. Sanamunda prima Clusii. Ger. Emac. 1595. Park. Theat. 203. Thymelæa foliis Chamelæa minoribus subbisjuriis. C. B. P. 463. Tourn. Inst. 594. Thymelæa foliis candicantibus, serici instar molibus. Raii Hist. 2. 1538. Tarton-raire Massiliensium. Park. Theat. 199. Tarton-raire Gallo-Provinciæ. Ger. 408. Emac. 506. Tarton-raire Massiliensium, Sanamunda prima Clusii. J. B. 1. 523. HEATH-SPURGE.*

This is a Shrub, a Cubit in Height, very ramous; the Root runs very deep in the Earth, and is cover'd with a Bark extremely viscous and pliant, and capable of being drawn into very small Threads, not without Flocks, which you may call Wool: The Branches are, also, cover'd with the like Bark; but overlaid with a dense, whitish, and, as it were, Silver-colour'd tomentaceous Substance. The Leaves are of the Size of those of the *Tarentine* Myrtle, only a little broader towards the Extremity, and ending in a more obtuse Point, quite cover'd with Down, soft to the Touch, and whitish, or Silver-colour'd, and shining. From the midst of these Leaves proceed the Flowers, resembling those of the *Olea*, yellow, oblong, and tetrapetalous. The Fruit, as *Clusius* was inform'd, is much like that of the *Thymelæa*, but of a blackish Colour. The same Author *Clusius* says, that the Leaves are carnos, gummous, and bitterish at first; but leaving an acrimonious and burning Taste behind.

It grows about *Marseilles*, on the Declivities towards the Sea, and very plentifully on the dry, squalid, and gravelly Hill called *Ment rond*.

The Leaves are of a caustic Quality, as has been said, and very much in Use among the Spanish Peasants, on account of their cathartic Virtue; but this Property, says *Lobel*, is so violent, and difficult to be restrained, that it frequently induces Dysenteries, and immoderate Fluxes; and therefore is not to be given but to robust Persons, and then with Caution. *Raii Hist. Plant.*

THYMELÆA is, also, a Name for the *EMPETRUM*; which see.

THYMIAMA, *θυμίαμα*. A Suffumigation of Aromatics.
THYMION, *θυμίων*. A Caruncle, or Tubercle, generated in the Pudendum, Anus, Glans, or Præputium. *Galen. M. M. Lib. 14. Cap. 13. & Lib. de Tumor. præter Nat.* The Latins call it *Thymion* and *Thymus*. *Hippocrates, Lib. de Ulceribus*, says that the Parthenium called *μυρτίσουλλον* (*tenuifolium*) cures a *Thymion* affecting the Præputium.

What they call an *Acrothymion* (*Thymion*) says *Celsus*, elevates itself above the Superficies like a Wart, being narrow and slender at the Skin, but broader above, somewhat hard, and very rough at the Top, where it is of the Colour of the Flowers of Thyme, whence it has its Name, and easily cleaves and bleeds, and sometimes discharges a small Quantity of Blood. It is usually of the Size of an Egyptian Bean, seldom bigger, sometimes very small; sometimes but one, sometimes several together, are generated in the Palms of the Hands, or Bottoms of the Feet; but the worst and most subject to bleed, are those which affect the Pudenda. *Celsus, Lib. 5. Cap. 28.*

Thymi, *θυμίοι*, in *P. Aegineta, Lib. 6. Cap. 58.* are carnosous Tubercles, affecting sometimes the Glans, sometimes the Præputium; and, *Cap. 71.* he says, *Thymus* is an Eminence in the Skin, sometimes red, sometimes white, for the most part indolent, and of the Figure of the Tufts or Tops of the Herb Thyme.

For the Cure of the *Acrothymion*, or *Thymion*, *Celsus* recommends a Caustic prepared of the Lees of Wine, or a Fig boiled in Water.

THYMITES, *θυμίτης*. An Epithet for Wine impregnated with Thyme. *Dioscorides, L. 5. C. 59.*

THYMOXALME. A Preparation of Vinegar, Thyme, Salt, and some other Ingredients, given by *Dioscorides, L. 5. C. 24.* See **ACETUM**.

THYMUS, *θύμος*, in Nosology, is a small, indolent, carnosous Tubercle, like a Wart, arising sometimes about the Anus, and sometimes about the Pudenda, of both Sexes, resembling in Shape the Flowers of Thyme.

THYMUS, in Anatomy, is that Gland, which in Calves, Lambs, and young Animals, is call'd the Sweetbread.

The Thymus is an oblong, glandular Body, round on the upper Part, and divided below into two or three Lobes, of which that toward the Left Hand is the longest. In the Fœtus it is of a pretty large Size, less in Children, and very little in aged Persons. In Children it is of a white Colour, sometimes mixed with Red; but, in an advanced Age, its Colour is generally dark.

The greatest Part of the Thymus lies between the Duplication of the superior and anterior Portion of the Mediastinum, and the great Vessels of the Heart, from whence it reaches a little higher than the Tops of the two Pleuræ, so that some Part of it is out of the Cavity of the Thorax; and in the Fœtus, and in Children, it lies as much without the Thorax as within it.

Its particular inward Structure and Secretions are not as yet sufficiently known to determine its Uses, which however seem to be designed more for the Fœtus, than for Adults. It has Vessels belonging to it, called *Arteries* and *Vena Thymica*. *Winslow.*

THYMUS, in Botany, is a well known Plant; the Characters of which are;

The Leaves are short, narrow, and rigid; the Stalks ligneous, small, and erect. The Galea is erect, and generally bifid; and the Beard divided into three Parts. The Flowers are collected into little Heads, the lower Whorle being remov'd at some Distance from the Head.

Boerhaave mentions five Sorts of *Thymus*; which are;

1. *Thymus; vulgaris; folio latiore.* C. B. P. 219.
2. *Thymus; vulgaris; folio tenuiore.* C. B. P. 219. *Tourn. Inst. 196. Boerb. Ind. A. 155. Thymus. Offic. Thymum-durius.* Ger. 458. Emac. 573. *Raii Hist. 1. 521. Thymum-durius vulgare.* Park. Theat. 7. *Thymum-vulgare rigidius; folio cinereo.* J. B. 3. 263. **THYME.**

The common Thyme seldom grows above half a Foot high, full of slender, round, and somewhat hairy Stalks; having two small roundish Leaves, a little pointed at the Ends, set opposite at a Joint: The Flowers grow in loose Spikes towards the Top of the Branches, set in Whorles among the Leaves, of a purple Colour, galeated, and labiated in small hairy Calyces; both Leaves and Flowers have a strong pleasant Smell, and an hot Taste; the Root is composed of a Bush of stringy Fibres. It is planted in Gardens, but grows wild in Spain and Italy, and flowers in July. The whole Plant is used.

Thyme is heating and attenuating, good to free the Lungs from viscid Phlegm; and by that means is helpful to those who are troubled with Wheezy and Shortness of Breath. It is likewise, cephalic, and of Use against all Diseases of the Head and Nerves.

The only Official Preparation is the *Oleum Thymi distillatum*. Distill'd Oil of Thyme. *Miller's Bot. Off.*

There is scarce a more common Herb in Provence and Languedoc. The Virtues are suppos'd much the same with those of **SERPILLUM**; which see: But it is particularly serviceable

in tartareous Affections of the Lungs and Joints, frees all the Viscera from Obstructions, and excites an Appetite, &c. *Dale* from *Schroder.*

3. *Thymus; capitarus; qui Dioscoridis.* C. B. P. 219. *Raii Hist. 1. 519. Tourn. Inst. 196. Boerb. Ind. A. 155. Thymum-verum.* Offic. *Thymum Creticum.* Ger. 459. Emac. 574. *Thymum Creticum sive Antiquorum.* J. B. 3. 262. *Thymum levisimum capitatum.* Park. Theat. 6. *Hyssopus capitata minor, Thymi odore.* Hist. Oxon. 3. 360. **TRUE THYME.**

It grows plentifully about Seville and Cadiz, where the Island is join'd by a Bridge to the Continent, and over all Andalusia, on the maritime Hills, facing the Sun, and in the Islands of Crete, Sicily, and Corcyra; and in the Island of Cithera, now Cerigo, there is another Species or Variety of it, with lesser Leaves, growing in Parcels together. It is found over all Greece, as *Bellonius* tells us; and no Herb is more common on the Mountains, where, according to the Variety of Soil, it produces a Flower, sometimes all white, sometimes bluish, or purple, or mixt.

This Thyme, with Vinegar and Salt, purges Phlegm by Stool; the Decoction is serviceable in an Asthma and Orthopnea, expels the small Worms called *Timeæ* from the Belly, provokes the Menes, and brings away the Birth and After-birth, and is a good Diuretic. Made into an Eclegma with Honey, it facilitates Expectoration; it dissolves Tumors, dissolves concentered Blood, and removes Warts, being rubbed on the Parts with Vinegar. Apply'd with Wine and Polenta, it gives Relief under the Sciatica; and, used in Food, helps Dimness of Sight, and is very good for healthy Persons to eat as Seasoning to their Meats. *Dioscorides.*

Pliny ascribes the same Virtue to it, and adds, that it is exhibited to epileptic Persons, who are roused from their Fit by the Smell of Thyme, and to Men afflicted with Inflations, Flux of the Belly, or Pains of the Testes or Bladder; that, being bruised, and apply'd with Oil on Wool, it is effectual in the Gout and Luxations; and that, for the Gout, it is taken, also, inwardly, to the Weight of three Oboli in three Cyathi of Vinegar and Honey.

The Inhabitants of Seville, as *Clusius* says, use a Decoction of Thyme, in washing out and cleansing their Wine-vessels, because of its most grateful Smell; and it is of no less Service in giving a good Scent to those Vessels in which they preserve their Grapes. *Raii Hist. Plant.*

4. *Thymus; vulgaris; folio tenuiore, candido & graveolente.* C. B. P. 219.

5. *Thymum; legitimum; cephalotes; angustifolium.* *Salvad. Boerb. Ind. alt. Plant.*

This Plant is excellent in Suffumigations to revive the Spirits; and, by its extraordinary Fragrancy, is very comfortable to the Brain, and highly exhilarating to the Heart. Infused in cold Wine, it cures the Bites of all venomous Animals, and is recommended against the Bite of a mad Dog. It is very effectual against pituitous and cold Diseases, particularly the Asthma and Cough. A Conserve is prepared of the Leaves with Sugar, and kept in China or Glass-vessels; there is, also, a medicated Wine made of the same, and, also, a Water which has the same Virtues in curing almost all Diseases of the Breast incident to aged and phlegmatic Persons; but in hot or inflammatory Diseases these Plants are not to be used. A little Thyme mixed with Wine gives it a most grateful Savour, and both the Smell and Taste of it are very penetrating; whence it becomes sudorific, inciding, penetrating, healing, and opening; and is of Service in the flatulent Colic, restores a decay'd Appetite, is properly given in difficult Labour, and removes Obstructions of the Menes: Externally used, it is effectual against the Pain of the Gout, and cold Tumors. *Hist. Plant. adscript. Boerb.*

THYMUS CEPHALOTES. A Name for the *Satureia; Virginiana.*

Besides the foregoing Sorts of *Thymus*, *Dale* mentions the following;

- THYMUS SYLVESTRIS.** Offic. *Thymus Narbonensis Zygis dictus Serpyllum Creticum.* Ger. 456. Emac. 571. *Serpyllum Narbonense.* Park. Theat. 7. *Serpyllum folio Thymi.* C. B. P. 220. *Raii Hist. 1. 523. Serpyllum sylvestre, Zygis Clusio, Thymo-vulgari rigidiori simile.* J. B. 3. 271. *Thymbra Hispanica Coridis folio.* *Tourn. Inst. 117.* **WILD THYME.**

This Thyme, as *Clusius* describes it, in Appearance, Branches, Height, and Roots, is very like the common Thyme; only its Leaves are somewhat broader, and not so sweet-scented; but have a stronger Smell, as between that of *Abrotanum* and *Stachas*. The Flowers, also, are disposed in Whorles on the small Branches, and are of a white Colour, inclining to Purple; by which Disposition of the Flowers, and its Smell, it can almost only be distinguish'd from the common Thyme. It has, also, less Acrimony, as having a Mixture of Astringency. *Raii Hist. Plant.*

It grows in Old Castile in Spain, in the same Places with the other Thyme; but is cultivated with us in the Gardens of the Curious, and is esteem'd to have the same Virtues with the *Thymus Offic.* or common Thyme. *Dale.*

THYNNUS. See **TRUNNUS.**

THYROARETÆNOIDEI MUSCULI. Two Muscles of the Larynx. See LARYNX.

THYROIDEÆ GLANDULÆ. The Thyroide Glands. On the lower Part of the Larynx, upon the Sides of the annular Cartilage, and of the first Ring of the Trachea, there are two lymphatic Glands called *Thyroidea*, of the Figure of a Pear; their Colour is red; they have Veins, Nerves, and Arteries, as the Larynx. *Keil's Anatomy.* See LARYNX.

These Glands secrete a lubricating Fluid, which moistens the Cartilages and Muscles of the Larynx. *Boerhaave's Institutes.*

THYROIDES, *θυροειδής*, from *θυρεός*, a Shield, and *είδος*, Shape. The Name of a Cartilage of the LARYNX; which see.

THYROPHARYNGÆI MUSCULI. Two Muscles of the Pharynx. See OESOPHAGUS.

THYROSTAPHYLINI MUSCULI. Two Muscles of the Uvula. See PALATUM.

THYRSUS. See ACANTHUS.

THYSSELINUM.

The Characters are;

The Root is perennial, large, and very full of a lacteous Juice, as is, also, the whole Plant; it has the Leaf of the *Ferula* or *Phellandrium*. The Seed is oval, flat, large, striated, margined, and sometimes casts its Husk.

Boerhaave mentions two Sorts of *Thyselinum*; which are;

1. *Thyselinum.* Plinii. See APIUM.

2. *Thyselinum*; palustre. T. 319. *Seseli, palustre, lactescens acre, foliis ferulaceis, flore albo, semine lato.* J. B. 3. 2. 188. *Seseli, palustre, lactescens.* C. B. P. 162. Prodr. 85. *ic. Ancho Pyrethrum umbelliferum.* C. B. P. 148. *Boerb. Ind. alt. Plant.*

Thyselinum is from *θύω*, (*thyo*) to be hot, and *σέλινον*, (*Selinon*) Apium; that is to say, hot Apium.

It is a very acrid Plant, so that when I first found it in the Ditches; and tasted it, I felt my Mouth and Fauces inflamed. We are to rank it, therefore, among those Plants which are of the most acrimonious Nature; and, tho' it may have its Use in Medicine, it must be with a great deal of Caution. The Roots are aperient and penetrating, and provoke Urine and the Menfes. It grows in watry Places; the Milk is much of the Nature of Scammony, and may be substituted in its room. *Hist. Plant. adscript. Boerhaav.*

TIBERIANUM TORMENTUM. The Colic.

TIBIA. The larger Bone of the Leg. See CRUS.

TIBIÆUS. The same as TIBIALIS.

TIBIALIS. An Epithet for several Muscles. Thus there is the TIBIALIS ANTICUS.

This is a long Muscle, fleshy at the upper Part, and tendinous at the lower, situated on the fore Side of the Leg, between the Tibia and the Extensor Digitorum Longus.

It is fixed above by fleshy Fibres, in the upper third Part of the external Labium of the Crista Tibiæ, and of the Inside of the Aponeurosis tibialis, or of that ligamentary Expansion, which goes between the Crista Tibiæ, and the anterior Angle of the Fibula. It is, also, fixed obliquely in the upper Two-thirds of the Outside of the Tibia, or that next the Fibula.

Thence it runs down, and ends in a Tendon, which first passes through a Ring of the common annular Ligament, and then through another separate Ring, situated lower down. Afterwards the Tendon is fixed partly in the upper and inner Part of the Os Cuboides, and partly in the Inside of the first Bone of the Metatarsus.

The Tibialis Anticus bends the Foot, that is, turns the Point of the Foot toward the Leg; which Motion is performed by the Ginglymoide Articulation of the Astragalus with the Tibia and Fibula. It, likewise, bends the Leg on the Foot, or hinders its Extension. The first of these Uses is generally known; and we have an Instance of the second, every time we stand or walk. When we stand, the Feet being turned directly forwards this Muscle, like a Frænum, keeps the Leg in Æquilibrio, and hinders it from falling backward. This Use is still more evident, when we walk backwards.

By its lateral Insertions in the Os Cuneiforme Maximum it moves this Bone, in particular, over the anterior Extremity of the Os Calcis, by which the Sole of the Foot is turned inwards toward the other. This lateral Situation of its Insertion is the Reason why it cannot bend the Foot directly, without the Help of the anterior Peronæi; neither can it alone keep the Leg in Æquilibrio, when we stand on one Foot. *Winflow.*

TIBIALIS GRACILIS. See PLANTARIS.

TIBIALIS POSTICUS.

This is a long fleshy penniform Muscle, broader above than below, situated between the Tibia and Fibula on the back Side of the Leg, and covered by the Extensor Digitorum Longus.

It is fixed above by fleshy Fibres, immediately under the Articulation of the Tibia and Fibula, to the nearest Parts of these two Bones, principally to the Tibia, reaching to the lateral Parts of that Bone, above the interosseous Ligament, which is here wanting.

From thence its Insertion is extended below the oblique Line

or Impression in the Tibia, over all the neighbouring Part of the interosseous Ligament, and through more than the upper Half of the internal Angle of the Fibula.

Through all this Space it is fleshy, penniform, and covered by the Extensor Digitorum Longus, which sometimes communicates with it by a middle Tendon, and sends off an Aponeurosis to it, which does the Office of a Frænum.

After this it forms a Tendon, which runs down behind the inner Malleolus, through a cartilaginous Groove; and an annular Ligament, passing under the Malleolus, is inserted in the Tuberosity or lower Part of the Os Scaphoides. This Tendon is sometimes divided into two, either of which, crossing a little over that of the Peronæus Longus, is fixed in the Os Cuboides.

When the Tibialis Posticus acts alone, it extends the Foot obliquely inward. When it acts together with the Gastrocnemii and Soleus, it changes the straight Direction of their Motion to an oblique one. When it acts with the Tibialis Anticus, the Sole of the Foot is turned more or less directly inward or toward the other Foot. *Winflow.*

TIBURO.

This is a large ceraceous Fish, found in the Indian Ocean, which is sometimes twenty Feet in Length, and ten in Thickness. In its Head are found three or four bony, insipid Stones, which may be easily scraped into Powder. The Stones are reckon'd good for the Stone, and a Difficulty of Urine, serving to dissolve the Stone in the Kidneys and Bladder. *Lemery des Drogues.*

TIFACOU. Quicksilver. *Rulandus.*

TIFATUM. Sulphur. *Rulandus.*

TIGALA. An Arabic Epithet for Sugar. *Cassellus.*

TIGILLUM. A Tile. According to *Blancard*, a Crucible.

TIGRIS. Offic. Aldrov. de Quad. Digit. 101. Gesn. de Quad. Digit. 936. Jons. de Quad. 84. Charlt. Exer. 14. Schw. Quad. 130. Raii Synop. A. 165. **THE TIGER.**

The Part of this Animal used in Medicine is the Fat, which is suppos'd to agree in Virtues with the Fat of a Dog. *Dale.*

TILIA.

The Characters are;

The Calyx is pentaphylloidal, the Flower rosaceous, polypetalous, and furnished with numerous Stamina. The Ovary has a long Tube, with a globous Apex, and becomes a roundish uncapitular Shell, containing oblong Seeds.

Boerhaave mentions five Sorts of *Tilia*; which are;

1. *Tilia*; *scemina*; folio majore. C. B. P. 426. *Tourn. Inst. 611. Boerb. Ind. A. 2. 230. Tilia.* Offic. *Tilia femina.* Ger. 1298. Emac. 1483. *Tilia femina major.* Park. Theat. 1407. *Tilia vulgaris platyphyllos.* J. B. 1. 131. Raii Hist. 2. 1694. Synop. 3. 473. **THE LIME-TREE.**

This is a Tree well known, having an handsome Body with a smooth Bark, spreading its Branches round in a regular manner; the Leaves are broad and roundish, with a sharp Point, serrated about the Edges; at the Foot of these, in the Summer spring out thin leafy Ligulas, of a yellow Colour, from the middle of the back Ribs of which arise Stalks about an Inch long, divided into four or five shorter ones, each bearing a yellow, five-leaved, sweet Flower, succeeded by a small hoary Fruit about the Size of a Pea. Limes grow every where about Gentlemens Seats, and in Parks, and flower in July.

We seldom use any thing but the Flowers, which are accounted cephalic and nervine, and good for the Apoplexy, Epilepsy, Vertigo, and Palpitation of the Heart. They are put in the compound Peony-water, and the Spirit of Lavender. The *Aqua Florum Tiliæ*, or Water of the Flowers of the Lime-tree, takes its Name from them. *Miller's Bot. Off.*

The feminal Leaves of the Lime-tree, as *J. Bauhine* observes, are generally cut into five Divisions, as into so many Fingers, the extremes and middle one exceeding the rest in Length, which is a Thing rare and singular.

Thalys observ'd an Excrescence, or Tumor, like the Gall of an Oak, in the Roots of old Lime-trees. *Raii H. P.*

It is planted in Walks and Areas, flowers in June, and the Leaves and Flowers are used. The Leaves are drying and repellent, and provoke Urine and the Menfes. The Flowers are heating and drying, and of fine Parts, discutient, and cephalic. *Dale.*

2. *Tilia*; *scemina*; folio minore. C. B. P. 426. *Tourn. Inst. 611. Boerb. Ind. A. 2. 230. Tilia.* Offic. *Tilia folio minore.* J. B. 1. 137. Raii Hist. 2. 1695. Synop. 3. 473. *Tilia.* Offic. *five facunda Pseudopiperifera.* Hoff. Cat. Altorff. **THE SMALLER LIME-TREE, BAST, or PEPPER-TREE.**

It grows in Woods and Hedges; the Flowers are used, and agree in Virtues with those of the former. *Dale.*

3. *Tilia*; foliis molliter hirsutis; viminibus rubris; fructu tetragonis. *Raii Synop. 316.*

4. *Tilia*; folio subtrus glauco Populi.

5. *Tilia*; folio magno; ramis erectissimis. *Boerb. Ind. alt. Plant.*

The Bark and Leaves of the *Tilia* are drying and repellent; the Mucilage of the Bark is of great Use in Wounds and Ambustions. *Dodonaus* recommends the Bark chew'd, and apply'd for these Purposes. The Leaves bruised, and sprinkled with Water,

Water, discuss Tumors of the Feet, and are accounted a singular Remedy for the Aphthæ, and fluxulent Spasms in Women with Child; the expressed Juice, mixed with Wine, and rubbed hot on the Joints, is good for the same spasmodical Affections.

The Flowers are of fine Parts; their Smell is extremely sweet, and the Water of Use in cephalic Affections; it is commended in Palpitation of the Heart, Pains of the Uterus, Stone in the Kidneys, and Concretions of Blood occasioned by Contusions. Some mix therewith Powder of Charcoals made of the *Tilia*. The Dose is an Ounce, or an Ounce and an half; some exhibit the same against the Gripes; and Women use it as a Cosmetic.

The Berries, reduced to Powder, are highly commended in the Dysentery, and other Fluxes of the Belly; the same, bruised with Vinegar, and put up the Nostrils, stop Bleeding at the Nose; and some of the Berries, swallowed, are said to be very effectual for that Purpose.

The Ancients wrote on the inner Bark of the *Tilia*, called *Philyra*, while it was fresh. *Rais H. P. p. 1694.*

The distilled Water of the Flowers is good against the epileptic Disorders of Children, and against hypochondriac and cephalic Affections. Externally they are recommended in the Form of a Cataplasm in a Teneismus. *Hist. Plant. adscript. Boerhaav.*

The *Tilia* affords us some very good Remedies, particularly in the Flowers, by an Infusion of which in Water, after the manner of Tea, with long and constant Use, I have known an inveterate Epilepsy perfectly cured. The Water of the Flowers is specific in all Diseases where Pains or Convulsions are predominant; whence it justly deserves the Name of *Polychrestum*. The middle Bark of the Tree, reduced with Water to a Mucilage, is of incomparable Virtue in mitigating Pains, Heats, and Inflammations; whence it gives immediate Relief in the Pain of the Arthritis and Podagra. *F. Hoffman.*

TILMATA, *τίλματα* (the Plural of *τίλμα*, *Tilma*), from *τίλλω*, to vellicate. Vellications. *Galen, Com. 3. in Lib. nat. intp.* tells us, that Spasms affect the Fibres of the Muscles, which are distended to such a Degree, as to cause a Rupture in some of them; and that these Spasms are, by the more modern Physicians, properly called *τίλματα*, Vellications.

Τίλματα (called, also, *τίλματα* and *τίλτα*) in *Hippocrates, Lib. περί ευσχημ.* signify scraped Lint, or Tents of the same. Thus, also, *Archigenes, in Galen, Lib. 2. τῶν κατὰ τόπον*, by *τίλμα* and *τίλματιον* (*Tilmation*), means a kind of scraped Lint, proper for Wounds of the Head, and otherwise called *μοτὸν τίλτον*, (*Moton tilton*) or, simply, *τίλτον* (*Tilton*); and number'd among the five Kinds of *μοτὸς* (*Motos*), or Lint.

Τίλμοι (*Tilmoi*), in *Hippocrates, Lib. περί χυμῶν*, and *1 Epid. Sect. 3.* signify Vellications of the Bed-clothes, plucking Hairs out of Garments, or picking Motes from the Wall, and such-like Morions as are usually practised in a Delirium, by those who labour under acute Diseases, as a Phrensy and Peripneumony. Sometime *τίλμοι* signify Vellications or Lancinations of the Parts from acrimonious Humours, or corroding Pus; sometimes, also, Vellications of the Parts by the Patients themselves; when under a Delirium, as we are informed by *Galen, Com. 3. in 1 Epid.*

TIMÆI COMPOSITIO AD IGNEM SACRUM VEL CANCRUM. The Name of a Composition in *Celsus, Lib. 5. Cap. 22.*

TIMARTIRI. This Word occurs in *Nicolaus Myrepsus, Sect. 1. Cap. 150.* *Fuchsus*, his Commentator, confesses, he don't know what the Author means, unless it be burnt Silk.

TIMBO. See *GUAIANA*.

TIN. Sulphur. *Rulandus.*

TINA. A Bath, of great Service in the Colic.

TINCA. Offic. *Schrod. 5. 334.* *Aldrov. de Pisc. 645.* *Bellon. de Aquat. 324.* *Gesf. de Aquat. 984.* *Charlt. de Pisc. 43.* *Mer. Pin. 190.* *Jonf. de Pisc. 114.* *Rondel. de Pisc. 2. 157.* *Salv. de Aquat. 90.* *Rais Ichth. 251.* *Ejusd. Synop. Pisc. 117.* *Schonf. Ichth. 76.* **THE TENCH.**

It is a mucous, excrementitious Fish, which delights in marshy and muddy Waters. As to its Uses, it is cut abroad, and apply'd to the Wrists, and Soles of the Feet, in order to mitigate feverish Heats, and to divert the Venom of the Pestilence; in like manner is it apply'd in Pains of the Head and Joints. Live Tenches, apply'd one after another to the Regions of the Umbilicus and Liver, and kept there till they die, are said to cure the Jaundice; for they contract, it seems, a yellow Colour. *Schroder* says, that he has seen an incinerated Tench, and especially its Tegument, exhibited with Success in the *Fluor. Albus*.

TINCAR. See *BORAX*.

TINCONES. Bubos. *Fallopis de Morb. Gallico.*

TINCTORIA Arbor, J. B. is a Tree growing in the Kingdom of *Jenago* in *Ethiopia*, of the Thickness of our glandiferous Trees, bearing a Fruit like a Date, from which is extracted an Oil of admirable Virtue. This Oil, mixed with Water, turns it quite of a Saffron-colour, and with the same Colour they dye their Caps, and their Caps, which are made of a Contexture of Rushes, or Rice-straw; the Oil smells like the *Viola Martia*, and tastes like our Oil; for which Reason many use it in seasoning their Fish, Rice, and other Food. *Rais Hist. Plant. 1794.* from *M. Thevet.*

TINCTORIUS FLOS. A Name for the *Genista*; *tinctoria*; *Germanica.*

TINCTURA. A Tincture.

The Processes of Distillation, and that for extracting Tinctures, differ only in this, that the former can take out those lighter Parts only which are able to rise in Vapour; and the latter, all such Parts as are capable of being suspended in a Menstruum.

The Management and Rules of Procedure in Tinctures, Elixirs, medicated Wines, Vinegars, Decoctions, and Infusions, depend upon the same Reason and Principles; these several Forms differing only in the Finesses of the Materials for Suspension in Fluids of different Consistences, and the best manner thence arising for drawing them out: The principal Rule in all which is, that the Liquor made use of for a Menstruum, or Vehicle, be more or less spirituous, as the Ingredients which are ordered in it are of a lighter or more fixed Nature; and the Times of standing in Digestion, either hot, or cold, are, also, to be proportion'd accordingly.

Under the Denomination of Tinctures and Elixirs are generally included those Things of a volatile, light Texture, which best give out their Virtues to spirituous Liquors; and these are either simple or compound. Of the former are the Tinctures of Saffron, Castor, Myrrh, Sulphur, Snake-root, and red Roses; all which are ordered in Liquors, judged suitable to their respective Textures and Virtues. Saffron is drawn with the Treacle-water in the Intention of an Alexipharmic; but as a Cordial, and for the better Preservation of its Colour, which soon fades with any Acid, Liberty is given to infuse it, also, in Canary, or *French Brandy*. The Tincture of Castor is, likewise, drawn by a Spirit with equal Ease and Readiness, because both these are of a lax Texture, and soon open in such Vehicles; but the Myrrh, upon Account of its Tenacity, requires a Mixture of Salt of Tartar with it, and to stand for some time, previous to its Infusion in Spirit; by which means its adhesive Texture is broken, and it comes more readily to unite with the Spirit afterwards. Something like to this is ordered with the *Virginian Snake-root*, it being directed to be drawn with the Tincture of Salt of Tartar; but if this Root is broke small in a Mortar, it gives out all its Warmth to a various Spirit; and some rather prefer it, because the Tincture of Salt of Tartar gives it a nauseous urinous Scent, and makes it almost intolerably burning in the Stomach; which Quality in itself is frequently moderated with Acids, which is a very opposite Management to this. The red Roses are drawn only with hot Water acidulated with Oil of Vitriol, which not only greatly assists the Intention of an Astringent in all Instances, as well as this, but, likewise, contributes to strike a most beautiful red Colour. The Tincture of Poppies become a Compound only by the Addition of some Nutmeg; and it agrees with the Roses in this respect, of being greatly improveable in its Colour by Acids, but both would change into a most unsightly Green, were Salt of Tartar, or any alkalious Matter to touch them; a Difference very proper to take notice of.

In all compound Tinctures or Elixirs, drawn with a Spirit, and where the Dose is so small, as to be assigned in Drops, particular Care ought to be taken not to interpose any Ingredients, which are not of proportionable Efficacy with the rest, howsoever they may agree in Intention. For it is not here as in Distillation, where an useless, or a weak Ingredient may do no Harm; because, in a Tincture, every such one will so help to fate the Menstruum, that it will be less able to take up Things of more Efficacy, and will consequently be, in the Whole, a weaker Medicine. Thus, in *Mynsicht's* Elixir of Vitriol, tho' Mint certainly comes within the Intention of a Stomachic, and Sage may be allowed to do so too; yet, in a Medicine that will not bear Exhibition in a larger Quantity than twenty or thirty Drops for a Dose, such things are very improperly crouded; for, besides the Hindrance they occasion to the Menstruum in taking up the other more efficacious Ingredients, by saturating it with something from themselves, if we compute the Share they have in a Dose, it will vanish almost to nothing; for here is no more than half an Handful of these Things, in a Quantity that makes some Thousands of Doses; whereas common Experience informs us, that they may be, and frequently are, taken with our common Food, in as large Quantities as they enter into the Whole of this Composition, without any Inconvenience. What the Sugar-candy does in this Composition is, likewise, not easy to guess or justify; and the Oil of Vitriol seems to be ordered in too large a Quantity, the Sharpness of that necessarily making a Dose small, that the Spices have not a due Proportion in it. But the greatest Error in this celebrated Medicine consists in the making, when all the Ingredients are digested together; for the Oil of Vitriol entirely burns and hardens them, so that they not only give out their Virtues the less, but, also, deform the Whole with a blackish dirty Colour; both which Inconveniencies might be avoided by infusing the Spices in the Spirit alone; and, after that is strained fine, the Oil of Vitriol might be added, which then only gives it a thicker Consistence, and somewhat raises its Colour.

The same is observable of the Acid in that Sort of Elixir Proprietatis, which is made with it. If it be put upon the Ingredients with

with the Spirit, it unites them for giving out their Virtues, and will not admit of so good a Colour or Consistence, as when put in afterwards.

These Remarks naturally lead us to another Circumstance, very necessary to be regarded in the Extraction of all compound Tinctures; and that is, when the Ingredients are so different in Texture, that some open and take the Menstruum much sooner than others, they ought to be drawn separately, with a proportionable Part of the Menstruum, because, otherwise, those which with most Difficulty give out their Virtues, will have very little or no Share in the Composition. Thus, in the common *Elixir Proprietatis*, though there are but three Ingredients, yet they are so unequal in their Fitness for Solution, that if they are put in together, the hardest, which is the Myrrh, will, in a good measure, be lost; because the Spirit will be very soon loaded with the other two, and, consequently, become less able to take up the Myrrh. If, therefore, they are all infused in their proper Shares of Spirit, they will be all easily dissolved; and when put together afterwards, with the Addition of the Acid, they will make a most beautiful high-coloured Tincture, almost of the Consistence of a Syrup. To this Rule the *Elixir Proprietatis* of Helmont hath a particular Regard, where the Aloes and Saffron, which are of the loosest Texture, are dissolved together, and the Myrrh separately from them both, the several Tinctures being at last united.

Thus, likewise, in the compound Tincture of Myrrh, if the Myrrh be first dissolved, the Aloes, with equal Ease, will afterwards be taken up; but if they are put in together, the Aloes loads the Spirit so soon, that the Myrrh will be much longer in Solution. And in all the liquid Laudanums, if the Spices are first drawn out, the Opium will soon dissolve afterwards; but if the Opium be put in with them, they will give out their Virtues to great Disadvantage. Thus, also, in the *Elixir Salutis*, if the Seeds, Liquorice, and Raisins, were added, after the harder Ingredients had stood some time in the Spirit, the Medicine would be the better; but these are Circumstances which very few Compounders will be exact enough to observe.

The usual Intentions, for which Tinctures are ordered in common Practice, are those of Cephalics, Stomachics, or Cathartics. The Cephalics take in oleous and aromatic Simples, and such as are called for in nervous Affections; the Stomachics receive the same things in Conjunction with Bitters; the Cathartics, such as are appropriated to that Distinction by their purgative Qualities. In all nervous Cases, the odorous Simples are best brought into Tincture with spirituous or vinous Liquors, as they most readily give out their Virtues to them; and this is best done cold; or, when Heat is required, in close Vessels, to prevent Exhalation and Loss of the better Parts. Tinctures, also, of Stomachics, are best ordered without Heat, and commonly in Liquors moderately spirituous, as the ordinary White-wines. And Cathartics, whether resinous or saline, for extemporaneous Occasions, want nothing more than hot Water, as in making common Tea, to draw out their Virtues. The Proportions of Ingredients in all these Cases cannot be adjusted, but by Examples, and Experience of the Patient's Strength; but, for Cephalics and Stomachics, it is a certain Rule, never to take a Liquor with Ingredients beyond what is agreeable to the Palate, for an irksome Cordial, or Stomachic, almost implies an Absurdity; tho' in hysteric Affections, and where the fetid Simples are required, the Case is quite otherwise.

In the Exhibition of the officinal Tinctures of any Intention; all those which are so sated with resinous, or gummy Simples, that they turn milky in common Water, are, in a more agreeable and slight manner, directed in Wine, where the Circumstances of a Patient will admit of it; and, for Bitters in particular, made with a vinous Liquor, they are much better directed: between the Times of Breakfast and Dinner, or about an Hour before the latter, than fasting, which was formerly the customary Way, because they then less affect the Head.

A cordial, or cephalic Tincture for present Occasions, is very readily made; and now occurs frequently in extemporaneous Prescription, with the species *Diambra*, and some genurous White-wine. In hysteric and hypochondriacal Affections, the Root of Cassamunir, black Hellebore, and others of the same Tribe, are conveniently directed in compound Briony-water, or Water of Pennyroyal; and, for a Stomachic, Centaury-flowers, Gentian-root, Galangal, the Peels of *Seville* Oranges, and other Things of like Properties, may be drawn with any White-wine. All these are to be varied in the Proportion of the Ingredients to the Strength of the Liquor, and the Quantities for a Dose, according to the several Circumstances of a Patient. *Quincy's Pharmaceutical Lectures.*

TINCTURA ANTIMONII ACRIS SIMPLEX. The simple acrid Tincture of Antimony is directed to be made in the *Brandenburgh Dispensatory*, by digesting the *Scoria* of the Martial *Regulus* of Antimony just made, and hot, in highly rectify'd Spirit of Wine. Another acrid Tincture of Antimony, called the *Reguline Tincture*, is made by digesting equal Parts of the Martial *Regulus* of Antimony detonated with an equal Quantity of Nitre, in highly rectify'd Spirit of Wine.

It is said, that neither of these take up much from the Antimony, but that all their Virtues are borrowed from the Nitre rendered alkaline and acrid, by being fused with Antimony.

These Tinctures, given in a proper Vehicle, and a considerable Dose, are said to bring away the serous Humours of cachectic Patients.

TINCTURA ASTHMATICA.

Tincture for an Asthma.

Take Roots of Elecampane, Florentine Orris, Seeds of Anise, Caraway, Liquorice, of each two Drams; Leaves of Carduus Benedictus, two Handfuls; stoned Raisins, one Pound; Sena, six Ounces; Aniseed-water, six Pints. Let them all digest four Days; then strain the Liquor, and keep it for Use.

The Carduus here nauseates the Medicine, and contributes but little to its Efficacy; and, therefore, is better left out. This may be taken two or three Spoonfuls, going to Bed; and as much next Morning, according to the Strength of the Patient; and if it be long continued in corpulent Habits, it is said to do much Good.

TINCTURA AURI. See **AURUM.**

TINCTURA BENZOINI. See **BENZOINUM.**

TINCTURA BEZOARTICA.

The Bezoartic Tincture.

Take Roots of Elecampane, Angelica; Zedoary, *Virginia* Snake-root, of each one Ounce and an half; Saffron, one Ounce; Myrrh, Cinamon, dry'd Citron-peels, of each six Drams; Leaves of Scordium and Rue, of each half an Handful; *Venice* Treacle, three Ounces; Opium, two Drams; rectify'd Spirit of Tartar, fifteen Ounces; Spirit of Vitriol, three Ounces; Spirit of Elder, and Juniper-berries rectify'd, of each eighteen Ounces. Digest them together for some Days in a Sand-warmth in a close Body, then filter and dissolve in it Salt of Amber, one Ounce; and of Camphire, two Drams; which keep close-stopt for Use.

This is an admirable Alexipharmic, and very convenient to give in extemporaneous Draughts or Mixtures, from two Drams to one Ounce in a Dose. It has in it all that can be expected, or wished for, to answer the Intentions of a Cordial and Cephalic. Where, therefore, a Person is almost spent with struggling under a Fever, or the Nerves are even convuls'd; it is very proper to be given. And in the Beginning, also, of an acute Distemper, it will, with proper Diluters, as soon as any thing, raise a Sweat. The Camphire and Salt of Amber are admirable Ingredients, and in very few official Prescriptions besides; though the latter is often in occasional Practice. This is not much known in the Shops, but highly deserves Encouragement, being preferable to most of those in Use.

TINCTURA CANTHARIDUM. See **CANTHARIDES.**

TINCTURA CASTOREÆ. See **CASTOR.**

TINCTURA CINNAMOMI.

Tincture of Cinnamon.

Take Cinnamon, two Ounces; rectify'd Spirit of Wine, one Quart. Digest for four Days; then add Sugar, half a Pound; Rose-water, one Quart, Ambergrise half a Scruple, and Musk four Grains.

It is preferable to the Spirit in all Fluxes and Relaxations, as it abounds more with the rough astringent Parts of the Spice. It is, also, as pleasant to take, and from the Sweets in it, where they do not offend, is much more cardiac. The Dose is from half an Ounce, to two or three Ounces.

TINCTURA CORALLI. See **CORALLIUM.**

TINCTURA CORTICIS.

Tincture of the Bark.

Take of the Bark in Powder four Ounces; put it into a Bolt-head; add to it rectify'd Spirits of Wine, twelve Ounces; sit it for Circulation, and set it in a gentle Sand-heat four or five Days, shaking it often; then decant the Spirit carefully into a Phial for Use.

It is best given in red Wine, from twenty to one hundred Drops; and to be repeated every four Hours between the Fits, or oftener, according to the Urgency of the Symptoms.

TINCTURA CROCI. See **CROCUS.**

TINCTURA EUPHORBII.

Tincture of Euphorbium.

Put into a Phial what Quantity you please of pulveriz'd Euphorbium, and pour upon it Oil of Tartar made *per Deliquium*.

quim, about four Fingers high; stop the Phial, and place it in Digestion upon hot Sand, and leave it there for two Days, and there will be made a deep-yellow or redish Tincture; strain it, and keep it in a glass Bottle.

This is very attenuating and incisive, and is powerful in cleansing old foul Ulcers, carious Bones, and callous Lips of Wounds; and is good, also, to dissolve scrophulous Tumors, and very obstinate Indurations of the Glands.

TINCTURA FERRI. See MARS.

TINCTURA GUAIACI. See GUAIACUM.

TINCTURA HELLEBORI. See HELLEBORUS.

TINCTURA HIERÆ PICRÆ. See HIERA PICRA.

TINCTURA GUMMI LACCA. See JUJUBA INDICA.

TINCTURA MARTIS AUREA. See MARS.

TINCTURA MARTIS GLAUBERI. See MARS.

TINCTURA MARTIS MYNSICHTI. See MARS.

TINCTURA MARTIS CUM SPIRITU SALIS. See MARS.

TINCTURA MELAMPODII. See HELLEBORUS.

TINCTURA MELLIS. See MEL.

TINCTURA METALLORUM. *Tincture of Metals*. I have already given the Manner of preparing this under the Article *Metalum*, from the Memoirs of the Royal Academy, which see. But *Quincy's* Preparation is different, and is as follows:

Take of *Regulus Martis*, half a Pound; of Spittle-Duff, (which is the Scoria that falls from hot Plates of Copper, quenched in Water) four Ounces (or the like Quantity of Caput Mortuum of the Spirit of Verdegrise); of Saltpetre, two Pounds; of Tartar, half a Pound. Powder and mix them well; and put them into a red-hot Crucible by Spoonfuls: After it has stood melting half an Hour, remove it from the Fire, and powder it in a clean warm Mortar. Before it attracts the Air, return it into a Matrafs, and add two Pounds of tartarized Spirit of Wine: Make a circulating Vessel of the Matrafs, and let it digest two Days. When cool and settled, decant the Liquor by Inclination.

It is reckoned an efficacious Alterative in all chronic Cases. The Dose is from twenty to an hundred Drops.

TINCTURA MYRRHÆ. See MYRRHA.

TINCTURA NITRI.

Tincture of Nitre.

Take of the Nitrum fixatum, (described in *Quincy*) one Pound; melt it in a Crucible, with a strong Heat, for three or four Hours; then put it into a warm Mortar; powder it, and, whilst warm, pour upon it half a Pound of tartarized Spirit of Wine: Set the Mixture in a Matrafs upon warm Sand, gradually increasing the Fire, till the Spirit of Wine simmers; and so continue for two or three Hours, in which time the fixed Nitre will have communicated its Tincture to the Spirit of Wine: Decant, and put on more, and digest, as long as it yields any more Tincture.

This operates both by *Diaphoresis* and Urine, but principally the latter Way. It is accounted a great Purifier of the Blood, and a good Antiscorbutic. Its Dose is from twenty to sixty Drops.

TINCTURA PARALYTICA.

Tincture against the Palsy.

Take *Spanish Flies* in Powder, two Ounces; Seeds of Bishops-weed, six Drams; rectified Spirit of Wine, three half Pints. Let them digest together for some Days in a Sand Heat, and then decant, or filtre the clear Liquor from the Ingredients.

This is designed for Embrocations in Numbness, and for paralytic Limbs; in which Cases it is a notable Stimulus; and, if possible, will rouse and stir the almost insensible and stupefied Fibres, and occasion a proper Derivation of their Fluids. If much rubbed into the Part, it is sharp enough to excoriate; but for inward Uses, it is not to be meddled with, without Hazard of Stranguries, and other Disorders of the Bladder.

TINCTURA PAPAVERIS COMPOSITA.

Compound Tincture of Poppies.

Take of the wild Poppy Flowers, one Pound; of Nutmegs sliced, three Drams; of white Sugar, two Ounces; of French Brandy, four Pounds. Draw out the Tincture by a gentle Heat.

TINCTURA REGALIS.

The Royal Tincture.

Take of Copper, in little Pieces, two Ounces, put it in a

Crucible, and set it in a melting Furnace; when it is red-hot, put to it of *Regulus Foris* (in gross Powder) fourteen Ounces, let them melt well together the Space of a Quarter of an Hour; then cast them into a warm greased Cone; when cold, beat them into a Powder, which must be put (by a Spoonful at a time) into double its Weight of melted Salt of Tartar; when it is all in, shut the Door of the melting Furnace, and keep it in the strongest Fire can be given it, for two or three Hours: Then take it from the Fire, and pour it into a clean warm Mortar; beat it to Powder, whilst warm; and, before it attracts any Air, put it into a Matrafs, where there is one Pint of tartarized Spirit of Wine: Lute it as in the *Tinctura Antimonii*, and in all things proceed as in that Tincture.

Some are so fond of this, as to cry it up for an universal Medicine: And indeed its Defects are great; for it is very efficacious in all chronic Diseases: It is sudorific and diuretic. Its Dose is from ten to fifty or sixty Drops. In the room of two Ounces of Copper, there may be used two Ounces and an half of the Scoria of Copper, and the Tincture will be more beautiful. Some are of Opinion, that the emetic Quality of Antimony is not to be destroyed, so as not to return again; but if these Tinctures are kept ever so long, they will not prove emetic.

TINCTURA REGIA.

The Royal Tincture.

Take Musk, half a Scruple; Civet, five Grains; Balsam of Peru, twelve Drops; Oil of Cloves, four Drops; of Rhodium, two Drops: Drop these upon half a Dram of Salt of Tartar, and mix them well together; then pour upon the Mass, rectified Spirits of Wine, two Ounces; and let them stand in a Heat equal to that of the Sun, in a close Vessel, many Days; and afterwards pour off the clear Spirit by Decantation.

This is fit only to be kept in Readiness to flavour any cordial Dram, that such things are proper and required in, and is as good for this Purpose, as can well be contrived: The least Drop is sufficient for many Ounces of a Liquor. This is a Preparation of *Le Mort*.

TINCTURA RHABARBARI.

Tincture of Rhubarb.

Take of Rhubarb, one Ounce and an half; of the lesser Cardamom-seeds and Saffron, of each two Drams; of Licorice-root, half an Ounce; of French Brandy, one Pint; and make into a Tincture.

This is given for the same Intention as the Root.

TINCTURA RORIS SOLIS.

Tincture of Sun Dew.

Take of Ros Solis, or Sun Dew, four Handfuls; Cinnamon, Nutmegs, Mace, Cloves, Ginger, of each one Ounce; Musk, five Grains; Spirit of Wine, one Gallon: Digest all together twenty Days; and then dissolve in the strained Tincture, of Loaf Sugar, one Pound; and put up in a close Vessel for Use.

This is a warm high Cordial, and a good Cephalic, especially in cold Constitutions: It heats the Blood, and quickens its Motion, and greatly recruits the animal Spirits. For all these Reasons it contributes to what it is most celebrated for, the Cure of Impotence, and a Provoker to Venery.

TINCTURA ROSARUM RUBRARUM.

Tincture of Red Roses.

Take half an Ounce of Red Rose Leaves, well cleared of the white Heels, and thirty Drops of Oil of Vitriol; pour upon them, in a glazed earthen Vessel; two Pints and an half of boiling Spring-water; and let them stand close covered for three Hours; then strain off the Liquor; and put to it three Ounces of fine Sugar-candy.

In the making, most drop in the Oil of Vitriol, after the Water is poured upon the Roses.

TINCTURA SACRA. See HIERA PICRA.

TINCTURA SALIS TARTARI HARVEYANA. See TARTARUS.

TINCTURA SALIS TARTARI HELMONTIANA. See TARTARUS.

TINCTURA SCAMMONII. See SCAMMONIUM.

T I N

TINCTURA SERPENTARIÆ VIRGINIANÆ.

Tincture of the Virginia Snake-root.

Take of *Virginia* Snake-root powdered, two Ounces; of the Tincture of Salt of Tartar, sixteen Ounces. Digest so, as to draw out a Tincture.

It is convenient enough to those who cannot take it in Substance; and may be given from one to three Drams in any proper Liquor.

TINCTURA STOMACHICA AMARA.

The bitter Stomachic Tincture.

Take Gentian-root, and Orange-peels dried, both cut very small, of each one Pound; pour upon them, into a glass Body, rectified Spirits of Wine, one Gallon and an half: Let them stand close covered, in a very mild Warmth, for some Days; then press out the Spirit strongly, and let it fine down for Use.

The Peels must be of the most fragrant *Seville* Oranges, cleared of the White, and carefully dried. This makes a Tincture not to be known from several which are so extravagantly cried up in Empirical Advertisement, and is the best that can be made, notwithstanding those Boasters talk of so many Ingredients in theirs; which is only to put a Blind upon the Ignorant. To this, Centory, and many things of the like kind, might be added; but they would rather clog the Medicine, than increase its Virtues. This is very conveniently kept in the Shops, to make the bitter Draught *extempore*, with any kind of Wine, or other Vehicle: From fifteen to sixty Drops is sufficient for a Dose of two or three Ounces. It is, also, very conveniently added to Steel-wine, as Bitters are often joined with it. It has all the Virtues of the common Bitters, and warms and strengthens the Stomach; but answers that End much better when joined with a little Acid, which makes a Subastringent of it not much unlike the *Elixir Vitrioli*; one Ounce of *Spiritus Sulphuris per Campanam* would be enough for a Pint of this Tincture, and make it of a more beautiful Colour, and pleasanter to take.

TINCTURA SUCCINI. See AMBRA.

TINCTURA SULPHURIS.

Tincture of Sulphur.

Beat of the Liver of Sulphur, (while it is warm) four Ounces, in a warm Mortar; put it presently into a Matrafs; and to it Spirit of Wine, one Pint; set them in Digestion for twenty-four Hours, and there will be a very red Tincture, which keep in a Phial well stopped, for Use.

Canary Wine is the best Vehicle to give it in. Its Dose is from ten to forty Drops.

TINCTURA TARTARI TARTARISATI. See TARTARUS.

TINCTURA THERIACALIS.

The Alexipharmic Tincture.

Take of French Brandy, and the best Vinegar, of each one Quart; of *Venice* Treacle, and Mithridate, of each half a Pound; digest them in a gentle Heat, and strain out the Tincture for Use.

It has all the Virtues of the Treacle; and, by the Help of the Vinegar, will sometimes procure a Diaphoresis, where that fails. In short, it is an excellent Alexipharmic, and well deserves the first Rank in Practice. It may be given from two Drams to two or three Ounces with any convenient Vehicle, or by itself. This may, also, be enticed down with many Children, who cannot be prevailed upon with any other Form: They may take from one Dram to half an Ounce. In Fevers, if no other Medicines of the same Intention are used, it ought to be repeated every four or six Hours, according to the Exigency of the Case, till a Sweat rises.

TINCTURA TERRÆ JAPONICÆ.

Tincture of Japan Earth.

Powder finely four Ounces of *Japan* Earth; of Cinnamon, one Ounce; of *Peruvian* Bark, one Ounce and an half; Musk and Ambergrise, of each six Grains; rub the two last with Sugar-candy, one Ounce: Put them all into a Matrafs; and put to them Spirit of Wine, twenty-four Ounces; make of the Matrafs a circulating Vessel; lute well the Junction; set it upon warm Sand, to digest, for four or five Days, shaking it about two or three times a Day; then set

T I N

it by to settle; and, by gentle Inclination, pour it into a Phial for Use.

This is of good Service in all Defluxions, Catarrhs, Fluxes of the Belly, Dysentery, and Overflowing of the Menfes; and even in a Gonorrhœa and old Gleet, where the Virulence has been already conquered. It is, also, said to be a good Succedaneum to the Bark, and that it will cure Intermittents. Its Dose is from half a Spoonful to three or four, in rough Wine, or any other proper Vehicle.

TINCTURA VENERIS.

Tincture of Copper.

Take Verdegrise, one Dram; Spirit of Sal Ammoniac, and rectified Spirit of Wine, each half an Ounce; let them stand until they are of a deep Sky-colour.

This is not fit for any inward Use; for it offends the Stomach, and provokes to Vomiting; but it makes an admirable Injection for a Gonorrhœa; and if Care be taken, and Skill enough acquired to know when the Infection is only in the Urethra, a Person may be soon and infallibly cured with it. But it is adviseable, that Beginners be not too busy with it.

TINCTURA VIPERARUM COMPOSITA.

Compound Tincture of Vipers.

Take of Flowers of Sulphur, one Pound; crude Antimony, four Ounces; grind them to a fine Powder; put it into an earthen Dish, and saturate it with Oil of Sulphur, made by the Bell, (or Oil of Vitriol) four Ounces; put it into a Retort, and pour gradually upon it, of sweet Spirit of Nitre, one Pound; place the Retort in a sand Furnace, and draw off the Spirit. Into one Pound of this Spirit put two Ounces of dried Vipers; (cut into small Pieces) let them digest forty-eight Hours in a Matrafs; when cool, strain it thro' an hair Cloth. Return the Menstruum into a Matrafs, adding of Cochineal, Saffron, and *Virginia* Snake-root, of each two Drams; let them digest forty-eight Hours; then decant the clear Tincture.

This is said to be an excellent Diaphoretic; and in the *London* Sickness 1665. it was much used with Success. Its Dose is from ten to fifty or sixty Drops, in Canary or Plague-water.

TINCTURA VIRIDIS.

The green Tincture.

Take of Verdegrise, half an Ounce; of yellow Arsenic, six Drams; of Alum, three Drams: Boil them together in one Pound of White-wine, to the Consumption of half the Quantity; and, after it is cold, add to it of Rose and Plantain-water, of each six Ounces.

This hath not been received by the College, until the Dispensatory before the present; and in that, Nightshade-water was ordered, where that of Plantain is here substituted, because that is not now directed to be made amongst the simple Waters.

TINDA parva. H. M. *Arbor Malabarica, baccifera, cortice albicante, glomerato flore.* D. Syén. It is a tall Tree, growing in sandy Places, in the Country of *Malabar*.

The Root bruised, and used by way of Lotion, is good for the Morbus Sacer; the same, bruised, is applied to Impostumes. The Leaves, in Decoction, are used in Fomentations, or Cataplasms, for easing all Kinds of Pain; and are serviceable to Women in Childbed. *Raii Hist. Plant.*

TINEA. See ACHOR.

TINEARIA. A Name for the *Stachas Citrina angustifolia*.

TINIARIA, in *Marcellus Empiricus*, C. 17. is the *Polygonum*.

TINKAR. Borax.

TINNITUS AURIUM. A Noise in the Ears, like that of a Bell.

TINNUNCULUS. A Species of Hawk mentioned by *Al-droavandus*.

TINTINNABULUM. The UVULA. *Vesalius*.

TINUS.

The Characters are;

The Calyx is double, the lower trifid, the upper quinquefid, and both monophyllous. The Flower is monopetalous, rotated, quinquefid, tabulated for a short way below, and furnished with five Stamina, which arise from the Inside of the Tube of the Flower. The Ovary in the Bottom of the Calyx is furnished with a long, triangular, scabrous Tube, and becomes a Fruit like an Olive, umbilicated, and full of a single pear-shaped Seed.

Baerhaave mentions three Sorts of *Tinus*, which are;

1. *Tinus*;

1. *Timus*; prior; *Classi. Tourn. Inst. 607. Boerb. Ind. A. 225. Laurus Timus. Offic. Ger. 1224. Emac. 1409. Laurus Timus Lusitanica carulea bacca. Park. Theat. 206. Laurus sylvestris corni feminae, foliis subbisfutis. C.B.P. 461. Lauri Timi sylvestris primum genus. J. B. 1. 418. WILD BAY.*

It is a Native of Portugal, and flowers in July and August. The Berries, which are used, being taken inwardly, purge by Stool, with great Disorder and Perturbation of the whole Body. Dale from Parkinson.

2. *Timus*; II. *Clus. H. 49. Lugd. 204. Laurus sylvestris, foliis venosis. C.B.P. 461.*

3. *Timus*; III. *Clus. H. 49. Lugd. 204. Laurus sylvestris, folio minore. C.B.P. 461. Boerb. Ind. alt. Plant*

The *Timus* is a poisonous Plant; the Berries, held in the Mouth, soon burn the Fauces; they are sometimes exhibited in the Dropsy with singular Success, being a very strong Cathartic; but I would not advise the internal Use of this Plant. *Hist. Plant. adscript. Boerhaave.*

TIPL. A shrubby Species of *Alliaria* growing in Brasil, with a whitish Flower, and a black round Fruit, like a Plum. *Pis. Raii Hist. Plant. Index.* There are no Virtues ascribed to it.

TIPIOCA. A Sort of Cremor prepared of the *MANIHOT*, which see.

TIPSARIA. Barley-water, from *Pisana, Rulandus* and *Johnson* write it *Tapfaria. Castellus.*

TIPULA. A kind of Water-fly, resembling a Spider. It has six long Legs, which it extends upon the Water, and walks upon them without sinking; its Body is of an oval Shape, and a whitish Colour; its Wings are silver-coloured, its Eyes black, and its Tail sharp-pointed.

It is of a discutive-Virtue, being outwardly applied. *Lemery des Drogues.*

TIRUCALLI. *H. M.* A Name for the *Tithymalus Indicus frutescens.*

TITANOKERATOPHYTON, from *τίτανος* Lime, or Plaster, and *ΚΕΡΑΤΟΦΥΤΟΝ*, which see. A Name given by *Boerhaave* to a very large marine Plant, found near the Coast of Norway, resembling the *Keratophyton*, except that it is incrustated, as it were, with a calcarious or gypseous Substance. *Boerhaave* mentions twenty-four Species of this Plant, none of which have any medicinal Virtues ascribed to them at present, that I know of.

TITANOS, *τίτανος*, *Calx*, Lime; *τίτανος* is expounded in *Erotian* by *λίμω*, Lime, or a Lixivium prepared thereof; *τίτανος* *ή άναόβης* is Quicklime, commonly called *άόβης* (*Asbestus*), and advised by *Galen, de C. M. S. L. Lib. 1. Cap. 4.* among dry Depilatories. *Titanos* in *Rulandus* is Lime of Gypsum. *Foefius. Castellus.*

TITHYMALOIDES.

The Characters are;

It is a Species of *Tithymalus*; the Flower is monopetalous, anomalous, and shaped like a Shoe.

Boerhaave mentions two Sorts of *Tithymaloides*, which are;

1. *Tithymaloides*; frutescens; folio-myrti amplissimo. *T. 654. Tithymalus Curassavicus, myrtifolius, flore coccineo mellifero. Par. Bat. H. R. D.*

2. *An Tithymaloides*; frutescens; foliis Nerii. *Plum. T. 654. Boerb. Ind. alt. Plant.*

There are no medicinal Virtues ascribed to this Plant at present, that I know of.

TITHYMALUS.

The Characters are;

The Root is fibrous or tuberous; the Leaves are alternate, oblong, intire, and a few of them orbicular. The Pedicle ends in a gross Body, hollow like a Calyx, to the Top of whose Lobes grow four or five anomalous Petals, often semilunated, and excavated, representing a tetrapetaloidal Flower, with almost lunar Segments, surrounded with two Leaves, instead of a Calyx. From the very Bottom of the Cavity of the Calyx, at the Sides of the Pointal, arise four, five, or more Stamina, longer or shorter, with their Testiculi. From the Centre of the Calyx arises a long Style, or Pointal, bearing a triangular or hexagonal tricapsular Ovary, from whose Centre arises a long, triple Tube, with a bifid, scabrous Apex; this Tube runs out into so great a Length, that the Ovary appears almost in the Middle of the Pointal. Every Part of the Plant abounds with Plenty of Milk.

Boerhaave mentions forty-four Sorts of *Tithymalus*, which are;

1. *Tithymalus*; latifolius; Cataputia dictus. *Tourn. Inst. 86. Boerb. Ind. A. 255. Cataputia minor, Lathyrus. Offic. Cataputia minor. Raii Hist. 1. 866. Lathyrus major. C.B. Pin. 293. Lathyrus major hortensis. Theat. 191. Lathyrus, five Cataputia minor. Ger. Emac. 503. J. B. 3. 880. Esula major. Rivin. Tet. Irr. Rupp. Flor. Jen. 219. GARDEN SPURGE.*

It is frequently found in Gardens, and the Parts in Use are the round oblong Seeds, or Grains, which are bigger than a Pea, and include under a corticous Pellicle a white, pinguious Nucleus, or Kernel, of a sweetish, acrid, and nauseous Taste, and a vio-

lent cathartic Quality; but those Grains, as well as those of the other Species of *Tithymalus*, are seldom used.

Twelve or fourteen Grains, bruised, and taken in Wine, put the whole Body in a Commotion, purge the Belly, evacuate Bile and Phlegm, potently provoke Vomiting, and attract Phlegm, Bile, and Melancholy.

This Plant, the first Year of its springing from Seed, grows scarce to be two Foot high, with a thick reddish Stalk, beset with long and narrow bluish-green Leaves, and so continues, without running into Branches, till the next Year, when it rises to three or four Foot high, with many Branches toward the Top; on which, at every Division, grow broader and somewhat triangular Leaves, set on without Footstalks: The Flowers are small and yellow, standing in round hollow Leaves, which encompass the Stalk like a Cup, and these are followed by three square Seed-vessels, containing three oblong Seeds. The whole Plant is so full of Milk, that, if you cut off a Branch, it will run out by Drops in some Quantity; which Milk is of a hot, fiery, burning Taste, inflaming the Mouth and Throat for a great while. This Spurge grows in Gardens, where it springs up of its own sowing, dying after it has brought its Seed to Perfection.

This is much of the same Nature with the *Cataputia major*, but is rather stronger, and more violent, in its Operation; and therefore only given by bold adventuring Empirics. The Milk is good to take away Warts. *Miller's Bot. Off.*

The Whole of this Plant abounds with a milky, highly acrid Juice, which operates violently both by Vomit and Stool. It is classed among the Poisons which are manifestly acrid and caustic, which create a Gangrene and Putrefaction, and whose Effects are to be opposed by aqueous, tepid, somewhat acrid, and pinguious Substances; as, also, by Preparations of Honey. See *Boerhaave, Institut. 1137. Forest. Obs. Med. L. 1. Obs. 23. Joel. T. 2.* Its most specific Remedy or Antidote is said to be *St. John's-wort*. See *Kircherus, Mund. Subt. T. 2.* and *Baubine* from *Matthioli* informs us, that if any one intends to destroy the Hairs of his Eyebrows and Forehead, he may mix the Juice of this Plant with Oil, and anoint them with it in the Sun, but in such a manner, that no Part of the Preparation touch his Eyes and Face, since such Parts are immediately inflamed, become red, and resemble a Leprosy. The Juice of the Garden-spurge removes the Tooth-ach, when put into the Cavity of the affected Tooth; but due Care must be taken to fortify the Gum by means of red Wax; for which reason it ought to be principally used in removing superfluous Hairs, Warts, and Serpigos. Impudent Beggars generally use to spoil and deform their Skins by means of this Juice, in order the more effectually to move the deluded Spectator to Compassion. *Baubine*, also, informs us, that, in order to purge by Stool, *Fernelius* orders three or four Leaves of Garden-spurge to be exhibited in pinguious Broth. *Disco-rides*, also, observes, that the Leaves of this Plant boiled with a Fowl, or Pot-herbs, produced the same Effect. If Fishes eat the Leaves and Seeds of this Plant, when thrown into Ponds and Lakes, they turn up their Bellies as if they were dead, so that they may be caught by the Hand, and will revive, when put into other Water, according to *Baubine* from *Hollerius*. Twelve or fourteen Seeds of Garden-spurge, bruised and drank in Wine, throw the whole Body into Commotions, purge by Stool, eliminate Phlegm and Bile, powerfully vomit, and procure an Expectoration of Phlegm, Choler, and Melancholy. *Morison* from *Tragus* affirms, that Pills prepared of the Milk of this Plant, Vinegar, and aromatic Substances, are beneficial to dropical Patients. *Disco-rides* informs us, that six or seven of the Seeds taken in Pills, Figs, or Dates, purge by Stool, and evacuate Bile, Phlegm, and Water, but that the Patient must drink cold Water after them. According to *Pliny*, "twenty Seeds of "Garden-spurge, drank in pure Water, or Hydromel, cure "dropical Patients, and evacuate Bile. Those who intend to "be violently purged, take them with the Husks; but, as these "are found offensive to the Stomach, it is thought proper to "take them with Fish, or Broth prepared of Fowls." *Baubine* from *Matthioli* informs us, that ten or twelve Seeds of Garden-spurge, freed from the Husks, are beneficially exhibited in order to excite a violent Vomiting in those who have swallowed Love-potions, or other bewitching Things. But as there is no Scarcity of secure Emetics and Purgatives in the *Materia Medica*, there can be no Reason for prescribing the Seeds of this Plant, with which presumptuous Quacks have killed many, thinking to distinguish themselves from the knowing and skilful Physicians. Those who have, perhaps, without any Injury, swallowed any of these Seeds, owe their good Fortune rather to the Smallness of the Dose, their Stomachs abounding with acid Juices, a previous Use of oleous Liquors, the using Things of a like Nature immediately after, or the natural Vigour of their Constitutions, than to the safe and innocent Nature of such a Medicine. That in some Patients the Seeds of Garden-spurge should operate by Stool, and in others by Vomit, seems to be owing to the particular Habit and Temperament of those who use them; since it is certain, that some have Bodies more disposed to one particular kind of Evacuation, than others; or to the Juices, or Remains

of the Aliments, lodged in the Stomach, and promoting one or other of the Evacuations by means of the Purgative. Perhaps this Circumstance has laid a Foundation for the Story which prevails among superstitious old Women, who assert that, if the Seeds are stript downwards, they purge by Stool; whereas, if they are stript upwards, they evacuate by Vomit. *Ettmüller* informs, "that the Seeds of Garden-spurge are purgative. Thus, for Instance, if from ten to twelve or fifteen Seeds are bruised and taken in a poached Egg, they purge violently and instantaneously by Stool. If the Intention is, that they should purge strongly, they should be well chewed; but if they are intended to vomit, they are to be swallowed whole." See *Bauhine*, 3. P. *Morif.* 3. *Ray*, 1. *Diösc.* 4. *Plin.* 27. *Bodeus in Theophrast.* *Schrod. Pharm.* *Ettmüller*, 1. *Dale. König. R. U. Böhler.* 1.

B.* 3. 671. *Raii Hist.* 1. 864. GERMAN SPURGE.

This Species of *Tithymalus* has a very large thick Root, several times bigger than a Man's Arm, spread out into many Branches, and sending up many tough Stalks, two or three Foot high, reddish, and much divided, having smooth, long, narrowish, green Leaves, broadest at the End. The Flowers, which grow on the Tops of the Stalks, are small and yellow, like other Spurges, which are followed by triangular Seed-vessels containing three roundish Seeds. The whole Plant is full of a caustic Milk, burning and inflaming the Mouth and Jaws for a great while together. It grows in several Parts of Germany, flowering in June. The Root is used, and of that the Bark only.

It is a strong Cathartic, working violently by Vomit and Stool, but is very offensive to the Stomach and Bowels by reason of its

sharp corrosive Quality, and therefore ought to be used with the utmost Caution by steeping it in Vinegar, and giving proper Correctors, and then it is said to evacuate serous and bilious Humours, and to help the Dropsy, Gout, and other obstinate Distempers. It is put in the *Pilula Mechoacanna* and *Ferida.* *Miller's Bot. Off.*

It grows plentifully in the upper Germany, and in the lower by the Rhine, and in Silesia on the sandy shelving Banks of Rivers, but with us is cultivated in Gardens. The Part used in Medicine is the Root, which is a very potent Purge of Phlegm, chiefly by Stool. Of the Root, Herb, and lacteous Juice, is prepared a singular kind of Ointment, which is very effectual against a contagious Scabies of the Head.

P.* 291. *Raii Hist.* 1. 869. *Synop.* 3. 313. *Tourn. Inst.* 87. *Tithymalus Helioscopius five falsequius.* *J. B.* 3. 663. *Esula falsequa.* *Rupp. Flor. Jen.* 219. SUN-SPURGE, or HARTWORT.

This Species is of an herby Taste, a little saltish; it gives a very deep Tincture of Red to the Blue-paper. *Martyn's Tournefort.*

This Plant has a single white Root, which runs strait downwards, is furnished with some Fibres, and shoots forth a single Stalk, half a Foot, or a Foot in Height, round, and with a few Hairs. The Leaves grow thick on the Stalk, without any Order, and are like those of Purslane, or the *Peplis*, a Digit, and sometimes a Digit and half in Length, roundish at the End, and finely indented about the Edges. The Top of the Stalk divides itself into Sprays, commonly five in Number, making a sort of Umbella and surrounded by a like Number of Leaves, which are large, and rounder than those on the Stalk, and each Spray parts into three others, surrounded by as many Leaves. The Flowers grow single on the Stalks and Divarications of the Sprays, and are small, herbaceous; tetrapetalous, with roundish, and not at all lunulated Petals. The Pointal proceeds from the Middle of the Flower, and has its Apex turgid with a triangular, tricoccus Seed-vessel, reflexed towards the Sides of the Flower.

It flowers, and the Seed is ripe in Summer, but it perishes in Winter. It grows in Kitchen-gardens, far ploughed Fields, and is frequently found among Ruins by the Walls of Cities, and in the like Places. *Raii Hist. P.*

Besides the Virtues it has in common with the other Species, the Juice is recommended against Warts. *Dale.*

19. *Tithymalus*; *rotundis foliis, non crenatis.* *Tourn. Inst.* 87. *Boerb. Ind. A.* 256. *Peplus.* *Offic. Peplus five Esula rotunda.* *C. B. P.* 292. *Ger.* 406. *Emac.* 503. *J. B.* 3. 669. *Raii Hist.* 1. 869. *Esula rotunda five Peplus.* *Park. Theat.* 194. *Tithymalus parvus, annuus, foliis subrotundis, non crenatis, Peplus dictus.* *Raii Synop.* 3. 313. PETTY-SPURGE.

This is a Plant a Span in Height, full of a milky Juice, like the *Tithymalus Helioscopius*, and seems to be a Species of it, only less in all respects. The Stalks are reddish, the Leaves are very small, of an oblongish Round, and entire at the Margin, (by which proper Character it is certainly distinguished from the *Tithymalus Helioscopius*, whose Leaves are crenated) larger below, and smaller above. The Coma, or Tops of the Stalks, are rounded, or formed into an Umbella. The Root is slender, fibrous, and annual.

It grows in Gardens and Vineyards, and sometimes is cultivated in Fields; flowers in Summer, and endures till Winter. *Raii in Hist. Plant.*

Taken in Hydromel, it evacuates Bile and Phlegm; sprinkled upon Meat, it excites Commotions in the Belly. *Dale* from *Dioscorides.*

minor, *Pityusa*. Offic. *Tithymalus Pineus*. Ger. 402. Emac. 499. *Pityusa*, *Tithymalus Pineus* five *Esula minor*. Park. Theat. 192. *Tithymalo Cyparissie similis*, *Pityusa*, *multis*. J. B. 3. 665. Raii Hist. 1. 867. PINE-SPURGE.

This Species has a much lesser Root than the *Tithymalus palustris fruticosus*, and sends forth many Stalks not much branched, a Foot or more high, set thick with long narrow Leaves like Toad-Flax, but rounder pointed; the Tops of the Stalks are divided into several Partitions like Umbels, having several hollow Cup-like Leaves pierced through by the Foot-stalks of the Flowers, which are small and yellow; the Seed-vessel is triangular. It grows in several Places of Germany and France, but with us only in Gardens.

The Virtues ascribed to this Spurge are the same with those of the *Tithymalus palustris fruticosus*, being a strong and violent Cathartic and Emetic; but the Shops being furnished with safer and gentler Medicines, both of them are worn out of Esteem, and very rarely prescribed. *Miller's Bot. Off.*

The Parts used in Medicine are the Root, Bark of the Root, and the Leaves. The Root is oblong, more slender than that of the *Esula major*, of a brown Colour on the Outside, but of a whitish Yellow within, and of a pretty acrid Taste.

It burns the Tongue and Fauces by its caustic Acrimony, when but tasted; but, taken inwardly, it purges Water from hydropic Persons upwards and downwards, with such Violence and Disorder, as requires great Caution in using it. Both this, and the *Esula major*, are corrected by Maceration in Acids. *Dale.*

Esula purges Phlegm most violently, and especially by Stool; whence it is called the Countryman's Rhubarb. It is of an acrimonious, caustic, and corrosive Nature, so as to be serviceable to sturdy Beggars, who with its Juice raise Exulcerations on their Skin, that they may appear afflicted with the Scabies, and the like Diseases, in order to move Pity. *Schroder.*

C. Hoffman says, that he never prescribed it himself, but has been an Observer of the Rashness of the common Sort, who have ventured to take it by whole Spoonfuls. If any, however, has a mind to try it, let him use the *Esula preparata* of the Shops, which has lain four-and-twenty Hours in an Infusion of very strong Vinegar, and then dry'd. The Dose hereof is from two Scruples to a Dram, and is an innocent Purge. *Casp. Dornavius* corrects it thus:

Take of *Esula* prepar'd, four Ounces; Mace, Galangals, each two Drams; Spodium prepared, one Dram; Tragacanth, Bdellium, each three Drams: Reduce them to a Powder, of which give from half a Dram to a Dram. *Raii Hist. Plant.*

25. *Tithymalus*; *cyparissias*. *Prosp. Alpin. Exot.* 65. *M. H.* 3. 238.

This Species of *Tithymalus* has a thick Root, four Digits in Length, and turgid with a milky Juice, as is, also, the whole Plant, while it is fresh. This Root shoots up a Multitude of thin, slender juncous, Stalks, furnished with numerous small, slender, short Capillaments, like Lime-leaves, (whence the Name *Cyparissa* has been given to this Plant) naked near the Root, but marked with frequent blackish small Spots. Each of these Stalks has its Top form'd into an Umbella consisting of three or four Sprigs; and at the Beginning of the Umbella, on each Side a small oblong Leaf, sharp at the Extremity, and resembling a Myrtle-leaf; but less, and thinner. Every Sprig of the Umbella, also, has about the Middle, on each Side, a Leaf like the former, but less, from whence it continues to bare Leaves in manner of a Spike to the Extremity, inclining on one Side, and much shorter and broader than the rest; with small Flowers, like those of the *Leucoium*, and small Fruit of a triangular Figure, containing three round, white Seeds, less than a Grain of Pepper. Among the aforesaid long, slender, and strait Stalks, there are sometimes one or two of the Thickness of the little Finger, which are likewise divided into several foliated Caules, or Sprigs, each adorned on the Top with an Umbella, as the others, and these thick Stalks, before their Division, are, also, naked; and marked with Spots.

The whole Plant, while fresh, abounds with a milky Juice, which the Natives use as a Cathartic for the Evacuation of pituitous and serous Humours. *Prosper Alpinus de Plantis exoticis.*

26. *Tithymalus*; *exiguus*; *procumbens*; *Chamaesyce dictus*. *Boerb. Ind. A.* 257. *Chamaesyce*. Offic. Ger. 407. Emac. 504. Park. Theat. 195. C. B. P. 293. J. B. 3. 667. Raii Hist. 1. 869. *Tithymalus exiguus glaber*, *Nummularia folio*. Tourn. Inf. 87. *Esula minima Chamaesyce dicta*. Volck. Flor. Nor. 155. TIME-SPURGE.

This Species has a little slender Root, about a Palm in Length, and furnished with some very slender Fibres. The Stalks are from three Inches to a Foot in Length, and subdivided into small Branches; the Stalks are of a reddish Colour, somewhat hairy, and spreading circularly on the Ground; at their Joints grow small Leaves, conjugated, roundish, and reddish on the Side towards the Earth, and greenish above, only distinguished with a purple Spot in the middle; and some of them at the Extremities of the Sprays, have both their upper and under Face of a very deep Red. The Flowers are of a

purple Colour, and are produced at the Divarication of the Sprays among the Leaves.

It grows in the Vineyards and Fields of Italy, Sicily, and Languedoc and Provence in France, and flowers in Summer.

The Herb is used, and is esteem'd a Cathartic, as well as the Juice, which is a Remedy against the Sting of a Scorpion, the Place being anointed therewith. *Dioscorides.*

Rivin. Irr. Tet. TREE-SPURGE.

The *Tithymalus arborescens* grows in the Island of Crete (now Candy) to the Height of a Man, or higher. The Roots are numerous, long, slender, whitish, running out here-and-there in strait Lines within the Earth, and all meeting together at the Beginning of the Trunk, or all proceeding from the Beginning of the Trunk. From the Trunk, which is thick, round, and of a Man's Height, proceed several strait, slender, viscid Branches, forming a kind of Umbella, and beset with long Leaves, without any Order, and thinner than those of the *Tithymalus Characias*. On the Tops are the Flowers representing a small Umbella, and succeeded by small, round, white Seed. The whole Plant is turgid with a lacteous Juice.

It is used as a Cathartic; for the Weight of half an Obolus purges Bile, Phlegm, and serous Humours. It is hot and dry beyond the third Degree, and excites an Inflammation and Exulceration. P. Bellonius tells us, that he saw on the Top of Mount Ida a *Tithymalus Dendridas* of twice a Man's Height, and as thick as a Man's Thigh. *Prosper Alpinus de Plantis exoticis.*

It grows in the mountainous Parts of the Kingdom of Naples, and other Countries. The Leaves, Seeds, and Juice, are used; which, according to *Dioscorides*, have the same Virtues as most of the other Species of *Tithymalus*. *Dale.*

This Root is small in respect of the Plant, black on the Outside, and produces several Stalks a Foot in Height, reddish from the Bottom, and smooth; but, from the Middle, there are several Leaves disposed almost in the Form of a Wheel, to the Top, of a lively Green and hairy, and cover'd with short, roundish Leaves, placed alternately. The Stalk about the Bottom is bare of Leaves, like the *Characias*. From the Top of the Leaves proceed some Alæ, bearing, on the Top, round, hollow Leaves, from whence proceed two others, standing on juncous Pedicles, and hollow, like a Bason: In these grow the Flowers, which are of an herbaceous Colour, inclining to yellow, tetrapetalous, and representing the Figure of a new Crescent, the Horns turned outwards, and the gibbous Parts looking inwards, and touching one another. They are furnished with four yellow Stamina, from whose Umbilicus proceeds the Pointal, sustaining on the Top a triangular Fruit, propending downwards.

It grows in several Parts of Italy, delighting in high, moist, and but little sheltered Places; it has nothing singular in its Virtues. *Raii H. P.*

The whole Plant, in what Part soever wounded, discharges a very copious and very white Milk, which by Infolation becomes of a brown Colour. This Juice is of a most acrid, fervid, and penetrating Taste, which remains a long time; and, if taken in too great a Quantity, it inflames the Fauces, and produces a Quinsy. Apply'd to the Skin, and suffer'd to remain there for some time, it first causes a Redness, and afterwards corrupts the whole Part. Hence by virtue of its caustic Quality, it is very effectual in eating out and extirpating Warts, small Cancers, and Tumors. The Plant dried, and taken to the Weight of four Grains, causes a plentiful Evacuation of Serum, but not without most violent Gripings, and forces out Water through the Kidneys and Bladder. The Roots dry'd, and boiled in Whey, are proper in a Dropsy, and we read of wonderful Effects of it in *Rulandus's* Book of *Empiric Cases*. From the first Species is prepar'd the Juice of the *Cataputia* of the Shops, and of the same is prepared an Oil, which is brought from *India*. A few Drops of this Juice, being involved in some tenacious Matter, and taken, are a more potent Cathartic than the *Esula*. This Juice is much like Scammony, but more acrimonious. If this Plant be boiled in Vinegar or Rhenish Wine, it loses all its Force; and this is all the Method by which the French Physicians would have it corrected, but then it is of no Service in the Cure of Diseases. *Hippocrates* says, that the *Esula*, *Hellebore*, and the *Grana Cnidia*, cure the Dropsy; but those are of an alkaline and igneous Quality. The *Tithymalus*, since the Root of Jalap has been known, is but little used. *Hist. Plant. adscript. Boerhaav.*

Besides the foregoing Sorts of *Tithymalus*, *Dale* mentions the following;

1. *Tithymalus Myrsinites fructu Verrucæ simili.* C. B. P. 291. *Tourn. Inst.* 84. *Tithymalus verrucosus.* J. B. 3. 673. *Raii Hist.* 1. 871. *Synop.* 3. 312. *Tithymalus verrucosus Dalechampi.* Park. *Theat.* 187. ROUGH-FRUITED-SPURGE.

It grows in the Fields, and the Herb, which is used in Medicine, agrees in Virtues with the other Spurge.

2. *Tithymalus platyphyllos.* *Offic. Ger.* 404. *Emac.* 500. *Raii Hist.* 1. 870. *Tithymalus latifolius Hispanicus.* C. B. P. 291. *Tourn. Inst.* 86. Park. *Theat.* 188. BROAD-LEAVED SPURGE.

It grows in *Spain*, and flowers in Summer. The Parts used are the Root, the Juice, and the Leaves, which have the same Virtues with the other Species. *Dioscorides* says, that, bruised, and thrown into the Waters, it kills Fish.

3. *PITYUSA.* *Offic. Tithymalus foliis brevibus, aculeatis.* C. B. P. 292. *Tithymalus Cyparissias vulgaris.* Park. *Theat.* 193. *quoad icon.* PINE-SPURGE WITH SHARP-POINTED LEAVES.

It grows in *Italy*. The Root, which is the Part used, is reckoned among Cathartics.

4. *PEPLIS.* *Offic. Ger.* 406. *Emac.* 503. Park. *Theat.* 194. J. B. 3. 668. *Raii Hist.* 1. 869. *Peplis maritima folio obtuso.* C. B. P. 291. *Tithymalus maritimus supinus annuus Peplis dictus.* *Raii Synop.* 3. 313. *Tithymalus maritimus folio obtuso, aurito, rubro perinde ac caule.* *Tourn. Inst.* 87. PURPLE SEA-SPURGE.

This Species grows in the sandy Places of the Sea-shore, and flowers in Summer. The Herb, which is used, is endow'd with the same medicinal Virtues as most of the other Species.

The fifth is the HIPPOPHAES; which see.

The sixth is the *Tithymalus cyparissias.* *Offic. C. B. P.* 291. J. B. 3. 663. *Raii Hist.* 1. 867. *Tourn. Inst.* 86. *Tithymalus cyparissias vulgaris.* Park. *Theat.* 193. *Tithymalus cupressinus.* *Ger.* 402. *Emac.* 499. *Esula Officinarum.* Volck. 154. *Cæsalp.* 374. CYPRESS-SPURGE.

Caspar Baubine ranges under this last Species the *Tithymalus cupressinus* II. of *Tabernæmontanus*; but those who consider this Figure well, and those of the *Tithymalus Cyparissias*, and of the *Tithymalus Cupressinus* I. of the same Author will allow that *John Baubine* had Reason to believe, that these three Figures represent the same Plant in different States. It is often found in the Spring, with several Stalks without Branches, garnished with larger Leaves than ordinary; especially towards the Top, where they are marbled with Spots of the Colour of Oker. *Caspar Baubine* has made a different Species of it. *Thalius* calls it *Tithymalus σικτόφυλλος*, and has taken it for a non descript. *John Baubine* believes, that it is an Abortion of the common *Tithymalus Cyparissias*. It has been observed in the Wood of *Boulogne*, that the same Plant had such Stalks and Leaves as *Thalius* has described; these Stalks were mixed, also, among others that were in good Condition; they perished in a little time, and then the Root produced better.

The Leaves of the *Tithymalus Cyparissias* have the Taste of Almonds, the Milk of which has been drawn by Emulsion; they are styptic, but without any Acrimony, or Bitterness; and give a pretty deep Tincture of Red to the blue Paper; but the Roots give a much deeper: They seem at first, to have the same Taste with the Leaves, but leave at last a very considerable Acrimony in the Throat. It is very likely, that there is in the Roots of this Plant a Salt resembling Alum, but involved in a great Quantity of refinous Sulphur. This Mixture whitens the

Phlegm of the Spurge much after the same manner, as it happens to the Magistery of Jalap, or that of Scammony. This Spurge is an excellent Hydragogue. It is very proper to correct it by macerating it in Vinegar, or the Solution of Cream of Tartar: For if one swallows ever so little of this Root, it leaves a considerable Acrimony and Burning, not only in the Throat, but all along the Oesophagus, and sometimes in the Stomach itself. The Bark of the Roots of this Plant is given in Substance from a Scruple to a Dram, and in Infusion from one Dram to two. This Purgative is good for the Dropsy, Cachexy, and intermitting Fevers. It may be used in all Diseases, where it is requisite to carry off the Humours that resist the ordinary Purgatives. It must be given in a Bolus after the following manner; take half a Dram, or two Scruples, of the Root of this Spurge, half a Dram of Cream of Tartar, twenty Grains of *Mercurius dulcis*; mix them with a sufficient Quantity of Marmelade of Orange-flowers, or with the Conserve of Wormwood perfumed with five or six Drops of Balm of Peru: The Magistery may, also, be made of the whole Plant, bruised and digested in Spirit of Wine. Twelve, fifteen, or twenty Seeds, with the Husks of this Spurge, purge well: It is usually called in French, *Petite Esula*, *Esula minor Officinarum*.

Fernelius used it as the Basis of the Pills, which he calls *Pilule ex Esula*, the Dose of which is two Scruples. The Root of this Plant is an Ingredient in the *Benedicta laxativa*, *Hydragogum eximium* of *Renodæus*, *Extractum eximium* and *Cholagogum* of *Rolfsincius*. *Martyr's Tournefort.*

TITHYMELÆA. The same as THYMELÆA. *Blancard.* TITIANOS, τῑτιανός. The Name of an emollient Pessary, describ'd by *Aetius*, and by *Paulus Aegineta*. L. 7. C. 24.

TITILLARES VENÆ. The Iliac Veins.

TITILLICUM. The Arm-pit.

TITTHOS, τῑτθος. The Breast. See MAMMA.

TLACHICHINO PATLAHOAC. A Name for the *Heliotropium*; *Mexicanum*; *mali Limonii foliis*.

TLA ALLI. A Name for the *Mayx*; *granis aureis*, which see. TLAPALCOCATLI. A Name for the *Tagetes*; *Indicus minimus*; *flore sericea hirsutie obfita*.

TLAPALTE. A Name for the *Tagetes*; *Indicus*; *medius*; *flore luteo*; *multiplicato*.

TLATLANCUAYE. A Name for the *Piper longum*; which see.

TLEON. The Name of a Serpent found in *Brasil*, whose Bite is extremely dangerous, and which is to be cur'd by the same Methods, as those taken for the Bite of the Viper.

As to its medicinal Virtues, it is esteem'd sudorific, and a Restiter of Poisons.

TLILZCHITL. See VANILIA.

TMOLITES, τμολίτης. The Name of an excellent Wine, like the *Falerian*, mention'd by *Galen*.

TODDA-PANNA. A Name for the *Palma*; *Japonica*; *spinosis Pediculis*; *Polypodii Folio*.

TOETICA, according to *Blancard*, are attenuating Medicines.

TOLLES, TOLES, or TOLÆ. The Tonsils. The Name is, also, apply'd to glandular Abscesses in the Limbs. *Cæsellus*, from *M. Aur. Severinus*.

TOLUTANUM BALSAMUM. Balsam of Tolu. See BALSAMUM.

TOMAHUACTLI COPATLI *Hernandez*. The Name of a Mexican Species of *Aristolochia*.

TOMEION, or TOMEUS, τομειον, or τομύς. An incising, or cutting Instrument, either in Mechanics, or Surgery; from τέμνω, to cut.

TOMINEIO. The Name of an extremely minute Bird, found in *Brasil*, said to be good for an Epilepsy, either eaten, or taken in Powder. *Lemery des Drogues*.

TOMOTOCIA, from τέμνω, to cut, and τόκος, a Foetus. The Cæsaean Operation.

TONDI-TEREGAM. H. M. P. 4. T. 60. p. 123. *Arbor flore tetrapetalo odorato, fructu nullo*.

This is a tall Tree, about sixty Feet in Height, with a thick Trunk, and very numerous, strait, long, dark-green, lanuginous, rough Branches, full of fungous Pith. The Leaves stand by Pairs, in a parallel Order, on long Pedicles, about the small Branches, and are oblong-round, acuminate, crenated, thick, soft, smooth, green, and shining above, and greenish and lanuginous beneath, of a sweet Smell, and an aromatic Taste. The Flowers, which consist of four acuminate Petals, proceed from the Bosom of the Leaves, three or more together, and are of a purple Colour, and, being rubbed in the Hands, emit a pleasant Smell. Between the Petals are four purplish Stamina, in the middle of which is the Pointal, of a beautiful red Colour, and a whitish Apex. The Inhabitants of *Malabar* assure us, that this Tree bears no Fruit; but we cannot believe them.

The Leaves of this Tree, boiled in Whey, make a good Collution of the Mouth for the Aphthæ; and of a Decoction of the Bark and Root is prepared an Apozem, with Water which allays the Heat of Fevers, opens Obstructions of the Liver, and cures the Herpes, Scabies, and the like Affections. *Raii Hist. Plant.*

TONICOS, τονικός. An Epithet in *Galen*, for external Applications, which increase the Strength, Vigour, and Elasticity

city of the Parts. Or it is apply'd to internal Medicines of the same Efficacy.

TONITRU. Thunder. It is more the Province of the Naturalist, than Physician, to explain the Nature of Thunder. It has been sometimes esteem'd the Cause of Epilepsies; and I have been acquainted with some, in whom it always excited a temporary Purging. But, in both these Causes, I apprehend it acted only by causing a Terror.

TONOS, *τόνος*, from *τείνω*, to stretch, in the Language of Hippocrates, is a Nerve; whether proceeding from the Brain, or the spinal Marrow. *Galen. Lib. i. de Mot. Musc.* tells us, that the same Organ is called by two Names, *νεῦρον* and *τόνος*, because it may be said, both *νεῦρον*, to hang loose or slack, and *τείνω*, to stretch. The same Author, *Com. 1. in 6 Epid.* tells us, there are three Kinds of similar Bodies in Animals, which are exanguinous, and void of Cavity, some proceeding from the Bones; others generated of the Brain, and spinal Marrow; and others in the third place, deduced from the Muscles. The first of these, in Hippocrates, have commonly the Name of *σύνδεσμος*, (*Syndesmos*) a Ligament: The second he calls *νεῦρον*, and *τόνος*. the Third, *τένον* (a Tendon). And to the same Purpose *Ruffus Ephesius* describes the *τόνοι*, as taking their Original, and doing the Functions of Action, Motion, and Sensation to the whole Body. We often meet with the Word in this Sense in Hippocrates; for Instance, *Lib. 2. Epid.* where he says, *δύο δὲ τόνοι ἀπ' ἐγκεφάλου ὑπὸ τὸ ὀστέον τῆς μεγάλης σπονδυλῆς*, "there are two Nerves which proceed from the Brain, under the Bone of the great Spondyle or Vertebra." The same is repeated, *Lib. de Ossium Natura*; and, *Lib. de Artic.* we read, *τότοι γὰρ ἐπικαλεῖσθαι τόνοις γινώσκουσιν*, "for they are in the Vicinity of the principal Nerves." Here *Galen*, in his Comment, writes thus: *ὑποκρίσθαι τὸ ὑπὸ τῇ μασχάλῃ φησὶ τόνοις ἐπικαλεῖσθαι, &c.* He (*Hippocrates*) says that under the Arm (or Arm-pits) are seated some considerable *τόνοι*, so he calls the Nerves. It is a ridiculous Assertion, therefore, of some modern Physicians, who imagine, that he only calls the Nerves which proceed from the Brain by Pairs, by the Name of *τόνοι*, because, in a Book of his *Epidemics*, he says, there are two Nerves, &c. as before; for the Nerves which proceed to the Arms, are, by all skilful Anatomists, concluded to arise from the spinal Marrow about the Neck, in those Parts which are in the Vicinity of the Thorax; and are here, by Hippocrates, called *τόνοι*, as he, also, calls them again twice successively, that is, "a little below, and where he treats of the Spine." He uses the same Word, *τόνοι*, to express the Nerves in other Places of the same Treatise. *Galen*, also, explaining those very remarkable Nerves under the Arm-pits, which Hippocrates calls *ἐπικαλεῖσθαι τόνοις*, "says, that Hippocrates usually applies this Appellation to those Nerves which have a great Force, as those have in particular, on account of their Vicinity to the spinal Marrow, and their extraordinary Thickness." Again, in the same Treatise of Hippocrates, we read *ἥντιν ἀν κοινωσάντων αὐτοῖς τοῖς σὺννεργῶν*, "with which the neighbouring Nerves communicate." Here, tho' *Galen* understands, by *τόνοι*, the Nerves of the Back and Vertebrae, it is rather meant of the Ligaments, which by their Force, and a Communication of Tubercles, more easily pervert and draw aside the Vertebrae, from whence they have their Original, than the small, soft, and weak Nerves. In the same Book, *τόνοι νεύροδες* are the Nerves, which are extended lengthwise on both Sides of the Vertebrae, from the Top to the Bottom. Here *νεύροδες* are expounded, in *Galen*, by *ἰσχυροί*, "strong." With respect to these, and some other like Places of Hippocrates, *Erotian* expounds the Word *τόνοι*, where he says, *τὰ περιελαμένα σώματα τοῖς σάξιν, διὸν φλέβας, καὶ τὰ ὅμοια, τόνοις ὀνομάζον, ἀπὸ τῆς περιπελάσθαι ἐνὶ σὲ δὲ τὰ νεύρα μόνον, ἐννοεῖ δὲ τὰς ὑμέρας ἐκτασθαι*. "Those Bodies which stretch themselves about the Flesh, as Veins, Nerves, and the like, he calls *τόνοι* from the Verb *περιπελάσθαι* (to be stretched about); sometimes he gives this Name to the Nerves only; and some have bestowed the Appellation on the Membranes."

Τόνος, also, is not only a Nerve, but a Tension of that Nerve, as well as of other Parts, as appears from *Aretaeus, Cap. 4. Lib. i. de ὄφθ. παθ.* and *Hippocrates de Glandulis*.

TONSILLÆ. The Tonsils. These are describ'd under the Article *SALIVA*, by the Name of the Almonds, or *AMYGDALÆ*.

THE METHOD OF SCARIFYING THE TONSILS, WHEN AFFECTED WITH AN INFLAMMATION AND QUINSEY.

A violent Inflammation of the Tonsils, especially if attended with a Quinsey, may be reckoned amongst the most violent Disorders. In order to prevent a Gangrene, and the like dismal Consequences, immediate recourse must be had to the most efficacious Remedies, for alleviating the Inflammation. Besides the Remedies of this kind proposed in an Inflammation of the Uvula, (*SEE UVULA*) repeated Bleedings at the Arms, Legs, Jugulars, and under the Tongue, and Scarification of the Tonsils themselves, will be very beneficial; for, by these means, the superfluous and inspissated Blood may be happily discharged. The ancient Surgeons used to perform Scarification and Cupping on the external Parts of the Neck, nearest the Tonsils; a Practice

which I have found very efficacious in this Disorder. In *England* and *France* it is usual, as I have been informed, to scarify the Tonsils internally; which is certainly the readiest and most convenient Method of Cure, if, at the same time, proper internal Medicines are exhibited; as plentiful drinking of thin aqueous Liquors, and cooling Clysters. For the more convenient Performance of this Operation, such an Instrument should be used as is delineated in *Tab. XLII. Fig. 9.* which may serve to depress the Tongue, whilst at the same time the Scarificator is concealed. This Instrument may be called *Paristhmiotomus*, from the Greek Word *Peristhmia*, which signifies the Tonsils, and should be somewhat longer than it is represented in the Figure.

THE METHOD OF OPENING ULCERS IN THE TONSILS.

Sometimes, through Neglect or Mismanagement, an Inflammation of the Tonsils cannot be resolved, but degenerates into an Abscess, or Scirrhus. In such a Case it is necessary, by emollient Gargarisms and Malagmas, to accelerate the Suppuration with all Expedition; by which means the Patient will not only be relieved from a most miserable Situation, but, also, from the Danger of Suffocation, which is threatened by the Increase of the Exulceration; having, likewise, his Speech and Deglutition restored. For these Reasons it would be highly improper and extremely dangerous, to wait till the Matter bursts spontaneously; and, therefore, the Abscess must be opened by Incision, as soon as the Pus can be perceived to be formed; which must be carefully observ'd both by Feeling and Inspection.

This Operation may be thus performed: Take a long Lancet covered with Linen, or a Piece of Plaister, so that only about the Breadth of a Finger may be left naked at the Point. Then the Tongue being depressed with a Spatula, like that in *Tab. XXII. P.* or the plain Handle of a Spoon, the Lancet must be entered into the most proper Part of the diseased Tonsil; and, immediately upon the bursting of the Matter, the excruciating Pains will abate. In this Operation, the *Paristhmiotomus*, or Instrument above recommended, for scarifying the Tonsils, (*see Tab. XLII. Fig. 9.*) may be more conveniently used; which not only serves to depress the Tongue, instead of a Spatula; but, as the Lancet is concealed, as it were, in a Sheath, the Patient is not intimidated by seeing it: It must be introduced into the Abscess by pushing forward the Button B, with the Fingers. This Instrument is, therefore, very necessary for Children, and timorous Patients.

The exulcerated Tonsils being thus opened, a warm Gargarism of a Decoction of vulnerary Herbs mixed with Honey of Roses, or of Wine mixed with Water, or a little of the Infusion of Tea, and Honey of Roses, must be often used every Day, till the diseased Part is healed. Mean while the Patient should be strictly ordered to abstain from whatever is acrid or salt; for, should any such Substances adhere to the Wound, they may irritate and excite a new Inflammation, to the great Hazard of his Life.

THE METHOD OF TREATING INDURATED TONSILS.

Sometimes, after an Inflammation of the Tonsils, they are so extremely indurated and swelled, that they almost close up the Fauces, and prevent the Patient from either swallowing or breathing, especially if both the Tonsils are affected. As this Hardness cannot easily be dissolved, it will be more proper to extirpate it; and Extirpation may be performed either with corrosive Medicines, with the Knife, or sometimes by a Ligature.

In the Application of corrosive Medicines, particular Care must be taken not to use the stronger Escharotics, which might happen to slip into the Stomach, and occasion greater Misery to the Patient. Here, then, we may apply the Oil of Tartar per Deliquium; and, if that should fail, a Mixture of Aqua-fortis, with as much Quicksilver as it can dissolve over the Fire. With these, or the like Remedies, that Part of the Tonsils, which is most severely indurated, should be touched once or twice a Day with a Brush, till they are sufficiently diminished. Two Cautions are necessary to be observed in this Method of Cure; that none of the sound Parts be touched with the Escharotic; and that neither Meat nor Drink be taken, nor even the Spitte swallowed, for some time after its Application, lest some of it should be carried into the Stomach. It is, therefore, expedient for the Patient to incline his Face downwards, for half an Hour after the Application, that the Escharotic may flow, with the Spitte, out of his Mouth; and, before eating or drinking, he should wash his Mouth, and gargarize with warm Water. This Course he must pursue, till a sufficient Quantity of the Tonsils is consumed to make him breathe and swallow freely. There is no Occasion for consuming the Tonsils totally, which would not only prolong the Cure, but prove prejudicial.

The Method taken by the Antients to extirpate indurated Tonsils, was by Incision. They opened the Mouth with an Hook, like those represented in *Tab. XXIX. Fig. 2. or 3.* and carefully removed the indurated Part with a proper Knife. But as this Operation must be very cruel, and is, also, inconvenient, because of the obscure Situation of the Tonsils, it is seldom now performed.

Lastly, the third Method of removing indurated Tonsils, is by Ligature, which is to be performed when the Tonsil hangs, as it were, by a slender Stalk; though, it may be, with equal Conveniency, extirpated with a Knife, or Pair of Scissars. To apply the Ligature, that Instrument is recommended, which is represented in *Tab. XLII. Fig. 7.* The Ligature must be renewed every Day, till the corrupted Part of the Tonsils falls off; which, according to some Physicians, happens in two or three Days, if the Ligatures be exactly made. The Ends of the Thread or Ligature should be fixed upon the Cheek with a Piece of Plaster, lest it should slip into the Fauces. *Cheselden* made a Ligature in this kind of Disorder, with the Assistance of a Probe. But in a scirrhus Tonsil, with a broad Root, he perforated its Basis with a peculiar kind of Needle, made a Ligature on both Sides, and, by this Method extirpated it. *Heist. Chir.*

Of Ulcers of the TONSILS.

The Tonsils are subject to Ulcers, some of which are familiar, of a favourable Kind, and harmless; others foreign, malignant, and deadly. The mild or favourable Sort are pure, small, not deep, and free from Pain and Inflammation; but the malignant are broad, hollow, sordid, and contained under a white, livid, or black concremented Humour; and these Ulcers go by the Name of *Aphthæ*. If the Concretion be deep, the Disease is an *Eschara*, (or Crust) and is called by that Name. Round this *Eschara* appears a great Redness and Inflammation, attended with a Pain in the Veins, as from a Carbuncle, and an Eruption of thin, small Pustules, which, breaking out one upon another, form at last a Coalition, and become one broad Ulcer. And if this Ulcer eats its Way outwardly, it comes first to the Uvula, and consumes it; and afterwards makes its Approaches to the Tongue, Gums, the Ligaments of the Jaws, [*χαλνὸς*] and the Teeth, which are loosened in their Sockets, and become black, and the Inflammation extends itself to the Neck; after which the Patient survives but a few Days, sinking under the accumulated Weight and Oppression of the Fever, Inflammation, Fœtor, and Famine. But if the phagedenic Ulcer spreads itself through the *Aspera Arteria* towards the Thorax, it induces a Suffocation on the same Day; for the Heart and Lungs are incapable of supporting either the Smell, or the Ulcer, or the Ichor; but Coughs and a Dyspnoea seize the Patient.

The Cause of an Affection of the Tonsils is the Deglutition of cold, rough, hot, acid, and astringent Things; for these Parts are serviceable to the Thorax for the Voice and Respiration, to the Belly for the Transmission of the Aliment, and to the Stomach for Deglutition. And if any Disorder happens to the internal Parts, as to the Belly, Stomach, and Thorax, the same ascends, and is communicated to the Fauces and Tonsils, with the adjacent Parts, by Eructation. For this Cause Boys, before the Age of Puberty, are principally subject to this Disease; for as, at this tender Age, they abound with Heat, they require and receive great Quantities of cold Air by Inspiration; they are, also, intemperate in eating, and cover Varieties; and are, besides, much given to Vociferation, when they are angry, or at Play. Girls, too, are much subject to this Distemper, before their first menstrual Purgations. *Aret. περί ἀσθ. καὶ σπυ. δέ. παθ. Lib. I. Cap. 9.* See the Remainder of this Chapter, which gives an Account of the Countries most subject to this Disorder, and the most miserable Kind of Death it induces, under the Article *ÆGYPTIA ULCERA*.

Of the Cure of malignant Ulcers in the TONSILS.

The Method of Cure of this Kind of Ulcers is partly in common with that of other Affections of the Tonsils, partly proper to the Disease itself. Common Remedies, which serve as well for an Inflammation and Strangulation, are Clysters, Phlebotomy, Embrocations, Cataplasms, Fomentations, Ligatures, and Cupping. But stronger Unctions are to be used; for neither the Ulcers remain in a settled State, nor Crusts arise on the Superficies; and if there be a Distillation of Ichor from the Place inwardly, the sound Parts are very soon ulcerated, and the Ulcer very quickly eats its Way into the internal Parts, and destroys the Patient.

It would, therefore, be proper indeed to cauterize the diseased Part, if it were not too rash an Undertaking on account of the Situation of the Fauces; but we ought, however, to use Remedies equivalent to a Caution, in order to restrain the spreading of the Ulcer, and to cause the Crusts to fall off. Such are Alum with Honey, Galls, Balaustines dry mixed with Hydromel; or the same may be blown in through a Reed, Pen, or a long and thickish Quill [*καυλῶ*] so as that the Medicines may apply themselves to the Ulcers. Very proper Remedies are, also, burnt Chalcitis, with Cadmia triturated with Vinegar; or two Parts of Cadmia with one Part of the Root of Rheum in some (proper) Liquor. But Care is to be taken, that the Ulcers may not be compressed; for by that means they would contract Humidities, and spread themselves the farther. For this Reason dry Medicines are to be applied by way of Insersion with a Feather, and the liquid Kind

rendered thin enough to be infused on the Uvula. If the Crusts are already resolved, and the Ulcers appear red, there is great Danger of Convulsions; for, as the Ulcers generally dry up, the Nerves are contracted. The Parts are, therefore, to be mollified and moistened with Milk and Amylum, or the Juices, or Cremors, of Pistan, *Tragus*, Linseed, or the Seed of Fenugreek. Sometimes the Uvula is corroded to the very Bone of the Palate, and the Tonsils are consumed to their very Basis, and the Epiglottis; by which means a Cicatrix is induced so considerable, as to intercept the Deglutition of either solid or liquid Aliment; and even to force a Return of what the Patient drinks, through his Nostrils, whence, of Necessity, he perishes with Hunger. *Aretæus, περί ὁσπας. Ὁζ. παθ. Lib. I. Cap. 9.*

TONSORIS EMPLASTRUM. See EMPLASTRUM.

TOPAZIUS. The Topaz. See CHRYSOPASIUS.

TOPHUS. A Toph. A calcarious, or rather chalky Substance, growing in any Part of the Body.

TOPICA, from *τόπος*, a Place. Topics, or local Applications.

The best and most generous Remedy may, according to *Galen*, prove injurious, as well as beneficial. This Maxim holds true, not only with respect to internal Medicines, but, also, with respect to Topics, or external Applications. Though the former of these are more efficacious, and of more universal Use, than the latter, yet Topics are, in some Cases, so necessary, that Practice cannot subsist without them; for which Reason we shall point out the several Errors with respect to the Use and Application of Topics.

Topics in general include whatever is externally applied to any Part of the Body, and consequently comprehend whatever is laid to Wounds, Ulcers, or any Injuries of the Limbs; whether it consists in the Application of the various chirurgic Instruments, or in the Use of Ointments, Plaisters, Injections, and Tents. But we shall confine ourselves to the Consideration of those Topics used in Disorders which arise from an internal Cause, and consequently belong rather to the Province of the Physician, than of the Surgeon.

Baths, then, for the Head, whether prepared of simple Water and a Lixivium, or Wine boiled with cephalic or emollient Herbs, are often preposterously used by Persons ignorant of Medicine. These are generally prejudicial in all Disorders of the Head, and a Weakness of the Brain or Nerves; but they are in a particular manner injurious in Achors, Catarrhs, a Ringing of the Ears, Dulness of Hearing, and Inflammations of the Eyes. I have often known an Epilepsy produced by a preposterous Use of Baths for Childrens Heads; and I am of Opinion, that we ought totally to abstain from such Baths; and substitute, in their room, Frictions of the Head, and Substances of a drying and corroborative Nature; for the above-mentioned Disorders are produced by an impetuous Conveyance of the Humours from the inferior Parts to the Head, and an Infarction and Stagnation of Blood either pure or serous there. Now nothing more disposes the Head to receive the Impetus of the Humours, and retain the serous Parts of the Blood, than these Baths; which, by their hot or tepid Moisture, render the Fibres flaccid, and hinder the congested Humours from returning thro' the Veins. But in all Disorders of the Head, or superior Parts, we are rather to bathe and relax the Feet and Legs, in order to make a Revulsion and Derivation from the superior to the inferior Parts.

I, also, condemn the Use of cephalic Plaisters; when, for Instance, the whole Head is shaved, and covered with a Plaister, as is usual in violent Hæmorrhages, Epilepsies, and other Symptoms, generally produced by external Causes, such as Contusions or Blows: And though some, upon this Occasion, make a Distinction between Plaisters prepared of Balsams and Gums, and those which consist of viscid and glutinous Substances, yet, in my Opinion, both are more hurtful than useful, not excepting the celebrated Bethony-plaister. The Reason of this Assertion seems to be, that the freer the Perspiration of the Part affected, is, the Cure always succeeds the better. Besides, the farther the Parts are removed from the Heart, the Source of Heat, or the less Blood circulates in them, of the greater Importance it is, to promote Transpiration in them. Every one must, therefore, be convinced, that Plaisters must prove prejudicial by closing the Pores of the Head.

We can, therefore, from Experience, recommend in their stead dry Powders, either sprinkled on the Head, or included in Bags; and which, by their subtle, mild, and sulphureous Quality, corroborate the nervous or cold Parts, and preserve a free Perspiration. But if dry Powders are contraindicated, we may substitute, in their room, Bags with cephalic Ingredients, boiled in Wine, or Liniments prepared of such Substances, as are possessed of a penetrating Quality, a volatile, oleous Salt, and a balsamic Resin; among which the most considerable are the *Peruvian* Balsam, Camphire, rectified Spirit of Wine, Sal Ammoniac, or volatile Salt of Worms, strengthened by the unadulterated Oils of Lavender, Marjoram, Rosemary, or Nutmegs, and impregnated with Essence of Castor. These Liniments afford great Relief in all Disorders of the Head, whether they partake of the Nature of Convulsions and Epilepsies, or are accompanied with Pain,

Pain, and the Interception of any of the Senses. But my Intention is not to destroy the Use of all Plaisters, which, in certain Cases, are beneficial, when applied to the Forehead, or Nape of the Neck; but I only speak of those Plaisters which cover the Whole or Half of the Head. It is, also, to be observed, that frequently powdering the Hair, especially with pounded Starch, is productive of bad Consequences. Thus a Gentleman of Distinction told me, that, by the frequent and immoderate Use of such Powder in his Youth, he contracted a Weakness of his Eyes, which at last terminated in a perfect Cataract. Nor is it difficult to assign a Reason for this, since such tenacious Substances, by blocking up the Pores of the Head, greatly obstruct Perspiration, so necessary to the Health and Strength of that Part.

It is a common Error in Practice, to apply various Liniments and Balsams in most Disorders of the Head, especially a Vertigo, an Head-ach accompanied with a Sense of Weight, a Carus, an Apoplexy, a Torpor of the Senses, and an Hemiplegia. Thus it is customary not only to anoint the Nostrils and Temples, but, also, the Crown of the Head and Neck, with fragrant Balsams prepared of Musk, Amber, Civet, and Oil of Roses, because these are thought efficacious against Disorders of the Head. But such a Practice is not so innocent as it is imagined; for these are vaporous Medicines, and, by their elastic Vaporosity, insinuating themselves into the Pores of the Vessels, distend them too much, and, in some measure, fix the impetuous Motion of the Blood; and thus, by their sedative and anodyne Quality, dispose to Drowsiness. Hence every one must perceive, that we are to deal cautiously with Medicines of this kind, which are not proper in Disorders of this Nature, where the Head and its Vessels are already infarcted and distended by the Impetus and Quantity of the Blood. In this Case, by increasing the Expansion of the Humours, and consequently augmenting the Danger of their Stagnation, they are experimentally found to produce Head-achs, Vertigos, Ringing of the Ears, Drowsiness, and a greater Oppression and Torpor of the Mind and Senses. What *Hippocrates* says in *Aphor.* 28. *Sect.* 5. with respect to Fumigations, holds true concerning these Medicines; which is, that they would, in many respects, contribute to the Production of good Effects, if they did not induce an Heaviness of the Head. For which Reason, to the Remedies above-mentioned, we prefer such balsamic Liniments, as only consist of highly rectified Spirit of Wine, in which Camphire, the Oils of Marjoram, Lavender, and Rue, but not adulterated with Turpentine, are dissolved; for these Substances rather operate by discussing and opening the Pores, than by filling the Head with Vapours; and for that Reason are always safer in Cephalalgias, and violent apoplectic Fits.

We now proceed to the Topics generally used in Disorders of the Eyes; and so great are the Errors committed both by Physicians and Surgeons in this respect, that we may justly affirm, that more are deprived of Sight by a preposterous Application of these, than by the Violence of the Disorders. Thus it is a vulgar Error, that cold Substances are friendly to the Eyes; whereas such as are hot are prejudicial to them: This, indeed, holds true, when the Eyes are found, in which Case it is more expedient to wash them with cold, than with warm Water; because the latter, by relaxing the Fibres, disposes the Eyes to Defluxions, whereas cold Water, by corroborating the Pores of the Coats, and Sides of the Vessels, prevents an excessive Flux of Blood and Humours, and thus preserves the Eyes serene, lively, and sound. But this Rule is by no means to be observed in a preternatural State of the Eyes, especially in an Ophthalmia, in which the Use of cold Substances is highly dangerous. Thus *Forestus*, in *Obs. Chirur. L. 2. Obs.* 19. gives us an Account of a Woman, who, labouring under an Ophthalmia, used a Collyrium of Talc, and distilled Water; but, soon after, her Eyes were seized with such an intense Pain and Heat, that an Ulcer succeeded. When the Eyes have been afflicted with an inflammatory Heat, I have often seen them rendered turbid, and the Inflammation so greatly increased, that within a few Days the Sight has not only been obscured, but, also, sometimes totally destroyed for want of proper Management; for as in all Inflammations, skilful Physicians justly condemn the external Application of cold, astringent, and incrustating Substances, so I see no Reason why we should admit their Use in Inflammations of the Eyes, whose capillary Vessels are far more tender than those of other Parts; for the Cause and Origin of every Inflammation is an Infarction of Blood or Humours in the larger Vessels, on account of the Obstruction of the adjacent small Vessels: Now Obstructions are by nothing more confirmed, than by Things actually cold, which deprive the Juices of their Fluidity, and render them thick, and incapable of Circulation.

In inflammatory Disorders of the Eyes, we not only reject such Collyriums, as are actually cold, but, also, such as are possessed of an incrustating and condensing Quality, or invite a farther Afflux of the Humours to the Part affected; such as all the ophthalmic Waters, the Frogspawn Water, for Instance, Rose-water, that of Plantain, that with Sugar of Lead, that of Alum, the White of an Egg, red Bole, and all mucilaginous Substances. Thus *Forestus*, in *Lib. 2. Obs.* 26. observes, that oleous and pinguious Substances are hurtful to the Eyes; in Confirmation of

which, he tells us, that a Barber treated an Ulcer with hot Oil, till, breaking into the Tunica Cornea and Uvea, it at last degenerated into a Cataract. Greater Efficacy is to be promised from such Substances, which, without any great Acrimony or Heat, are possessed of a discutient Quality; among which Camphire is the most considerable, because, as in all other Inflammations, so, also, in this, it affords instantaneous Relief. If, therefore, the Inflammation is only slight and superficial, Elder-flower Water, in which a little Saffron is dissolved, with the Addition of a few Drops of a well-saturated Solution of Camphire, applied tepid, is of singular Service. If the Inflammation is accompanied with a saline and acrid Lymph, a Mucilage of Quince-seeds, or Rose-water mixed with Saffron and Camphire, are of singular Efficacy; for when the Inflammation is violent, deep, and dangerous, the Eye being almost deprived of Sight and Sensibility, I have found happy Effects produced by tepid camphorated Spirit of Wine, mixed with *Petravian* Balsam; by which means the Sensation, Motion, Tone, and Colour of the Eyes are gradually restored.

It is sufficiently known, that Vitriol, in consequence of its partaking of Copper, is among Practitioners reckoned a great Arcanum in Disorders of the Eyes; but as it is almost promiscuously used in all Collyriums, great Misfortunes are sometimes produced by it. We are, therefore, to abstain from the Use of Vitriol in all Inflammations, and in saline, hot, and acrid Defluxions; accompanied with Redness and Itching, because Vitriol, by its Acrimony, increases all these Symptoms. But Vitriol is properly used, either when the Humours are thick, and formed into Sordes; or when they begin to form small Membranes in the Tunica Albuginea, which frequently happens after the Small Pox and Measles, which induce a too great Thickness of the Lymph. In such a Case, therefore, surprising Effects are produced by one Grain of *Cyprian* Vitriol, dissolved in one Ounce of Celandine Water, with which Liquor upon a Feather the Part affected is to be frequently touched every Day. But when a manifestly corroding and burning Matter is perceived, temperating, demulcent, and mucilaginous Substances are to be used; and of these the best are, the Mucilages of the Seeds of Fleabane, and white *Sieff* without Opium; as, also, the Powder of Sarcocolla.

With respect to the Fat of Vipers, and of that Species of Fish called *Umber*, which is so greatly extolled in Wounds of the Eyes, and in that Disorder in their Corners, which is generally called the *Pannus*, we are to observe, that these Fats ought to be recent, since, when by Age they have contracted a Rancidity, they are not only injurious in these, but, also, in all other Disorders of the Eyes. Besides, Collyriums are of no Use, or rather hurtful, when, from a Fault and Dyscrasy of the Lymph and Blood, which often happens in a Scurvy and Lues Venerea, the Eyes are red, painful, dropping, and turbid. In such Cases, Topics of all Kinds are useless: We first correct the Juices by internal Medicines, which is excellently performed by Decoctions of the Woods, and of such Herbs, as sweeten the Blood. It, also, sometimes happens, that, in consequence of an inveterate Tumor of the Glands of the Neck, an obstructed Discharge from the Ears, an Application of Cosmetics to the Face, or the Retropulsion of an Anchor in the Head, the peccant Matter fixes its Seat in the Eyes; in which Case we are not to trust to Topics alone, but these are to be assisted by internal Medicines, and the Cause of the Disorder must be totally removed.

With respect to Disorders of the Ears, numberless Errors are, also, committed; for nothing is more improper, than, in a Dulness of Hearing, to put Oils, whether expressed, as the Oil of sweet Almonds, or mixed with Cephalic Oils, into the Ears. Though this Piece of Practice is extolled by many Practitioners, yet I have rarely found it productive of good Effects: For a Dulness of Hearing proceeds either from a too great Relaxation of the Tympanum, or from an excessive Humidity of the Membrane surrounding the Organ of Hearing, that is, the Labyrinth and Cochlea; so that Oils, by producing a greater Relaxation, increase the Disorder; and Oils of an hot, acrid, or too spirituous Kind produce intense Pain and Heat in that highly nervous and sensible Membrane, which surrounds the auditory Passage. Besides, if we have recourse to the Observations of the most skilful Practitioners, we shall find, that Topics are so far from being beneficial in a Dulness of Hearing, or Ringing of the Ears, that they are rather hurtful. Nor do I see by what means the Virtues of Medicines, whether unctuous, oleous, or spirituous, can penetrate to the Seat of the Disorder, which is within the Brain, or in the most remote Recesses of the Os Petrosum. In such Cases I have always observed happier Effects produced by apoplegmatizing and cephalic Substances.

There are, however, some Cases, in which Topics are beneficial in Disorders of the Ears; when, for Instance, the Ear-wax is so indurated, as to assume the Nature and Consistence of a Plaster, and greatly obstruct the Hearing; in which Case tepid Oil of sweet Almonds mollifies the indurated Ear-wax, so that it may be commodiously extracted with Ear-picks. I remember some Years ago a Mountebank pretended to a wonderful Secret for removing Deafness, which consisted in injecting into the Ear, with a Syringe, Fennel-water, into which a little of the Oil of Tartar had been dropped. This Injection he cautiously made several

times a Day; and in some Patients, that is those whose auditory Passages were block'd up with the Ear-wax, the Experiment succeeded very well. The like happy Effect is sometimes produced by a tepid Injection of mineral Waters into the Ear; but they are only beneficial, when the Dulness of Hearing proceeds from Sordes too much clogging the Membrane of the Tympanum.

As Abscesses sometimes arise in the internal Ears, 'tis to be observed, that these require a particular Treatment, since, if they are treated in any other manner, they frequently terminate in putrid and carious Ulcers, accompanied with a total Loss of Hearing. 'Tis, therefore, a bad Piece of Practice to use digestive and oleous Ointments, such as these cold, dry, nervous, and sensible Parts cannot bear. But such Abscesses are rather consolidated and hindered from degenerating into Ulcers, by putting warm Balsamics into the Ear, with Cotton; such as the Essences of Myrrh, Opobalsam, and Amber.

The Nostrils have, also, their peculiar Topics, which, when properly apply'd, are very beneficial, but no less prejudicial, when preposterously used; an Instance of this we have in the great Variety of Things thrust up the Nostrils, in order to stop excessive Hæmorrhages: And tho' the Applications of this Kind are inconceivably numerous, yet few of them are useful, or even innocent in Practice. For as an Hæmorrhage generally proceeds from an internal Cause, which for the most part is a Spasm, a violent Constriction or Obstruction of some Parts remote from the Nostrils, and as the Blood is imperiously convey'd to the Vessels of the Head, when this Blood is too much congested, it distends the Orifices of the Vessels, and at last breaks the Coats of the Nostrils. Hence, every one must perceive, that it is not only in vain, but, also, dangerous, in such Cases, to use external Styptics and Repellents; for, closing up the Orifices of the Vessels by Astringents, we derive the Disorder to other Parts of the Head, or perhaps to the Breast, whilst the internal Impetus of the Blood still remains. But if the open Orifices of the Vessels from which the Blood flows, are situated pretty deep in the Fauces, so that the Efficacy of Styptics cannot reach them, and the Nostrils, in the mean time, so stop'd up, as to afford no Discharge of the Blood, it falls from the Fauces upon the Aspera Arteria, sometimes not without Danger of Suffocation. Besides, as all Styptics are unfriendly to nervous and glandular Membranes, they greatly injure these Parts, when thrust far into the Nostrils.

These Topics, for the Nostrils, are, therefore, of little or no Use, unless we previously derive the Blood from the Head, by Venesections, Frictions, and Immersions of the Feet and Hands in warm Wine or Water; as, also, by Diaphoretics, which, without any great Motion and Heat, propel the Blood from the Centre to the Circumference of the Body; and then there is no Necessity for these cold and styptic Repellents, since the Essence of *Terra Japonica* alone, received into the Nostrils, is far superior to them all. 'Tis customary, among the Vulgar, in excessive Hæmorrhages of the Nose, to apply a Piece of Silver Coin wet in cold Water, either to the Forehead or Nape of the Neck; or to apply a Linen Cloth wet with cold Water, either to the Forehead or Whole of the Neck. But these Practices cannot be used in the Beginning of the Hæmorrhage, without Danger of an Apoplexy. We do not, however, disapprove of such Epithems as are at once possessed of a discutient and corroborative Virtue; such as Vinegar of Roses, mixed with Nitre, Camphire, and the Oil of Rosewood; which Mixture, when apply'd tepid to the Temples and Neck, is of singular Efficacy, and preferable to all others.

We now come to consider the Topics generally used in those putrid and carious Ulcers of the Ossa Squamosa, which are familiar to those labouring under the Lues Venerea, or the Scurvy. The Topics for these Purposes are generally the Waters of Roses, Plantain, and Houfleeck, mixed with red Bole, Sugar of Lead, or Magistery of Lead; or, if the Ulcers penetrate to the Bones of the Fauces, or corrode or consume the Substance of the Uvula, Injections or Gargarisms are commonly used. But all these cold Preparations are of no Use, since they are by no means fit for stopping the putrid Corruption. Disorders of this Kind require far more powerful, and more penetrating Medicines; such as Oil of Cloves, which is an excellent Preserver of the Bones, especially when mixed with *Peruvian* Balsam; *Elixir Proprietatis*, prepared without an Acid; Essence of Amber, or camphorated Spirit of Wine, cautiously injected thro' the Nostrils, by means of a Syringe, are, also, excellent for curing these feid and malignant Ulcers. This Method I have often, upon Reflection, concluded good; and, upon Trial, found it to answer my Expectations. Many Venereal Patients, on account of the Ignorance of their Surgeons, and the preposterous Application of Medicines, are long afflicted with such sordid Ulcers, which at last corrode and consume the whole internal Structure of the Nostrils, the Uvula, and the Bone of the Palate, to the great Detriment not only of their Voice, but, also, of their Health, since Gargarisms, tho' prepared of the most efficacious Ingredients, are in vain apply'd, because they cannot reach the Root of the Disorder, and the Part affected, which is above the Bone of the Palate.

Many Topics are, also, prescribed both by Physicians, Surgeons, and the Vulgar, for the Tooth-ach; but most of these generally do

more Injury than Good: And tho' after the Use of gentle Astringents and Anodynes, the best of which seems, to me, to be the Essence of *Terra Japonica*, mixed with the anodyne Essence, there is some Alleviation of the Pain; yet it is very small, short-liv'd, and, at another time, not to be obtained. And as a Tooth-ach is frequently epidemical, and arises from a Rheumatism, or an acrid erysipelatous Defluxion, infecting the carious Tooth, and generally joined with a catarrhal Fever, it is easy to perceive, how foolish and ineffectual an immediate Application to the Tooth must be. In this Case, if any Benefit is to be expected from external Applications, the best we can use, are paregoric Bags, prepared of discutient, carminative, and anodyne Ingredients: And tho' the Oils of Cloves and Origanum are excellently appropriated to a Caries of the Teeth, accompanied with Pain, yet, when, in a carious Tooth, a nervous Membrane is too much distended, or corroded by an aqueous Fluid, lodged between the narrow Interstices of the Bone, we are rather to use the liquid apoplectic Balsam, or the Balsam of Life, received into the Nostrils, or a tepid Decoction of Milk with Elder-flowers and Saffron kept in the Mouth, will better alleviate such a Pain, than any other external Application whatever. And I can affirm, from Experience, that Diaphoretics alone, such as the Bezoardic Tincture, Sulphur of Antimony, prepared in the manner directed by me, or succinated Spirit of Hartshorn, mixed with the sweet Spirit of Nitre, used in violent Tooth-achs, with a sudorific Regimen, after the Use of such Medicines as render the Body soluble, produce very happy Effects; so that 'tis sufficiently obvious, how preposterously Topics are generally used in Tooth-achs.

Various Errors are, also, committed, with respect to the Cure of cutaneous Disorders of the Face and Head. Thus nothing is more customary among the Vulgar, than the curing Achors and Scal'd-heads in Children, with various Lotions, Lixiviums, Decoctions, and Ointments prepared with Sulphur, Oil of Olives, and other unctuous Substances. But I have experimentally found this Method productive of the worst Consequences, since it is generally succeeded by Epilepsies, Inflammations, and Suppurations of the Eyes, an Epiphora, a Gutta Serena, violent Peripneumonies, Asthmas, and other Disorders of a like Nature. We are, therefore, in such Cases, to deal very cautiously with external Applications, for fear of obstructing the Perspiration in the Parts; nor are we ever to prescribe them, without at the same time exhibiting internal Medicines for correcting and evacuating the peccant Humours. We are never externally to apply moist, oleous and astringent Substances; and if Topics are indicated as proper, antimonial Balsam of Sulphur, dissolved in camphorated Spirit of Wine, and mixed with Oil of sweet Almonds, will produce excellent Effects, by mollifying, discussing, and resisting farther Putrefaction. In Venereal Pustules, and the Gutta Rosacea, we are, also, to deal very cautiously with Repellents, and such Medicines as constrict the Pores of the Skin, since, by their means, I have often observed the saline acrid Serum precipitated to the Coats of the Eyes, and an Ophthalmia produced. How much Topics are abused in the Cure of an Erysipelas, is too obvious; for, certainly, this Disorder requires a cautious Application of Externals, particularly when near the Brain and Origin of the Nerves; and it is not free from Danger, especially in scorbutic Patients, as Practitioners sufficiently know.

Practical Authors furnish us with numberless Instances of the bad Effects of Topics in the Cure of an Erysipelas. Thus *Rolfinckius*, in *Method. curand. Affect. Capit.* makes mention of a Quinsy produced by the unseasonable Use of Repellents in the Cure of an Erysipelas of the Head. *Aquapendente*, also, in *Lib. de Tumoribus*, justly orders, that, in an Erysipelas of the Face or Head, we are neither to use Topics before, nor after Purging; for, by cold Substances, the Matter may be repelled to the Brain, and produce a Phrenitis; or to the Fauces where it induces a Quinsy. In such Cases all Cataplasms, all unctuous, moist, and aqueous Substances are highly prejudicial. But we are rather to use dry Substances alone, such as Bags prepared of emollient and discutient Herbs, that the Transpiration may remain free. Sometimes, however, camphorated Spirit of Wine, mixed with Essence of Castor, or Oil of Nutmegs, mixed with volatile Salt of Worms, Nitre, and a little Opium, used by way of Ointment, produce very salutary Effects. Those seem to be in a great Error, who, for the Cure of a Gutta Rosacea, and Pustules, use sublimate Mercury, or a weak Water of precipitate Mercury, since these, when received into the Pores, greatly dispose to violent Heads-achs, Hemicranias, and Looseness of the Teeth. But the Intention will be far better answered by Essence of Benjamin, mixed with Magistery of Lead, Camphire, Sugar of Lead, Frogs-spawn-water, and Elder-flower-water.

When the Flesh of the Gums is so corroded, that the Roots of the Teeth appear bare, the Disorder is generally thought to proceed from a Relaxation of the Fibres. Hence 'tis a common Custom to prevent this Misfortune by the external Use of Astringents, such as the Essences of Mastich and Tormentil, Alum, and the Essence of *Japon* Earth, which, instead of being beneficial, are rather hurtful; for the Disorder is an Atrophy, and proceeds from a Defect of the nutritive Juice, in consequence of an Obstruction of the minute and numerous Arteries of the Gums. Now, if

this Obstruction is confirmed by Astringents, the Gums must be still more deprived of their fine nutritive Juices. In such Cases, happier Effects are produced by Decoctions of Wine with Sage, Origanum, Rosemary, Camphire, Nitre, and a small Quantity of the Spirit of Sal Ammoniac. By washing the Mouth and Gums frequently with such Decoctions warm, the Vessels are opened, the Blood and Juices invited, the Fibres of the Gums corroborated, and the Use and Vigour of those Parts restored.

We now come to consider the Abuse of Topics in Disorders of the Thorax. In those inflammatory Tumors, therefore, of the Lungs, commonly called Pleurifies, or Peripneumonies, nothing is more customary than the external Use of oleous Ointments, in order to allay the Pain. But I have rarely seen happy Effects produced by such a Practice, since, when the Disorder might at first have been dissipated by internal Diaphoretics and Discutients, they hinder its Discussion, and dispose it to a Suppuration; just as in other erysipelatous Disorders of the external Parts, these Ointments, by obstructing the Pores, and relaxing the Fibres, invite a farther Defluxion of Humours, and dispose the Part to Suppuration and Exulceration. If, therefore, as it often happens, the Pleurisy is spurious, that is, if an acrid saline Serum stagnates between the Membranes of the intercostal Muscles, in which Case, it is a Species of Rheumatism, the above-mention'd Topics will be far more injurious than beneficial, by hindering the Transpiration and Excretion of the stagnant Matter; which, however, is absolutely necessary to the Recovery of the Patient. Some, in order to allay violent Pain, have a Custom of adding to those, Oil of Henbane, by which means the Pain is, indeed, mitigated, but, at the same time, a Drowsiness, a Languor of the Strength, and a difficult Expectoration succeed, which, especially in Old-age, are not without Danger. Besides, in these Disorders, 'tis customary, with some, to apply Plaisters, such as the Emplastrum Vigonis, mixed with Mercury, Balsam of Sulphur, and Camphire. But, by this means, I have found, that when the Pleurisy has been spurious, and affected the intercostal Muscles and Membranes, but not the Lungs, the Pain has, indeed, been dissipated, but the Matter has been conveyed to other Parts; and I have frequently known the Matter repelled to the Substance of the Lungs, where it has produced Impostumations sufficiently chronical and dangerous.

In my Opinion, therefore, in all these inflammatory Disorders of the Thorax, we are either absolutely to abstain from all Topics; or, if any are to be admitted, camphorated Spirit of Wine, mitigated, and rendered anodyne by an Addition of Castor, Saffron, and distilled Oil of Nutmegs, used by way of Ointment, seems preferable to all others. There are, however, some Disorders in which pinguious Ointments, those possessed of an anodyne Quality, and such as relax the Fibres, produce happy Effects, though they are rarely used. A Disorder of this Kind is the dry Chincough, in which, not so much the Quantity, as the peccant Quality of a thin and acrid Matter stimulates the pneumonic Nerves and Thorax to violent convulsive and concussive Motions, in which Case 'tis necessary to allay these Motions, and relax the constricted Parts of the Thorax, not neglecting, at the same time, to inspissate and correct the thin and acrid Humour. This Species of Cough is frequently very obstinate, and raging violently at certain Seasons, principally attacks Children and Infants. I have frequently seen good Effects produced by anointing the whole Breast with an Ointment prepared of the Unguentum Portabile Rubrum, Sperma Ceti, Badger's Fat, Ointment of Poplar, Oil of Anise, and Camphire.

We shall now subjoin something with respect to Topics, in a true Phthisis, or Exulceration of the Lungs: We have Instances of phthisical Patients who bear some Ointments and Plaisters well, but others not without Injury. The Nature, therefore, of every Phthisis, and its particular Cause, are to be investigated. Topics are not, therefore, useless, when the Lungs are full of hard Tubercles, which, for the most part, gradually come to a Suppuration: For this Purpose the Plaisters ought not to consist of too hot Substances, nor of those of too rough and unctuous a Kind; for the former increase the Pain and Inflammation, and the latter hinders a free Perspiration. The best of all is *Rulandus's* Emplastrum Diasulphuris, without the Colophony, which is prepared of amygdalated Balsam of Sulphur, Myrrh, Earth of Vitriol, Wax, and Turpentine, to which Bdellium may be added. This Plaister, by its corroborating Quality, diverts the Impetus of the Humours from the Breast, and discusses the Stagnation of the Juices. But 'tis to be observed, that, in Disorders of the Lungs, Plaisters are not to be applied to the Sternum, thro' which they cannot penetrate, but rather to the Back and Sides, because there the Pores are more open, the Blood more copious, and the Vessels more numerous, in consequence of which, the subtle and salutary Parts of the Plaister are the better received and admitted.

We now come to consider some Disorders of the Stomach, in which Topics are beneficial, provided they are duly applied. No Pain is more cruel than that which is fixed in the Right and Left Orifices of the Stomach, which are highly sensible; and is generally called a Cardialgia. In this Disorder, 'tis customary to take internally various Remedies for mitigating the Pain, and externally to anoint the Region of the Stomach with some spiri-

tuous Liniment, or an Ointment prepared of carminative and anodyne Ingredients. But this Method does not produce the desired Effect; for since the Pain is fixed in a very small Part, that is, in these nervous Orifices, it is sufficiently obvious, that a penetrating and efficacious Medicine is to be applied as near as possible to those Parts. Now, if either a Plaister, Liniment, or Ointment, is applied to the whole Region of the Stomach, a small Quantity of any of them can only penetrate to the Orifices of the Stomach. Besides, as 'tis certain from Anatomy, that the superior Orifice of the Stomach is nearer the Back and Vertebrae, since it is situated hard by the Aspera Arteria, it is sufficiently obvious, that the Medicines applied to the Pit of the Stomach can by no means penetrate to it. Such Remedies are, therefore, to be applied to the Back about the eighth or ninth Vertebra, before they can affect it. But if the Right Orifice is affected, we are to apply our Remedies under the Stomach, towards the Right Side. But in Cases of this Nature, we are by no means to use too volatile Substances, such as Spirits; nor unctuous and emplastific Substances, which operate too slowly, but rather a pretty thick Liniment, in the Form of a Plaister, and prepared of Treacle, Saffron, Oil of Nutmegs, Camphire, *Peruvian* Balsam, and Oil of Henbane. I have often found this Preparation afford Relief, and where it proves unsuccessful, nothing is to be expected from other Topics.

Practitioners well know, that in a Weakness of the Stomach, Vomiting and Nausea, nothing is more common, than to apply Ointments, or oval stomachic Plaisters under the Sternum. But, upon dissecting Carcasses, we find, that only a very small Portion of the Stomach, but the Liver, the Intestinum Colon, and the small Intestines are situated there. The Stomach rather inclines to the Left Side under the Ribs, where, at least, three Parts of it are situated towards the Spine. If, therefore, we apply generous and penetrating Medicines to the spurious Ribs of the Left Side towards the Back, we shall find far more happy Effects produced on the Stomach by them.

The violent Pain arising from a Stone sticking in the Beginning or Middle of the Ureters, also, demands the Use of Topics; but they must be applied with great Caution; for 'tis sufficiently known, that a pretty large Stone, whilst lodged in the tubular Substance of the Kidneys, creates no Uneasiness; but creates an intolerable Pain, when it falls into the narrow and sensible Ureters. Hence we perceive, that Topics for this Purpose ought not to be applied to the Loins where the Kidneys are situated; but according to the Direction of the Ureters, that is from the Loins to the Groin. But even in this, a violent Error is generally committed, whilst, with the Ointments, most Persons mix hot forcing Substances, such as the Oil of Amber, the Spirit of Turpentine, and the Oil of Juniper; which Practice is productive of very bad Effects. Many, indeed, intend, by these hot Substances, to force the Passage of the Stone thro' the Ureters; but it is, by this means, rather fixed, and more violent Symptoms, such as a Suppression of Urine, Vomiting, and Convulsions, are excited: For that the Stone remains fixed in the Ureter, is not so much owing to the Bulk thereof, as to the painful Spasm of the Ureter; and, as by the Austerity of the Stone, the nervous Fibres are generally irritated, there happens an Influx of the Spirits, and Pain accompanied with Spasms and Constrictions; and the more intense the Pain is, the more narrow and contracted the Passages are. Now, if spirituous hot Substances are, in such a Case applied, we excite an Influx of the Blood and Spirits, fix the Stone more firmly in the Part, increase the Pain, and induce many terrible Symptoms. 'Tis not, indeed, to be denied, that where there is neither Pain nor Spasms, or where there is a certain Laxity, or Want of Tone, in the nervous and membranous Fibres of the Kidneys, such Things, externally applied, because they strengthen the Tone of the Parts, promote a Discharge of the Urine, but they are by no means to be used when there is any Pain or Spasm, in which case we are rather to use emollient paregoric and anodyne Oils, such as the Ointments of Poplar, Henbane, Poppy-seeds, and white Lilies, Badger's Fat, and Camphire, which gives them a penetrating Quality. With these the Region of the Ureters is to be frequently rubbed and anointed with a warm Hand; for these Substances, by checking the Imperus of the Spirits, and relaxing the constricted Fibres of the Ureters, occasion a far more easy and expeditious Passage for the Stone. For this Reason, sitting in a Bath is highly beneficial, and sometimes affords instantaneous Relief.

In excessive Discharges of the Menfes, and involuntary Effusions of Seed in Men, 'tis customary to apply to the lumbar Region, where the large Ramifications of Blood-vessels are situated, and freely exposed, such Medicines, as, in some measure, check the Imperus of the Blood to the genital Parts; for it is of great Importance, what Medicines are used on such an Occasion, and at what Time they are applied; for I knew a Woman, who, when after forty Years of Age, in an immoderate Flux of the Menfes, had a Plaister applied to her Loins, consisting of the Frog's-spawn Plaister, mixed with Sugar of Lead, and Oil of Henbane; but, from that time forth, her Menfes never returned to the great Detriment of Health. We are, also, carefully to abstain from all things actually cold, and much more from Narcotics; because

because all these, by checking the Blood, if it tends too much to these Parts, produce a palliative Cure; but bring on much worse Misfortunes, such as Inflammations of the Kidneys, convulsive Colics, and spasmodic Disorders of the Abdomen. Hence, 'tis the safest Method, especially in Evacuations of Blood, totally to abstain from these Topics, and rather carry on the Cure by internal Medicines.

We now come to consider some Disorders which proceed from a Relaxation, Resolution, or Want of Tone and Strength in the Ligaments; such as the Falling down of the Fundament in Infants, and of the Uterus in Women. Physicians and Surgeons, in consequence of the Relaxation, generally treat these Disorders with Astringents; and, for that Purpose, foment and cherish the Parts affected with astringent Decoctions. But as this Prolapsus, or Falling down, does not so much proceed from a Relaxation of the Uterus, or Intestinum Rectum, as from a Relaxation of their Ligaments, on account of the Congestion and Accumulation of the Juices there, so every one must perceive, that this Method is idle and ineffectual, because these external Astringents cannot penetrate to the Ligaments themselves. Hence, in a Falling down either of the Uterus itself, or of the Vagina, such Things, immediately applied to the Uterus, are of no Efficacy. But rather the inguinal Region is to be cherished with balsamic and penetrating Liniments and Plaisters, which, being not so much possessed of an earthy Stypticity, as of a spirituous corroborating Quality, restore Vigour, Motion, and Tone, to the moist and relaxed Parts. But 'tis here to be observed, that as in all other Cases, so, also, in these, Topics alone are not sufficient, but that internal Medicines are more universally necessary in all internal, and even external, Disorders of the Body. I do not, however, reject Fumigations, and Fomentations of Wine prepared with aromatic Herbs, such as are possessed of a volatile, oleous Salt, and a certain earthy Principle, by which these Parts may be immediately affected, since the Force of Fumigations penetrates intimately, as do, also, the Effluvia arising from Baths.

With respect to the blind Hæmorrhoids, it is sufficiently known, that great Uneasiness is produced by this Tumor of the hæmorrhoidal Veins arising from the too great Afflux and Stagnation of the Blood, or of a viscid Serum. For the Cure of this Disorder, Physicians and Surgeons have invented numberless Medicines, especially Topics; but how much they all fall short of their Intention, is too well known to the miserable Patients; for the Astringents recommended rather obstruct the Humours which produce the Tumor; on the contrary, emollient and anodyne Substances, relax the Parts, and invite a farther Afflux of the Humours; whilst acrid Medicines corrode the Parts, and generally dispose them to malignant Ulcers, and even Fistulas. The Skill, therefore, of the Physician consists in distinguishing the Use of these according to Circumstances, and knowing what he ought, and what he ought not to do; for, if the Pain is excessive, anodyne and emollient Substances are beneficial. Hence, Linseed-oil alone, applied in a sufficient Quantity, excellently mitigates the Pain. If the Tumor is troublesome by its Bulk, then not so much earthy Styptics, as Corroboratives, are to be used, such as Fomentations of Wine prepared with Mastich, Amber, Rose-flowers, Balaustines, Frankincense, and Yarrow. Nor are Fumigations, in such Cases, to be excluded, especially such as are prepared of Things impregnated with a volatile, oleous Salt, the Nature and Virtues of which are, to insinuate themselves deeply, to strengthen the Pores, and dissipate the excessive Humidity. Hence, also, the Sea-mice (a Sort of Shell-fish), whose peculiar Virtues are at present so much extolled, act in no other manner, than other Fumigations impregnated with a certain volatile, oleous Salt: From what has been said, I think 'tis sufficiently obvious, how preposterous a Practice it would be, when the Pain is greatest, to use astringent, cold, or acrid Substances; or if, when there is a violent Tumor without Pain, we should apply emollient, anodyne, and relaxing Substances.

Here occurs a Question to be discussed; which is, Whether, in excessive Effusions of Blood or Lymph from the Uterus, Injections may be properly used, especially since we find from Experience, that they are with great Advantage used in excessive Fluxes of the Semen? But as the Vulgar are of Opinion, that Fluxes ought only to be stopt by Astringents, so nothing is more dangerous, than to attempt the checking of excessive Discharges of this kind by external Injections possessed of an astringent Quality. I remember a Woman, who, when labouring under an excessive Discharge of the Menes, by an Injection of the Decoction of Yarrow impregnated with Alum, contracted an Ulcer, accompanied with a Consumption and hectic Fever, which prov'd mortal to her. We are, therefore, to deal very cautiously with Injections, since they do more Harm than Good.

We now come to consider the Disorders of the Joints: And certainly, if Topics are in any Cases abused, they are so in arthritic and gouty Pains; for, because the Disorder lies in the external Parts, many are of Opinion, that the Remedy is immediately to be applied to the Part affected, that they may the sooner reach the Cause of the Disease. But in this they are greatly mistaken; for Topics are not, in these Disorders, so requisite, but the Pain may be mitigated without them; for we learn from Experience, that

without any Topics, by internal Medicines alone, opposite to the morbid Cause, the Violence of these Pains may, in Process of Time, be not only mitigated, but, also, totally removed. But we are, above all things, to take care, that Repellents, especially in the Beginning of the Disorder, be not used; for these disturb the Motion of Nature, which is from the Centre to the Circumference, repel the peccant Matter inwards, and excite violent Symptoms. See *Drabizius de Scorbut. Tit. de Arthrit.* In the Beginning of a Gout, I know the Application of a Plaister, composed of the White of an Egg and Alum, in a plethoric Man, produce, in one Night's time, a lathargic Disorder, which destroy'd the Force of his Genius, and the Strength of his Memory, all his Life after. *Hagendorp, in Cent. 1. Hist. 28.* gives us a memorable Instance of a Merchant, who, labouring under a scorbutic Tumor, had an Epithem prepared of distilled Waters, Cerufs, and Camphire, applied to it, by which his Pain was alleviated, but he lost his Speech, and the Use of his Left Arm. With no better Success is the present Practice, of anointing the external Parts with camphorated Spirit of Wine. It is hardly possible to enumerate the Misfortunes which may be produced by this Remedy, used without any respect to the Patient, and his Circumstances. Thus, by the Application of it to gouty Feet, I have frequently observed Cardialgias, convulsive and epileptic Motions of the Limbs, Palsies, and other terrible Symptoms, excited. 'Tis, also, certain from Experience, that all Medicines are not beneficial to all Patients, since some Topics remove the Pain in some, and increase it in others, whilst others are relieved by spirituous Liniments, others by anodyne Plaisters, and others by Cataplasms prepared of Milk, and the Crums of Bread, whilst none of all these Remedies agree with others.

The Cause of these particular Effects is not sufficiently adverted to, and investigated, since 'tis sufficiently known to Surgeons, that all Patients cannot equally bear the same thing in external Wounds. But the Cause of this is not so much the peculiar Disposition of the peccant Humours, as the sensitive and tonic Constitution of the Fibres, Pores and Vessels of the Skin; for all the Parts, especially the Emunctories and Strainers, have their peculiar Strength, Tone, Tension, and Dilatation, which Species of Motion, so highly necessary to the Secretions and Excretions principally depend upon the Influx of the animal Spirits, and the Tension of the nervous Membranes. Of what Kind, therefore, this Influx of the animal Spirits, and Tension of the nervous Membranes, is in every Patient, in all Disorders, and their various Stages, ought to be diligently considered by Physicians, in the Application of their Topics; for every one sees, that when the Pores are constricted by Pain and Spasms, hot and spirituous Substances are by no means proper, but rather such Medicines as gently relax the constricted Parts. On the contrary, if there is too great a Relaxation after the Pain, which appears from the Tumor, and the Decrease of the Pain, all moist, unctuous, and anodyne Ointments are very injurious; in which Cases we are, therefore, rather to use spirituous nervous Liniments. And tho' Topics, sometimes, are beneficial in allaying Pain, and mitigating the Fever, yet they do not always produce the same happy Effects in the same Patients. In a Word, the stronger Nature is in expelling, and the greater the Strength of the Body, and of the internal Motion, are, the less Danger Topics, if decently applied, induce. But, if the Vigour of the Motions has ceased, if the Patient is old, or afflicted with a Cachexy, Topics are absolutely to be rejected; for the principal Intention of the Physician is not, by Topics, to hinder the Evaporation of the peccant Matter, but to promote it; and, since great Judgment is necessary to this, it is safest to abstain from all Topics, to commit the whole Cure to internal Medicines, and keep the Parts affected in a gentle Heat.

I have, also, observed, that the Generation of Tophi, which principally happen in a fixed Gout, is, for the most part, owing to an incautious Application of Topics, especially those of the stupefying and refrigerating Kind. Thus *Wedelius, in his Tract. de Medicament. Facultat.* informs us, "that many arthritic Patients have suffered much, have had their Wandering converted into fixed Gouts, and many Tophi formed, by using unctuous and pinguious Plaisters." Hence *Galen, in Method. Medend. Lib. 4. Cap. 3.* tells us, that in the Gout, Tophi are produced by a thick and glutinous Humour, which is not gradually digested, but suddenly dried by violent Remedies. And *Fernelius, in Consil. 12.* observes, that Gout Pains are produced by the same means. But I am of Opinion, that all Topics are not to be discarded in internal Pains of the Joints; for when the Pain is inveterate, and accompanied with a certain Torpor, and Insensibility, which frequently happens in Old-age, then after checking the internal Ebullition of the Blood, we are, by nervous and balsamic Liniments, to corroborate the Nerves, and invite the Influx of the nervous Fluid into the weakened Parts.

We must not forget the common Practice of applying live Earthworms to the Parts affected in a wandering scorbutic Gout. Great Encomiums are bestowed on this Remedy, by practical Physicians, especially by *Wierus*. And 'tis certain, that on account of the volatile, absterfing, and nitro-sulphureous Salt these Animals contain, they are of an excellent discutient and sedative Virtue, which manifests itself not only internally, but, also, externally.

ternally in various Kinds of Pains, and even in the Lues Venerea itself. Yet great Caution is requisite in the Application of these Animals; for though, in the most cruel Pain, when the Fluids are in Motion, the Strength entire, and the Patient young, these actually cold Substances produce happy Effects, yet they produce quite contrary Effects in a fixed inveterate Gout.

We shall subjoin something more, with respect to an Erysipelas; for the Cure of which, most Surgeons and Physicians have immediate recourse to Topics, tho' the Errors arising from that Practice have been often exposed. But I would have it observ'd as a general Maxim, that an Erysipelas, arising from an external, ought to be distinguished from that arising from an internal Cause. In the former, produced by Contusions, and other Wounds, Topics are not generally prejudicial; but when the Disorder proceeds from an Orgasm of the Humours, and a febrile Impetus, an heterogeneous Matter, generally of an acrid and corrosive Nature, is protruded to the Surface of the Body; in which Case we must be very cautious; since the Matter is easily repelled, and since by those Topics, which, in other Cases, prove beneficial, we may do an irreparable Injury to the Patient, by repelling to the internal Parts the peccant Matter, which then acquires the Nature of a Poison; see *Frid. Hoffman. Dissert. de Conversione Morbi Benigni in Malignum*. Nothing is more common, than by Astringents, such as the White of an Egg, mixed with Alum, to render a slight Erysipelas fixed and profound, and to excite malignant Ulcers; Instances of which daily occur in Practice. Hence those Physicians act prudently, who treat all the Species of Erysipelas with Internals, applying only, externally, Bags full of paregoric Herbs, which, by their mild Influence, keep the Pores open, relax such as are constricted, and cherish the Parts.

We must, also, observe, that Surgeons commit a terrible Error in applying hot Cataplasms, prepared of Bean-meal, Liquorice-root, emollient and discutient Herbs, and proper Waters: For since by the Heat the Moisture is dried up, and the Matter is more firmly impacted in the Skin, and its Pores, so that it can hardly be remov'd by a Knife, the Business of Transpiration is greatly injur'd; and the Erysipelas, which by proper Measures might have been discuss'd, is converted into an Abscess or an Ulcer: We are, therefore, to endeavour, to preserve a free Respiration in the Parts affected; which can neither be obtained under a cold State of the Air, an intense Heat, or a great Load of Clothes, but under a moderate Heat, which excellently encourages Perspiration.

In like manner Topics ought to be cautiously applied to Buboës, because by Repellents they are render'd malignant. Much less are we to apply Topics of an astringent and refrigerating Kind to malignant and critical Buboës, because such a Practice is highly dangerous. Critical Buboës, when the Humours are convey'd to the Glands, are known by the Patient's retaining his Strength, by their happening on the critical Days, and by the previous Signs of Concoction in the Urine. At this Time all Repellents are highly prejudicial; for, as *Hippocrates* justly observes, in a perfect Crisis, no Change of the Patient's State is to be attempted, but the whole Business is to be left to Nature. Sometimes a Bubo arises from a Redundance of Blood, in which Case, according to *Avicenna*, *Oribasius*, and others, we are by no means to use Repellents. But when a Bubo tends to Suppuration, nothing is more beneficial than the Application of the Diachylon plaster with the Gums, mixed with Opopanax.

'Tis justly to be doubted, whether Topics are proper in the Small Pox; only we may affirm in general, that, as this Disorder is a critical Evacuation, great Caution is requisite. However, if before the Eruption the Patient is afflicted with a Delirium, we may with Advantage apply to the Forehead Spirit of Roses mix'd with Camphire. But, during the Eruption and the Suppuration, I am of Opinion, that we ought to abstain from all Liniments. In the Decline, and at the Time of the Exiccation of the Disease, when the Force of the Disorder is subdued, I can not disapprove of Oil of sweet Almonds, mix'd with Camphire and Sperma Ceti, in order to prevent the Defecation of the Skin, and correct the Acrimony, which generally lies pretty deep. See *Frid. Hoffman. Dissert. de Variolis epidemice grassantibus*. For this Reason we are cautiously to proceed with Topics of this Kind, such as Spirit of Wine impregnated with Myrrh, and Sugar of Lead mixed with Rose-water.

The Itch, which is a pustulous Exulceration of the Skin, more or less moist, is generally thought incurable without the Use of Topics. Hence, neglecting all internal Remedies, they forthwith have recourse to various sulphureous and mercurial Liniments, which they apply either to the whole Surface of the Body, or only to the Joints, tho' frequently with a very considerable Danger both to Life and Health; for it is never safe by Topics to cure external Disorders, proceeding from an internal Cause; but as Nature expels the heterogeneous and morbid Matter, the Physician ought to do the same, and never counteract the Intentions of Nature, which is generally done by Repellents, externally applied. Hence I am of Opinion, that the Cure of these cutaneous Disorders, ought not only to be begun, but, also, finish'd by such internal Medicines, as correct and dispose the peccant

Matter to Excretion, and at the same time eliminate it. To this Class of Medicines belong not only Diaphoretics, emollient and laxative Infusions, but, also, if the Itch is inveterate and malignant, Preparations of Mercury and Antimony. Then, for the better Consolidation of the Skin, and the Restoration of its Beauty, we may use Baths, drying, sulphureous, and saturnine Ointments. But we are always to abstain from external mercurial Liniments, which can never be us'd without Danger, as is obvious from numberless practical Observations.

As for mercurial Liniments and Fumigations us'd to excite a Salivation in the Lues Venerea, it is sufficiently known, what violent Symptoms are brought on by this means, and how precarious this Method of curing so obstinate a Disorder is. I am certain from Experience, that the Lues Venerea may be happily remov'd by proper Preparations of Mercury and Antimony, and Decoctions of the Woods exhibited internally in a due manner, without any external mercurial Applications, and often without exciting a Salivation, or any Train of uneasy Symptoms.

With respect to Topics applied to paralytic Parts; tho' these excellently assist the Operation of internal Remedies; yet they ought to be properly chosen, and cautiously applied. Those are, in my Opinion, greatly mistaken, who think that only Fats, Lards, and unctuous Liniments, ought to be applied either immediately to the Parts affected, or to the Spine of the Back; for these Substances obstruct the Pores, and still more relax the Fibres, whose Tone is already destroy'd; by which means they dispose the Parts to a Tumor. On the contrary, spirituous, hot and ethereal Oils alone, do not produce the desired Effect, since most of them, in consequence of the Subtility of their Parts, fly off in the Air, and leave the nervous and muscular Fibres too rigid. This Intention is better answer'd by Ointments prepar'd of the Fats of Animals, and the distilled Oils, such as those of Rice, Marjoram, Lavender, Juniper, Cloves, and Rosemary; for the Tone of the nervous Parts ought to be render'd natural, so that there be neither too great a Relaxation nor Constriction, too great an Humidity or Dryness. Besides, 'tis to be observ'd, that in a Palsy arising from a Disorder of the Spinal Marrow, and Origin of the Nerves, these Medicines are not to be applied to the Parts destitute of Sensation and Motion; but to the Source of the Disorder, which is lodg'd in the Spinal Marrow. But 'tis quite otherwise in that Species of Palsy, in which the Motion, but not the Sensation of the Part is destroy'd, which happens frequently to Metall-diggers; in which case 'tis of no use to anoint the Spinal Marrow, but the Part affected is to be frequently fomented and cherish'd with the above-mention'd Medicines.

With respect to oedematous Tumors, which frequently seize the Feet; great Caution is, also, in this Case, requisite, as to the Application of Topics, since they who treat them with Baths, commit a terrible Error. Thus I have seen cachectic Persons, by immersing their Feet in warm Water, contract, in one Nights time, a considerable Tumor of them, which could not afterwards be easily remov'd. The Reason of this is obvious; for these Baths by their Moisture, which by means of the Heat insinuates itself into the Pores, renders the weaken'd Fibres still more lax, so that the Humours flow down, and are not quickly again receiv'd into the Veins, and lymphatic Vessels. The same Effects are, also, produc'd by those who attempt to dissipate such Tumors by Ointments and Plaisters, for a Reason easily deduc'd from what has been said. Some have a Custom of tying discutient Herbs about the Feet, such as the greater Celandine, Fumitory, Wormwood, and Rue; but if these are moist and cold; they often increase the Tumor, instead of removing it. 'Tis, therefore, better to abstain from all these, and apply proper Bandage to the Feet, especially towards the Evening, when such Tumors are always observ'd to increase, that by this means the Fibres may be corroborated and strengthen'd. Fomentations of strong Vinegar, mixed with Essence of Amber, and pour'd upon ignited Bricks, have often been found productive of happy Effects.

'Tis customary, in various Disorders, to apply Epithems and Plaisters to the Pulse in the Wrists. This Practice, tho' not to be discourag'd in itself, is nevertheless often abus'd, especially by Nurses, and the common People, who, whether a Disorder is of the cold or hot Kind, commonly have recourse to the celebrated Aqua Carbunculi, which they think of so incredible Efficacy to restore Strength. But every one must perceive, that this is by no means proper in a burning or acute Fever, or in the Heat of an intermittent Fever; in which Cases rather penetrating Acids, such as Citron-juice, and Vinegar of Roses, are proper. Epithems and Plaisters are, also, applied to the Wrist, in order to remove the febrile Paroxysms in Intermittents; for which Purpose, they mix Alum, Vinegar, Rue, the greater Houfleck and Spiders Webs. They, also, make a Plaister of Turpentine, Alum, and Powder of Spiders, which are often of great Service in mitigating the Paroxysms, and even in totally removing them, if the greater Part of the febrile Matter is evacuated.

The Manner in which such Medicines operate, is somewhat difficult to be conceiv'd; and such an Experiment, in my Opinion, illustrates the Generation of Fevers of this Kind; for the Heart

and Arteries, which have their proper Nerves, and systaltic and diastaltic Motions, are the Instruments, by which the intense Motion of the Fluids is perform'd. Hence such things as in some measure check and hinder the excessive Motion of the Spirits to these Parts, when immediately apply'd to the Arteries, must necessarily for some time stop the febrile and intensely hot Motion of the Blood. *Frederic Hoffman.*

TOPINARIA. A Species of Tumor in the Skin of the Head. The same as **TALPA**.

TORCULAR HEROPHILI, in Anatomy, is the Place where the Sinuses of the *Dura Mater* meet.

TORCULAR, in Surgery, is the *Tournequet*.

The *Tournequet* is a sort of Bandage, which is very necessary in suppressing copious Hæmorrhages, particularly after the Amputation of the larger Limbs; and consists of several Parts; 1. A plain Roller, an Inch in Breadth, and a *Paris Ell* in Length; 2. A small cylindrical Piece of Wood; 3. A rolled Bandage, about the Thickness of two Fingers, and four in Length; 4. Long Compresses about the Breadth of four Fingers, for encompassing the Leg or Arm, to which the Roller is to be applied; lastly, 5. A square Piece of thick Paper, or stiff Leather, about the Breadth of four Fingers.

Let us next consider the Method of applying the *Tournequet*. The rolled Bandage must be applied to the Trunk of the wounded Artery lengthwise; and the Compresses must be placed in a contrary Direction, surrounding the Arm or Leg like a Ring; then the Roller must be twice brought round them, and tied, but so loosely, that the Hand may easily pass between it and the wounded Limb. The Piece of Leather, or thick Paper must next be introduced with the greatest Caution, under the Roller, on the external Side of the wounded Leg or Arm; then the small cylindrical Piece of Wood must be introduced above the Piece of Leather or Paper, and the Roller twisted about by it, till it be made sufficiently tight to stop the Bleeding. Then the Stick must be fixed, lest it should untwist itself; the Wound must be treated in a proper manner, and the Profusion of Blood suppressed by Astringents, by a Ligature, or the actual Cautery, or by any other Instruments designed for that Purpose in Amputations. This Intention being answered, the *Tournequet* may be relaxed or removed, as soon as it can be done with Safety and Convenience. When the *Tournequet* is applied to the Arm, the rolled Bandage should be placed near the Arm-pit, in the internal Part of the Humerus, as the Situation of the Artery requires that Position; and the Stick, with which the whole is to be tightened, is to be introduced on the external Part. See *Tab. XXIV. Fig. I. Let. K.* When the Hæmorrhage is to be stopped in the Leg, the *Tournequet* should be applied to the upper Part of the Thigh, or a little above the Ham, according to the Circumstances of the Case. See *Let. L, M. N.* But in order to give a distinct Idea of this *Tournequet*, it is represented separately in *Tab. XXIV. Fig. 2.*

In the room of this Instrument, *Petit's Tournequet* has been substituted, who invented and describ'd it in 1718, which has been preferred, because it could be applied without the Help of an Assistant, which the other required to preserve its Situation. It might, also, be retained upon the Limb, as long as might be thought necessary, without obstructing the Circulation of the Blood in the Part affected; whilst the other entirely stopped the Circulation, and must therefore be quickly removed. But its Description is so short and imperfect, especially as the Parts of the Instrument are not described separately, that in many Places I could not understand it. *Garengeot* has given us another Representation of it; but he, also, is obscure.

I have, therefore, endeavoured to correct it, as is shewn in *Tab. XXVI. Fig. 6.* AA represent the upper Part; BB the lower; C the Screw, all in their proper Size, and made of strong Wood. In the Extremity DD are fastened two smaller Iron Screws, to which a strong Silk Roller or Bandage is to be fixed, being of the same Breadth with the Instrument, and about twenty Inches in Length, that it may encompass the larger Limbs, the other End being to be fastened to the Hooks at EE. The Extremities FFFF must be a little hollowed, that the Roller may lie firm without Danger of being moved, or falling off. G represents an Iron Plate, which is there placed to strengthen the Wood. The Wound, therefore, being properly dressed, the lower Part of the *Tournequet* BB, being guarded with a thick Bolster, must be applied to the Side opposite to the Wound, and the Roller drawn tightly round the Limb, and fastened to the Hooks at E. Then by turning the Screw C, it may be stretched sufficiently to stop the Hæmorrhage, and kept in this Situation as long as may be thought necessary.

Garengeot has described and delineated another *Tournequet* of this Kind, invented by *Morand*; which in many Particulars agrees with that of *Petit*, but principally differing in this Circumstance, that, instead of a simple Screw, *Morand* furnished his with a compound Screw made of Iron, for quicker Actions, one Turn of which would tighten the Roller more, and consequently sooner compress the Wound or Artery, than two or more Turns of the Screw used by *Petit*. However, *Garengeot* makes some Objections to this Instrument, and prefers that of *Petit*.

I once saw a *Tournequet*, made of Iron, and very heavy, which in many respects agreed with that of *Morand*, though in some Particulars it differed, by I know not whose Contrivance, which is delineated in *Tab. XXVI. Fig. 7.* AA, is the lower Plate with many Perforations towards the Edges, by which means a Cushion or Bolster may be sewed to it. B is the Barrel for receiving the Screw; CC is the superior Plate; D is another Barrel on the superior Plate for receiving the Screw. EE represent the Extremities of the superior Plate, one furnished with Hooks, the other with Hooks, and a kind of Arch, for fixing the Roller, for compressing the Limb, as is done in the *Tournequets* represented in *Fig. 2.* and in *Tab. XXVII. Fig. 1.* 'Tis a kind of Ring surrounding the Barrel in the superior Plate; G is a square or cubical Body, made like a female Screw, for the Reception of the small Screw H; and thus is the larger Screw I, K, kept firm in the Box D, which would otherwise easily fall down, and remit. L is an Iron Cylinder, which is firmly fixed in the lower Plate, but is loose in the other, that the upper Plate may be allowed to slide freely up and down, as Occasion may require; it, also, serves to retain the Plates in the same Situation with respect to one another.

With Design to improve this Instrument, I ordered one to be made of Brads, like that represented in *Tab. XXVII. Fig. 1.* where the superior Plate is much shorter than the inferior, which, being fixed to one Extremity of the upper Plate, is brought round the Limb, and fastened to Hooks in the other. The Belt must, also, be passed through Openings, made at each Extremity of the lower Plate for that Purpose. By this Contrivance the Instrument is kept even, and does not change its Position on the Motion of the Screw. The Reader may choose which of these Instruments he pleases: All of them will answer the Intention, for which they were designed; only some do it sooner than others.

It may be proper to observe here, that astringent Medicines; exhibited internally, have little or no Effect in stopping Hæmorrhages proceeding from Wounds of the larger Arteries; and they not only create Obstructions in the lacteal Vessels of the Intestines, Glands of the Mesentery, and other Parts, but, also, excite Pains, Inflammations, Fevers, and the like dangerous Disorders; and therefore we should abstain from them, rather than use them. *Heist. Chirurg.*

TORDILIUM.

The Characters are;

The Root is annular and fibrous; the Petals are unequal; Heart-shaped, and deeply bifid. The Seed is orbiculated, flat, with a raised Margin, which is for the most part denticulated, and deposits its Husk.

Boerhaave mentions seven Sorts of *Tordylium*; which are,

1. *Tordylium*; maximum. *T. 320. Caulis, maxima, Sphenodylii aculeato femine. C. B. P. 152. An & Sefeli, majus. C. B. P. 161?*

2. *Tordylium*; minus; limbo granulato; Syriacum. *M. U. 37. 40. Gingidium, foliis Pastinaca latifolia. C. B. P. 151. Caulis, Syriaca, cum maximo femine. J. B. 3. 2. 86.*

3. *Tordylium*; Narbonense; minus. *Tourn. Inst. 320. Boerb. Ind. a. 68. Raii Synop. 266. Sefeli, Creticum. Offic. Ger. 894. Sefeli Creticum minus. C. B. P. 161. Ger. Emac. 1050. Tordylium five Sefeli Creticum minus. Park. Theat. 906. Raii Hist. 1. 412. Caulis minor pulchro femine five Bellonii. J. B. 3. 84.*

HARTWORT OF CANDY.

It is cultivated in the Gardens of Botanists; and the Seed, tho' but seldom, is used.

The Seed of this Plant is Nephritic, Uterine, and Pulmonic: Its principal Uses are in the Strangury, and Stoppage of Urine. It removes Pain, provokes the Menfes, and promotes Expectoration in Catarrhs. *Schroder.* In the Catalogue of Simples in the *London Dispensatory* this Plant is, I know not how, confounded with the *Sefeli Massiliense*.

4. *Tordylium*; Apulum; minimum. *Col. 1. 124. M. H. 3. 316. Sefeli, Creticum, minimum. C. B. P. 161.*

5. *Tordylium*; album; facie Tordylii luteo, Columnæ. *H. C.*

6. *Tordylium*; folio longo, angusto; flore albo, magno, semine elegantissimè & profundissimè crenato, albo.

7. *Tordylium*; Orientale; Secacul Arabum dictum Rauwolfio. *Boerb. Ind. a. 68. Secacul. Offic. Sifarum Syriacum. C. B. P. 155. Raii Hist. 1. 443. Sifarum alterum Syriacum. Park. Theat. 945. Pastinaca Syriaca & Secacul Arabum quibusdam. J. B. 3. 66. Pastinaca Syriaca Rauwolfii, Secacul Arabum & Maurorum quorundam. Chab. 390. Apium Syriacum radice amplè eduli. Hist. Oxon. 3. 292. SYRIAN SKIRRET.*

It has a tender, smooth Root, hoary on the Outside, and white within, brittle, of the Thickness, but double the Length, of a Finger, and distinguish'd with Nodes or Tubercles, like Warts; it has a pleasant Taste, like a Carrot. From this Root arise a Multitude of Leaves very much cut and jagged, like those of the Carrot. The Stalks at the Joints are cover'd with the same sort of Leaves, and have their Tops adorn'd with an Umbella of Flowers, like those of the Carrot, but of a pale-yellow Colour. It grows spontaneously about *Grand Cairo* in *Egypt*, and *Aleppo* in *Syria*. *Raii Hist. Plant.*

The Root, in medicinal Uses, agrees with that of the common *Sifer*, or *Skirret*. *Dale*.

TORI. The Knots in the Stalks of Plants.

TORMENTILLA. Tormentil. A Name for the *Quinquefolium minus*; *repens*; *luteum*; *flore tetrapetalo*.

TORMENTUM. Pain in general; the Colic; or Iliac Passion, in which last Sense it us'd by *Calius Aurelianus*.

TORMINA. Gripes. See *COLICA*.

TORNA SOLIS. Tornesol. See *HELIOTROPIMUM*.

TORNATA URINA. Urine which is thick, muddy, and not transparent. *Johannes Anglicus*.

TORNESOL. See *HELIOTROPIMUM*.

TORNEUMATA, *τορνευματα*. Shavings, or Rasplings. *Dioscorides*, L. I. C. 108.

TORPEDO. Offic. Aldrov. de Pisc. 415. Rondel. de Pisc. 1. 358. Jonf. de Pisc. 18. Charlt. Pisc. 9. Salv. de Aquat. 142. Bellon. de Aquat. 89. Gesn. de Aquat. 988. Raii Ichth. 81. Ejsld. Synop. Pisc. 28. **THE CRAMP FISH.**

It is taken in the *Mediterranean Sea*.

It mitigates the Violence of the Pain in an inveterate Headach, being apply'd to the Part; and, also, prevents and restrains the Prolapse or Falling-down of the Anus, being in like manner apply'd. *Dioscorides*.

TORPOR. A Numbness, or deficient Sensation.

Of Prædiction from a *Torpor* and *Paralegia*.

By a *Torpor*, we mean a Disorder of the animal Faculty, attended with a Difficulty of Sense and Motion, and sometimes a kind of dull Sense and Motion of some Part.

The Cause of this last, as we are taught by *Galen*, de *Caus. Symp. Lib. 1. Cap. 5.* is an Obstruction, Incrassation, or Hebetude of the Nerves, by which means the Spirits are clog'd and hinder'd in their Motion; for the Nerves are render'd dull by cold and gross Humours, in the same manner, as the Air is darken'd and obscur'd by Dirt, Water and Clouds: Or else the Disorder is occasion'd by some cold Quality, either internal or external. The Causes of this kind of *Torpor* maybe, also, a Fever Phlegmon, Scirrhus, and a Luxation of the Vertebra inwards, by which the Nerves, being under a compression, are obstructed, and the Passages straiten'd.

The Causes of a *Torpor*, in our first Sense of the Word, or, as it is defin'd, an Affection of the Animal Faculty, with a Difficulty of Sense and Motion, is a Refrigeration of the Brain, either positive, as they call it, or from an Exinction of the natural Heat.

Having thus assigned the Cause of a *Torpor*, we are next to consider what it portends in Diseases; for in healthy Persons it threatens an Apoplexy, according to *Coac.* 476. "Unusual *Torpor*s and *Stupor*s, it is there said, are Forerunners of an Apoplexy." And, a little after T. 478. we read, that "Refrigerations and *Torpor*s under apoplectic Disorders are of bad Signification."

In continual Fevers, then, a perpetual *Torpor* is bad, especially of the first Sort, or that of the Mind, which they call a *Stupor*: Such *Torpor*s in acute Fevers are quite pernicious, as proceeding either from a Refrigeration of the Brain, or an Exinction of the natural Heat, both which are destructive. The Author of the *Coac.* T. 14. pronounces *Torpor*s proceeding from Rigors malignant, where he says *τα πολλά νωθρότητα πύρεα κακώδεια*, "many torporific Rigors are malignant." And, *ibid.* 91. he pronounces a *Torpor* of the Mind, or *Stupor*, in a Phrensy, destructive; and justly, because it is occasion'd either by a Refrigeration of the Brain, which is a very pernicious Symptom in a Phrensy, or an Exinction of the natural Heat. *Ibid.* T. 208. 334. he condemns a *Torpor*, and Deafness, succeeded by a small Distillation of Blood from the Nose: And we may affirm the same to be not only somewhat difficult and troublesome, as he pronounces it, but to be absolutely destructive.

Nor is this *Torpor* of the Mind less pernicious in an internal Phlegmon, as being occasion'd by a flammeous Heat, the natural Heat being dissipated. Of this kind of *Torpor*, perhaps, we read, *Coac.* 315. where it is said, that "a Pain seized in the Breast with a *Torpor* is bad in a Fever." For it is a bad Sign to see the Patient labouring under a *Torpor* from an internal Inflammation, which admits neither of Resolution, Suppuration, nor Expectoration. With relation to this Case, perhaps we find it written, *Coac.* 374. that, "under a Quinsy, a Pain of the Hypochondrium not critical, attended with an Impotence" and *Torpor*, proves mortal in an occult manner, while the "Patients seem to lie very quiet and compos'd." A *Stupor*, therefore, or a *Torpor* of the Mind, in acute Diseases, is always fatal.

A *Torpor* in the other Sense, affecting some Part of the Body, and inducing a Dulness or Diminution of Sense and Motion, is never good, unless it happens critically, and when the Disease is concocted. For it is not impossible for the Humors to be critically translated from the Veins upon the Nerves, and by that means to induce a *Torpor* upon the Parts which are supply'd by those Nerves, in the same manner as a critical Tremor [see that Word] is sometimes occasion'd. But such an Event

rarely happens, and may easily be distinguish'd by other critical Signs.

The same Judgment is to be form'd of a Palsy, Paraplexia, or partial Apoplexy, which are sometimes of Service in Diseases, the Humour being propelled from the Veins, either to the Spinal Marrow, or to the Nerves of some particular Parts, by which a Palsy is occasion'd. But when these Distempers proceed from a Disorder of the Brain in acute Diseases, they are absolutely pernicious; and, therefore, in recent Wounds, where some Parts suffer a Resolution, they indicate the near Approach of Death.

It is not so dangerous, after an Apoplexy, for some Parts to be deprived of Motion, which kind of Disorder is by *Hippocrates* usually called by the proper Name of *παρὰ πλῆξιν*, *Paraplexia*, or *Paraplegia*. It sometimes happens, that the Matter, which is the Cause of the *Paraplexia*, in its imperious Course from one Part to another, induces a paraplectic Resolution of those Parts, which is succeeded by Convulsions. These Mutations are mention'd by the Author of the *Prorrhetices*, T. 118. "Morbific Matter, he says, communicated by Redundance to the Neck and Head, and causing a Resolution in these Parts after a paraplectic Manner, threaten Convulsions, and a Delirium: It deserves Inquiry, whether such Disorders are remov'd by Convulsions. The Patient in such Disorders is long and variously affected:" Such Mutations, then, are occasion'd by the various Motions of the Humours, and are agreeable to the Observations of *Galen*, who, in his Comment on the Place, says, that "he once knew a Person affected after this manner, and observ'd him labouring under Mutations of various Symptoms succeeding one another. After those preceding Pains of the Loins, Neck, and Head, the Patient had one of his Hands depriv'd almost of Sense and Motion in every Part, after a paraplectic manner, as is here said, tho' it was not a perfect *Paraplegia*. But a Convulsion, which soon succeeded, render'd the Part more sensible, and more capable of Motion; but when the Convulsion ceased, the Part grew worse again by Degrees. Afterwards the Patient was again seized with Pains of the Loins, Neck and Head, and had a sudden and universal Increase of the Palsy in his Hand, after which it was again considerably convuls'd." All this may be very true, and yet nothing of Certainty concluded or learnt from it; for neither does a supervening Convulsion remove a Palsy, nor is the reverse true; for in whatever manner the Patient becomes paraplectic, in acute Fevers, it is always bad.

But what is most of all to be dreaded, both by sound and sick Persons from paraplectic Affections is an Apoplexy. And this we find confirm'd by *Hippocrates*, 6 *Aph.* 51. "Whoever," he says, in a State of Health are taken with a sudden Pain of the Head, and immediately become speechless, and snore, die in seven Days, unless a Fever seizes them. *Prosper Alpinus de Prasag. Vit. & Mort.*

TORQUILLA. The Wry-neck; a sort of Bird.

TORQUIS. A Necklace or Collar. *Galen*, de *simpl. Medicament. Facult.* L. 9. informs us, that he had experienc'd the Virtues of a Necklace made of the Jasper-stone, in such a manner, that the Stones reach'd to the Region of the Mouth of the Stomach, in Disorders of that Part. The Whimsical among the Moderns have, also, ascrib'd great Virtues to Necklaces made of various Materials, in a great many Diseases.

TORREFACTIO. The Roasting, or Toasting of Medicines. In Metallurgy it is the Roasting of Ores, in order to destroy their volatile Sulphur, for the more easy Extraction of the Metals.

TORSIONES. Gripes.

TORTA. A Pasty; or Tart.

TORTIO. A Strain of the Joints.

TORTJALIS FACIES. A cadaverous Countenance, or Hippocratic Face. *Calius Aurelianus* gives this sort of Countenance the Epithet *Mortuosa*.

TORTURA. A Spasm, particularly of the Face and Mouth. *Castellus* from *Valesius de Taranta*.

TORUSCULA. A Drop. *Rulandus*.

TORYBETHRUM or **THORYBETHRON.** A Name in *Oribasius*, *Collect. Medicinal.* L. 11. for the *Leontopetalon*.

TORYNE, *τορύνη*. A kind of Ladle, or Spatula, with which any thing, during Coction, is stir'd in a Pot.

TORYNETOS, *τορυνητος*, from the preceding Word. A kind of Panada made by boiling Bread, and agitating it, during the Coction, with a Spatula, Spoon, or some such Instrument. *Calius Aurelianus*, *Chron.* L. 1. C. 1. calls it, in his barbarous manner, *ex Panis Pulvicula confecta*.

TOSTIO. The same as **TORREFACTIO**.

TOTA BONA. See *Bonus Henricus*.

TOTANUS. The Name of a black and white aquatic Fowl, mention'd by *Jonston*, whose Fat is said to be anodyne and resolvent.

TOTOCIFERA ARBOR *Orellanensium*, *indigenis Ademanie Totocke*. De *Laet*.

This is a very tall and ramous Tree, with great Leaves shaped almost like Elm-leaves. It bears no Flower, but a kind of Buds, of the same Colour with the Leaves, that is, of a dark Green,

Green, which increases in Bigness by degrees, and protrudes at last a large Fruit, sometimes as big as a Man's Head, almost round, but somewhat compressed on the fore Part, of a ligneous, hard and very thick Cortex, striated and tuberosous on the Outside, and of a dark-brown and almost black Colour. It is divided by certain Spaces into six Regions, as we call them, in each of which are contained eight, ten, and sometimes twelve Nuts closely joined together, and each of them cover'd with a ligneous, hard, and pretty thick Cortex of various Forms, but generally triangular, convex on one Part, with three Suckers, as it were, and very rough and wrinkled, yet not so much as the whole Cortex, three Inches long, and an Inch and half broad, and of a russet, and sometimes of a brown, or Ash-colour. The Inside is wholly taken up with an oblong Kernel, like an Almond, cover'd with a red Skin, and consisting of a very white and solid Flesh, which is, also, somewhat oileous: but in Taste it is more like a Filbert than an Almond; it may very well, however, supply the Place of Almonds, even in Confections, as *Europeans* have observ'd. The Natives ascribe to them a Faculty of provoking Lust.

The Trees which bear this Fruit are so high, and the Fruit itself so hard and ponderous, that the Natives of the Country dare not enter the Woods when the Fruit is ripe, without having their Heads defended by some strong Buckler, or some other Covert, from the falling of the Fruit, which would break their Heads as effectually as a Stone. *Raii Hist. Plant.*

TOXICODENDRON, from *τοξικόν*, (*Toxicon*) Poison, and *δένδρον*, (*Dendron*) a Tree. The Poison-tree.

The Characters are;

The Leaves grow by Threes, as in the Trefoils. The Calyx is very small, dentated, quinquefid, and monophyllous; the Flower rosaceous and pentapetalous. The Ovary in the Bottom of the Calyx becomes a roundish, dry, striated Fruit, pregnant with a compressed, or flattish Seed.

Boerhaave mentions two Sorts of *Toxicodendron*; which are,

1. *Toxicodendron*; triphyllum; glabrum. *T. 611. Edera, trifolia, Canadensis.* Corn. 96. *Vitis, sylvestris, trifolia.* Park. Theat. 1556. *Apocynum, trifolium, Indicum, vulgò Epimedium.* Stap. in Theoph. 364.

2. *Toxicodendron*; triphyllum; folio sinuato, pubescente. *T. 611. Hedera trifolia Canadensis affinis Planta, peregrina, Arbor venenata quorundam.* H. R. Par. 84. *Arbor, trifolia, venenata, Virginiana, folio hirsuto.* *Raii Hist. 1799. Boerb. Ind. alt. Plant.*

This Species differs from the *Vitis Virginiana* by its hairy Leaves, and their red Pedicles, Ribs, and Fibres. *Raii Hist. Plant.*

To these two Species *Miller*, in his *Gardeners Dictionary*, adds,

3. *Toxicodendron*; Carolinianum, Foliis pinnatis, Floribus minimis herbaceis. Carolina Poison-ash, *vulgò.*

This Plant is poisonous to such a Degree, that it is said to kill all kinds of Animals; whence no Insect will feed on it, nor is ever found in it. *Hist. Plant. adscript. Boerb.*

The Wood of these Trees, when burnt, emits a noxious Fume, which will suffocate Animals, when shut up in a Room where it is burnt. An Instance of this is mention'd in the *Philosophical Transactions* by Dr. *William Sherard*, which was communicated to him in a Letter from *New England* by Mr. *Moore*, in which he mentions some People, who had cut some of this Wood for Fuel, which they were burning; and in a short time they lost the Use of their Limbs, and became stupid, so that if a Neighbour had not accidentally open'd the Door, and saw them in that Condition, it is believed they would have perished. *Miller's Dictionary.*

TOXICON, *τοξικόν*, from *τόξον*. An Arrow, or Bow. That particular Species of Poison, with which the Antients us'd to infect their Arrows and Darts. But it is us'd to express any sort of Poison. *Toxicon* is, also, a Species of *Ladanium*, which is found in *Syria* and *Africa*.

TRACHEA ARTERIA. The ASPERA ARTERIA. See PULMONES.

TRACHELAGRA. The Gout in the Neck.

TRACHELIUM. A Species of *CAMPANULA*; which see.

TRACHELO-MASTOIDÆUS. The Name of a Muscle, thus describ'd by *Douglas*.

It arises from the transverse Process of the first and second Vertebrae of the Back and from the three or four lowermost of the Neck, by so many thin Tendons, which, uniting, form a pretty thick fleshy Belly, that runs up under the *Splenius*, and is inserted into the middle of the Backside of the *Processus Mastoideus* by a thin Tendon.

Its Use is to assist the *Complexus*.

N. B. This Muscle often receives a roundish fleshy Slip from the *Longissimus Dorsi*.

TRACHELOS, *τραχηλος*. The Neck.

TRACHEOTOMIA. Bronchotomy. See *ANGINA*.

TRACHOMA, *τράχυμα*, from *τράχος*, rough. An Asperity, or Roughness of the Eye-lids, particularly the internal Parts.

The Eye-lids are subject to Scabs, which differ in proportion to the Largeness of the pruriginous Ulcers, that are formed about their Edges; and to the Malignity of the Humour, which produces them.

This Disease is known by the following Signs: A Weight and Heaviness in the Eye; Swelling in the Eye-lids, with Pain and Itching; Heat and Redness at the Corners, and in the *Conjunctiva*. A viscid Humour, mixed with pungent Tears, flows from the Ulcers; and, in proportion to its Viscosity, it glews the Eye-lids together in the Night-time. This Disease sometimes affects the Whole, and sometimes a Part, of the Eye-lid; and if it continues long, especially in old People, the lower Eye-lid grows considerably thick, and turns downwards, so that the Cartilage resembles raw Flesh.

The Tetter of the Eye-lids very much resembles those Scabs, and its Signs are almost the same, the Appearance of raw Flesh excepted; and if the Eyelids be turned out, they appear red in the Inside, and seem to have Inequalities resembling the small Grains of Figs.

The original Cause of these Disorders is a saline, corrosive Humour of the Blood, that is discharged on the Eye-lids, which suffer in proportion to its Malignity. The immediate Cause is often the Ulceration of the glandulous Vessels, which furnish the Film on the Edge of the Eye-lids; when these Vessels are ulcerated, they emit constantly a viscid slow Humour, which promotes their Ulceration.

Although this Disease is generally very obstinate, yet it may be speedily cured by Medicines which sweeten the Blood, and lessen the Violence of its Motion, provided the following Remedies be joined with them.

To cure the Ulceration of the Eye-lids, when it is caused by the Itch, I have found, that, by touching them with the *Lapis infernalis*, they cicatrize easily. The violent Heat of the Caustic must be abated, as soon as they have been touched, by washing the Eye in a small Glass full of warm Water; and all possible Care must be taken, that the Part of the Eye-lid, which was touched with the Escharotic, may not bear against the Globe of the Eye, till the Pain be entirely ceased. They may be touched, in this manner, once or twice a Week, till they seem to require no more Use of the Caustic; then apply to the Parts, Morning and Evening, Tutty, reduced to a very fine Powder, which will cicatrize them.

But, before the Application of the *Lapis Infernalis*, I use the following Water.

Take of Liver of Antimony, two Drams; prepared Tutty, half an Ounce; Camphire, half a Dram; Cloves, twenty Grains: Infuse them together for eight Days, in Eye-bright, Fennel, great Celandine and Rue-waters, of each four Ounces: Let some of this Water be dropped into the Eye, three times a Day.

Let the following Pomatum be used at the same time:

Take of Butter, melted, purified, and washed several times in Plantain and Rose-waters, an Ounce; of prepared Tutty, a Dram: Mix them together. Every Night, going to Bed, let a little of this Ointment be rubbed between the Eye-lids, so that some of it may pass on the Eye.

Ulcers of this Kind, which lie deep, are more difficult to cure than those attended with fungous Flesh.

The Tettors of the Eye-lids do not require such powerful Medicines; for the Ulcerations, which they cause, in the Inside of the Eye-lids, scarcely appear. The following simple Remedy may be successfully used.

Take of Sugar of Lead, and crude Sal Ammoniac, each four Grains; dissolve them in Plantain, and Rose-water, of each four Ounces. Let the Eye-lids be washed with this three or four times a Day.

These Remedies, together with Internals, proper to correct the peccant Quality of the Blood, and to dissipate its sharp Humours, will procure a speedy Cure of these Disorders. *St. Yves.*

TRACHOMATICON, *τράχματιζόν*. The Name of a *Collyrium* describ'd by *Galen*, *Metb. Medendi, L. 14. C. 19.*

TRACHSAT. A Metal existing in its Ore.

TRACHURUS, *τραχύρες*. The Name of a Fish mentioned by *Aldrovandus*.

TRAGACANTHA.

The Characters are;

The Leaves grow by Pairs, as it were conjugated, to a Rib which ends in a stiff, sharp Point. The Pod, which is bicipular, and divided lengthwise, is full of Kidney-shaped Seeds.

Boerhaave mentions four Sorts of *Tragacantha*; which are,

1. *Tragacantha*. Offic. C. B. P. 388. Boerb. Ind. A. 2. 53. *Tragacantha vera*. Park. Theat. 995. *Tragacantha Massiliensis*. J. B. 1. 407. Raii Hist. 1. 933. Tourn. Inst. 417. *Tragacantha*, five *Spina Hirci*. Ger. 1147. Emac. 1328. *Astragalus aculeatus fruticosus Massiliensis Tragacantha dictus*, Pluk. Almag. 60. GOAT'S-THORN.

The true Goats-thorn has a long, thick, crooked, woody Root, taking fast Hold in the Ground by its many Fibres, from which spring diverse Branches, growing very thick together, having several small, round, whitish, hoary Pinnæ, set opposite upon long Foot-stalks, ending in a Spine; which, when the Leaves drop, as they do every Year, become harder and stiffer; new Leaves springing out, the old Stalks degenerating into Thorns: The Flowers grow towards the Tops of the Branches, singly, being white; in Shape like Broom-flowers, but much less; and after them in their native Country, come short, flat Pods, with two or three small round Seeds. It grows in the Southern Parts of France and Italy, but it yields the Gum, only, in the more Eastern Countries.

The Gum *Tragacantha*, or Gum Dragon of the Shops, bursts forth from the Root of this Plant; it is brought to us from Turkey, in Pieces of different Magnitudes, twisted and curled up like Worms, sometimes white and sometimes yellowish, but the whitish and clearest is best: It has little Smell or Taste, it swells very much in Water, a little of it making a great deal of Mucilage.

Gum Dragon is of a glutinous Nature, good to correct the Acrimony and Sharpness of the Humours, and therefore pectoral and good for Coughs, Hoarseness, and catarrhus Defluxions; it likewise takes off the Heat and Sharpness of the Urine, and helps Dysenteries, arising from the Excoriation of the Bowels, by sharp corrosive Humours. Outwardly, it is good in Collyriums, for hot inflamed Eyes. *Miller's Bot. Off.*

Gum *Tragacantha* has an emplastick Virtue of stopping the Pores, and of obtunding Acrimony. Its Use is in Ophthalmic Medicines, as also in Coughs, Asperities of the Windpipe, Defects of the Voice, and in Catarrhs, being made into an Eclegma with Honey, or suffered to melt under the Tongue. A Dram of it macerated in *Pasum*, is taken for Pains in the Kidneys, and Corrosions of the Bladder, being mixed with burnt and washed Hartshorn, and a little feathered Alum. *Dioscorides, Lib. 3. Cap. 23.*

Externally, says *Schroder*, it is of Efficacy in Clysters for the Dysentery; and dissolved in Milk, or Rose-water, is good for the Redness, and acrimonious Rheums affecting the Eyes, and for Asperities of the Eye-lids. Being dissolved in warm Water, it makes a Mucilage, very convenient for the Formation of Troches, and other Forms of Medicines.

It is moistening, lenient, emplastick, corrects Acrimony, and incrassates: Hence it is of Efficacy in Hoarsenesses, Spitting of Blood, Asperities of the Fauces, and the Strangury. *Dale.*

It is called *Tragacantha*, from *τράγος*, (*Tragus*) a Goat, and *ἀκανθα*, (*Acantha*) a Thorn, that is to say Goat's Thorn, because its Pod resembles a Goat's Beard.

Gum *Tragacantha* is a most gentle and excellent Medicine, in all Diseases attended with a Bleeding of the Capillary Vessels, on Account of their Debility, or the Acrimony of the Humours. Four, or Six Grains, taken in Milk, or Water, are effectual against Pissing of Blood, and two Grains, diluted with Rose-water, are commended in Inflammations and Asperities of the Eyes. It is a Demulcent, and incrassates thin and acrid Lymph, and is therefore good in Hoarsenesses and Coughs, proceeding from thin Rheums; in the Strangury, and Acrimony, and Heat of Urine; a Decoction of the Leaves is a Strengtheners. *Hist. Plant. ascript. Boerhaave.*

2. *Tragacantha*; foliis incanis; minoribus; minusque villosis.

3. *Tragacantha*, humilis; Balearica; foliis parvis; vix incanis; flore albo. *Salvador.*

4. *Tragacantha*; foliis minimis; viridibus. *Boerb. Ind. alt. Plant. Vol. 2.*

Besides the foregoing Sorts of *Tragacantha*, *Dale* mentions the following,

POTERIUM. Offic. *Spina Hirci minor*. Ger. 1147. Emac. 1328. *Tragacantha altera, seu minor, Poterion forte, Dioscoridis*. Park. Theat. 996. *Tragacantha altera Poterion forte Clusio*. J. B. 1. 408. Tourn. Inst. 417. Raii Hist. 1. 933. *Tragacantha affinis lanuginosa five Poterium*. C. B. P. 388. SMALL GOAT'S THORN.

It grows in the Kingdom of Granada in Spain, and flowers in Summer. The Root, which is the Part used in Medicine, being bruised and applied, conglutinates Wounds and Cuts where the Nerves are divided; the Decoction, also, being drank, is effectual in nervous Affections. *Dioscorides, Lib. 3. Cap. 17.*

TRAGANOS. A Name for the *Ephedra, maritima, major*.

TRAGASIUS, *τράγασιος*. An Epithet for a Sort of Salt, procured from a certain stagnant Water, very little different from Sea-salt. *Galen de Simp. Facult. L. 15.*

TRAGEA, A Sort of Powder, made up with Sugar, in order to be apply'd externally, as to the Region of the Stomach; or to be infused in Wine; or made into an Electuary. *Schroder* gives several Powders under this Name, L. 2. C. 77.

TRAGELAPHAS. An Animal resembling a Goat and a Stag; mentioned by *Aldrovandus*.

TRAGEMA. The same as TRAGEA.

TRAGI, TRASI, or TRASSI, Names for the *Cyperus*; *retundus*; *esulentus*; *angustifolius*.

TRAGIA.

The Characters are;

It hath a funnel-shaped Flower, consisting of one Leaf, for the most Part divided into three Segments, but these are barren; for the Embrios are placed at a Distance, on the same Plant, which afterwards become tricoccus Fruits, composed of three Cells, each containing one spherical Seed.

Miller mentions two Species.

1. *Tragia alia scandens, urticae Folio*. Plum. Nov. Gen.

2. *Tragia scandens, longo Betonica Folio*. Plum. Nov. Gen.

These Plants were discovered by Father Plumier in America, who constituted this Genus by this Name, in Honour to Hieronymus Bock, a famous Botanist, who was commonly called *Tragus*.

The first Sort grows plentifully in the Savannas in Jamaica, and the other warm Parts of America; where it twines round whatever Plants or Trees it grows near, and rises seven or eight Feet high, having tough woody Stems. The Leaves are like those of the common Nettle; and the whole Plant is covered with burning Spines, like those of the Nettle, which renders it very unpleasant to handle.

The second Sort was found by the late Dr. Houstoun, at Campeachy, from whence he sent the Seeds. *Miller's Dictionary.*

TRAGIUM.

Dioscorides mentions two Species of *Tragium*, but has written so obscurely of them as to leave much room for Controversy, concerning the first of them, among Botanists, who call several Plants by that Name. *Gesner*, makes it the *Polygonum bacciferum*; *Dodonæus*, in his *Historia Gallica*, will have it to be the *Atriplex olida*, which he calls *Tragium Germanicum*; *Pena* and *Bellus* take it for the *Androspermum feridam*, which *Bellonius* calls *Tragium Creticum*. *Lobel* affirms the *Tragium* of *Dioscorides* to be our *Fraxinella*, to which Opinion I am most inclined, because none of the foresaid Plants, besides this, can be said to be like the Lemisk in Seed, Leaf, and Branches, only of a lesser Size.

The other *Tragium* *Rauwolfius* makes a Species of *Stachas*; which see under *Tragium alterum*.

TRAGIUM ALTERUM, Offic. *Tragium alterum Dioscoridis quibusdam, Foliis Trichomanis*, J. B. 3. 279. *Stachadi serrata Afensis*, C. B. P. 216. Raii Hist. 1. 514. *Secudus, vel Sucudus Avicennæ*, *Rauwolf. BASTARD DITTANY.*

Dioscorides describes it as having the Leaves of the *Scolopendrium*, and the fine white Root of the wild Radish. The Leaves in Autumn have the strong, rank, Smell of the Goat, whence the Plant takes the Name of *Tragium*. It grows on Mountains and Precipices, and was found by *Rauwolfius* about Aleppo, especially in moist Places.

The Herb and Root are used; the Herb, whether crude or boiled, is said, by *Dioscorides*, to be good for the Dysentery.

TRAGOCEROS. *Brunfelsius* informs us, that this is the *Anemone*; and, also, that the *Tragium Alterum*, and the *Alie* are both thus called by *Dioscorides*. But he either mistakes, or misquotes his Author, for I find no such Passages.

TRAGOPOGON.

The Characters are;

It has all the Characters of the *Scorzonera*, only the Calyx is oblong, not squamous, and its Segments are extended without the Flowers, surrounding them in the Form of a Star; the Floscules, also, are easily convolved, and unfold themselves against the Sun.

Boerhaave mentions nine Species of *Tragopogon*, which are;

1. *Tragopogon*; alter; gramineo Folio; suaverubens. Col. 1. 232. *Desfer. 231. Ic.*

2. *Tragopogon*; flore obsolete purpureo. Flor. 2. 29. *An. Tragopogon, Porri Folio, dilute ianthino Flore*. H. R. P?

3. *Tragopogon*; pratense; luteum; minus. M. H. R. Blasf.

4. *Tragopogon*; pratense; luteum; majus. C. B. P. 274. Tourn. Inst. 477. Boerb. Ind. A. 90. *Tragopogon*. Offic. Park. Parad. 514. *Tragopogon luteum*. Ger. 595. Emac. 735. Raii Hist. 1. 252. Synop. 76. *Tragopogon Flore luteum*. J. B. 2. 1058. YELLOW GOAT'S BEARD.

It grows in Meadows and Pastures, and flowers in June and July. The Roots are very nutritive, and for that Reason good for lean and consumptive Persons. They are said, also, to cure Disorders of the Breast, the Cough, and Difficulty of Respiration, and the Pleurisy; for which Effects, since the Roots are sweet, *C. Hoffman* knows not how to account. They are, also, supposed to be good for the Strangury, and to expel the Stone, whence the Herb is called by the Italians *Sassifica*, as much as to say *Saxifraga*. It is, also, usefully apply'd to Wounds. The expressed Juice of the Root, and its distilled Water work the same Effects. *Raii H. P.*

This Herb grows in Meadows and moist Places. Its Root is soft and sweet like Milk, affords good Nourishment, removes Costiveness, purifies the Blood, sweetens the acrid Humours, increases the Milk, provokes Urine, expels Gravel, and is good against Oppressions of the Breast and Lungs, the Cough, a Consumption, and pricking Pains of the Sides. Some in Consumptions, arising from Ulcers in the Lungs, recommend the Roots of this Herb and a Syrup prepared of its Juice. The expressed Juice cures recent

cent Wounds. Its Water is said to be possessed of surprising Qualities for the Cure of a Spitting of Blood. *Zorn. Botanologia.*

It is said to be good for Effusions and lancing Pains of the Stomach and Thorax. *Dale.*

5. *Tragopogon*; luteum; *Foliiis gramineis*; caule purpurascens; *Rand.*

6. *Tragopogon*; purpuro-ceruleum; *crocifolium*. C. B. P. 275. *M. H.* 3. 80. 8.

7. *Tragopogon*; *Coronopi Folio*. C. B. P. 274.

8. *Tragopogon*; purpuro-ceruleum; *Porri Folio*; quod *Artifi vulgo*. C. B. P. 274. *Barbula Hirci*; *purpurea caerulea*. Tab. Ic. 599. *Gerontopogon*, sive *Saxifraga Italorum*. Lugd. 1079.

9. *Tragopogon*; caule circa caput tumido. *Vaill. Boerb. Ind. alt. Plant. Vol. 1.*

The Name is from *τράγος* (*Tragos*) a Goat, and *πάγων* (*Pogon*) a Beard; because its downy Seed, while inclosed in the Calyx, resembles the Beard of a Goat.

The Virtues are the same as those of the *Scorzonera*, only a little weaker; it affords very good Nutriment, and is therefore adapted to culinary Uses. It is accounted, also, a Specific against the Pleurisy, and the Stone in the Kidneys and Bladder; it opens and molifies the Passages, and acts upon them by its demulcent Quality; it is, also, a very good Digerter of Phlegm, and for that Reason of excellent Service in an Asthma and Dyspnoea. *Hist. Plant. adscript. Boerhaav.*

Tragopogon Hispanicus. A Name for the *Scorzonera*; *latifolia*; *sinuata*.

Tragopogon, laciniatum. A Name for the *Scorzonera*; *laciniatis Foliiis*.

TRAGOPYRUM. The same as FAGOPYRUM.

TRAGORCHIS; see ORCHIS,

TRAGORIGANUM. Offic. *Tragoriganum Creticum*. C. B. P. 223. *Park. Theat.* 16. *Raii Hist.* 1. 523. *Tragoriganum Cretense*. *Ger. Emac.* 668. *Tragoriganum quibusdam nigrius*, *Folio duro*, *Flore purpureo*. J. B. 3. 261. GOAT'S MARJORAM.

It grows in the Island of Crete or Candy, and flowers in March.

Tragoriganum is of an hot and acrimonious Quality, and useful for the same Purposes as Thyme, Savory, Hyssop, and the like; that is, for pulmonic Affections, as the Cough and other Disorders of the Lungs; to provoke Urine, and the Menstrues; for Crudities of the Stomach, acid Eructations, and the like Affections of that Part.

TRAGORIGANUM ALTERUM. Offic. *Tragoriganum Clusii*. *Ger.* 543. *Emac.* 668. *Tragoriganum Hispanicum*. *Park. Theat.* 16. *Tragoriganum angustifolium*. C. B. P. 223. *Raii Hist.* 1. 523. *Tragoriganum tenuioribus Foliiis*, *Flore candido*. J. B. 3. 261. SPANISH GOAT'S MARJORAM.

It grows in the Kingdom of Valentia in Spain, and flowers in March; and the Herb, which is the Part used in Medicine, agrees in Virtues with common Goat's Marjoram.

TRAGORIGANUM, is, also, a Name for several Sorts of *Satureia*; which see.

TRAGOSLINUM.

The Characters are;

The Root is like that of a Cabbage, and acrimonious in many Plants, the Leaves are pinnated like those of the *Pimpinella saxifraga*; the Petals of the Flower are bifid and unequal in many; and the Seeds are oblong, gibbous, and striated.

Boerhaave mentions nine Sorts of *Tragoslinum*; which are,

1. *Tragoslinum*; majus; umbella candida. *Tourn. Inst.* 309. *Boerb. Ind. A.* 54. *Pimpinella Saxifraga*. Offic. *Ger.* 887. *Emac.* 1044. *Raii Hist.* 1. 445. *Synop.* 3. 213. *Pimpinella Saxifraga major umbella candida*. C. B. P. 109. *Saxifraga Hircina major*. *Park. Theat.* 947. J. B. 3. 109. BURNET SAXIFRAGE.

The Root, of the great Burnet Saxifrage, is thick at the Head, spreading into several Branches; which grow deep in the Earth, of a whitish Colour, and an hot biting Taste, from which spring several pinnated Leaves, having three or four Pair of Pinnæ, set opposite, with an odd one at the End; they are somewhat hard in handling, and are larger, narrower, and more deeply cut in, than those of the common Burnet; the Stalks are about a Yard high, stiff-jointed, and full of Branches clothed with narrower Leaves; and at their Ends grow Umbels of small white Flowers, followed by very small, dark, brown, striated Seed; it grows in divers Parts of England, particularly, in many Places of Kent; but is not very common about Town; and therefore our Herb-women sell the Roots of the smaller Kind, or the *Pimpinella Saxifraga minor* *Foliiis Sanguisorbæ*, *Ray's Synop.* which grows frequently in gravelly Places, and is a much smaller Plant, with lesser and rounder Leaves, next the Stalks; and, in the Composition of the *Syrupus Althææ*, they generally give either the common Burnet, or that and the Meadow Saxifrage, instead of this.

The Roots of Burnet Saxifrage are hot and dry, carminative, expelling Wind, and are good for the Colic, and Weakness of the Stomach; they are, likewise, diuretic, and usually given against the Stone and Gravel, as, also, for the Scurvy, and are an Ingredient in the *Pulvis Ari composita*. *Miller's Bot. Off.*

2. *Tragoslinum*; majus; umbella rubente. T. 309. *Pimpinella Saxifraga, major, umbella rubente*. C. B. P. 159.

3. *Tragoslinum*; alterum; majus. *Tourn. Inst.* 309. *Boerb. Ind. A.* 54. *Pimpinella, Saxifraga minor*. Offic. *Pimpinella Saxi-*

fraga minor, Foliiis Sanguisorbæ. *Raii Hist.* 1. 445. *Synop.* 3. 213. *Pimpinella Saxifraga major, altera*. C. B. P. 159. *Pimpinella Saxifraga major nostras*. *Park. Theat.* 946. *Saxifraga hircina minor* *Foliiis Sanguisorbæ*. J. B. 3. 111. SMALLER BURNET SAXIFRAGE.

It grows in dry Pastures and flowers in June: The Herb is used, which agrees in Virtues with the *Tragoselinum*; majus; umbella candida, to which it may be a *Succedaneum*.

4. *Tragoselinum*; minus. T. 309. *Pimpinella, Saxifraga, minor*. C. B. P. 160. *Saxifraga, hircina, minima*, *Pimpinella crispa Tragi*, J. B. 3. 2. 113. *Saxifraga parva*. *Dod. p.* 315.

It is very well adapted, as *Tragus* says, for breaking and expelling the Stone, being of an hotter Temperament than all the Species of *Apium*. The dried Root may be used with Food, instead of Pepper; for in Taste and Strength it so well answers to Pepper, that it might, fitly enough, be called *German Pepper*: And, in my Opinion, it is more useful and salutary than Pepper, as I have learnt by long Experience. The Herb, Root, and Seeds, have the Virtues of the *Petroselinum*; but are much more efficacious in mitigating and removing Pains. Of the Roots may be prepared Troches, of great Service in a cold Distemperature of the Stomach, or when that Part is affected with gross and viscous Humours. The Root, in what Manner soever taken, whether in Powder, Potion, or Eclegma, is a singular Remedy against all Kinds of Poison; mitigates Pains of the Intestines; is good for the Stone in the Kidneys; provokes the Menstrues, and whatever else requires to be evacuated with the Urine. The same Effects are to be expected from the Seed, and the distilled Water, which latter, also, deterges Spots of the Face, and renders it hard. That it is a Vulnerary, is not so certain, because of its Heat and Acrimony; but perhaps it may be of Service in destroying sordid Ulcers. The Root, according to *Fuchsius*, is of extraordinary Use in preventing and curing the Pestilence, and other contagious Disasters. Taken in Vinegar, it is highly commended in pestilential Distempers. Some exol an Electuary of the Root bruised very small, and made up with Sugar of Roses, against a Phthisis: But, says *J. Baubine*, I can scarce persuade myself, that so hot and acrimonious a Root can be proper in a Phthisis. Others prescribe it for the Colic, I know not how successfully. Externally, it is of Use as a Masticatory, in the Tooth-ach, by extracting Phlegm; and to ripen Buboes, and cancerous Tumors; to increase Milk, and for some other Purposes.

5. *Tragoselinum*; majus; degener; umbella alba. *Pimpinella, Saxifraga, major, degener, seu Foliiis longius dissectis*. *M. H.* 3. 284.

6. *Tragoselinum*; quæ *Pimpinella*; *Saxifraga*; minor; crispa; *M. U. Ic. T.* 5.

7. *Tragoselinum*; parvum; Folio *Apii*; umbella alba.

8. *Tragoselinum*; Folio *Apii*; minimum.

9. *Tragoselinum*; perenne; Folio *Apii* majus. *Boerb. Ind. alt. Plant. Vol. 1.*

It has its Name from *τράγος* (*Tragos*) a Goat, and *σέλινον* (*Selinon*) *Apium*, *Petroselinum*, because the Leaves resemble those of the *Petroselinum*, and the Goats delight to feed upon them; and it is called *Saxifraga*, because it grows out of the Rocks, as if it broke through them. Many think this Name given it because it breaks the Stone, but they are mistaken, for Plants which grow on rocky Mountains, or spread their Roots among Rocks, are of an acrid and aromatic Quality.

It is scarce thought of any Use in Medicine: The first, second, and third Species are called Pepper, because they are so hot as not to be suffered in the Mouth, whence they are proper where heating Things are required, as in an aqueous Dropsy; the second acts very powerfully, and may be of great Force in expelling the Stone, but I do not say that it is always proper to be given. The Plant, in short, is an Aperient, Emmenagogue, Diuretic, and Diaphoretic. The fourth Species is called Pepper, for it exceeds Pepper in Acrimony. *Hist. Plant. ascript. Boerhaave.*

TRAGUS, *τράγος*, (*Hircus* a Goat,) is a Greek Word, signifying that Affection of Youth, about fourteen Years of Age, when the Voice alters to a graver Sound, Hair begins to appear on the Beard and Pubes, and Venerel Inclinations arise, with an Intumescence of the Testes, as in the *Tragos*, or Goat, whence the Name is derived, and in which, during their Time of Rutting, that Intumescence is very remarkable. *Hippocrates* seems by the Word *τράγος* to mean rather this Intumescence of the Testes, than the Alteration of Voice, in those who have their first Venerel Desires and Tuitations, in that Expression, 6 *Epid. Sect. 4.* *Aph. 25.* *τράγος ὁλόσπερος ἀν' ὧν ἔξαι, ἔργον δὲ ἔστιν, ἀσπεν, ἐν δὲ ἐν-ἔνυμος, ἥλιον*, "which *Tragos* (*Testis*) appear jutting out, if it be the Right Testicle it is a Male, if the Left Female;" for he seems here to advise us to observe which of the Testes swells and is prominent; and this Affection he calls *τράγος*. To the same Purpose, with an Eye to this Passage, speaks *Galen*, when he says, *ἐπὶ δὲ καὶ τῶν ἀρχαίων, &c.* "For the same Reason, when the right Testis is better turn'd, and foremost in the *Tragus*, or Intumescence [*τράγος μὲν ἐν τῷ τραγῶν διαστύβει*] it makes Begeters of Males; when slenderer, and last in Intumescence, it disposes for the Generation of Females. Here the Verb *τράγαν* seems to be spoken of that Intumescence of the Testes

"in Animals, at their first Impulses to Coition." The same Author, *Lib. 14. de Usu Partium*, has the following Expression, "ὁ δὲ ὄρχις ὁ δεξιὸς ἔστιν ἀσθενέστερος ἀσπράχτης θάλασσης, &c. But when the Right Testis is of the weaker Construction, the Left is first distinguished by what they call the *Tragus*; and by this we may conjecture, that the Animal will be a Procreator of Females; as, on the contrary, if the Left Testis remained as Nature required, and the Right were first elevated, according to the *Tragus*, that Animal, as far as lay in this Part, would beget Males." But *Galen*, in his Comment on the foregoing Place, 6 *Epid.* seems in the Phrase ἐν τῷ τραγῶν, to join both Affections, the Change of the Voice, as well as the Infecundity of the Testes, for these are his Words; ὅτις ἐν καὶ αὐτῷ πρὸς ἰσχυρότερος ἐλέγχο, τραγὸς ὁπλοῖται ἂν φανῇ ἔξω, &c. "To the same Purpose are these Words of *Hippocrates*. You are to observe which Testis is prominent, if it be the Right, a Male, if the Left a Female (is portended). For when the Members of Generation are first elevated, and the Voice is somehow altered to a rougher and graver Tone, which is what we mean by the *Tragus*, (τὸτο γὰρ τὸ τραγῶν ἐστὶ). *Hippocrates* directs us to observe which of the Parts is more robust, for those Parts which first swell, and grow big, from a Supply of Matter, are certainly the strongest." And, hence it is, I suppose that *Alexand. Aphrodis.* in his *Natural Questions*, expresses this Change of the Voice, not simply by the Verbs τραγῶν, or τραγίζειν, but by βράχχει τραγῶν, to signify the Roughness of the Voice, made by this Alteration.

The Verb, τραγίζειν, as derived from τραγός, is used by *Hippocrates* 6 *Epid. Sect. 3. Aph. 18.* to signify that State of Youth which first begins the Use of Venereal Exercises, when the Voice becomes rougher and more unequal, and in a manner hoarse, and Hemorrhages happen from the Nose, on account of the Increase of Heat in the Blood. These are Symptoms incident to those, who, as *Hippocrates* expresses it, 3 *Aph. 27. πρὸς τὴν ἡβὴν προσέρχεται*, "arrive at Puberty;" which as *Alex. Aphrod. Lib. 1. Qu. 123.* explains it, is about the fourteenth Year.

Some will have τραγός, and τραγίζειν, to be spoken by *Hippocrates*, of young Men, who have experienced the Use of Veneries, and have lecherous Desires, in that respect resembling Goats, as well as in a kind of Rankness of Smell, in which, as the *Latin* Phrase is, *Hircum olent*, they smell of the Goat. Young Men of this Cast, were called by the Antients *Hircosi*, and *Hirquitalli*, and were said *Hirquitallire*, which expresses the Greek τραγίζειν. *Hirquitalli*, in *Festus*, are Boys approaching to the State of Manhood, and so called, he says, from their Goat-like Lust. And hence τραγός seems to signify, also, that rank and goatish Smell under the Axæ, or Armpits, of which *Horace* says,

Gravis hirsutis cubat Hircus in Alis.

Τραγός is, also, a kind of Food prepared of Zea; according to *Galen, Com. 1. in Lib. de Rat. Viſt. in Morb. acut.* or of Olyaa. *Lib. de Alim. Fac.* which *Pliny, Lib. 18. Cap. 10.* calls *Tragum*. Τραγός, also, is reckoned among oleraceous, as well as frumentaceous Foods.

Τραγός, signifies, also, a Disease in Vines, when they bear no Fruit, but abound in Leaves, as appears from *Aristotle, Lib. 5. Cap. 18. de Gen. Animal.* and *Theophrastus, de Caus. Plant. Lib. 5. Cap. 10, 13.*

TRAGUS. A Name for the *Ephedra*; *maritima*; *major*; and for the *Ephedra*; *maritima*; *minor*.

TRAGUS, in Anatomy, is a Part of the external Ear. See *AURIS*.

TRAGUSSPINOSUS. A Name for the *Kali*; *spinosum*; *Folii longioribus & angustioribus*.

TRAMIS, τραμῖς, is expounded by ὄρρος (*Orrhus*) called ἰπποπόρις, (*Hippopruris*), that is, the Line which intersects the Middle of the Scrotum, and passes through the *Taurus* to the Anus. But *Ruffus Ephesus*, reckoning the Parts of the Pudenda virilia, calls the propending Part, as he expresses it, καύλος and σῆμα, the non-propending, or fixed Part, ὑπέσκημα, and κύσας πρᾶχλος: the Neck of the Bladder, and the Line which intersects them τραμῖς, which, others, he says, call ὄρρος. *Hesychius* makes τραμῖς the Filure of the Anus; so τραμῖν, or τραμῖς, in *Aristophanes*, signifies τὸ πρῖμα τῆς ἔδρας, "the Perforation of the Anus", that is, the Podex, or σφινκτήρ "the Sphincter," according to *Lyfimachus*, as we read in *Erotian*. *Pollux* says, that the Line, like a Suture, under the Penis, which passes through the Middle of the Scrotum, and under the Part called *Taurus*, ταῦρος, is called περίλαον (*Perineum*), τραμῖς, (*Tramis*), and ὄρρος, (*Orrhus*).

TRANSFUSIO.

Transfusion and Infusion may be reckoned surgical Operations, because, as in Bleeding, the Aperture of a Vein is required. By Infusion, is meant the Injection of Medicines into the Blood; and by Transfusion, the Conveyance of the Blood of one Person, or Animal, into the Veins of another. Although these Operations are seldom now performed, yet they were much practised from the Year 1660 to about 1680, and the following were the Reasons that occasioned the Invention of them.

The Generality of Physicians agree, that almost all Diseases proceed from a Disorder of the Blood, which, may, therefore, be sooner, and more easily, corrected by the Injection of Medicines into the Blood, or by the Transfusion of the Blood from a

found Person, or Animal, into the Veins of the Patient. For Medicines taken by the Mouth, are not only changed in the Stomach, and Intestines, but are likewise weakened before they arrive at the Blood. There are, also, some Cases, in which Medicines cannot be taken by the Mouth, as in Apoplexies and the Quinsy, which may be expeditiously remedied by the Infusory Method. Physicians, therefore, imagined that the most inveterate Diseases must yield to this Method, such as proceed from the Leprosy, Gout, Epilepsy, Apoplexy, Consumption, the Pox, Scurvy, malignant and obstinate Fevers, and large Hemorrhages, and that it would even restore Youth to Old-age, and recover the worst Constitutions. But how much soever a Remedy, endowed with such Virtues, might be desired, yet the Event of these Operations, was so far from answering Expectation, that it often produced the worst Consequences. For almost all the Patients, on whom the Experiment was tried, were affected, either, with Stupidity, Foolishness, a Delirium, or Melancholy, or were suddenly deprived of Life. Such fatal Consequences soon brought these Operations into Disrepute, and they are said to have been condemned and prohibited by an Edict of the Parliament of *Paris*.

The Infusory Method is thus performed. A Vein must be opened, generally in the Arm, as in Bleeding: Here the Remedy must be injected, with a Syringe, or with a Clyster-pipe and Bag, as in *Tab. XXXII. Fig. 10.* which must be turned upwards, that the Medicine may the sooner arrive at the Heart, and then the same Manner of Dressing may be used as in Phlebotomy. But whether this Operation should be entirely condemned, or whether it may be useful to inject proper Remedies in an Apoplexy, or Quinsy, when the Case is desperate, as warm Milk, or Broths; or to transfuse the Blood of a sound Person, or Animal, into the Veins of the Patient, after discharging the morbid Blood, remains, in my Opinion, to be determined by future Experience. *Purman* in his *Surgery, Part 3. Chap. 31.* testifies, that he not only cured others in this Manner, but, also, himself of a violent Itch, and an obstinate Fever.

The Transfusion of Blood may be done in this manner. A Vein of the Patient's Arm must be opened, as in *Tab. XXXII. Fig. 11.* or his Hand, as in *Fig. 12.* into which introduce a Pipe of Silver, Brass, or Ivory, keeping the End in the Vein turned upwards: The same should be performed in the sound Person, but so, that that End of the Pipe, which is introduced into the Vein, should be turned downwards, or towards the lower Part of the Vein, then let the smaller of the two Pipes, be inserted into the larger, and as much Blood, as may be thought necessary, will flow from the sound Person, into the Vein of the Patient, and then the Wound may be dressed. If thus the Patient is not recovered, the Operation, after some time may be repeated. But before the Blood be transfused, some of the morbid Blood should be drawn from the Patient, that the new Blood may circulate more freely. Sometimes a Vein is opened in each of the Patient's Arms at the same time, so that the same Quantity of the vitiated Blood, is discharged at one Orifice, that he receives of the sound by the other. *Lamswerde*, in his Notes on *Schulsetus*, may be consulted about this Operation, and *Junken*, in his *Chirurgia Germanica*, p. 487. If it be necessary to convey the Blood of an Animal into the Patient, as that of a Calf, or a Sheep, a Vein or Artery must be opened in their Neck, Leg, or Thigh, and the Operation proceeded in nearly as before. See *Tab. XXXII. Fig. 13.* and *Lamswerde in Append. ad Sculteti Armatum. Chir. & Purmanni Chirurg. P. 3. Cap. 31.* When Pipes of Metal and Ivory were found too stiff, and on that account painful, others were invented of a softer and flexible Kind, to be placed between the two solid ones, made of the carotid Artery, or Ureter of an Ox, Calf, or Sheep, or of the Aspera Arteria of a Fowl; by which means both the Pain and Trouble in Transfusion of the Blood were lessened.

Dr. Lower, in his Treatise *de Corde*, asserts himself to be the Inventor of the Transfusion of the Blood, in Opposition to *Denys*, who in a certain Epistle claims this Honour to himself. Many Experiments of this kind did *Denys* make at *Paris*, but they were attended with very ill Success. *Sturmius* a celebrated Mathematician of *Altorf*, and *Vehrius* a Professor of *Frankfort*, ascribe this Invention to *Maurice Hoffman*, a Physician at *Altorf*. *Muys*, however, contends, that *Libavius* described it at large in 1615, but without informing us in what Book. The Invention of the Infusory Method has been generally attributed to *Wren* a celebrated Englishman. But I think this Method was described before him by *Major*, a Professor of Physic at *Kiel*, in a Treatise published in 1664, this Operation being never before heard of in *Germany*. Those who desire more on this Subject may consult *Majoris Lib. de Chirurgia infusoria*; *Ettmulleri Disputat. de eod. Eltshozii Clysmat. nov. & Purmanni Chirurgia*. The most remarkable Writers on the Transfusion of the Blood are, *Lower de Corde*, *Santinellus in Confusione Transfusionis*, *Manfredus de Sanguinis Transfusionis*, *Sturmius in Philosophia ecclē. Diff. X. Mercklinus de Ortu & Occasu Transfusionis Sanguinis*; and *Lamswerde in Appendice ad Scultetum*, pag. 29. Cases of the Infusory Method, in desperate Diseases, may be seen in *Misc. Nat. Cur. Ann. IX. & X. Heist. Chirurg.*

TRANSLATIO. The same as METASTASIS; which see.

TRANSPIRATIO.

TRANSPIRATIO. Transpiration, or Perspiration. See CUTIS, and PERSPIRATIO.

TRANSPLANTATIO. Transplantation. *Paracelsus*, in many Parts of his Works, mentions, and recommends a Method of curing Diseases, by transplanting them into Vegetable or Animal Substances. A Subject too whimsical to deserve farther Notice.

TRANSVERSALES MUSCULI. The transverse Muscles; a Name for a great many Muscles of the human Body. Thus there are the

TRANSVERSALES ABDOMINIS. See ABDOMEN.

TRANSVERSALIS ANTICUS PRIMUS.

This is a small, pretty thick, and wholly fleshy Muscle, about the Breadth of a Finger, situated between the Basis of the Os Occipitis, and the transverse Apophysis of the first Vertebra. It is fixed by one End, in the anterior Part of that Apophysis; and from thence, running up a little obliquely, it is inserted by the other End in a particular Impression between the Condyle of the Os Occipitis, and the Mastoid Apophysis of the same Side, behind the Apophysis Styloides, and under the Edge of the Jugular Fossula.

For the Uses of this and the following Muscle, see RECTUS ANTICUS.

TRANSVERSALIS ANTICUS SECUNDUS.

This is a small Muscle situated between the transverse Apophysis of the first two Vertebrae of the Neck. It is fixed by one Extremity, very near the Middle of the second Apophysis, and by the other near the Root or Basis of the first; and therefore it is a Muscle of the Neck rather than of the Head.

TRANSVERSALIS COLLI MAJOR.

This is a long thin Muscle, placed along all the transverse Apophyses of the Neck, and the four, five, or six upper Apophyses of the Back, between the *Complexus major & minor*, lying, as it were, on the Insertions of the first of these Muscles.

It is composed of several small muscular Fasciculi, which run directly from one or more transverse Apophyses; and are inserted sometimes in the Apophysis nearest to these, sometimes in others more remote, the several Fasciculi crossing each other between the Insertions of the two *Complexi*, which are, also, crossed by them. They have sometimes a Communication with the *Longissimus Dorsi*; but this is not uniform.

The *Transversalis major*, *Transversalis gracilis*, and the little *Transversales*, acting on one Side, can have no other Use; but to bend the Neck laterally; and to hinder these Inflections, when they act on both Sides. The small *Transversales* may, also, preserve the Capular Membranes of the Joints from being compressed, or otherwise hurt, by the Motions of the oblique Apophyses.

TRANSVERSALES COLLI MINORES. See INTER-TRANSVERSALES.

For the Uses of this Muscle, see TRANSVERSALIS COLLI MAJOR.

TRANSVERSALIS DIGITORUM.

This is a small Muscle, which lies transversely under the Basis of the first Phalanges, and which, at first Sight, appears to be a simple muscular Body, fixed by one End to the great Toe, and by the other to the little Toe.

When this Muscle is carefully examined, we find that it is fixed by a very short common Tendon to the Outside of the Basis of the first Phalanx of the great Toe, conjointly with the Antichenar, and by three different Portions or Digitations to the three interosseous Ligaments, which connect the Heads of the four Metatarsal Bones next the great Toe, laterally to each other. These three Portions are very slender, and gradually cover each other.

This Muscle might be reckoned a second *Antichenar*.

TRANSVERSALIS DORSI MAJOR. See LONGISSIMUS DORSI.

TRANSVERSALES DORSI MINORES.

I have found, says *Winslow*, some particular Muscles of this kind fixed to the Extremities of the three lowest transverse Apophyses of the Back. The rest are all, in some measure, Continuations of the *Transversalis major*; but these few which are distinct, and which lie in the Interstice between two Apophyses, may justly enough be termed *Inter-transversales*.

For the Uses of these Muscles, see SPINALES.

TRANSVERSALIS GRACILIS, SIVE COLLATERALIS COLLI.

This is a long thin Muscle, resembling the *Transversalis Colli major* in every thing but Size, and situated on the Side of that Muscle. It is commonly taken for a Portion or Continuation of the *Sacro-lumbaris*. *Diemerbroek* distinguished it by the Name of *Cervicalis Descendens*; and *Steno*, and others after him, have called it *Accessorius Musculus Sacro-lumbaris*. See its Uses under TRANSVERSALIS COLLI MAJOR. *Winslow*.

TRANSVERSALES LUMBORUM. See SPINALES.

TRANSVERSO-SPINALES COLLI. See SEMISPINALIS.

TRANSVERSO-SPINALIS LUMBORUM. See SACER.

TRAPEZIUS MUSCULUS. A Name for the CUCUL-
LARIS.

TRASI. See TRAGI.

TRAUMA, τραῦμα. A Wound. See VULNUS.

TRAUMATICA. Vulnerary Medicines. See ASTRINGENTIA.

TRAUMATICUM DECOCTUM. A Vulnerary Decoction.

Take of Sarsaparilla, two Ounces; of the greater Comfrey, and Liquorice-roots, each six Drams; of white Dittany, two Drams; of stoned Raisins, two Ounces; of the Shavings of Hartshorn, half an Ounce: Boil them in a sufficient Quantity of Spring-water, to strain off four Pounds; adding towards the latter End, of the Leaves of St. John's-wort, Agrimony, Plantain, and Ground-ivy, each half an Handful; of the Flowers of the great Daisy, one Handful; of Nettle-seed, two Drams: Strain out the Liquor for Use.

ANOTHER VULNERARY DECOCTION.

Take of the Tops of St. John's-wort, *Paul's Betony*, both Sorts, Periwinkle, Agrimony, each two Handfuls; Roots of China, Comfrey, white Sanders, Nephritic-wood, each an Ounce; Dates cut, thirty; Liquorice, an Ounce and an half: Infuse all for twelve Hours in a sufficient Quantity of Lime-water; and strain to four Pounds; and thereto add Syrup of Mouse-ear, and of the Juice of Fluellin, each two Ounces. Mix, and keep in a cold Place for Use.

TRECHON, τρέχων. Quicksilver. *Nicolaus Myrepsus, Sect.*

3. C. 97.

TRECHYSMA, τρέχυσμα. The same as TRACHOMA.

TREMATE *Brasiliensis*. *Marcgrav. Tremate Pisoni Frutes Brasiliensis flore composito, in pappo abeunte. Raii 1783.*

This Shrub in Figure resembles the Pomegranate-tree; its Bark resembles that of Elder; its Wood is white, and contains a Marrow. Its Leaves are of a dark-green Colour, and, when triturated, smell exactly like Storax; and are used by the *Brasilians* in Pains and Redness of the Eyes. *Raii Hist. Plant.*

TREMOR. See PYRETOS.

TREPANATIO. The Operation of Trepanning. See CAPUT.

TREPANUM. The same as TEREbella.

TREPONDO. Three Pounds.

TRIANGULARIS. Triangular. A Name of several Muscles. Thus the Deltoide Muscle is call'd the Triangularis Humeri. There is, also, the

TRIANGULARIS STERNI. See STERNO-COSTALES.

TRIANGULUS. See TRIGONOS.

TRIBADES. See MALTHACOS.

Tho' the Clitoris is commonly concealed within the Lips of the Pudenda; yet in some Women it becomes so far prominent, that they are either, by ignorant Persons, thought to be transform'd into Men, or make Attempts to converse in a criminal manner with other Women. The unhappy Females, who pollute themselves in this manner, are by the *Greeks* call'd *Tpιδάδες*, and by the *Latins* *Fricatrices*, who, according to *Celsus Aurelianus*, in *Lib. 4. Tard. Pass. Cap. 9.* are fonder of associating themselves with Women than with Men.

Hemica Schuria, a Woman of a masculine Turn of Mind, being weary of her Sex, dress'd herself like a Man, and serv'd in Quality of a Soldier for some time under his Serene Highness *Frederic Henry Prince of Orange*, in the Siege of *Boisleduc*. But returning Home, she was accus'd of uncommon and preternatural Lust, since her Clitoris sometimes appear'd so far without the Lips of the Pudenda, that she frequently attempted that Species of criminal Dalliance with other Women, which the *Greeks* call *Κετροειζεν*. She could, also, perform what the *Greeks* call *Τριβαν* with such a Degree of Vigour and Virility, that she pleas'd a certain Widow, of whom she was excessively fond, so well, that, if the Laws of the Land had permitted, she would have married her, perhaps more cheerfully than she had done her deceas'd Husband, by whom she had six Children.

This Woman, in external Appearance had the same Configuration of the Parts of the Pudenda with other Women. But, according to the Declaration of three Midwives, internally, a little before the urinary Passage, there was evidently perceiv'd a certain glandulous Caruncle, call'd the Clitoris, which tho' in other Women it hardly exceeds the Bulk of a Nail, was yet said to be half a Finger long in her, and in Thickness to resemble the Penis of a Boy.

This Clitoris, tho' not always, yet sometimes, appear'd without the Lips of the Pudenda, especially when the discharg'd her Urine with Difficulty, or was under the Influence of strong Inclinations to her unnatural Crime; at which time her Clitoris protuberated half a Finger's Length, or sometimes more, accord-

ing to the Strength of her Inclinations. *Johannes Poponius*, a celebrated Lawyer, in *L. 22. Tit. 7. Arest. 11.* is of Opinion, that such Women ought to be punished by Death. But *Henrica Schurta* had a milder Judge, and, being only whipt with Rods, was banish'd far from the Partner of her Crimes; who was, also, punish'd, tho' allow'd to remain in the City. *Talpū Obferuat. L. 3. C. 35.*

TRIBE, *τρίβη*, (from *τρίβω*, a Verb, besides its usual Significations of rubbing, breaking, and the like, importing, in a metaphorical Sense, Exercise and Employment) is Practice, Use, Exercise. *Τρίβη μέλα λόγῳ* is Exercise or Practice founded on Reason, and oppos'd to *λογισμὸς πειθάνῳ*, a Persuasion grounded on mere Ratiocination. *Hippocrates, Lib. Præcept. prope Initium.* In the same Treatise, towards the End, *τρίβη* and *δυσμάτων ἰσογίη*, that is, Exercise, or Practice, and the Knowledge of Precepts or Rules, are set in Opposition; as are, also, in the Words which follow, *δυσμάτων πολυχεσίη*, a comprehensive Knowledge of Precepts, and *χειροτερίβη ἀπρεμύτης*, the Usefulness and Stability of manual Operations and Practice. *Τρίβη*, in this Sense, is express'd by *Hippocrates*, in this same Treatise, and in *Lib. περί εὐνοίας*. by *πρήγμωσις*, Actions, Practice. *Quintilian, Lib. 2. Cap. 16.* renders *τρίβη* by *Usus*, Use. *Roefus.*

TRIBOS, *τρίβος*, from *τρίβω*, to rub, in *Hippocrates*, signifies a well-trodden and frequented Path; but, in a metaphorical Sense, is taken for a Place much wore by long Attrition, or become callous, as we read in *Galen, Com. 1. in Lib. de Art.* Hence the Head of the Os Humeri, when it has continu'd long in a Place, whither it is remov'd by Luxation, and has work'd itself by continu'd Attrition into a kind of Settlement, is said by *Hippocrates, Lib. de Art. τρίβον ποιεῖσθαι*, "to make a Tribos." And in the same Treatise we read *ὅταν μὲν ἐν τρίβον λάβῃ τὸ ἄρθρον ἐν τῇ σαρκί*, "when the Joint shall acquire a Tribos (a Settlement by Attrition) in the Flesh;" where he writes, that *τρίβος* is spoken by way of Metaphor taken from Places much worn by the Feet of Travellers. Again, in *Möchlic*, it is said, *τὸ ἔθος τρίβον ποιεῖ*, by which Words we are to understand, that Use induces a Callus on elapsed Joints. But in *Lib. xli. ἰσπίων*, *τρίβος*, according to *Galen*, is that Part of a Member with which it operates when inflected, extended, or resting on one Side. *Τρίβος*, also, signifies that Part of the Body which is rubbed, or with which we act, or on which we stand, or lay any Strefs, whether standing, walking, sitting, or lying; as the Soles of the Feet, when we stand or walk; the Buttocks, when we sit; and the Back, and hinder Parts of the Head, when we lie in a supine Posture. Some call that Part, on which the Strefs is laid, *Mora*, Rest, because we rest, in a manner, on it; others, *Samira*, or *Callis*, a Foot-way, or Path, from its being, like these, subj-cted to continual Impressions.

TRIBULUS.

The Characters are;

The Root is annual; the Leaves are like those of the *Lentula*, or *Cicer*. The Flower is rosaceous and pentapetalous; the Fruit cruciform, or turbinated, composed of a Multitude of small muricated Particles collected into an Head, in each of which are oblong Seeds disposed in their proper Cells.

Boerhaave mentions but one Sort of *Tribulus*; which is, *Tribulus; terrestris; folio Ciceris; fructu aculeato. C. B. P. 350. Emac. Boerb. Ind. A. 298. Tribulus terrestris. Offic. Ger. 1066. Emac. 1246. Park. Theat. 1097. Raii Hist. 2. 1344. J. B. 2. 352. CALTrops.*

It grows in *Italy*, and flowers in *July*; and the Herb and Seed are used.

The *Tribulus* refrigerates and inspissates, cures Inflammations, Ulcers in the Mouth, and Putrefaction of the Gums. The Seed is commended against Poisons, and restores those who are bitten by Serpents. *Dale.*

This Plant, is refrigerating, aperient, astringent, and, taken inwardly, a Vulnerary: Hence it is of Service in a Diarrhoea, and the Stone. *Hist. Plant. adscript. Boerhaav.*

TRIBULUS AQUATICUS, *Nuces aquatica. Offic. Ger. 676. Emac. 874. C. B. P. 194. J. B. 3. 775. Raii Hist. 2. 1321. Tribulus aquaticus major. Park. Theat. 1248. Tribuloides vulgare aquis innascens. Tourn. Inst. 655. WATER-CALTrops.*

The Root of this Plant grows deep under Water, being jointed, and full of Fibres at every Joint. The Leaves are somewhat like Poplar-leaves in Shape, being roundish and indented about the Edges, each standing on a long Foot-stalk. The Flowers arise immediately from the Root, being small and white, growing on separate Stalks; and are succeeded by large round prickly Heads, of a blackish Colour when ripe, containing a large eatable Kernel; it grows in standing Pools and Lakes in *Italy* and *Germany*, but no-where in *England*.

They are eaten as other Nuts in the Places where they grow; but as they are rarely to be met with here, so I never knew them applied to any physical Use. *Miller's Bot. Off.*

Tribulus aquaticus is, also, a Name in *Boerhaave* for several Sorts of *Paranagiton*; which see.

The Nuts, while new, are good against the Stone. The Herb is endu'd with the same Virtues as the *Tribulus terrestris*. *Dale.*
TRICA LUMBORUM. A Species of *PLICA POLONICA*: *Blancard.*

TRICAUDALIS. A Name for the *TRICEPS AURIS*.

TRICEPS AURIS, or *RETRAHENS AURICULAM*. The Name of a Muscle of the external Ear, called by *Winslow* the Posterior. See *AURIS*.

TRICEPS PRIMUS.

This, with the two following Tricipital Muscles, are fleshy and flat, and of different Lengths, situated between the Os Pubis, and the whole Length of the Os Femoris. The first and second cross each other in such a manner, as that the Muscle which is the first on the Os Pubis, becomes the second on the Os Femoris, and the second on the Os Pubis is the first on the Os Femoris. The third Muscle keeps its Rank.

The *Triceps Primus* is fixed above, by a short Tendon to the Tuberosity or Spine of the Os Pubis, and to the neighbouring Part of the Symphysis, its Fibres mixing a little with those of the *Pectineus*. Thence it runs down, increasing in Breadth; and is inserted by fleshy Fibres interiorly in the middle Portion of the *Linea Femoris Aspera*.

At the lower Part of this Insertion, a Portion of the Muscle separates from the rest, and sends off a long Tendon, which, together with a like Tendon from the *Triceps Tertius*, is inserted in the inner Condyle of the Extremity of the Os Femoris.

TRICEPS SECUNDUS.

This Muscle is fixed above by fleshy Fibres, below the superior Insertion of the *Triceps Primus*, in all the Outside of the inferior Branch of the Os Pubis as low as the Foramen Ovale; but seldom so low as the Branch of the Os Ischium. This Insertion is broader than that of the former Muscle.

From thence it runs down, and is inserted in the upper Part of the *Linea Aspera*, between the *Pectineus* and *Triceps Primus*, mixing a little with each of these Muscles. This Insertion appears sometimes divided.

TRICEPS TERTIUS.

This Muscle is fixed above by fleshy Fibres to the anterior Part of all the short Branch of the Ischium, and to a small Part of the Tuberosity of that Bone. This Insertion covers some Part of the Tendon of the *Semi-membranosus*, and is covered by that of the *Semi-nervosus*.

From thence it runs down, and is inserted by fleshy Fibres in the *Linea Aspera* almost from the little Trochanter, down to the Middle of the Os Femoris. It goes lower down than the first *Triceps*, sending off a separate Portion like that of the Muscle last-mentioned.

These two Portions join together, and form a common Tendon, which, running down to the lower Extremity of the Os Femoris, is inserted in the back Part of the Tuberosity of the inner Condyle. This separate Portion is sometimes large enough to be taken for a distinct Muscle, in which Case we have a *Quadriceps* instead of a *Triceps*.

In all this Progress this Muscle is joined to the *Vastus Internus* by a perforated Aponeurosis, through which the Blood-vessels pass.

The three *Triceps* Muscles join in the same Use, that is, to move the Thigh inward, and bring the two Thighs near each other; as when, in riding, we press the Thighs close against the Saddle; when, in sitting, we hold any thing close between the Knees; when we cross the Thighs; or when, in standings, we bring the Legs close together, in order to jump.

The Use of these Muscles is, also, to hinder the Thighs from separating more than is convenient, especially in great Efforts and Jerks. This might happen, for Instance, when, in mounting an Horse, or laying the Leg over any Height, we raise one Thigh hastily, and support the Body on the other. It might, also, happen by the Weight of the Body alone, when, in standing, we separate both Legs at once, or jump hastily to one Side.

This Use of bringing the Thighs together, and hindering their Separation, has Place in all possible Situations of the Body or Thighs; that is, in standing, sitting, and lying, and when bent, extended, or turned backward, or outward. This shews the great Necessity of providing for this Function, not only by a strong moving Force, but, also, by distributing this Force in such a manner as that it may be able to act through almost all the Degrees of a very long Lever of one kind.

The longest Portion of the *Triceps Tertius*, being inserted in the Side of the inner Condyle of the Os Femoris, seems to counterbalance the other Portions, which are inserted more posteriorly in the *Linea Aspera*. *Winslow.*

TRICHIASIS, *τρίχιασις*, from *τρίχῆς*, an Hair, is a Disorder of the Eye, consisting in an Irritation thereof by the Eye-lashes; or, according to the Author of the *Definitiones Medicae*, it is *πλεονέκτων πλῆθος, ὃ τῶν ἐν αὐτῇ τριχῶν γένεσις παρὰ τὸν ὀφθαλμὸν*,

"a Falling of the Eyelids, and a preternatural Generation of Hairs in them." He makes three Sorts of *τριχίασις*, to which he gives the Name of *φάλαγγσις* (*Phalangosis*), *πρόσις* (*Prosis*), and *υπόσις* (*Hypophysis*); to which some, he says, add *δυσίχια* (*Dysichia*). See these Words in their proper Places. In *Lib. de R. V. I. A.* this Disease is called *Trichosis*, as, also, by *Advarias*.

Trichiasis, also, signifies an Affection of the Urine, when something like Hairs is seen floating in it. Thus *Galen, Com. ad 4. Aph. 76.* says that "the more modern Physicians call that Disorder, when something like Hairs, especially white ones, appear in the Urine, by the Name of *Trichiasis*." Some call it *Piliuicium*, or Pissing of Hairs; whence, in the Additions to the Book *de Natura humana*, they are called, *τριχουδία σαρκία σπινδα ἐν τῷ ἐνθίμῳ ζυγέζοντα*, "mixture Pieces of Flesh, like Hairs, mixed with the Urine;" and the same thing is expressed 14 *Aph. 76.*

Trichiasis, in *Erotian*, is called an Abscess about the Breasts of Women, when he expounds *τριχιάσις* in *Hippocrates*: Whence I am persuaded, that *Erotian* read that Passage, *Lib. 2. περί γυναικ.* as follows: *ὁύσαν γυναῖκα ὁ μαστός τριχιάσις*, "when the Woman shall have her Breast affected with a *Trichiasis*;" instead of which, it is written every-where, "*τριχὺς γυνή*," shall become rough; so that *Trichiasis* is a kind of Austerity of the Breasts, when they are affected with capillary Fissures, or rugous Inequalities, like very fine Scissures; in which Sense, *Trichiasis*, or *Trichismos*, signifies a very fine Species of Fracture, resembling a Hair; and, under this Notion, *Erotian* ought rather to be read with *ἀπὸ τριχίας* than *ἀπὸ τριχίας*, "an Abscess."

Trichiasis signifies, in the last Place, the *Pilare Malum*, as *Gaza* renders it, or the hairy Evil, which *Aristotle, Hist. Animal. Lib. 7. Cap. 11.* calls *Trichia*, *τριχία*, where he says, by way of Description, "the whole Breast is of so fungous a Substance, that if the Woman happens to swallow an Hair in drinking, she is affected with a Pain in her Breast, which ceases not, till the Hair is discharged either spontaneously, or by Pressure, or is sucked out with the Milk." *Foesius.*

Few Physicians have had an Opportunity of observing the *τριχίασις*, or a Discharge of Hairs by Urine; and fewer still, a periodical Return of this Disorder. A memorable Case of the last-mentioned Kind I had in the Son of a Gentleman of Distinction, who was afflicted for more than four Years with a *Trichiasis*, which return'd every fourteen Days with a considerable Difficulty in discharging his Urine, and so great an Uneasiness of Body, that he could hardly lie in Bed.

Every Hair in Length equal'd sometimes half, and sometimes a whole Finger's Length; but they were so cover'd and wrapt up in Mucus, that they were rarely discharg'd separately, but, as it were, wrapt up. Every Paroxysm lasted almost four Days; and tho' during these he continually render'd his Urine with Difficulty, yet he pass'd the intermediate Days without any Pain, or Discharge of Hairs by Urine, till the fresh Paroxysm returned. *Tulpius Observat. Medic. L. 2. C. 52.*

TRICHOMANES.

The Characters are;

The Leaves consist of roundish Lobes, which are, in a manner, conjugated; and the Fruit is like that of the Filix, or Fern.

Boerhaave mentions two Sorts of *Trichomanes*; which are, 1. *Trichomanes*; five Polytrichon; *Officinatum*. *C. B. P. 356. Tourn. Inst. 539. Boerb. Ind. A. 25. Trichomanes. Offic. Capillus Veneris, Pharmacopolis. Trichomanes. Park. 1051. Raii Hist. 1. 140. Synop. 46. Trichomanes mas. Ger. 985. Emac. 1146. Trichomanes five Polytrichum. J. B. 3. 754. Trichomanes, Polytrichum, Callitrichum. Chab. 556. ENGLISH BLACK MAIDENHAIR.*

The Root of this Maidenhair is composed of small Strings or Fibres, from which spring several Leaves about a Span long, having a slender shining black Stalk, set on both Sides with small roundish Leaves, sometimes a little crenated about the Edges, and sometimes not; whose under Part is covered, at the latter End of the Year, with small dusty Particles, which is the Seed. It grows in hollow shady Lanes, and on old stone Buildings, being to be gathered in September or October.

This is what is commonly made use of in the Shops for the true *Capillus Veneris*, or Maidenhair, there being but a little of that to be had: It is reckoned to be much of the same Nature with the true; and to be pectoral, and good for Coughs and Consumptions; to help the Stone, Gravel, and Stoppage of Urine; and to be, in all Cases, a fit Succedaneum for the true *Capillus Veneris*. *Miller's Bot. Off.*

In the English Shops it is a Succedaneum for the *Adiantum verum*, or *Capillus Veneris*, which grows not spontaneously in England; and is supposed to have the same Virtues, and *Tragus* ascribes the same Effects, to it. The Herb, boiled in Wine or Hydromel, and drank, removes Obstructions of the Liver; cures the jaundice; cleanses the Lungs; helps Difficulty of Breathing; purges Melancholy by Urine; mollifies hard Tumors of the

Spleen; expels Poison, and the Stone; and provokes the Menstrues. The same Decoction, or the Powder of the Herb, or an Eclegma, or Syrup prepared of it, or the distilled Water, stops all sorts of Fluxes of the Belly, and cools Inflammations of the Liver. A Lixivium of the Leaves restrains the Falling off of the Hair, the Head being washed therewith; and cures the Bites of Serpents, and other Animals. Some Farmers and Graziers make a singular Use of the *Trichomanes*, in curing the Diseases of their Swine. But let the Skillful judge, says *J. Baubine*, whether an astringent, cold, and dry Herb can perform such Effects as are ascrib'd to the *Trichomanes*. The chief Virtues of this Plant, and which are allow'd it by all, were in its being adapted to the Cure of Pulmonic Fevers, the Gravel in the Kidneys, and the Strangury.

2. *Trichomanes*; foliis eleganter incis. *T. 539. Adiantum mas. Tab. Ic. 797. Boerb. Ind. alt. Plant.*

This Plant is, also, called *Polytrichum*, from *πολύς* (*Polys*), much, and *τριχίς* (*Trichis*), Hair; as much as to say, a capillary Herb, because it is one of the Plants which go by the Name of *Capillary*.

These Plants have their Seed-vessels in the back Part of the Leaf; the *Trichomanes* have all the Properties of the *Polypodium*, except its cathartic Quality; it is aperient and pectoral, and of Service in Diseases of the Spleen, and Obstructions of the Menstrues. *Hist. Plant. adscript. Boerhaav.*

TRICHOPHYTES, *τριχοφύτες*, from *τριχίς*, the Hairs, and *φύω*, to grow.

TRICHOPHYLLON. A Plant, whose Leaves are small, and resemble Hairs, according to *Blancard*. But it seems rather to imply what Botanists call a capillary Plant.

TRICHOSIS, *τριχώσις*. The same as TRICHIASIS.

TRICHOTON, *τριχότων*. The Hairy Scap.

TRICOCOS. The Medlar. *Blancard.*

TRICOR. Gold. *Rulandus.*

TRICOTYLOS, *τρικότυλος*. A Measure of three Corylæ.

TRICUSPIDES VALVULÆ. Three Valves plac'd at the Mouth of the Right Ventricle of the Heart, just at its Junction with the Auricle. See *COR.*

TRIDACTYLES. A Name in *Boerhaave* for several Sorts of *Saxifraga*.

TRIENS. Three Ounces.

TRIFOLIATA PALUDOSA. A Name for the *Menyanthes*; *palustre*; *latifolium*; *triphyllum*.

TRIFOLIUM.

The Characters are;

The Flowers are papilionaceous, or nearly so, obvolv'd, together with the Ovary, in a simbrated Vagina, and disposed in Spikes. The Ovary becomes a Capsula, which is concealed in the Calyx, and full of Seed; which is, for the most part, Kidney-shaped; and, when ripe, closely adheres to the Capsule: The Fruit itself is of a wonderful Variety of Forms; the Leaves are disposed by Threes, rarely by Fours or Fives.

Boerhaave mentions thirty-six Sorts of *Trifolium*; which are,

1. *Trifolium*; montanum; purpureum; majus. *C. B. P. 328.*

2. *Trifolium*; Hispanicum; angustifolium; spicâ dilute rubente. *C. B. P. 328. Lagopus, angustifolium, folius, Hispanicus. Clus. H. 247.*

3. *Trifolium*; montanum; spicâ longissimâ, rubente. *C. B. P. 328. Lagopus major, alter. Dod. p. 578.*

4. *Trifolium*; lagopoides; hirsutum; angustifolium; Hispanicum, flore ruberrimo. *M. H. 2. 141. Lagopus minor, flore ruberrimo. Park. Theat. 1107.*

5. *Trifolium*; montanum; angustissimum; spicatum. *C. B. P. 328.*

6. *Trifolium*; arvense; humile; spicatum; five *Lagopus*. *C. B. P. 328. Tourn. Inst. 405. Raii Synop. 3. 330. Boerb. Ind. A. 2. 31. Lagopus Pes Leporinus. Offic. Lagopus vulgaris. Park. Theat. 1107. Raii Hist. 1. 948. Lagopus trifolius quorundam. J. B. 2. 377. Lagopus five Pes Leporis. Ger. 1023. Emac. 1193. HARES-FOOT.*

This Plant seldom rises very high, but spreads out into many slender Branches, having small narrow hairy Trefoil-leaves set at every Joint: On the Tops of the Branches, grow short round Heads composed of small papilionaceous pale-purple Flowers, each set in a soft woody Calyx, making the Heads appear soft and downy. The Seed is small, lying at the Bottom of the Calyx; the Root is little, and perishes yearly. It is found frequently among Corn and in Fallow-fields, and flowers in June and July. The whole Plant is used, though not very often.

Hare's-foot is drying and binding, accounted good for a Diarrhoea and Dysentery, and to stop the two great Flux of the Catamenia, and the *Fluxus Albus*, and Spitting of Blood. It helps the Ulceration of the Bladder; Strangury, and Heat, and Pain, in making Water. It is sold in our Shops for the *Hispidula*. *Miller's Bot. Off. and Dale.*

7. *Trifolium*; pratense; flore monopetalo. *Tourn. Inst. 404. Boerb. Ind. A. 2. 31. Trifolium, Lotus Herba, agrestis. Offic. Trifolium pratense. Ger. 1017. Emac. 1185. Trifolium pratense purpureum.*

purpureum. C. B. P. 327. Raii Hist. 1. 943. Synop. 3. 328. *Trifolium pratense purpureum vulgare*. Park. Theat. 1110. *Trifolium purpureum vulgare*. J. B. 2. 374. *Triphyllodes pratensis flore purpureo*. Pont. Anth. 241. **COMMON TREFOIL.**

The common purple Trefoil has three oval Leaves growing on the Top of pretty long hairy Foot-stalks; they are of a lighter Green underneath, and deeper above, having a white Spot in each Leaf. The Stalks grow to be a Foot or more in Height, with but a few, and those shorter Leaves; but having a Couple of small ones at the Bottom of the Flowers, which consist of round Spikes of small purple papilionaceous Flowers, set each in an hairy five-pointed Calyx; in which, afterwards, grow little short Pods, including two or three small, round, yellowish Seeds. The Root is long, slender, and spreading; it grows everywhere in the Fields and Meadows, flowering in May and June. The Leaves and Flowers are used, tho' but seldom.

They are drying and binding, and good for all Kind of Fluxes, as, also, for the Strangury, and Heat of Urine, made into a Cataplasm with Hog's Lard. They are reckoned good for Tumors and Inflammations. *Miller's Bot. Off.*

It is hardly ever used in Physic. *Tragus* prescribes the Flowers and Seeds, boiled in Wine, to ease acute Pains, and cut the glutinous Matters in the Intestines. He recommends them, also, boiled in Water or Oil, and apply'd in form of a Cataplasm, to resolve Tumors, where there is no Inflammation. *Martyn's Tournefort.*

8. *Trifolium*; *purpureum*; *majus*; *foliis longioribus* & *angustioribus*; *floribus saturatioribus*. *Raii Syn.* 194.

9. *Trifolium*; *pratense*; *album*. C. B. P. 327.

10. *Trifolium*; *quadrifolium*; *hortense*; *album*. C. B. P. 327. *Boerb. Ind. A. 2.* 31. *Trifolium purpureum*. *Offic. Trifolium pæum fuscum luxurians quaternis, quinis & senis foliis*. *Tourn. Inst.* 406. *Trifolium affine quadrifolium Pæum Lobelii*. J. B. 2. 380. *Raii Hist.* 1. 942. *Quadrifolium fuscum*. *Park. Theat.* 1112. *Lotus quadrifolia*. *Ger.* 1028. *Emac.* 1198. **PURPLE WORT, and PURPLE-GRASS.**

It is found in Meadows, whence it is taken, and carefully cultivated in Gardens; it flowers in Summer, and the Herb is used.

The Juice expels phlegmatic Humours from the Intestines, cures Ulcers of the Mouth and Tongue, is a Preservative against the Small-pox, and is vulgarly esteemed a present Remedy for the Purple Fever of Children.

B. 2. 366. *Trifolium Asphaltites sive bituminosum*, *Oxytriphylum & Menianthes dictum*. *Chab.* 160. **STINKING TREFOIL.**

This is a shrubby Plant, a Cubit, or a Cubit and an half, in Height, with stiff, hoary, and, also, blackish, striated Stalks, or Sprigs. The Leaves are, at first, round; but grow, by Degrees, long and acuminate; they are hoary also, and hairy; have the noisome Smell of Bitumen, and are glutinous to the Touch. The Flowers are not quite collected into a Body, but disposed on an oblongish Head, and are of a purple-violet Colour, and seated in oblong, striated, villous Calyces. The Seed is black, rough, hairy, and ends in a foliaceous Point; it has the same Smell as the rest of the Plant, and a medicated Taste.

I have, for a long time, says *Ray*, cultivated a Plant resembling this now described in all respects, except in that its Leaves are quite destitute of Smell, but the Flowers have a sweet, tho' faint Scent. The Reason of this is given by *C. Baubine*, when he says, that the Seed of this Trefoil from Italy, sowed in Germany, produces a Plant of a bituminous Smell; but the Seed of a Plant grown in Germany, being sown again, brings forth a Plant deficient in Taste and Smell; and if the Sowing were repeated, it is probable, that the Produce would degenerate into a Plant destitute of all Smell and Taste.

It grows plentifully in Italy, Sicily, and in Languedoc, and Provence, on rocky Hills not far from the Sea; but is cultivated with us in Gardens, and flowers in August; and the Root, Leaves, and Seed, are used.

The expressed Oil of the Seed is highly commended for the Palsy. *D. Soam. Raii Hist. Plant.*

The Leaves and Seed, taken in Water, are effectual against the Pleurisy, Dysury, Epilepsy, Dropsy, and female Disorders, and provoke the Menstrues; they, also, cure the Bites of Serpents. The Root is alexipharmic. - *Dale from Dioscorides.*

25. *Trifolium*; *Bitumen redolens*; *angustifolium*.

26. *Trifolium*; *stellatum*; *glabrum*. *Raii Synop.* 194.

27. *Trifolium*; *flosculis albis*, in *glomerulis oblongis*, *asperis*, *cauliculis proxime adnatis*. *Raii Synop.* 194.

28. *Trifolium*; *capitulo oblongo*, *aspero*. C. B. P. 329.

29. *Trifolium*; *Epithymi capitulis inter genicula*; *annuum*.

30. *Trifolium*; *minus*; *supinum*; *capitulis densiori lanugine candicantibus*. *Triumf.*

31. *Trifolium*; *minus*; *supinum*; *flore flavescente*; *capitulis globosis*, *parvis tomentosum*.

32. *Trifolium*; *foliis parvis*, *lanuginosis*; *flore pallide rubello*; *capitulo globoso*, *lanuginoso*, *molli*.

33. *Trifolium*; *capitulo spumoso*, *lævi*. C. B. P. 329. *Prodr.* 140.

34. *Trifolium*; *cum glomerulis rotundis ad caulium nodos*. *Raii Synop.* 194.

35. *Trifolium*; *clypeatum*; *argenteum*. *Prosp. Alpin. Exot.*

This is a very beautiful small Plant, almost trails on the Ground, resembles the *Trifolium pratense*, and grows in my botanic Garden at Padua, from Seed which I procured from Candy. It bears a silver-coloured Flower, void of Smell, but of a moderately acrid Taste. These Flowers, which are collected into a sort of silver-coloured Heads, are succeeded by black, oblong, broad, thin, foliaceous Seeds, in Shape very much resembling the old Venetian Bucklers. The Plant is annual, and the Seeds come to Maturity in Summer, and thrive well enough in the Soil of Padua.

The Flowers, Leaves, and Seeds, are moderately heating, drying, deterring, and digestive; and a Decoction, prepared of them all, is a potent Anodyne in Pains proceeding from Flatuofities. *P. Alpinus de Plant. Exot.*

36. *Trifolium*; *Alopecuron*; *spicâ globosâ*. *Barr. Ic.* 497. *Boerb. Ind. alt. Plant. Vol. 2.*

It is called *Trifolium*, from its three Leaves; and *Lagopus*, from *λαγώς* (*Lagos*), a Hare, and *πὺς* (*Pys*), a Foot; Hares-foot, because the Spikes on the Tops of the Branches represent the Figure of an Hare's Foot.

This Plant, especially the seventh, eighth, and ninth Species, affords plentiful Fodder for Cattle; and much better than Grass, and the Cattle are rendered much stronger by it, because it remains longer in the Stomach. The twenty-fourth and twenty-fifth are called Bituminous, because they have the Smell of a Species of *Bitumen Judaicum*; whence they afford, by Infusion, a very penetrating Oil. *Hist. Plant. adscript. Boerb.*

Trifolium is, also, a Name for several Sorts of *Melilotus*, *Medica*, and *Lotus*; all which see.

Trifolium acetosum. See **ACETOSELLA.**

Trifolium album. A Name for the *Dorycenium*; *Monspeliensium*.

Trifolium arborescens. A Name for the *Cytisus*; *glabris foliis*, *subrotundis*; *pediculis brevissimis*.

Trifolium frutescens. A Name for the *Medicago*; *trifolia*; *frutescens*; *incana*.

Trifolium fruticans. A Name for the *Jasminum*; *luteum*; *vulgò dictum bacciferum*.

Trifolium Halicacabum. A Name for the *Vulneraria*, *pentaphyllos*.

Trifolium Hepaticum. A Name for the *Hepatica*; *trifolia*; *cæruleo flore*.

Trifolium Lusitanicum. A Name for the *Sinapisrum*; *Lusitanicum*; *triphylum*; *flore rubro*; *siliquis corniculatis*.

Trifolium palustre. A Name for the *Menyanthes*; *palustre*; *latifolium*; *triphylon*; and for the *Menyanthes*; *palustre*; *angustifolium*; *triphylon*.

Trifolium siliqua falcata. A Name for the *Medicago*; *annua*; *trifolii facie*.

TRIGLA, *τρίγλα*. The Mullet.

TRIGLOCHINES, *τρίγλωχινες*. The same as **TRICUSPIDES**.

TRIGONA, *τρίγωνα*. The Name of certain narcotic compound Medicines mentioned by *Galen*.

TRIGONOS, *τρίγωνος*. The Name of a Troche, described by *Galen*, *de Comp. M. S. L. Lib. 7. C. 5.* and *Paulus Aegineta*, *L. 7. C. 12.*

TRIMESTRIS. This is an Epirhet for Wheat, Meal, or Barley, which frequently occurs in medicinal Authors. It imports, that the Grain has been but three Months in the Ground. I cannot, with *Columella*, and *Bapt. Porta*, believe, that this is a distinct Kind of Wheat; but rather think, that Husbandmen, after a bad Autumn, sow it by way of Recompence; that some of the Nations about the Alps, because their Wheat cannot bear the Rigours of the Winter, and the Showers, they delay the Sow-

ing of it till the Spring; not because they imagine, that it is a peculiar Kind, and would not thrive, if it was sown in another more indulgent Soil, and elsewhere in Italy. Thus the *Triticum Trimestre* is unknown in most Countries; and Wheat for several Years sown in the Spring, constitutes a certain particular Kind; for the Continuation of a Thing changes its Nature. Hence the Wheat, which has the Epithet *Trimestre* bestowed on it, differs not from the common Wheat in Species, but only in a certain Weakness of Constitution. *Raii Hist. Plant.*

TRINCIATELLA. A Name for the *Sonchus*; *levis*; *angustifolius*.

TRINITAS. A Name for the *Trifolium*; and, also, for the *Viola Tricolor*, according to *Blancard*.

TRIOBOLON. *τριόβολον*. The Weight of three Drains.

TRIOMPHYLLON. The Name of a Compound Medicine in *Mesue*. *Castellus*.

TRIOPHYLLUS ANTIDOTUS. The Name of an Antidote described by *Nicolaus Myrepsus*, *Secl. 1. C. 212*.

TRIORCHIS. *τριόρχης*. A Person who has three Testicles; of which there have been some Instances. *Triorchis* is, also, a Sort of Hawk, called a Buzzard.

TRIOSTEOSPERMUM. *Doctor Tinkar's Weed*, or false *Ipecacuanha*.

The Characters are;

It hath a tubulous Flower consisting of one Leaf, divided into five roundish Segments, and inclosed in a five-leaved Empalement, having another Cup resting on the Embryo; which, afterwards, becomes a roundish, fleshy Fruit, inclosing three hard Seeds, which are broad at their upper Part, and narrower at Bottom.

Miller mentions but one Sort of this Plant; which is,

Triosteospermum latiore folio flore rutilo. *Hort. Elth.*

This Plant is a Native of *New England*, *Virginia*, and some other Northern Parts of *America*, where it has been frequently used as an Emetic, and is commonly called *Ipecacuanha*. One of the first Persons who brought it into Use, was *Doctor Tinkar*, from whence many of the Inhabitants call it by the Name of *Doctor Tinkar's Weed*. The Leaves of this Plant greatly resemble those of the true *Ipecacuanha*, but the Roots are very different; and, by the most authentic Account we have of the true Sort, it differs in Flower and Fruit from this Plant.

It grows on low marshy Grounds, near *Boston* in *New England*, very plentifully; where the Roots are taken up every Year, and are continued in Use amongst the Inhabitants of *Boston*. *Miller's Dictionary*, Vol. 2.

TRIPALE. See **KANDEL**.

TRIPETALOUS FLOWERS are such Flowers as consist of three Leaves, which are called Petals, to distinguish them from the Leaves of Plants. *Miller's Dict.* Vol. 1.

TRIPHYLLON. Trefoil.

TRIPLOIDES, according to *Blancard*, is the Name of a chirurgical Instrument for elevating a large Depressure of the Cranium. See **CAPUT**.

TRIPOLIS, or **TRIPOLITANA TERRA**. See **ALANA TERRA**.

TRIPOLIUM. Offic. *Tripolium majus & minus*. J. B. 2. 1064. *Tripolium vulgare majus*. Ger. 333. Emac. 413. *Tripolium majus five vulgare*. Park. 673. *Tripolium majus ceruleum*. C. B. 267. *After maritimus ceruleus Tripolium dictus*. *Raii Synop.* 80. *After maritimus purpureus Tripolium dictus*. *Raii Hist.* 1. 270. *After maritimus palustris ceruleus Salicis folio*. *Tourn. Inst.* 481. **SEA STARWORT**.

It rises from a fibrous Root to the Height of a Cubit, or a Cubit and an half. The Leaves are pretty like those of the *Limonium majus*, narrower, but almost equal in Length, with the strait Fibres of the Plantain leaf, smooth, thick, fat, sometimes inclining to a ceruleous Colour, and disposed about the Stalks and Branches in an irregular manner. The Flowers grow on the ramous Top of the Stalk, adhering to the Extremities of the Sprays; and are of a purple or ceruleous Colour [an Edge or Border of small purple Leaves surrounding a middle yellow tufted Boss], and vanish into Down.

The *Tripolium majus & minus*, differing only in Size, are here put together. The *Tripolium Flore nudo* has been known to grow about *Bristol*, in great Plenty.

It grows, as *Lobel* truly observes, on the Sea-shores of *England* and *France*, and by the Banks of Rivers exposed to the Ebbing and Flowing of the Tide. We observed a smaller Species in the salt Marshes, not far from *Montpelier*. *Raii Hist. Plant.*

Two Drains of the Root, which is white, sweet-scented, and hot in Taste, purges off Water and Urine by Stool; it is, also, an Ingredient in alexipharmic Compositions. *Dioscorides*, Lib. 4. Cap. 135.

TRIQUETRA OSSA. Triangular Bones found in some Skulls. See **CAPUT**.

TRISCA, **TRISCHA**, or **TRISSIA**. The Name of a Fish, the same as **MUSTELA**.

TRISPASTUM APELLIDIS SEU ARCHIMEDIS. The Name of a Chirurgical Machine, described by *Oribasius*, in his *Treatise de Machinamentis*, Cap. 26.

TRISPERMON. The Name of a Cataplasma consisting of the Seeds of Cumin, Apium, and Bay-berries.

TRISSAGO. See **CHAMÆDRYS**.

TRISTITIA. Sorrow. This relates to Medicine only, as it relaxes the Fibres, and is hence the Cause of various Distempers.

TRISTO, according to *Paracelsus*, is the material Fire contained in all the four Elements, and producing the proper Effects of each Element.

TRISULCÆ. The same as **TRICUSPIDES**.

TRITÆOPHYES, *τρίταοφύες*, from *τρίταος*, tertian, and *φύς*, importing Similitude of Nature, or Original, is an Epithet of a Fever, much of a Nature with a Tertian, and taking its Rise from it. It seizes the Patient on the third Day, and arrives almost at its Height, or Perfection, so as to be distinguished from a Tertian, simply so called, a perfect Tertian, a lengthened Tertian, and a Semitertian, and to be a Sort of a Medium between them, as we are informed by *Galen*, *Com. 2. in Lib. 6 Epid.* where he, also, says, that *τρίταοφύς* may be, also, a general Epithet of all Fevers, which return with their periodical Fit, or Accession, every third Day. But, in his *Com. 1. in 1 Epid.* though he distinguishes the *Tritæophyes*, from a Semitertian in Name, yet he seems, in some measure, to join them together, as, also, *Lib. de Temp. Morb.* For it is of those Kinds of Fevers, or Mixtures of Tertians and Semitertians, that *Hippocrates* seems to speak, *1 Epid.* where he says of them, *τὸ μὲν ὅλον ἐκ ἐκλείπεται, παραξύνόμενοι δὲ τριταοφύα τριτον, "they were not wholly intermittent, but had their Paroxysms, or Fits, after the manner of a Tritæophyes."* And again, *ibid.* *ὅτι δὲ ἐκλείπεται, &c.* The Fevers were continual, and never intermittent, but had Paroxysms after the manner of the *Tritæophyes*. Here *Galen*, on the Place last-quoted, expounds the Word *τρίταοφύς*, of a kind of Conjunction of a Tertian and Semitertian.

Erotian, explaining the Fevers called *τρίταοφύς*, from *6 Epid.* tells us, that he thinks the Word *τρίταοφύς* may be supposed to be used by some, instead of *τρίταος*, for the Smoothness or Elegance of the Term; but he seems to be rather of the Opinion of *Philonides Siculus*, who will have the *Tritæophyes* to be a Fever which gives Signs of its approaching Paroxysms, but whose Intervals are regular, as it never arrives at Perfection; and that it takes its Name from its great Similitude to a Tertian; and that it is, also, called a small Semitertian. In *6 Epid. Sect. 2. Aph. 15.* it is said, that the Night preceding a Fit of the *Tritæophyes* is very troublesome. In *4 Epid.* the *Tritæophyes* is mentioned with the *Epidiodes*; and *Coac. 33.* a *Tritæophyes*, attended with an Anxiety, is said to be malignant. *Ibid. 37.* we read of a wandering or uncertain *Tritæophyes*. And again, *ibid. 26.* we meet with *τρίταοφύα, πύα*, "Rigors, such as are incident to a *Tritæophyes*." *Foesius*.

TRITÆOS, *τρίταος*. A Tertian.

TRITARII. The same as **DIATRITARII**. See **DIATRITOS**.

TRITICOSEPTIUM. A Name for the *Triticum*; *spica Hordei Londinensis*.

TRITICUM.

The Characters are;

The Flowers are hermaphrodite, and apetalous, consisting of simple masculine Stamina, furnished with their proper thin and slender Testiculi, within which is seated the Ovary, furnished with a Pair of scirrhous and recurve Tubes, which are each defended by two petaloidal Leaves, often awned, by means of a long, sharp, slender Appendix, which is sometimes hairy, sometimes smooth; they are, besides, surrounded with two hollow carinated Leaves, instead of a Calyx. These are sustained by one Pedicle, a Number of which, growing to an Axis, constitutes a dense Spike. The Seeds are large and oblong.

Boerhaave mentions eleven Sorts of *Triticum*; which are,

1. *Triticum*; *Hybernum*; *aristis carens*. C. B. P. 21. *Theat.* 351. *Tourn. Inst.* 512. *Boerb. Ind. A. 2. 155.* *Triticum*. Offic. *Triticum spica mutica*. Ger. 58. Emac. 65. Park. *Theat.* 1120. *Raii Hist.* 2. 1236. *Synop.* 3. 386. *Triticum five filigo spica mutica*. Merc. Bot. 1. 75. *Triticum vulgare, glumas trititando deponens*. J. B. 2. 407. *Frumentum, Triticum*. Chab. 173. **WHEAT**.

This is the most common Wheat that is sown with us, of which there are two Sorts, white and red; they grow alike, having an hollow Stalk, with usually four Knots taller than Barley, but not so tall as Rye; the Spikes are three or four Inches long, without Awns or Beards, containing a longish, round, white, or reddish Grain, easily rubbed out from the Ear. Wheat is sown in Autumn, and reaped in July or August following.

Wheat is most generally used, and the best Grain we have in *England*; the Bread made of it being more pleasant and nourishing, than of any other Grain. It is more used for Food, than Medicine, tho' a Poultrice made of it, boiled in Milk, eases Pains, and ripens Tumors and Impostumations; and a Piece of roasted Bread, dipt in Wine, and applied to the Stomach, is good to stay Vomiting. Bran is sometimes made use of in Cataplasms, and applied hot in Bags, for Pains in the Sides.

There was formerly kept, in the Shops, an *Emplastrum de Crusta Panis*; but it has been out of Use a great while. *Miller's Bot. Offic.*

Wheat,

Wheat, the more ponderous, the better it is, other Properties being alike; for which Reason our *London* Corn-factors sometimes buy Wheat by the Weight: It has something of Viscidity, and an obstruent Nature. The Characters of the best Wheat are, that it be new, of perfect Maturity, of a yellow Colour, very dense and ponderous; that, when macerated in Water, it swells very much, and very speedily; that it yields a great Quantity of Flour, and is free from all Mixture and Defects, as Tares, Cow-wheat, Blights, or Rust.

Among all Sorts of Corn, proper for Food, Wheat is esteemed the most excellent, not only for its highly nutritive Quality, but for its medicinal Uses, both internal and external, in many Diseases. C. B.

Of the Flour of Wheat, well fermented, is made the best Bread; and *Pliny* says, that *Amylum* is, also, prepared of it. Of the same, boiled in Water or Milk, are made the most convenient Pap-meats for Infants, which afford the best Nourishment, and are commended in a canine Appetite, and Impotence. They are of great Use, also, in Affections of the Fauces and Breast, Exulcerations of the Kidneys and Bladder, Fluxes of the Belly, and especially the Dysentery, being prepared as before, or of Broth, with an Addition of Butter. The Eating of raw Wheat causes Inflamations of the Belly, and is not easily digested. *Galen* condemns the Use of boiled Wheat in Food; but we have often eaten it seasoned with Butter, and sweetened with Sugar, without the least Inconvenience.

Cato's Method of preparing the *Grana triticea* (which is the Name he has for a wheaten Pritan, or a Sort of Spoonmeat of it) differs but little from that of our Preparation of wheaten Puls, or Spoon-meat, which we call Frumenty. "Put, he says, half a Pound of pure Wheat into a clean Mortar; wash it, and cleanse it carefully from the Husks; this done, after washing it thoroughly, put it into a Pot with pure Water, and boil it; when it is boiled, add thereto Milk, by little and little, till it comes to the Thickness of a Cremor."

As to its external Use, there is prepared a Collyrium, in which Wheat is an Ingredient, for Weakness and Dimness of Sight, and to remove Specks and Films; for which latter Purpose, the expressed Juice of Wheat is, also, effectual. Wheat-flour, dissolved in warm Bean-water, clears the Face from Wrinkles. *Galen* mentions a Medicine of *Crispus*, prepared of Wheat, for a recent Lichen on the Chin, or any other Part of the Face.

Put a good Number of Grains of Wheat upon an Anvil; then take a Plate of Brass, or Iron, for it is all one, heated in the Fire, and lay it upon the Wheat; the hot Liquor, which by this means comes from the Wheat, must be taken off, and rubbed upon the Lichen. By this Remedy alone, we have known many cured; and is not only good for a Lichen of the Face, but for all Sorts of Herpes and Imperigo, as we have experienced. The same is effectual in sinuous Ulcers, Chaps of the Feet or Hands, proceeding from Cold; and to render the Skin smooth, and free from Asperities.

Wheaten-flour, mixed with Oil, and applied in the Form of a Cataplasma, tho' better with boiled Water, and an Addition of Oil, mollifies the Hardness of the Breasts, and ripens Impostumes of the Liver, Spleen, and other Parts. Flour boiled in Vinegar, and apply'd, is effectual in Contractions of the Nerves, and for hanging Breasts. Crude Wheat chewed, and applied to the Place, is said to be effectual for the Bite of a mad Dog; the same ripens Abscesses of the Eyes.

To provoke Excretion by Stool, make a Paste of two Parts Flour, and one Part Salt, with the White of an Egg; and, reducing it to the Form of a Suppository, rub it over with Oil or Butter, and intrude it into the Anus. For the Gout, it is a good Remedy to put the Feet and Legs up to the Knees into Wheat, by which *Sextus Pompeius*, as *Pliny* relates, was freed on a sudden; but the Cure would succeed better, if the Wheat were first tossed in a Vessel, and heated at the Fire.

For all Pains of the Joints, of what Kind soever, is prepared a Cataplasma of Wheaten and Barley-meal, with the Flowers of Chamomile and Roses, each two Ounces, boiled in Water; to which afterwards is added, of the Oils of Chamomile and Roses, each one Ounce: It is to be apply'd hot.

The Ferment or Leaven of Wheaten-meal is endued with the Virtue of heating, extracting, and maturing; it wastes Callosities in the Soles of the Feet, and with Salt maturates and opens a Furunculus, and other Sorts of Tubercles.

Bran is of manifold Use; it serves instead of Soap, to scour the Hands, being mixed in the Water; and, besides, renders the Hands soft and white. Water, in which, when heated, Bran has been infused for a Day and a Night, is good to deterge the Furfur of the Head; and a Gargarism of the Decoction of Bran mitigates the Pain and Asperities of the Fauces.

Bran boiled in Water, then put into a Bag, squeezed dry, and apply'd hot, removes the pungent Pains of a Pleurisy, if the Bag, when cooled, be heated in the same Water, then again squeezed and apply'd, and this Method be several times repeated.

It is certain, that Bran has an absterfivè Virtue, by which the Intestines are stimulated to Excretion. Bread, therefore, which is made of Flour not thoroughly cleansed from the Bran, provided

it be duly fermented, seems to us to be more wholesome, and, also, more savoury, than what is made of pure Flour, or Siligo. For outward Use, Crums of Bread serves for much the same Purposes as Wheaten-flour. *Galen* writes, that a Cataplasma, prepared of Bread, is more digestive than one of Wheat, because Bread has a Mixture of Salt and Leaven; and his Opinion seems consonant to Reason, and is confirmed by Experience.

Far is of two Kinds, native and factitious. The first is a Sort of frumentaceous Grain; the latter seems to be taken, by *Pliny*, for the Meal, Puls, or decorticated Grain of the *Far*; where he tells us, from *Verrius*, that, for three hundred Years, the Romans used nothing but *Far*, prepared of *Frumentum*. *Far*, according to *Aetius*, is any Kind of *Frumentum*, or frumentaceous Grain, first decorticated, and cleansed from the Husks, and afterwards broken into some Parts, and dry'd.

Athera, *Puls*, and *Gluten*, as prepared from Wheat, differ only in Consistence. For the first, see the Article *ATHERA*. The *Gluten*, or Paste, as prepared of the Flour of Wheat, is more thick and solid than the *Athera*, and serves to conglutinate Papers; it is esteemed good for an Hæmoptoe, on account of its being an Agglutinant. *Puls* is a middle Preparation between them, as being thicker, and more solid, than the *Athera*, and more liquid than the *Gluten*; consequently, it is less obstruent of the Viscera, than the *Gluten*; but has more of that Quality, than the *Athera*. A Kind of *Athera*, or rather *Puls*, is that Sort of Food, which, *Galen* tells us, is made of Wheaten-flour mixed in great Proportion with Milk, an Aliment which all Lower Germany very frequently uses at this Day [I suppose he means the *Puls* which we call Hasty-pudding]. This is a Food of good Juice, and very nutritive; but hurtful to those who daily use it; for it causes Obstructions in the Liver, and generates Stones in the Kidneys, as we are taught by *Galen*. *J. Baubine*.

Tragus is a factitious Thing. It was made of several Sorts of Corn, or frumentaceous Grain; as appears by comparing together, those Places of *Dioscorides*, *Galen*, and *Pliny*, where they treat of it. It differs from the *Chondrus* and *Alica*, principally in the Way of Preparation; for the *Chondrus* was completed with Gypsum and Sand, the *Alica* was cleansed with Chalk, but the *Tragus* was excorticated by Maceration in Water alone. *Raii Hist. Plant.*

Among the Preparations of this Grain may, perhaps, be reckon'd the *Vermicelli* made at *Genoa*, so called from their Likeness to small filamenous Worms. They are of two Kinds, the white and the yellow, and are used in the Kitchens of the Nobility and Gentry for Broths and Soops, and are thought to have an analeptic Virtue. *Dale*.

For other Preparations of Wheat, with their Uses and Virtues, see the Articles *ARTOS*, *PANIS*, *ALICA*, *AMYLUM*, *FURFUR*, *FARINA*.

2. *Triticum*; spica multiplici. C. B. P. 21. *Theat.* 371. *M. H.* 3. 175.

3. *Triticum*; spica *Hordei Londinensis*. *Raii Synop.* 3. 387. *Tourn. Inst.* 512. *Boerb. Ind. A.* 2. 155. *Zeopyrum. Offic. Zeopyrum seu Triticospeltum.* C. B. P. 22. *Theat.* 423. *Park. Theat.* 1123. *Hordeum nudum.* Ger. 66. *Emac.* 72. *Hordeum nudum five Gymnocritum.* J. B. 2. 430. *Raii Hist.* 2. 1908. NAKED BARLEY.

The Spike, or Ear, of this Grain is bearded like that of Barley, but the Corns are redish, sharp at both Ends, sulcated on one Side, and shewing a longish Bud proceeding from the Mucro, or Point on the Side opposite, covered with a simple Husk, which is more easily rubbed off, than that of Wheat. The Rows of Grain, if an Observation may be taken of them, seem to be four; to which we may add, that the Leaves are broad, and much envelope the Stalk. *Raii Hist. Plant.* p. 1908.

It is sown in Germany, where it serves to make Bread, and other Sorts of Food, and is no less used than Barley.

The *Gymnocritum* is of a refrigerating Quality, like the *Hordeum*, or Barley, being administered in Broths.

4. *Triticum*; siligineum. C. B. P. 21. *Theat.* 355.

5. *Triticum*; spica & granis rubentibus; culmo rubro.

6. *Triticum*; spica & granis rubentibus; culmo luteo.

7. *Triticum*; majus; longiore grano, glumis foliaceis incluso. *M. H.* 3. 175.

8. *Triticum*; spica quadrata; villosa, breviori.

9. *Triticum*; spica quadrata; villosa, longiori.

10. *Triticum*; spica albicante; granis rufescentibus; five *Triticum mixtum.* *M. H.* 3. 175.

11. *Triticum*; aristis circumvallatum; granis & spica rubentibus; glumis lævibus, & splendentibus. *Raii Synop.* 244.

The following Grasses are reckoned, by *Boerhaave*, among the Species of Wheat.

1. *Gramen caninum*; Spicæ *Triticæ* aliquatenus simile. See *AGROSTIS*.

2. *Gramen latifolium*; spica *triticea*, latiore, compacta. C. B. P. 8. *Prodr.* 17. *l. J. B.* 2. 477.

3. *Gramen*; caninum; longius radicatum majus. C. B. P. 1. *Theat.* 12.

4. *Gramen*; caninum; longius radicatum minus. C. B. P. 1. *Theat.* 12.

[Y +]

5. Gra-

TRO

5. Gramen; caninum; maritimum; spicatum. C. B. P. 1. *Theat.* 14.

6. Gramen; caninum; maritimum; spicâ foliaceâ. C. B. P. 2. *Theat.* 15.

7. Gramen; maritimum; vulgari canino simile. *Park. Lob. M. H.* 3. 178.

8. Gramen; geniculatum; parvum; arenosorum aggerum maritimorum Zelandiæ, longius radicans. *Lob. M. H.* 3. 178.

9. Gramen; angustifolium; spica Tritici muticæ simili. C. B. P. Prodr. 17. *Theat.* 132. *Boerb. Ind. alt. Plant.*

TRITICUM INDICUM. A Name for the Mayz; *granis aureis.*

TRITICUM TEMULENTUM. A Name for the *Lolium, verum; Gesneri; Lolium; album.*

TRITICUM VACCINUM. A Name for the *Melampyrum; comâ purpurascens.*

TRITIO. Triture.

TRITOMA. An Instrument us'd in Disorders of the Ears. *Castellus from Albucasis.*

TRITORIUM. A Chymical glass Instrument, open at both Ends, like a Funnel; narrow at the Top, but more so at the Bottom, but wide in the Middle. Its Use is to separate Liquors of different specific Gravities; for when the heaviest is run out, the inferior Orifice is stop'd, and the lightest is kept in the Vessel.

TRITURA. Triture.

TRITURATIO. Triture, or Trituration.

This is principally employ'd to reduce hard Substances to fine Powders, either by the Mortar, or by way of Levigation upon a Marble. There is little Difficulty in this, besides the Labour.

Trituration has a great Share in some Instances, in raising or depressing the Efficacy of what comes under its Management. For, in grinding, all those Bodies whose Efficacy consists much in the peculiar Shape and Points of their component Parts, the more and finer they are broke, the less will they operate: Thus may Calomel be render'd much gentler, and made capable of being given in much larger Quantities, only by long rubbing in a glass Mortar: For the continual Triture has the same Effect upon it, as repeated Sublimation, which is only breaking of the saline Spicula more and more, until it becomes almost plain Mercury. But in resinous Substances, particularly those which are purgative, as Jalap, Scammony, &c. the finer the Powder they are reduced into, the greater is likely to be their Efficacy: As the Sense which the Stomach and Bowels have of them, is in Proportion to their Contacts, therefore, the more the same Quantity is divided, the further will it diffuse itself, and vellicate the Fibres; that is, in other Words, it will work the more.

TRIUMFETTA.

The Characters are;

It hath a Flower consisting of several Petals, which are placed circularly, and expand in form of a Rose; From whose Empalement arises the Pointal, which afterward becomes an hard spherical burry Fruit, inclosing four angular Seeds.

Miller mentions two Sorts of *Triumfetta*; which are,

1. *Triumfetta fructu echinato racemoso. Plum. Nov. Gen.*

2. *Triumfetta fructu echinato racemoso, minor. Miller.*

The first of these Plants is very common in the Island of *Jamaica*, and several other Parts of *America*; but the second Sort is more rare, being found in but few Places. The Seeds of this Kind were sent to *England* by Mr. Robert Miller, who discovered the Plant on the North Side of the Island of *Jamaica*.

The Flowers of these Plants are small, and of a yellow Colour, somewhat like those of *Agrimony*; for which the Plant has been by some ranged under that Genus. These Flowers are produced in Branches, at the Extremity of the Shoots; but as they are not very beautiful, so they are seldom preserved, but in such Gardens, where Variety is principally intended.

The first of these Sorts rises to the Height of six or seven Feet, and the Stem becomes woody. Toward the Top it divides into several Branches, each of which produces a Spike or Bunch of Flowers. The Leaves of this Sort are pretty large, and shap'd like those of the larger *Malvinda*.

The second Sort seldom rises more than three Feet high, and has smaller Leaves than the first. The Stem of this Sort is woody, but it doth not branch so much as the former, and is in every respect a much less Plant than that. *Miller's Dictionary.*

TRIXAGO, the same as *Triffago*. See *CHAMEDRYS*.

TROCHANTERES. Two Processes of the Thigh-bone are thus call'd. One is the greater; the other the lesser *Trochanter*.

TROCHILODES, *τροχιλάδης*. An Epithet for the round Part of the Arm, in *Galen de Usu Partium, L. 2. C. 15.*

TROCHILUS. The Wren.

TROCHISCI.

The Form of Troches, is in all respects blamed by some Commentators on the officinal Dispensatories, particularly by *Sassenus*, who wonders how it came to be contrived at all: But

TRO

there are certainly some good Reasons for it, as it either better preserves those things against their Time of Use, which would decay in Powder; or assists in a particular manner of taking them, by gradually dissolving in the Mouth.

The *Trochisci Hysterici* are an uniform and efficacious Composition; but still seem to give place to those *de Myrrha*, which are of the same Intention, and something preferable in two respects: For every Ingredient in them fully coincides with the main End, and they are more ready in this Form for extemporaneous Occasions, than the same things could be in any other, or in their natural Productions. The *Trochisci de Terra Japonica*, are not yet come much into Acquaintance; but are so easily made, and so much pleasanter to take, than any other of this Form in the like Intention, that they are much to be preferred to the *Trochisci Gordonii*, and *de Terra Lemnia*. The *Trochisci Bechici albi* and *nigri* are both calculated likewise to dissolve gradually in the Mouth, and for the same Intention; the former are by much more grateful, but the latter more efficacious. The *Trochisci Albandal* might be mention'd among those for inward Use; but they are so much in Neglect, unless in a few officinal Prescriptions, that it is hardly worth Inquiry, whether the Reduction of the Colocynth from six Ounces to six Drams, in the last Alteration of the College, be Mistake or not. The *Trochisci albi Rhasis* are purposely contrived for cooling Lotions, and are principally used in Solution, with Plantain or Rose-water, against Inflammations, and hot Defluxions upon the Eyes; the usual Quantity is about half a Dram to two Ounces of Water, which, when dissolved, looks white as Milk. The *Trochisci de Plumbo*, are designed for the same Purposes; but are a much coarser Medicine, and therefore hardly ever prescrib'd.

There are many things, which might be contrived into this Form for extemporaneous Uses, in the manner of the *Trochisci Bechici*, and several Medicines are reduced under the Title of Lozenges; but the same Intentions are answerable by things in other Forms, with more Certainty; and few caring to be troubled with them, they are hardly ever met with in regular Prescriptions; though, for the Preservation of some things for present Use, it is a very serviceable Form, as hath been already observed, concerning the Troches of Myrrh, and some other officinal Compositions of the like Nature. *Quincy's Praelect. Pharm.*

TROCHISCI ALBI RHASIS.

The white Troches of Rhases.

Take of Cerufs washed with Rose-water, ten Drams; of Sarcocolla, three Drams; of Starch, two Drams; of Gum Arabic, and Tragacanth, of each one Dram; of Camphire, half a Dram: And make them all together into Troches with a sufficient Quantity of Rose-water.

These are dissolv'd in White-wine, Rose-water, or any other Liquid, to make Collyria for the Eyes. They assuage Inflammations, and sometimes repel hot corrosive Rheums. The same are sometimes used for Injections in Gonorrhœas to cool the Urethra, and defend it against the Corrosions of the gleet Humours. Two Drams dissolved in two Ounces of Liquid, is the usual Proportion of Mixture; with which the affected Part is to be frequently washed.

TROCHISCI ALEXITERII. See *ALEXITERIA*.

TROCHISCI ALHANDAL. See *ALHANDAL*.

TROCHISCI ALIPTÆ MOSCHATÆ. See *ALIPTÆ*.

TROCHISCI ALKEKENGII. See *ALKEKENGII*.

TROCHISCI APOPLECTICI.

Lozenges against the Apoplexy.

Take Ambergrise, half a Dram; Oil of Rosemary, Cinnamon, Nutmeg, of each two Drops; Oil of Cloves, and Marjoram, of each one Drop; Spirit of Lavender, eighty Drops; fine Sugar, four Ounces: Make into Lozenges with a sufficient Quantity of the Mucilage of Gum Tragacanth.

These are proper to chew, and roll about in the Mouth frequently, by such who are subject to apoplectic Disorders: For this way the warm Aromatics more immediately penetrate the Fibres, than when swallowed at once into the Stomach.

TROCHISCI BALSAMICI.

Balsamic Lozenges.

Take Balsam of Tolu, Orrice-root, of each one Ounce; Gum Tragacanth and Arabic, of each half an Ounce; Flowers of Benjamin, two Drams; white Sugar-candy, one Pound. When all are reduced to fine Powder, make them into a Paste, with Mucilage of Quince-seeds and Rose-water for Lozenges.

These

TRO

These make a most grateful and efficacious Remedy in all Kinds of Coughs, but particularly those from tickling Defluations and Rheums. They will, also, greatly contribute to restore decaying Lungs, and Persons almost worn out in Consumptions. On no Account can they disagree; and almost in all Cases will they prove of great Service. They may be, also, used at Pleasure.

TROCHISCI BECHICI ALBI. See BECHICA.
TROCHISCI BECHICI NIGRI. See BECHICA.

TROCHISCI DE BENZOINO.

Troches of Benjamin.

Take Sugar-candy, one Pound; melt it in Rose-water; then taking it from the Fire, dissolve in it strained Storax, one Ounce; which stir well together; and, when almost cold, sift in fine Powder of *Benjamin*, six Drams; Aloes-wood, half an Ounce; Orrice-root, one Ounce; Musk, one Scruple: And with a sufficient Quantity, if any be wanting, of the Tragacanth, Mucilage, and Rose-water, make them into a Paste.

This is an admirable Balsamic, and would be of great Service to such who are subject to Diseases of the Breast, and inclinable to Consumptions, if frequently taken. They give, also, a very agreeable Sweetness to the Breath. They may be used at Discretion. If the Aloes-wood was omitted, they would be never the worse, but rather more grateful. These are from the *Pharmacopœia Regia*.

TROCHISCI DE CARABE.

Troches of Amber.

Take of Amber, one Ounce; of burnt Hartshorn, Gum Arabic, red Coral, Gum Tragacanth, Acacia, Hypocystis, Balaustines, Mastich, Gum-lacca washed, and black Poppy-seeds, of each two Drams and two Scruples; of Frankincense and Saffron, of each two Drams; of Opium, one Dram: And make them all into Troches with a sufficient Quantity of the Mucilage of Fleawort-seeds made in Plantain-water.

This Composition is ascribed to *Mesue*, and seems designed against Hæmorrhages, and principally Spitting of Blood.

TROCHISCI CEPHALICI.

Cephalic Lozenges.

Take *Pulvis de Gutteta*, and native Cinnabar, of each half a Dram; Oil of Rosemary, and Nutmegs, of each two Drams; fine Sugar, two Ounces; Mucilage of Gum Tragacanth, a sufficient Quantity.

TROCHISCI CYPHEOS PRO MITHRIDATICO. See CYPHI.

TROCHISCI AD EMULGENDUM SALIVAM.

Lozenges to occasion Spitting.

Take Pellitory of *Spain*, in fine Powder, half an Ounce; Mastich, two Drams; Oil of Cloves, and Marjoram, of each two Drams. Make into Lozenges or Pellets, with a sufficient Quantity of the best-scented yellow Bees-wax.

These may be of Use to such who want a Discharge of Rheum from the Glands about the Mouth, and cannot comply with the Custom of smoking Tobacco for that Purpose. For a great many Complaints arise from those Parts being overcharged with Moisture, for which this would be a convenient Drain; the Heat of it irritating the Glands to the Discharge of their Contents.

TROCHISCI GORDONII.

Gordon's Troches.

Take of the Four greater cold Seeds blanched, of the Seeds of white Poppies, Mallows, Cotton, Purslain, and Quinces, of Myrtle-berries, Gum-tragacanth, and Arabic, of Pistachios and Pine-nuts cleansed, Sugar-candy, Liquorice, Barley, Mucilage of Fleawort-seeds, and sweet Almonds blanched, of each two Drams; of *Armenian Bole*, Dragon's-blood, Spodium of Ivory, and red Rose-flowers, of each half an Ounce: Let them be made into Troches, *S. A.* with a sufficient Quantity of the Mucilage of Gum Tragacanth.

It was originally prescribed by *Gordonius, de Passionibus Reum, Cap. 10.* It is intended for some Distempers of the Kid-

TRO

neys, and urinary Passages; but it is not often described, and for that Reason it is seldom to be met with in the Shops.

TROCHISCI HEDYCHROI GALENI AD THERIACAM. See HEDYCHROI.

TROCHISCI HEMOPTOICI.

Lozenges against Spitting of Blood.

Take Japan Earth, two Drams; astringent Saffron of Steel, one Dram; Sugar of Lead, and Starch, of each half a Dram; fine Sugar, four Ounces; Mucilage of Gum Tragacanth, a sufficient Quantity to make them into Lozenges.

These may be taken at Discretion, by any who are subject to spit Blood; and they will, also, do Service in any Sort of Fluxes, whether of the Belly, or other Parts.

TROCHISCI HYSTERICI.

Hysteric Troches.

Take of Asafoetida, and of Galbanum, of each two Drams and an half; of Myrrh, two Drams; of Castor, one Dram and an half; of the Roots of Asarum, long Birthwort, of Savine, Motherwort, and Calamint, of each one Dram; and of Dittany, half a Dram: Let the Gums be soaked in the Juice or Decoction of Rue, and strained and boiled up to the Thickness of Honey; and then add the other Ingredients, finely powdered, so that the Whole may be made into Troches, *S. A.*

They are well contrived to the Purpose their Title denotes; and are very effectual in all uterine Disorders, to allay Vapours, Convulsions, to promote the Menstrues, to assist Delivery, and all that belongs to rectifying the Diseases of those Parts. They are conveniently reducible into Powder, for any extemporaneous Form; and may be given from five Grains to one Scruple for a Dose.

TROCHISCI DE LIGNO ALOES.

Troches of Aloes-wood.

Take of Aloes-wood, and red Roses, of each two Drams; of Mastich, Cinnamon, Cloves, *Indian Spikenard*, Nutmegs, Carrot-seeds, the greater and lesser Cardamoms, Cubebs, Gallia Moschata, Citron-peels, and Mace, of each one Dram and an half: And make them into Troches with the Pulp of Raisins, half a Scruple of Ambergrise; and Musk may be added at Pleasure.

TROCHISCI DE MYRRHA.

Troches of Myrrh.

Take of Myrrh, three Drams; of the Leaves of Rue, Horse-mint, and Cretic Dittany, of Cumin-seeds, Asafoetida, Sagapenum, *Russian Castor*, and Opopanax, of each two Drams: Let the Gums be dissolved in a Decoction of Mugwort, and the rest be thrown in, so that the Whole may be made into Troches, with a sufficient Quantity of the Juice of Mugwort, *S. A.*

These were first prescribed by *Rhazes, Cap. 9. ad Almanso-rem*, against Obstructions of the Menstrues. This Medicine is so approved as to be pretty much called for in common Prescription, and esteemed beyond the Hysteric Troches before directed for the same Purposes.

TROCHISCI ODORATI.

Perfumed Lozenges.

Take Musk, and Ambergrise, of each six Grains; grind them fine with a little white Sugar-candy, and ten Drops of Spirit of Roses; then put to them Powder of Orrice, four Ounces; Starch, two Ounces; fine Sugar, four Ounces; and Gum Tragacanth, a sufficient Quantity.

These are of no great Service, unless to those few who delight in Sweets, and to disguise a stinking Breath.

TROCHISCI PARALYTICI.

Lozenges against the Palsy.

Take Sugar in fine Powder, one Ounce; compound Spirit of Lavender, sixty Drops; Oil of Rosemary, four Drops; with a sufficient Quantity of Mucilage of Gum Tragacanth.

These may be given at Discretion, to such who are inclinable to nervous Disorders, as they are best liked.

TRO;

TRO

TROCHISCI PERUVIANI.

Peruvian Lozenges.

Take of *Peruvian Bark*, one Ounce; reduce it into a most fine Powder; Balsam of Tolu, two Drams; of Gilead, half a Dram; Sugar, half a Pound; Mucilage of Gum Tragacanth; a sufficient Quantity to make them into Lozenges.

They who can take these, will find Service from them in all hectic Indispositions, and beginning Consumptions.

TROCHISCI SIVE SIEF DE PLUMBO. See SIEF DE PLUMBO.

TROCHISCI DE RHABARBARO.

Troches of Rhubarb.

Take of choice Rhubarb, ten Drams; of the Juice of Eupatorium (that is, of the *Ageratum Mefues*) inspissated, of each half an Ounce; of red Roses, three Drams; of Asarum-root, Madder, and Spikenard, of the Leaves of Wormwood, of the Seeds of Anise and Smallage, of each one Dram: And, with the depurated Juice of Eupatorium, make them into a Mass for Troches.

TROCHISCI RESTRINGENTES.

Restringent Lozenges.

Take Japan Earth in fine Powder, one Ounce; Gum Tragacanth, three Ounces; Oil of Cinnamon, one Dram; Sugar of Roses, two Pounds: Make them into a Paste with Mucilage of Quince-seeds made very strong.

These are great Restorers of a weak Stomach and Bowels, and such as are subject to Indigestion, Vomiting, and Fluxes. They may be taken at Discretion, and by continu'd Use they have been known to recover some from Weaknesses, under which they have been just sinking; and for the Fluor Albus, and other female Complaints, there is not a more pleasant and effectual Remedy; as, also, in old Gleet, where no Malignity remains.

TROCHISCI DE SCILLA AD THERIACAM. See SCILLA.

TROCHISCI STOMACHICI.

Stomach Lozenges.

Take Spanish Angelica-root in fine Powder, one Dram; Oil of Cinnamon, Nutmeg, and Cloves, of each two Drops; Oil of Mint and Wormwood, of each one Drop; fine Sugar, four Ounces: Mucilage of Gum Tragacanth, made with Orange-flower-water, a sufficient Quantity.

These are good to warm the Stomach, and dissipate such Flatulencies, which sometimes communicate their Disorders a great way further, and so are of Service to the Head.

TROCHISCI DE TERRA JAPONICA.

Troches of Japan Earth.

Take of Japan Earth, two Ounces; of white Sugar, sixteen Ounces; of the Mucilage of Gum Tragacanth made in Plantain-water, a sufficient Quantity to make them into Troches.

These were not in any Dispensatory before, and are not only easy to preserve and take; but, also, more effectual to all the Intentions of a Restringent, than many others.

TROCHISCI DE TERRA LEMNIA.

Troches of Lemnian Earth.

Take of Lemnian or Seal'd Earth, of Armenian Bole, Japan Earth, Acacia, Hypocystis, Gum Arabic roasted, Dragon's blood, roasted Starch, red Roses, Anthora, or, in its Defect, red Rose-seeds, Blood-stone, red Coral, Amber, Balaustines, Spodium of Ivory, Purslane-seeds somewhat roasted, Olibanum, calcined Hartshorn, Cypress-nut, and Saffron, of each two Drams; of black Poppy-seeds, Gum Tragacanth, and Pearls, of each one Dram and an half; of Opium, one Dram: And make them all up together into Troches, with a sufficient Quantity of the inspissated Juice of Plantain.

This is design'd much for the same Purpose as the *Trochisci de Carabe*, and the *Trochisci Gordonii*, that is, to stop Hæmorrhages, especially Spitting of Blood.

TROCHISCI; SIVE SIEF DE THURE. See SIEF DE THURE.

TRO

TROCHISCI E VIOLIS SOLUTIVI.

Solutive Troches of Violets.

Take of Violet-flowers moderately dry'd, six Drams; of gummy Turpeth, one Ounce and an half; of the Juice of Liquorice, Scammony, and Manna, of each two Drams: To the Violets well beat, put the Manna, the Juice of Liquorice; and add the Turpeth, and Scammony in fine Powder; and when they are all well mixed together, make them into Troches with a little Syrup of Violets, if it be wanted.

TROCHISCI DE VIPERA AD THERIACAM.

Troches of Vipers for the Theriaca.

Take of Viper's Flesh, after the Skin is stripped off, the Fat and Entrails being taken out, and without the Head and Tail, eight Ounces; of the finest wheaten Bread, or rather Biscuit, powdered and sifted, two Ounces: Let them be formed into little Troches, by anointing the Head with Opobalsam, or Oil of Nutmegs by Expression; then dry them upon the Bottom of a Sieve inverted in some open Place, where the Air hath Passage thro'; and turn them often, till they are thoroughly dry.

TROCHITES. The Name of a Stone shaped like a Top (*Trochus*) with which Children play. It is without-side of a cineritious Colour, but white within.

TROCHLEA. A kind of cartilaginous Pulley, through which the Tendon of one of the Muscles of the Eye passes. See OCULUS.

TROCHLEARIS MUSCULUS. That Muscle of the Eye, whose Tendon passes thro' the TROCHLEA. See OCULUS.

TROCHOIDES, τροχοειδής, from τροχός, a Wheel. An Epithet for a Species of a Articulation, when one Bone enters into the Cavity of another, like an Axis into the Cavity of a Wheel, as it happens in the Articulation with the first and second Vertebrae of the Neck.

TROCHOS, τροχός, from τρέχω, to run, is a Course; but, in Hippocrates, seems to mean a curve or circular Course, as oppos'd to a strait one, which he calls *Dromos*, δρόμος. Thus, *Lib. de Insomni.* we read, δει δὲ ἀμφότερας τὰς ἀντιστάσεις ποιεῖσθαι, καὶ τοῖσι δρόμοις τοῖσι τε καμπύλοις χεῖσθαι. "Re-volutions must be made both Ways, and Running must be used both strait forwards, and in curve or circular Lines." In the same Treatise, he advises to use τοῖσι τροχοῖσι ὀξεῖσι, "swift, circular Courses, or Running at the Rings," which is repeated in the same Book. In *Lib. 1. περὶ διαίτης*, we read δρόμος ὀξεὺς καὶ καμπύλος, "swift and wheeling Races;" and *Lib. 2.* he seems to let τὸς δρόμους μακρὰς, "long Courses," and καμπύλους τοῖς τροχοῖς, "crook'd with or after the manner of the Trochus," in Opposition. Τρόχοι, in Galen's Exegeſis, are expounded by δρόμοι (*Dromoi*) strait Races; in which Sense the Word seems to be used, *Lib. 2. & 3. de Dieta.*

TROCHUS is the Name of a Shell-fish, resembling in Shape a Top; which is alkaline and absorbent, like other Sea-shells.

TROCTOS, τροκτός, from τρώγω, to eat, is the same as τροξιμος (*troximus*) eatable, esculent: But the Word is most commonly apply'd to such Foods as are eaten crude; for Instance, such as are eaten in Sallads, and serv'd up in second Courses, as dry'd Grapes, Figs, and the like, and, also, to *Tragemata*. Galen, in his Exegeſis, expounds τροκτός by ἐσθιόμενα, "eaten raw."

TROGLE, τρώγλη, is a Cavern or Cavity made by Erosion. *Helychius* expounds τρώγλαι by τρύπαι, (*Trupæ*) Perforations, and τρώγλαι by τρώγλαι, Holes eaten. In *Moschion, Cap. 126.* the Incisures made by Leeches are called τρώγλαι. *Hippocrates, Lib. de Carn.* calls the Passages, Perforations, or any other sort of Cavity, containing Humidities, *Trogle*, τρώγλαι, where he says, τὸ δὲ κοιλώδες τρώγλαι ἐγὲ ννοῖο, ἐν δὲ τῇσι τρώγλαι ταύταισιν τὸ ὑγρὸν, ὥσπερ καὶ ἐν τῇσι φλεβῖν τῇσι μεγάλαισιν. "The glutinous Substance pass'd into Perforations, in which "Perforations is contained an Humid, as there is in the large "Veins."

TROGLODYTES, τρωγλοδύτης. The Wren is call'd *Passer Troglodytes*. See PASSER.

TROGLODYTICA MYRRHA. The best Species of Myrrh; so call'd from the Country where it was produc'd.

TROLLIUS FLOS. A Name for the *Helleboro-ranunculus; flore luteo globoso.*

TRONOS, or TRONOSSA. The choicest Species of Manna. *Paracelsus. Rulandus.*

TROPHIODES, τροφιῶδες, in Galen's Exegeſis, is expounded by ἐχόν ἐμπεριέχονα τινα πτηνύετα, "containing some Matters of "a compact Substance," carry'd off (in the Urine); for the Word is spoken of the Urine, *7 Epid.* in a Passage to which Galen had certainly a Regard in his Exposition, where it is said ἐκταῖν ἔρπονεν ἀβρίον πρὸς τροφιῶδες, "on the sixth Day the "made

made Water freely and plentifully with something of a compact Substance," which floated in it.) Here by *τροφιῶδες*, and *ἔργος τροφιῶδες*, and *ἔρα τροφιῶδες* in the same Book, is to be understood Urine, which has swimming in it something of a dense and compact Substance, or some thick and condensed Corpuscles like an Enzorema, [see that Word] compacted into a globular kind of Form, as is observ'd under a great Redundance of Crudities, and in Fevers of a bad Kind; and indicates a great internal Burning, and vehement Exagitation of Nature, with an extraordinary Mixture of Flatuositities, of which we have frequent Instances in the *Epidemics*. We meet with *τροφιῶδες ἔργον*, also, *Coac.* 578. but the Reading seems to be corrupted, if we consult the *Prorrhetica*. And *Coac.* 604. we read of *τροφιῶδες διαχωρήματα*, by which must be understood, Excretions of a dense and concreted Substance. But the Reading appears to me very suspicious; and it appears from the *Prorrhetica*, that we are to read *ἐκ σφοδρώων* (not *τροφιῶδων*) *ὑπὸ αἵματι ὑποπύκνους*, "a sublivid Sediment of Excretions attended with Gripings;" which almost constantly accompanies liquid Stools, especially if it be considered, that the sublivid and muddy Sentiment proceeds from a great internal Heat, and a kind of Torrefaction, as *Galen* observes in *Prorrhet.* 156. and indicates a Distemperature of the Liver, and that such Excretions are usually attended with Gripes.

Τροφιῶδες is reckon'd by *Galen* one of those Words which are obscure, and but seldom used; and he derives it from *τρέφωμαι* (*trephomai*) which he expounds by *πύκνυνται*, to be compacted. *Eustathius* expounds *τρέφωμαι* by *πύκνυνται*, and *Hesychius* explains *τρέφω* by *πύκνυναι*, and *τρέφω* by *οἰκίζω*, in like manner, that is, by *πύκνυνται*. *Galen*, also, *Com.* 3. in *Prorrhet.* where he explains *σφοδρώδες ἔρα*, to be the same as in his *Exegesis* he makes *τροφιῶδες* to be, expounds *διασφύρεσθαι* by *πύκνυνται*, and tells us, that in *Homer* *διασφύρεσθαι* κυκλωδὲς signifies *περιπύκνυνται*, where *διασφύρεσθαι* and *περισφύρεσθαι* seem to be put for *διασφύρεσθαι* and *περισφύρεσθαι*, as in *Homer*, *Odyss.* 8. where we read *κατέσσει* *περισφύρεσθαι* *κεύσαλλος*, *Hesychius* reads *περισφύρεσθαι*, and expounds it by *περιπύκνυνται*. And in *Iliad.* 6. μάλα δ' ὦκα *περισφύρεσθαι* κυκλωδὲς, *Herodian* reads *περισφύρεσθαι*, which Reading is approv'd by *Eustathius*. *Erolian* says that *τρέφω* with the *Attici* signifies *πύκνυνται*, when he expounds *τρέφω* by *πύκνυνται*, and observes further, that *τρέφω* is *πύκνυνται*, and derived from *τρέφω*, but *Hesychius* better derives it from *τρέφω*, and says that it signifies *πύκνυνται*. The same Author expounds *τροφιῶδες* by *παχύνεται*, to be incrassated.

TROPHOS, *τροφός*. The Name of a Sort of Liniment mention'd by *Paulus Aegineta*, *L.* 4. *C.* 40.

TROPICUS MORBUS. A Chronical Disease.

TROXIMOS, *τρέξιμος*. The same as *TROCTOS*.

TRUNCULI. The Extremities of Animals, as the Feet, Ears, and Head. *Peritoeos*.

TRUTTA. *Offic.* *Schrod.* 5. 334. *Bellon.* de *Aquat.* 181. *Mer.* *Pin.* 188. *Trutta fluviatilis*. *Aldrov.* de *Pisc.* 585. *Salv.* de *Aquat.* 96. *Gesn.* de *Aquat.* 1005. *Rondel.* de *Pisc.* 2. 169. *Jonf.* de *Pisc.* 85. *Raii* *Ichth.* 199. *Ejulf.* *Synop.* *Pisc.* 65. **THE TROUT**.

The Trout is a Fish of excellent Taste, and is covered with small Scales, usually streaked with red. There are several Species of this Fish, which live in various Places, and differ in Colour and Size. Some are found in deep and rapid Rivers, others in Lakes; some are of a blackish Colour, others reddish, and rather of a gold Colour. There is another Sort, which is larger than the rest, named the Salmon-trout, because it resembles a Salmon, but is not so large; it is more valued for the Delicacy of its Taste, than the other sorts of Trout.

This Fish swims with much Agility and Swiftneſs, and is said on hearing Thunder to be so astonished, as to become immoveable. It feeds upon Worms, Slime, Mud, Insects, and small Fishes, which it pursues with so much Eagerness, from the Bottom to the Surface of the Water, that it sometimes throws itself into the Boats passing near it.

Trouts, besides being well tasted, produce good Juice, because they are always in Motion, feed upon good Food, and usually swim in clear and running Streams: Thus they acquire less gross and viscous Humours, eat short, and are easily digested; but they soon putrefy and corrupt, and therefore should be eaten without Delay, after they are brought out of the Water.

The Trout contains much Oil, volatile Salt, and Phlegm; and agrees with any Age and Constitution. In Summer it is most delicious, but in Winter it is deprived of almost all the Excellency of its Taste. It may be boiled, fried, roasted, or baked; and some salt it for Exportation.

There is another kind of Trout, somewhat different from those already mentioned, which is called in *Latin* *Thymallus*, a *Thymi Odore*, because it smells like Thyme. It is delicious Food, easy of Digestion, has good Juice, and so wholesome, that in some Places they allow sick Persons to eat it. Its Shape resembles that of the common Trout, and it, also, lives in clear and running Waters: It feeds upon the same Food, and in some Countries is more valued for the Goodness of its Taste than the

other sorts. Its Fat is good to remove Prints of the Small Pox, Deafness, Noises of the Ears, Specks, and Catarrhs of the Eyes.

The Fat of the first-mentioned Species is of a lenifying and dissolving Nature; good for the Piles, and other Distempers of the *Artes*, Ulcers in the Breast, and Fissures in the Nipples. *Lamery on Foods*.

TRYBION, *τρυβιον*, in *Hippocrates* *περί γυναικ. εἰς*. is by Translators render'd *Glandula*, a Pessary; but the Place, *τρυβιον ποιήσας*, "having made of them a Pessary," seems suspicious and corrupt, as appears from the Asterisk in the *Asulan Manuscript*, and for *τρυβιον ποιήσας* we are to read, in my Opinion, *τρίβων λείον ποιήσας*, "tritulating and levigating," that is, the Medicines before-mention'd, which are to be involv'd in fine Wooll for a Pessary. *Foesius*.

TRYBLION, *τρυβλιον*, in *Hippocrates*, *Lib.* *περί ἀφόρων*, is the Kettle, Dish, or Can, in which the Matter for Suffumigation is placed. In some Authors it is the same as *ἐξύβαρον*, *Oxybaphon*, or *Acetabulum*. The Word is often used by *Hippocrates*, *Lib.* *περί τῶν ἐν ἱδρὶ παθόντων*. In the spurious Additions to *Lib.* 1. *περί γυναικ.* we read *ἐλθε τρυβλιον πλείον*, which the Translators render an Hemina, or Acetabulum, full of Salt. *Foesius*.

TRYCHOS, *τρυχός*, is a worn and ragged Piece of Cloth, called, also, *ράκος*, a Rag. In *Aristoph.* *Acharn.* a Person calls a Fragment of Tragedy, *τα ράκια* of Tragedy, and the *ράκιον* of the old Drama, *τὰ ποία τρυχή*, "a kind of Tryche;" where the Scholiast observes, that *τρυχή* is the Tragedian Word for *ράκιν*, *Rhache*, "Rags." The Person here represented intends to laugh and jest at the worn and threadbare Habits of the old Comedy, and the ragged Dresses of the modern Tragedy, in which *Euripides* introduced his Heroes in poor, mean, and pitiful Habits.

Τρυχός *ἰδιότις μακρὸν*, in *Theophrast.* *Hist. Plant.* *Lib.* 3. *Cap.* 9. is the long Panicle of the *Ægilops*, and is the same with those Substances which *Pliny*, *Lib.* 18. calls *Panos arentes mustoso villo canos*, "dry'd Panicles, appearing hoary with their mossy Capillaments;" for whatever is of a round oblong Figure is called by *Pliny*, *Paniculus* and *Panus*, as well as what hangs down from the Boughs of the *Picea* and *Rubus*.

Τρυχίον is a Diminutive of *τρυχός*, and signifies the same as *ράκιον*, "a small Rag;" and is frequently used by *Hippocrates de Morb. Mulier.* and is sometimes expressed by *ράκιον* and *ἰδιότις*, all signifying a thin linen Rag, fit for wrapping up Medicines in the Form of a Pessary.

TRYGE, *τρυγή*, is expounded in *Hesychius*, *ὁ πυρός, καὶ ἡ κριθή, καὶ πᾶς ἄλλος καρπός, καὶ ποία βέλανη*, "Wheat or Barley, and all other sorts of Fruit, and a kind of Herb." *Eustathius* expounds *τρυγή* by *ὁ δὲ δμησίριανος καρπός*, "Corn or Grain for Bread." Hence *τρυγαβέλιον* signifies a Granary, or Repository for Corn.

TRYGEPHANIOS, *τρυγηφάνιος δίνος*. A kind of secondary Wine, made by expressing the Husks of Grapes, after the first Juice is press'd out.

TRYGIS, *τρυγίς*, in *Lib.* 2. *περί διαίτης*, is the *Tragus*, or *Olyra*, tho' *Calvus* renders it *Semen*.

TRYGODES. An Epithet for a Species of *Collyria* mention'd by *Galen.* de *C. M. S. Loc.* *Lib.* 4.

TRYPANON, *τρυπανον*. The same as *TEREBELLA*.

TRYPHEROS, *τρυφερός*, tender, soft, delicate, or mild. This is the Name of several Medicines describ'd by medicinal Writers. Thus *Scribonius Largus*, N° 230. mentions two mild Cauterics by the Names of *Tryphera*, or *Triphera*. *Galen* describes a *Collyrium*, and a *Pastil* or *Troche*, with this Epithet; the first in *L.* 4. *Cap.* 7. de *C. M. S. L.* the last in *L.* 7. *C.* 4. of the same Work.

In the *Augustian Dispensatory*, I find the following Medicines describ'd under the Title of *Tryphera*.

TRYPHERA PERSICA MESUÆ, which is thus prepared.

Take of the Juice of the best Endive three Pints; of the Juices of Smallage and Hops, each two Pints; of the Juice of Nightshade, nine Ounces; and of the Juice of Barberries, three Ounces: Pour all these upon recent, or dried, Violets and Roses, of each three Drams; of Sena-leaves, two Ounces; of Agaric, one Ounce; of damask Prunes, fifty; of Dodder, half an Ounce; of the Citrine, Chebule and Indian Myrobalans, rubbed with recently expressed Oil of sweet Almonds, each two Ounces; and of Indian Spike, three Drams: Let them boil on a slow Fire, till only two Pints of the Liquor are left: Then add of Dodder of Thyme, forty Drams: Then boil all together, and take the Vessel off the Fire; strain the Liquor, and in one Half of it, dissolve, of Tamarinds, three Ounces; of Manna, an Ounce and an half; of the Pulp of Cassia, four Ounces; and of the Conserve of Violets, one Pound: Strain the Whole, and cleanse it from Seeds and Sordes. To the other Half of the strained Liquor, add, of the finest white Sugar, three Pounds; and of Wine-vinegar, one Pint; boil over a gentle Fire, and pour it upon that which was dissolved in the Juices; mix all together, and boil to the Consistence of Honey; Then sprinkle into the Preparation the following Ingredients, reduced

reduced to Powder; of the best Rhubarb, two Ounces; of Citrine Myrobalans, an Ounce and an half; of Chebule, and Indian Myrobalans, each an Ounce; of the Belleric, and Emblic Myrobalans, each half an Ounce; of the Seeds of Fumitory, the Trochisci Diarhodon, Mace, Mastich, Cubebs, Spodium of Ivory, and yellow Sanders, each two Drams; of the Kernels of the Four greater cold Seeds, each two Drams and an half; of Aniseeds, half an Ounce; and of Indian Spike, two Drams. Make into an Electuary, in the Form of an Opiate.

This Medicine is said to be good in acute Fevers, in an hot Intemperature of the Stomach and Liver, and in all Disorders arising from a preternatural Heat of the Humours. It extinguishes Thirst; cures a Jaundice accompanied with Heat; dissolves those Suffusions which arise from bilious Vapours, and are offensive to the Sight. It, also, purifies the Blood; for which Reason it is, by *George Agricola*, and others, highly recommended in pestilential Fevers, and the Plague.

TRYPHERA MAGNA NICOLAI is thus prepared.

Take of Opium, two Drams; of Cinnamon, Cloves, Galangals, Indian Spike, Zedoary, Ginger, Costus, Styrax Calamita, Cyperus, Calamus Aromaticus, Root of Illyrian Orris, Hogs Fennel, the Acorus, or greater Galangals, the Bark of Mandrake, Red-roses, Celtic Spikenard, Pepper, Anise, Smallage, Parsley, Fennel, Carrot, the Sinous, Henbane, Hyssop, the Seeds of Ocymum, each one Dram, and of the purest Honey, ten Ounces and an half.

These Preparations are called *Triphera*, because they enliven the Colour of the Body, render the Breath sweet, and have a beautiful Appearance. They correct Putrefactions of the Humours, restore a due Succulence to the Body, and, like other Cosmetics, contribute much to augment Beauty. And this Preparation is in a peculiar Manner efficacious in Disorders of Women, arising from Coldness of Constitution. It may be, also, injected into the Uterus with Oil of Nutmegs.

TRIPHERA MINOR PHÆNONIS MESUÆ is thus prepared:

Take of Chebule, Belleric, Indian and Emblic Myrobalans, and of Nutmegs, each five Drams; of the Seeds of Water-creffes, of Asarabacca, Persian, or Cretan Origanum, Pepper, Frankincense, Bishops-weed, Ginger, the Fruit, or Leaves of the Tamarisk, Indian Spikenard, Camels Hay, each four Drams; and of the Scoriz of Iron or Steel, macerated for five Days in Vinegar, twenty Drams. Let the Myrobalans be moderately roasted with recent fresh Butter, and let the other Ingredients be covered with Oil of sweet Almonds: Then add of Musk, one Dram; and of the finest Honey, two Pounds, nine Ounces, and six Drams: Make into an Electuary.

This Preparation corroborates the Stomach, Liver, Kidneys, and Bladder; checks immoderate Discharges of the Hæmorrhoids and Menfes; corrects a Corruption of the Humours, Crudities, and Putrefactions in the Stomach; renders the Colour good, and the Countenance beautiful.

TRIPHERA SARACENICA MESUÆ is prepared in the following Manner.

Take of the five Kinds of Myrobalans, each five Drams; of Cinnamon, the three Species of Pepper, Secacul or Eryngo, Indian Leaf, or Mace, Indian Spike, both Species of the Cardamoms, Cassia Lignea, Indian Scitaragia, or Dittander, Cyperus, Smallage, Seeds of the Ash-tree, Cloves, both Species of the Bean, and of Ginger, each two Drams; of Nutmeg, Mace, and excorticated Sesamum, each three Drams; of both Species of Almonds, each five Drams; of Aloes-wood, Rhubarb, Rue, Fennel-seeds, and Mastich, each two Drams; of the Ocymus Caryophyllatus, dried Mint, and Cretan Origanum, each half a Dram.

Let the Myrobalans, when triturated, be fried with recent fresh Butter, obtained from Cows Milk; and the other Ingredients with Oil of sweet Almonds; and with a third Part of fine Honey, make into an Electuary. This Preparation, by its Heat, is beneficial to the Liver; assists Digestion; dissipates Flatulencies; removes putrid Matter lodged in the Stomach, or any other of the Viscera. It, also, enlivens the Colour, sweetens the Breath, removes Weariness, preserves Health, when present; and prevents the Generation of Diseases.

TRYPHONIS EMPLASTRUM. *Scribonius Largus* mentions several Plaisters under this Title. N° 203, 205, and 210.

TRYPHOS, τρυφός, in *Hippocrates*, signifies a Piece, or Fragment. Thus, *Lib. 2.* (περί γυναικ.) τρυφός ἀποφύας διαγὰς is a red-hot Sheard, or Fragment of a Pot, in which the Matter for Suffumigation is laid. Instead of this, *Lib. 1.* περί γυναικ. we find, ἐσπῆσαν γυψίδος καὶνὴν διατρυφόν, a new earthen Pot, heated red-hot, directed for that Purpose.

TRYX, Τρυξ, is the Lees of Wine or Oil; the Lees of which last are, also, called ἀμύρνη, *Amorga*. *Hippocrates*, *Lib. 1.* περί γυναικ. advises dry Tryx of old Wine, in Pessaries, and Collutions of the Uterus.

Τρυξ, 5 *Epid.* signifies, also, black Bile, which is, as it were, the Lees of the Blood; and 7 *Epid.* and *Coac.* we read Τρυγέσας σπύς, feculent Spitting.

TSHINKA. *Popoua Indis.* *Pison.* *Caryophyllus Regius.* Worm. *Caryophyllus ramosus, vel dentatus.* Jo. Bod. a Stapel. *Spicatus.*

The Dutch call this the Royal Caryophyllus, because it is valued by the petty Kings and Nobles of the *Molucca* Islands, even to Superstition; not so much for its Taste and Fragrance, though it excels others even in these respects, as on account of its singular Form, and extraordinary Rarity; for they say, that there are but two Trees of it to be found, and those in the Island of *Makian*. One of these Trees is bigger than the other, but both of them like the other caryophylliferous Trees, except in Tallness.

I am of Opinion, that these Trees are not a different Species, but belong to the Order of monstrous Vegetables; and that their Fruit is no other than the common aromatic Caryophyllus, divided into more Horns, which grow out by degrees, but want of the floriferous round Cup. It is no Wonder, therefore, that the Species is extinct. *Raii Hist. Plant.*

TSJAKELA. H. M. *Ficus Malabarica, semel in Anno fructifera, Fructu minimo.* A Species of *Ficus*, or Fig-tree, growing in *Malabar*. Of the Bark of the Tree the Natives make Strings for their Bows, and of the same prepare a red Colour, for dyeing what they call *Panos de Cambacci*, or *Cambayan* Cloths.

The Virtues are the same with those of the

Atty-Alu, or *Ficus Malabarensis Folio oblongo acuminato; Fructu vulgari amulo.* D. Syen. *Annot. in H. M.* The Fruit, like the Fig, is full of small, thin, oblong, Grains, in numerous Series, and, when ripe, Ants are found in them. The Natives feed on this Fruit, but not on the Fruit of the other Species.

The Decoction of the Root, or the Juice which flows from an Incision made in the Tree, and received in a Vessel set under it, serves to purify the Blood, to rectify Disorders of the Liver, and to heal Chops and Fissures of the Hands, Mouth, and other Parts: The Bark in Decoction serves for the same Purposes, and, being bruised, is successfully applied to Ulcers, and to the Part affected with the *Morbis Sacer*, called by the Portuguese, *Cobrella*. The Fruit binds the Belly, and is good to correct Phlegm, and the Distemperature of the Humours.

We shall here take notice of another Species of *Indian* Fig-tree, which, as well as the former, was omitted under the Article *Ficus*, to which it was referred; and that is the

Are-Alu. H. M. *Ficus Malabarensis; Folio cuspidato; Fructu rotundo; parvo, gemino, D. Siem.* This is a tall Tree with thick and shady Leaves, and growing in sandy and rocky Places, like the *Atty-Alu*, and has a Root like the *Per-Alu*. [See these *Alu's* below]. The Leaves are inspissated, and not so thick as those of the *Atty-Alu*; the Fruit grows in Pairs, close together, at the Origin of the Leaves; and are small, round, with a small Umbilicus in the Vertex, but containing no Ants, but numerous Grains, of the Size of those of the *Atty-Alu*, and inclosing a blackish minute Seed. The rest of the *Alu's* mentioned by *Ray* are,

Atty-Alu, H. M. *Ficus Malabarensis; Folio densiusculo nitente; Fructu parvo rotundo coronato.* This is a tall Tree, but less than the other Species of *Alu*. It is propagated by Fibres shooting downwards from the Branches. The Leaves have an astringent and bitterish Taste. The Fruit grows either single, or two or three together, and that either out of the Bosoms of the Leaves, or here-and-there out of the Boughs, and is small, round, with an eminent Umbilicus on the Vertex, of a yellow Colour when ripe. The Grains are like those of the *Atty-Alu*.

An Infusion of the bruised Bark in Milk, being first strained, is exhibited for the Vertigo. A Decoction of the Leaves in Oil is serviceable in the Cure of Ulcers, the Body being thoroughly anointed with it.

Itti-Are-Alou, H. M. *Ficus Malabarica, Folio mali cotonei; Fructu exiguo plano rotundo sanguineo. D. Commelin. Arbore de Raiis minor Lusitanis.* This is a tall Tree, running into a Multitude of Branches, which, after the Tree has lived forty or fifty Years, shoot forth a sort of slender Fibres, or Filaments, and those single, downwards, which, taking hold of the Earth, there take Root, and grow up into new Trees, which again propagate themselves in their Season, by other Fibres shooting downwards from their Branches, and so successively *ad infinitum*, so that sometimes one Tree has been found to occupy the Space of an Italian Mile in Compass, by this successive Propagation of its Shoots; and it has been difficult to know the Original, or first Parents, but only by the Thickness of its Trunk, which sometimes can scarce be fathomed by three Men; and not only the lower Branches send out Fibres, but the highest do the same, by which means one Tree makes a very thick Wood, which after remains for several Ages. The Inhabitants make themselves Passages under these Trees, and cut them into Arbours, and close and shady Walks, well defended from all Heat of the Sun, by the close Connexture and Luxuriance of the Branches; and so extensive, that a thousand Persons may repose themselves under the Shade of one such Tree. The Leaves are

are like those of the *Itty-Alu*, but less; the Fruit is small, flat, oblong, first green, then of a sanguineous Colour, both within and without, and full of Grains, like the common Fig, and sweet like that, but not so savoury; so that they are rather Food for Birds than Men.

It grows in all Parts of *Malabar*, and is green and fructiferous throughout the Year. Of the Bark, Leaves, and Root, boiled in Oil, is prepared a vulnerary Balm: Of the Bark, boiled in Butter-milk, is prepared a Collution for the Mouth, which absterges Aphthæ, heals flaccid and corroded Gums, and fastens loose Teeth. The Tree is not much different from the preceding, except in Bigness.

Tsjerou-meer-alou. This is less and lower than the preceding, but grows and propagates itself in the same manner, and the Leaves and Fruit are much like those of the other, only less; and the Virtues are the same as those of the preceding, except that of the Root boiled in Water, with Lime and Turmeric, is prepared a Bath for the Epilepsy, and the Leprosy.

Peralu. H. M. *Ficus Malabarensis; Folio crassiusculo majori; Fructu gemino intense rubente*. D. Syen.

The Liquor of the Filaments, which hang down from the Boughs, drank only in Water, or given in Decoction, mitigates the Heat of Fevers, and purifies the Liver and Blood. The Bark of the Tree, bruised, and applied to the Part affected, cures the *Morbus Sacer*.

Atty-meer-Alou, or *Alu*. H. M.

This is a Tree of a vast Bigness, with a thick Trunk; whence it shoots some slender and single Fibres downwards, which, adhering to the Tree, renders it vastly thick: By those Fibres taking Root in the Ground this Tree is propagated.

The Tree takes its Beginning from the Trunks of some Trees, or from Rocks, or the Gaps and Fissures of some old Walls, from whence it comes forth like a *Convolvulus*; after this the Root and Trunk shoot forth some thin Filaments, by which the Trunk is considerably increased. By the same Filaments it is settled in the Earth, and propagated far and wide, while the Tree, whence it had its Original, dies. This is the largest of all the Trees hitherto discovered in the *Indies*, and lives some Centuries. In *Kandante*, a Province of *Cochin*, near the Temple of *Beykan*, is a Tree of this Kind, which is fifty Geometrical Feet in Circumference, and is said by the Natives to be of two thousand Years standing.

The Juice of the Leaves cures burning Fevers, and the Fruit stops all manner of Fluxes of the Belly.

Hondir-Alu is a tall Tree, and propagates itself in the same Manner as the preceding. The expressed Juice of the tender Leaves is an excellent Remedy for corroded Gums, and other Affections of the Mouth, being used as a Collution. Of the same, prepared with fresh Butter, is prepared a Digestive, which is useful in cleansing and consolidating Ulcers. Of the Roots and Leaves, boiled together in Water, is prepared a Bath, which is said to be effectual towards curing the Epilepsy and Leprosy. *Raii Hist. Plant.*

TSJAMBOU. See JAMBOS.

TSIAPANGAM. See LIGNUM CAMPESCANUM.

TSIELA. *Ficus Malabarica; Fructu Ribesii Forma & Magnitudine*; is a large Tree, seven Feet in Height, with a thick Trunk, eighty Feet in Compass, and numerous Branches spreading circularly. The Fruit adheres to the Boughs among the Leaves, being without Pedicles, in Shape and Size resembling Currants, full of small, reddish Grains, as all the Fruits of the *Alu* and *Teregam*, and without Taste or Smell.

The Bark of the Root, boiled with long Pepper in common Water, cures an inveterate Cough, and other pulmonic Disorders. The expressed lacteous Juice of the Root and Fruit is an effectual Remedy in Diseases of the Eyes. *Raii Hist. Plant.*

TSJEM-TANI. *Myxa pyriformis Officulo trispermo*. This is a Tree of vast Bigness, growing in *Malabar*.

The Bark of the Tree is heating, incites viscous and pituitous Humours, attenuates, strengthens the weakened Viscera, and purges the Water from Hydropics. The same, with the Pulp of the Fruit, reduced to Powder and exhibited, cures an intermittent Fever; the Kernels of the Fruit, if eaten, loosen the Belly. *Raii Hist. Plant.*

TSJERIAM-COTTAM. H. M. *Frutex Indicus Bacciferus; Fructu racemoso, cuspidato, Ribium simili, monopryeno*. It is an evergreen Shrub of *Malabar*, whose Fruit is not much unlike our Currants.

Of the Leaves boiled in Water is made a Collution for the Mouth, which cures loose and tumid Gums; and of the Bark boiled in Whey, with the Seeds of Cumin, is prepared a Gargarism, which is said to be a potent Remedy for the Aphthæ. *Raii Hist. Plant.*

TSJEROM-KARA, *Malabarensibus*. H. M. *Baccifera Indica Flosculis ad Fœtorum Exodum confertis, Fructu dicocco*. It is a little low Tree, or rather Shrub, seven or eight Feet high, growing in *Malabar*, with a Trunk of a moderate Thickness, and a Multitude of small ash-coloured Branches, armed with rigid Spines, which are circularly disposed. The Root is reddish, sweet-scented, and bitter; the Flowers are small, greenish, scentless, and are seated in a small green Calyx, divided into five acuminate Lobes, and are succeeded by flat, round, dicoccous Berries, crowned with a broad Umbilicus at Top, and full of a green, humid, and bitter Pulp, within which are lodged two oblong Seeds, placed at Distance from each other.

Of the Leaves, boiled in Water, is prepared a Collution for the Mouth, and for the Aphthæ. The Decoction of the bruised Root in Water opens Obstructions of the Liver, purges the Blood, and exhilarates the Patient. *Raii Hist. Plant.*

TSJEROE-KATOU, *seu Cheru*. H. M. *Prunifera Malabarica; Fructu racemosa parvo, acris Succo tinctorio*. This is a very tall and beautiful Tree, with a thick Trunk, and numerous Branches, spreading far and wide. The Wood is whitish, close, covered with a dusky, and lanuginous Bark, which wounded, discharges a reddish, glutinous, strong-scented, very acrid, and caustic Tear, which grows black with long standing in the Sun. The Root is whitish, covered with a dusky Bark, scentless, and of an unctuous, acrimonious, and caustic Taste; as are, also, the Leaves, which emit a reddish, acrimonious, and burning Juice, which exulcerates the Skin, like the *Ranunculus*. The Flowers are of a beautiful, white, tender, sweet-scented, hot and acrid Taste, and pentapetalous. To the Flowers succeed small, round, oblong Fruit, exactly resembling those large cerulean Grapes, which the Greeks call *βύρασι* (*Bumasi*) both in Size and Shape: They are first green; a little before Maturity, glaucous and lanuginous; but, as they ripen, become of an arro-cerulean Colour, and glabrous, and full of a brownish, succulent, glutinous, acrid, and caustic Pulp, inclosing an oblong Stone, containing a whitish, unctuous, bitterish, and sub-acrid Kernel, in Shape something like the Kernel of a Filbert.

It grows in all Parts of *Malabar*, and is usually cultivated in Fields where Rice or Corn is sown, in order to keep off the Birds, by its deleterious Quality.

The Tear of the Cortex, or the acrid, and glutinous Juice of the Fruit, with a Mixture of Lime, are used by the Painters in staining their Cottons with an indelible Colour. The Decoction of the Fruit, drank, cures the Itch, Leprosy, Pain of the Head from a cold Cause, the Vertigo, tormenting Pain of the Colic, and other Disorders, proceeding from viscid, pituitous, and flatulent Humours. The expressed Juice of the Fruits, and the Bark of the Tree, by Application, cures the Tooth-ach, and opens cold Tumors, by corroding the Skin, and raising a Blister.

This Tree is very strong Poison to some among the *Indians*, who swell, in every Part of their Body, at a strange Rate, from but a slight Touch of it; but this Symptom is immediately mitigated by taking Milk, Butter, or Oil. *Raii Hist. Plant.*

TSJEROE-POEAM. H. M. *Baccifera Malab. racemosa, tripetala, Fructu oblongo tricocco, Calyce excepto*. This is a small low Tree, with a slender, whitish Trunk, cover'd with a blackish Bark, green on the Inside, and furnished with many geniculated Branches. The Root is yellowish, cover'd with a reddish Bark, and of an unpleasant Smell and Taste, as are, also, the Leaves, which are oblong-round, acuminate, smooth, of a Dark-green, and shining on the upper Face, and greenish and lanuginous beneath, and tripetalous: From whence arises a slender, oblong Pointal, of a green Colour inclining to yellow, and with a round Apex. The Flowers are succeeded by oblong-round Berries, tricoccous, green, lodged in Calyces, and containing Seeds of a whitish-green Colour, having their Cells separated by membranaceous Pellicles.

Of the Flowers, Fruit, and Bark, boiled in Oil, a Liniment is prepared, which, apply'd to the Part, is said to cure the Headach. The fresh Leaves, bruised, and apply'd to the Place affected with an Erysipelas, are reported to remove the Disorder. *Raii Hist. Plant.*

TSJOCATTI. H. M. *Frutex baccifer Malab. Fructu calyculato, tetracocco, umbellato*. It is a little low Tree, about twelve Feet high, with a slender Trunk, and a Multitude of small ligneous Boughs. The Wood is whitish, cover'd with a reddish Bark. The Root is whitish, bitter, and aromatic. The Leaves are oblong-round, acuminate, slightly crenated, thick, dense, glabrous, of a blackish Green on the upper Face, and greenish beneath. The Flowers are yellowish, scentless, and are disposed on the Top of the Boughs in the Form of an Umbella. The Berries are tetracoccous, and sometimes pentacoccous, first greenish, but when ripe, red and shining, and inhering in a blackish red Calyx; their Taste is an acid Bitter; and they contain, for the most part four whitish Kidney-shaped Seeds of a bitter-sweet Taste.

The Decoction of the Leaves in Whey is very much commended for the Cardialgia. The same boiled in common Water with the Flowers and Fruit, and the Mouth washed therewith, cures Erosions of the Gums, and fastens loose Teeth. Of the Root boiled with Cumin-seed in Milk, is made a Drink, which is a potent Anti-emetic; and the same, worn as an Amulet upon the Belly, is said to mitigate the Pain of the Colic. *Raii Hist. Plant.*

TUBA. A Trumpet. Acoustic Tubes are Instruments contriv'd to assist Hearing. See AURIS.

TUBÆ FALLOPIANÆ. The Fallopian Tubes, Appendages of the Uterus thus call'd. See GENERATO and UTERUS.

TUBEL. The same as *Squamæ Aris*, Scales of Copper. *Rulandus*.

TUBELECH. The same as **DUELECH**.

TUBERA. Fungi, or Mushrooms. Round Tumors on the Body, are, also, thus call'd,

TUBERARIA MAJOR, Myconi. J. B. The Name of a Species of *Cistus*, call'd by *Caspar Bauhine Cistus, Folio Plan-ruginis*.

TUBERCULUM. A Tubercle, or small Tumor. See **NEVUS** and **TUMOR**.

For Tubercles in the Auditory Passage, see **AURIS**.

For Tubercles on the Eye-lids and Eyes, see **OCULUS**.

For Tubercles of the *Vagina*, see **VAGINA**.

TUBEROSA. The Tuberosé.

TUBULARIA.

The Characters are;

It resembles a *Madrepora*, consisting of a Multitude of small Tubes elegantly compacted together.

Boerhaave mentions but one Sort of *Tubularia*; which is, *Tubularia*; purpurea. *T. Corallii affinis*; *Alcyonium*; *fistulosum, rubrum*. J. B. 3. 808. *Boerh. Ind. alt. Plant.*

There are no Virtues ascrib'd to this Lithophyte.

TUBULI *Arundinacei ad Asthma.* C. B. *Tabaci Haytinorum, quos Mexicani vocant POCYLT.* Fr. Hernandez.

They give the Name of *Tabacos* to those hollow and perforated Fragments of Reeds, which are a Span and half long, and smutted on the Outside with Charcoal, but have their Cavities filled with *Teli*, that is, Tobacco, Liquid Amber, *Kochicozell*, and sometimes other hearing Plants and Spices. These being set on Fire, at the End which is full, by the other the Fume is attracted and swallow'd; by which means, as by a Suffumigation, Sleep is induced, and all Sense of Labour and Lassitude is remov'd. By the same Remedy are mitigated all kinds of Pain; especially of the Head; Phlegm is expectorated; the Asthmatic are relieved; and the Stomach is corroborated. But we are to beware, lest the excessive Use of these *Tubuli*, or *Tabacos*, should induce an hot Distemperature of the Liver, with a Cachexy, and other incurable Distempers. *Rati Hist. Plant.*

TUBULUS MARINUS. A Name for the **ANTALIUM**.

TUBUS. A Tube, or Pipe. This Name is apply'd to many Conduits in the Body.

TUCUM. The Name of a Species of Palm, which grows in *Brazil*.

TUINAMTHIBA. A Name for the *Corallodendron*; *triphyllon*; *Americanum*; *spinosum*; *Flore ruberrimo*.

TULIPA.

The Characters are;

The Flower is liliaceous, hexapetalous, Pitcher-shaped, naked, single on the Top of a Stalk, erect, and furnished with six Stamina, and embracing the Ovary, which becomes an oblong Fruit, full of flat Seeds, lying one on another in a double Row, and furnished with a remarkably hairy Tube. The Stalk is surrounded by broad Leaves; the Root bulbous, tunicated, with its sessile Part fibrous.

Boerhaave mentions twelve Sorts of *Tulipa*; which are,

1. *Tulipa*; *præcox*; *rubra*; *flavo per oras discurrente*. C. B. P.

2. *Tulipa*; *præcox*; *alba*; *varia*. C. B. P. 59.

3. *Tulipa*; *præcox*; *lutea*; *varia*. *Clus. Hist.* 140.

4. *Tulipa*; *præcox*; *lutea*. C. B. P. 57. *Tourn. Inst.* 373. *Boerb. Ind. a. 2. 138. Tulipa. Offic. Tulipa præcox tota lutea.*

Ger. 117. *Emac.* 138. *Tulipa præcox flava*. J. B. 2. 666. **THE TULIP.**

It grows in Gardens, and flowers in the Spring; and the Root, which is used, is by some affirmed to have the same medicinal Virtues as the *Battata*, or *Pastinaca latifolia*.

5. *Tulipa*; *præcox*; *rubra*. C. B. P. 50.

6. *Tulipa*; *præcox*; *purpurea*. C. B. P. 57.

7. *Tulipa*; *præcox*; *flore Amethystino*. T. 373. *Lilio narcissus, purpureo-violaceus*. Lob. Ic. 129.

8. *Tulipa*; *præcox*; *alba*. C. B. P. 57. *Lilio-narcissus, niveus, totus*. Lob. Ic. 131. J. B. 2. 666.

9. *Tulipa*; *flore pleno*; *centifolia*; *præcox*.

10. *Tulipa*; *pumilio*; *præcox*.

11. *Tulipa*; *serotina*.

12. *Tulipa*; *dubia*. *Boerb. Ind. alt. Plant.*

Tulipa is a Turkish Word, signifying a Turbant. This beautiful Plant, which was first described by *Gesner*, was brought into Europe from *Constantinople*, in the Year 1590. The Dutch, and especially those of *Harlem*, have often given an hundred Ducats for the Root of a Tulip. There are no Plants so variable and transmutable in their Colours, as a Poppy, and a Tulip; and those Colours are chang'd by transplanting; and, if the Seeds of one Tulip are sown, they produce Flowers of all sorts of Colours.

This Plant seems to be of a fine, gentle emollient Virtue, like other Bulbs; but the Price has been an Impediment to its Use. In some respects it resembles the Onion, but its Bulb is not so aromatic. The Bulb gently roasted is said to afford good Nutriment, and to provoke Lust. *Hist. Plant. adscript. Boerhaav.*

TULIPA CAPENSIS. A Name for the *Hemanthe Africanus*. **TULIPIFERA**, of *Tulipa*, a Tulip, and *fero* to bear. **THE TULIP-TREE.**

The Characters are;

The Flower consists of several Leaves, which expand in such a manner, as, by some thought, to resemble a Tulip; the Pointal rises in the Centre of the Flower, surrounded by a great Number of Chives; and afterwards becomes a squamous Fruit, or Cone growing erect. To these Marks may be added, the Leaves, for the most part, being angular, the upper Part is hollowed, as if cut off with Scissars, terminating in two Points.

Miller mentions two Sorts of *Tulipifera*; which are,

1. *Tulipifera*; *Arbor Virginiana*. H. L. **THE VIRGINIAN TULIP-TREE.**

2. *Tulipifera*; *Virginiana, laurinis Foliis, averla parte Rore cæruleo tinctis Condi-baccifera*. *Pluk. Phys.* **THE LAUREL-LEAVED TULIP-TREE.**

The first Sort is very common in *America*, where it grows to a great Magnitude; but in *England* there are, at present, but very few of them, which have arrived to any considerable Stature. This Sort was formerly kept in Pots and Tubs, and housed in Winter with great Care; in which Management the Plants made but poor Progress, nor would ever have produced Flowers. But, about fifty Years ago, there was one of these planted out, in a Wilderness, in the Gardens of the Right Honourable the Earl of *Peterborough*, at *Parsons Green* near *Fulham*, which soon convinced the Curious of their Mistake in the Culture of this Tree, by the great Progress it made; and in a few Years after it produced Flowers. This Tree is yet standing, and annually produces a great Quantity of Flowers; though some of the Branches begin to decay, which perhaps may have been occasioned by its being too closely surrounded by other Trees, whose Roots are so much entangled with those of this Tree, that they draw the Nourishment of the Ground from it. In some Years this Tree produces Cones, but they have not ever been perfected so as to contain good Seeds.

There are some other Trees of this Kind, which have produced Flowers several Years, though I believe none of them are very large; the biggest I have seen (excepting that at *Parsons Green*) is not more than twenty-five Feet high; whereas my Lord *Peterborough's* is upwards of fifty Feet high, and is proportionably large in the Trunk; but this has a naked Body near forty Feet high, all the Branches growing near the Top of the Tree, which might be occasioned by being so closely surrounded with other Trees; for I have observed, where-ever they have a more open Situation, they are subject to extend their Branches, and do not aspire upwards very much, though they generally have one upright Shoot in the middle, much after the Manner of the Plane-tree, whose Manner of Growth is very like that of this Tree.

The Flowers, which these Trees produce, are by no means like those of the Tulip, though many Persons have been so incurious as to imagine they are so; especially the Inhabitants of *America*, who first gave the Name of Tulip-Tree unto this Plant, by which Name it has been since called by the Inhabitants of *Europe*, who received it from them, with the Plant, many Years since; but I have not heard, that any of these Trees have flowered in any Part of *Europe*, except in *England*.

Mr. *Catesby* in his *Natural History of Carolina*, &c. says, there are some of these Trees in *America*, which are thirty Feet in Circumference; that the Boughs are very unequal and irregular, making several Bends or Elbows, which makes the Trees distinguishable at a great Distance, even when they have no Leaves upon them. They are found in most Parts of the Southern Continent of *America*, from the Cape of *Florida* to *New-England*, where the Timber is of great Use.

The Laurel-leaved Tulip-Tree is at present very rare in *England*, though formerly there were several of these Trees in the Garden of the Bishop of *London*, at *Fulham*; and those of the Dutchess of *Beaufort*, at *Chelsea*; but these have been since lost, so that there are very few of them to be seen in the *English* Gardens. The largest Tree of this Kind, which I know at present, is in the Gardens of Mr. *Peter Collinson* at *Peckham*, which has produced a great Number of Flowers the three Years past.

Though I have inserted this Tree under this Title, (which is the Name, by which it was first brought into *England*) yet it does not strictly belong to this Place, there being a Genus under which this Plant should be ranged, which was established by Father *Plumier*, by the Name of *Magnolia*, in Honour to the learned Botanist *Peter Magnol*, Professor of Botany and Physic in the University of *Montpelier*. This Plant is curiously figured in the third Part of Mr. *Catesby's Natural History of Carolina*, by the Name of *Magnolia Lauri Folio subtus albicante*: He describes it to be a small Tree, seldom growing more than sixteen Feet high; that the Wood is white and spongy, covered over with a white Bark: The Leaves are in Shape like those of the common Bay, of a pale-green Colour, and white on their Backsides. In May they begin to produce their Flowers, which are white, and very fragrant; these are continued the most Part of Summer, during which time the Woods are perfumed with their Odour. When the Petals of these Flowers are decayed, the Pointal becomes a conical Fruit, about the Size of a large Walnut, thick set with Knobs or Rifings, from each of which

which, when the Fruit is ripe, are discharged flat Seeds, of the Bigness of French Beans, having a Kernel, within a thin Shell, covered with a red Skin. These red Seeds, when discharged from their Cells, fall not to the Ground, but are supported by small white Threads, of about two Inches in Length, which make a very beautiful Appearance. The Fruit is at first green; when ripe, red; and, when declining, turns brown. The Tree grows naturally in moist Places, and often in shallow Water; and, what is very extraordinary, they being removed on high dry Ground, become more regular and handsome, and are more prolific of Flowers and Fruit. They usually lose their Leaves in Winter, unless it be moderate: It is called by some, *The Sweet Bay*.

There is, also, another Sort of this Tree, which hath been lately brought into England, which is called, by Father Plumier, *Magnolia amplissima flos alba, fructu ceruleo*. This is esteemed one of the most beautiful Trees in America, where they usually grow in moist swampy Woods; and often rise to the Height of sixty Feet, or more: The Leaves are much larger than those of our common Laurels, and are of a light-green Colour; the Flowers, I am told, are very large, of a whitish Colour, and very fragrant: The Fruit is shaped like that of the former Sort, but is much larger, and emits the Seeds in like Manner; so that it is in Beauty from May to November; and the Leaves, always remaining green, afford an elegant Prospect in Winter: They are of quick Growth, and generally rise with strait Stems, which is a great Addition to their Beauty; and, since they are hardy enough to endure the Cold of our Climate in the open Ground, I doubt not, but, in a few Years, we shall have the Pleasure of seeing its beautiful Flowers, there being several Trees planted in the Gardens of some curious Persons near London, where they have borne the Cold of the three last Winters, without Shelter; and make considerable Progress every Year. *Miller's Dictionary, Vol. I.*

TULPBLOOM. A Name for the *Lepidocarpodendron*; *foliis angustis, brevioribus, salignis; calycis squamis elegantissime ex roseo, aureo, albo, atro rubro variegatis; florum plumis albis.*

TULOS. *Tulas*. A Callus.

TUMBABA, or TUMPABAR. Live Sulphur. *Rulandus*.

TUMBALUM, or TUBEL. The Scales (*Squama*) of Metals.

TUMBIL. Earth. *Rulandus*.

TUMOR.

By a Tumor, Physicians mean any Part of the Body that is preternaturally enlarged, or swelled; and its Situation and State may be known, both by seeing and feeling. But, although it has been usual to refer Excrescences, such as Warts and Corns, with other similar Pustules in the Nostrils and *Pudenda*, to the Class of Tumors; yet as these Excrescences do not grow beneath the Skin, but without, or upon the Skin, they may be properly distinguished from Tumors.

Tumors are of different Kinds, and assume different Names, according to the Causes, whence they proceed; and the particular Places, in which they are situated. Some are called *hot*, others *cold* and *watery*; some *windy*, others *scirrhus*; and some *benign*, others *malignant*. Some Tumors are contained in a membranous Bag, like a proper Coat, and, therefore, are called *encysted* Tumors. If a Tumor appears in the Arteries, they are called *Aneurisms*; if in the Veins, *Varices*; if in the Veins of the Anus, or *Intestinum Rectum*, the Disorder is termed *Hemorrhoids*; if in the Scrotum, Insides of the Thighs, or Navel, they assume the Appellation of *Hernias*, or *Ruptures*: But if any Pus, or Matter, be formed in a Tumor, it is called an Abscess. When a Tumor rises on the Bones, it is named *Exostosis*.

All these various Sorts of Tumors are generally subdivided into several other Species. Thus, the hot and burning Tumors, which are the same with Inflammations, when they are violent, and rise externally, are termed *Phlegmons*; if smaller, and gentler, they are called *Furuncles*. When the inflammation is not seated deep in the Flesh, but only spreads superficially upon the Skin, it is commonly named an *Erysipelas*. A Tumor, or Inflammation, on the Extremities of the Fingers, is termed a *Paronychia*, or *Whitlow*; but in the Insides of the Thighs, in the Groin, or under the Arm-pits, a *Bubo*; but near the Ears, a *Parotis*: But if, from extreme Cold, violent Inflammations be raised in the Hands or Feet, they are named *Perniones*, or *Chilblains*. Other Inflammations assume different Appellations, according to the different Parts of the Body which they affect. Thus, in the medicinal Writers, we frequently read of Inflammations in the Breasts, Eyes, Testicles, Arms and Legs.

THE METHOD OF TREATING ENCYSTED TUMORS.

If Tumors, or Tubercles, arise in the Body, contained in certain Coats, they receive the Appellation of encysted Tumors, which are generally unaccompanied with Pain, of the same Colour with the rest of the Skin; and sometimes harder, and sometimes softer. This Species of Tumor is produced by certain Obstructions in the Glands, or in the Fat, and appear in almost all Parts of the Body, particularly in the Head, Face, and Neck, (see *Tab. XXXIII. Fig. 13.*) frequently occasioning a prodigious Deformity. The Coat, which is often very thick, is formed either

by the obstructed Gland, or by some Cell of the Membrana Adiposa: They are, at first, small; and, generally, moveable; but, in time, they gradually increase; and, sometimes, arrive to an enormous and surprizing Size. Their Substance is sometimes thinner, and softer; and, at other times, harder and thicker. Their Figure is very various; some have the Shape of Filberts, Acorns, Balls, Walnuts, or Eggs; sometimes they assume the Form of a Pear, like a fleshy Excrescence suspended, as it were, by a Stalk; some have a broad Base, and some resemble a Fist, some a Head; with many other Shapes: Some grow so very large, as to weigh many Pounds; others adhere firmly to the adjacent Parts; and, at last, become entirely immovable; and, others resemble a Callus, or a Cartilage, in Hardness; some, however, continue always moveable; and some always soft. Encysted Tumors are, also, distinguished by the different Nature and Consistence of the Matter, which they contain. When the Matter of a Tumor resembles a Pulver, it is termed *Atheroma*; when like Honey, *Meliceris*; when it is like Fat, Suet, or Lard, *Steatoma*; when it resembles an indurated Gland, *Scirrhus*; and, when it seems to be a fleshy Substance, it is called *Sarcoma*. In some Patients, as *Celsus* observes, they are found like Concretions of Hair. These Tumors are, also, variously denominated, according to their various Situations. When one arises in the Scalp, it is by some named *Talpa*, *Testudo*, or *Lupia*; in the Neck, *Struma*, or *Scrofula*; but, if they appear in the Hands, or Feet, especially near the Tendons of the Muscles, they are called *Ganglia*.

Encysted Tumors may be easily known from others, by seeing and feeling them; but, they are not so easily distinguished from one another, unless we are able, by the Touch, to discover some Difference in the Consistence of the Matter, whether it be hard, thick, and tenacious; or, soft, thin, and liquid; for, as the Colour of the external Skin suffers little or no Alteration by these Tumors, we can learn little or nothing from it: Nor is it a Matter of great Importance, to know the Nature of the included Matter before the Cure, the Hardness only excepted; for, whatever Matter they contain, the Method of Cure is nearly the same. It is, however, necessary to be observed, that the Scirrhus and the Sarcoma, are the hardest of this Species of Tumors; next to these, is the Steatoma; the rest are softer, and, sometimes, differ a little in their Treatment, according to their different Degrees of Consistence. Those Tumors of the Neck, which are called *Scrofulous*, or *Strumous*, are, generally, said to be indurated Glands; but I have frequently observed Steatomas, and other encysted Tumors, to proceed from the Fat of the Neck: For it seems scarcely possible, that these small Glands, situated in the Sides of the Neck, should, sometimes, increase to so monstrous a Size, as to hang down over the Belly; which is frequently the Case with the *Tyrolese*, who are troubled with this strumous Affection, which may easily happen, when the Disorder is lodged in the Fat. But, besides these, there are sometimes smaller and harder Tumors in the Neck, which proceed from the Induration of these Glands, which then belong to the scirrhus Species.

If the Pain of encysted Tumors be not violent, if their Bulk and Hardness be not formidable, they are attended with little Danger. Whence it is not surprizing, that some, especially among the poorer Sort, bear them as long as they live, rather than submit to the Severity of surgical Operations. But if, as it sometimes happens, their Size should greatly increase, so as to weigh ten, twenty, or more Pounds; if they should begin to excite Pain; as is commonly the Case in scirrhus Tumors; they not only produce a monstrous Deformity, but intolerable Uneasiness; and, unless seasonably extirpated, they induce a Consumption and Weakness, or a Cancer; and the greatest Danger of Death. But, in the Cure of these Tumors, the Use of the Knife is almost always necessary; for they are not easily digested, or brought to a Suppuration. If they are recent, soft, moveable, and small, they may be readily and safely extirpated with the Knife; but not without Danger, if they are large, hard, and resist the Touch; especially if they be situated near the larger Veins and Arteries, or about the Nerves, Tendons or Joints; or if the Patient be worn out with Infirmities, or old Age; The Surgeon, therefore, must regulate his Method of Cure according to the Nature of the Disorder, and Circumstances of the Patient.

Of these Tumors, various Methods of Cure have been instituted. Many Surgeons direct them to be immediately extirpated by the Knife; but, according to the Precept of *Hippocrates*, I would not leave mild Means unattempted: For, when the Tumor is recent, and the Patient is of a lax, delicate Habit, it seems expedient to attempt Resolution or Suppuration, before the Application of the Knife. But, when the Tumor is inveterate and hard, external Remedies ought not to be applied; which would be so far from promoting Digestion, especially in a Scirrhus, or Steatoma, that they would increase the Tumor, and make it degenerate into a Cancer; whereas, without topical Applications, the Patient might have been supported under them many Years. In such Cases, therefore, immediate Recourse must be had to the Knife. But, if the Timidity of the Patient will not permit him to yield to the Knife, so that he will allow of nothing but external Remedies, digestive Plaisters may be properly applied; such as the Plaister of *Ammoniacum*, of *Galbanum*, of Frogs

with Mercury, of Diachylon with Mercury, the *Emplastrum Oxycroceum*, *Mynsicht's* diaphoretic Plaster, the *Emplastrum Diasaponis five miraculosum*, and the like. *Scultetus* asserts, that he has cured various Tumors, of the melicerous Kind, with the *Ceratum Diasapinos*. But, before a Plaster of this Kind is applied, the Tumor ought to be anointed with the Peruvian Balsam, the Oil of Soap, or Petroleum. By these means, when the Tumors are not inveterate, nor of the larger Size, they may be again discussed; and, for the more readily answering of this Intention, it may be expedient frequently to rub the Part with a warm mercurial Ointment; especially if the Tumor be of the scirrhus Kind.

When nothing can be effected by Plaisters, or digestive Medicines, Suppuration must be attempted; especially if the Tumor be still soft, as in an *Atheroma*, or *Meliceris*. The Plaster of Diachylon with the Gums, and digestive and emollient Cataplasms, frequently applied to the Tumor, excellently answer this Intention; especially, if the Middle of the Part affected be several times well moistened every Day with the strongest Spirit of Sal Ammoniac; and, as soon as the included Matter is perceived to have ripened, the Tumor should be opened by a large Incision, and the Pus discharged. After this Operation, the Tumor, with its Bag, must be removed by the Application of strong Digestives, or of mild corrosive Medicines; for, if any of the Coat should remain, after the Abscess is healed, a Relapse will gradually ensue; and, therefore, it is extremely necessary to apply, daily, a Diachylon-plaster, till the Detersion of the Wound be completed: Thus, whatever prternatural Substance remains in the Wound, will be more expeditiously softened, and the Wound more conveniently healed.

If, by these means, neither Discussion, nor Suppuration, can be obtained, but the Tumor rather gradually increases, lest it should become too much enlarged and be concreted with the neighbouring Parts, or degenerate into a Cancer, so as to yield to no Medicine, or Operation, they ought to be immediately extirpated. But these encysted Tumors ought to be extirpated by different Methods, according to their different Natures. Those which have a slender Root, and hang, as it were, by a Stalk, cannot be more expeditiously removed than by a Ligature, like Warts, or other Excrescences; by which means, in a few Days, it will drop off, as it were, spontaneously; or it may be extirpated with the Knife; and the Wound may be dressed, and healed, like other Wounds: But if, by the Incision, a large Artery should be wounded, the Hemorrhage may be stopt with some styptic Medicine, or the actual Cautery; or the Artery may be taken up with a Needle and Thread. Lastly, these Tumors may be removed with corrosive Medicines daily applied round the Root, and retained by Plaisters, till it falls off; or, the greatest Part of the Root being consumed, it may be conveniently cut through.

When the Root of the Tumor is broad, recourse must be had to Incision, or Escharotics, although the latter be generally preferred. The Incision may be thus performed: The Skin must be divided longitudinally, through the Middle of the Tumor; but, if this Wound be not sufficiently large, another Incision must be made transversely, in the Form of a Cross; then, with the Knife, and Fingers, the Tumor, with its Coat, must be carefully separated from the Skin and Flesh, keeping the Coat entire, that the Tumor may be extracted whole. That this may be done more commodiously, an Assistant should draw, asunder the Lips of the Wound, with Hooks; and the Blood, as it flows, should be wiped up with a Sponge, that it may not hinder the Operation. As soon as the Coat of the Tumor appears, which is, usually, whitish, and stretched, the Surgeon must keep it raised with his Left Hand, if it be small; but, if it be too large to be held in the Fingers, another Assistant ought to keep the Tumor raised with a Hook, (See Tab. XXIX. Fig. 2.) or with the Forceps represented in Tab. XLIV. Fig. 1. or with a crooked Needle and Thread: Thus, the Tumor, being cautiously separated from the contiguous Parts, it may be extracted entire. The Task is easily performed, if the Tumor be moveable; but, if fixed, the Operation requires both Pains and Skill. Particular Care must be taken, not to wound any of the principal Parts that may be situated near the Tumor; and, if the Tumor is to be taken from the Leg, or Arm, where a large Artery or Vein must be divided, the Tournequet ought, first, to be applied to the Limb. These Directions being duly observed, Tumors of this Kind, weighing several Pounds, may be extirpated, not only from the fleshy Parts, but, also, when they adhere to the Bones and Jaws.

The Tumor being rightly extracted; if the Wound be small, and the Hemorrhage slight, the Lips must be brought into Contact with the Fingers, Lint and Compresses must be applied, and the Whole secured with a Bandage: Thus will the Wound be healed in a few Days. But, if the Hemorrhage be large, it must be stopped, as in other Wounds, principally by the Application of Lint, Compresses, and Bandages, by Astringents, by a Ligature, or the actual Cautery. But, when, in the Operation, either by Negligence, or Accident, the Coat, including the Tumor, particularly, of the softer Kind, is wounded, as may sometimes happen in preventing the Eye from being injured, when the Tumor is in the Eye-lid, or by cautiously avoiding a large Vein or Ar-

tery in any other Part of the Body, particular Care must be taken, that the Coat be entirely extracted; otherwise the Tumor will easily return. In a Scirrhus, Sarcoma, or Sreatoma, when the glandular, fleshy, or pinguicous Substance is hard, though the Coat be wounded, the Matter will not flow out: Wherefore the whole Tumor, with its Bag, must be carefully extracted, as we have already directed; so that none of the Coat may be left behind. In other Tumors, where the Matter is soft and fluid, if the Coat be wounded or lacerated, the Contents are immediately discharged; then all that can be extracted of the remaining Bag, must not only be removed with the Knife and Scissars, but, if any Fragments should happen to remain, they must be extirpated with corrosive Medicines; such as red Precipitate, with burnt Alum, or the *Unguentum Egyptianum* mixed with a Digestive: And then the Wound may be healed like other Wounds, without the Danger of a Relapse.

When, in the Extirpation of encysted Tumors, Escharotics are preferred to the Knife, the *Lapis Infernalis*, Butter of Antimony, or the like, may be applied: But, in my Opinion, when the Tumors are large, hard, of a cancerous Disposition, inveterate, and painful, the Method by Escharotics is often dangerous, because a Scirrhus is easily changed into a Cancer: And in other Cases they cannot be totally consumed without intense Pain, large Effusions of Blood, with great Decay of Strength, or the Loss of Life. It is, therefore, safer to extirpate large hard Tumors by Incision, though sometimes they may be happily removed by Escharotics. But if the Tumors be of softer Kinds, such as the *Atheroma* or *Meliceris*, I frequently use this Method, opening the Integuments and Bag with a Caustic, or with a Knife, in the Middle of the Tumor, and discharging the contained Matter; then by promoting Suppuration, and the Use of Corrosives, I extirpate the Bag; and de-terge and incarnate, as in other Wounds. This Method I think milder than removing the entire Coat by Incision. *Heist. Chir.*

TUNA. A Name for the *Opuntia*. Indian Fig.

TUNETANUS FLOS. A Name for the *AFRICANUS FLOS*.

TUNICA. A Name for the *Caryophyllus*; *altiss*; *major*.

TUPA-IPU. A Species of large Onion, which grows in *Brasil*, called by the Portuguese *Cebola Albarã*.

TUPHUS, or TUFUS. See TYPHUS.

TUPIEWA. A Name for the *SCOPARIA*.

TURAS. The secret Effect of the Water; as *Thonus* is that of the Earth; and *Samies* that of the Air. *Paracelsus*.

TURBEDON. The Arabic Name for TURBITH.

TURBINATA OSSA. The turbinated Bones of the Nose.

TURBINATUM. The Pineal Gland.

TURBITH and TURPETHUM. Offic. *Turbith Alexandrinum Officinatum*. Ger. 335. Emac. 415. *Turbith Officinatum*, Park. Theat. 1610. *Turpethum repens foliis Althææ, vel Indicum*. C.B.P. 149. *Convolvulus Indicus, alatus, maximus, foliis Ibisconnonnibil similibus, angulosis*. Raii. Hist. 2. 1882. Tourn. Inst. 84. *Convolvulus Zeylanicus alatus maximis foliis, Ibisconnonnibil similibus angulosis*. *Trassawalu*. *Turbith Arabum legitimum & Officinatum*. H. Mus. Zeyl. 26. TURBITH.

This is a Root about a Finger thick, brown on the Outside, and whitish and somewhat resinous within; of an hot Taste.

Herman, in his *Catalog. Hortens. Lugd. Bazar.* gives a Figure and Description of it. He says, the Root is long and spreading; when broken, yielding a milky Juice, which soon hardens into a resinous Substance. It shoots forth many long, trailing, and climbing Branches, that twist one about the other like the great Bindweed; the Leaves are soft and downy, and in Shape like those of Marshmallows. The Flowers come forth among the Leaves, several together, on long Foot-stalks, of a white Colour, in Shape like those of the great *Convolvulus*, of which it is a Species. It grows plentifully in *Ceylon* and *Malabar* in the *East-Indies*; from whence the Roots are brought to us, being the only Parts used.

Turbith is a pretty strong Cathartic, purging tough serous Humours from the remote Parts; and thereby helps the Dropsy, Gour and Rheumatism; and is put into several of the stronger purging Compositions.

The *Pulepis Diaturpethi compositus* takes its Name from this Root. *Miller's Bot. Off.*

Turbith Gallorum. A Name for the *Seseli*; *que Ferula facie*; *Thapsia*.

TURBOTUS. The Turbot. See **RHOMBUS**.

TURCHOS. Offic. Worm. Musf. 106. Charlt. Foss. 39. Boet. 265. De Laet de Lap. 87. *Turchesia*. Aldrov. Musf. Metall. 902. **THE TURQUOIS.**

This is a precious Stone of the opaque Kind, and variegated with Streaks of green, white, and blue. There are two Species of it, the Oriental, and the Occidental: The former is more blue than green, and is found in *Persia* and the *East-Indies*. There are two Sorts of it; one, which always retains its Colour, and is called the Turchois of the old Rock; and another, which loses a little of its Colour, becomes greenish, and is called the Turchois of the new Rock.

The occidental Turchoise is of a Colour partly green, and partly white: It is found in *Spain*, *Germany*, *Bohemia*, and *Silesia*.

Sometimes Turchoises are found as large as an ordinary Nut, but very rarely; since their Bulk is generally no greater than that of a very small Nut.

This Stone is thought proper to fortify the Sight, and the Spirits of the Brain; but this pretended Virtue is not to be confided in. If it is reduced to a fine Powder, and exhibited internally, it operates like other alkaline Substances; absorbs Acids, and stops Fluxes; Hemorrhages, and Vomiting. The Dose is from six Grains to one Scruple. *Lemma des Drogues*.

The Virtues of this Stone are very great in Falls; a memorable Instance of which is related by *Boetius* concerning himself. *Scylla* would have it to be a Sort of Fish's Tooth. Dr. *Woodward* is of Opinion, that the Stones which the Jewelers call Turquoise, are only Fragments of Bones ting'd with a bluish Colour in the Veins of Copper Mines, where they are found: These Stones are polished by the Lapidaries, and set in Rings. *Woodw. Attempt. F. 2. Brown's Travels. Dale*.

TURCHOSA. A Name for the **TURCHOIS**.

TURDUS. Offic. *Turdus vulgaris*. Mer. Pin. 176. *Turdus visivorus minor*. Bellon. des Oyle. 326. *Turdus simpliciter dictus*. Aldrov. Ornith. 2. 600. *Turdus minor alter*. Gefn. de Avib. 690. *Turdus muscus*. Schw. A. 361. *Turdus simpliciter dictus, sive Visivorus minor*. Raii Ornith. 188. **THE MAVIS**, or **THRUSH**.

These Birds, when stuffed with Myrtle-berries, and roasted, are said to be exhibited with Success to those who labour under Fluxes. *Plin. Bellon.* In the Time of the Plague they are, by *Alexand. Bened.* said to be highly beneficial when macerated in Vinegar. The Powder of these Birds is, by *Gainarius*, recommended against the Effects of the *Napellus* or Monkhood. *Dale*.

Turdus is also a Name for a Fish, which Authors thus distinguish.

TURDUS. Offic. Charlt. Pisc. 13. Bellon. de Aquat. 258. Mer. Pin. 186. *Turdus vulgarissimus*. Raii Ichth. 319. Ejsd. Synop. Pisc. 136. *Turdus primus*. Rondel de Pisc. 174. Aldrov. de Pisc. 21. Jonf. de Pisc. 26. *Turdus primus*. Gefn. de Aquat. 1016. **THE WRASS**, or **OLD-WIFE**.

This Animal is found in the main Ocean, and in the *Mediterranean*. *Alexander Trallian* highly recommends it in the Epilepsy and Pleurisy. *Dale*.

TURNERA.

The Characters are;

It hath a funnel-shaped Flower, consisting of five Leaves, which are fastened to the Calyx, which is monopetalous, and divided into five Parts at the Top: Under the Flower-cup there are two Leaves, which join at the Bottom, and surround the Cup: From the Centre of the Flower-cup arises the Pointal, which is divided into three Parts to the Bottom, and surrounded by five Stamina. This Pointal afterwards becomes an almost spherical Fruit, which is divided into three Parts, and filled with roundish Seeds, which are fastened to the Piacenta by slender Threads.

Miller mentions two Sorts of *Turnera*; which are,

1. *Turnera frutescens ulmifolia*. Plum. Nov. Gen. 15.
 2. *Turnera frutescens, folio longiore & mucronato*.
- These Plants are both of them Natives of the warm Parts of *America*. The first Species was found by F. *Plumier* in *Martinica*, who gave it the Name of *Turnera*, from Dr. *Turner*, a famous English Physician, who lived in Queen Elizabeth's Reign, and wrote an Herbal, in which he has principally figured and described the useful Plants.

The other Species was discovered by Sir *Hans Sloane*, Baronet, who has figured it in his Natural History of *Jamaica*, under the following Name; *Cistus urtica folio, flore luteo, vasculis trigonis*. But both these Sorts were observed by Dr. *William Houstoun*, in several Parts of *America*. *Miller's Dictionary, Vol. 2.*

TURNESIUM. *turnesior*. The Name of a Weight mentioned by N. *Myrepsus*. *Scet. 8. C. 116*. But it is not known what Weight he means.

TURPETHUM. Turbith.

TURPETHUM MINERALE. Turpeth, or Turbith Mineral. See **MERCURIUS**.

TURREIS. The Name of a Stone, which is said to preserve the Bones from being fractured in a Fall.

TURRITIS.

The Characters are;

The Pod is pretty flat; the Seed is not marginated, but in other respects like the *Leucoium* and *Hesperis*; the Pods end in a pyramidal Form.

Boerhaave mentions four Sorts of *Turritis*; which are,

1. *Turritis*; foliis inferioribus cichoraceis, cæteris perfoliatis. T. 224. *Brassica sylvestris, foliis circa radicem cichoraceis*. C. B. P. 112. *Sinapi album*. Lugd. 1688.

2. *Turritis*; quæ *Barbarea muralis*. J. B. 2. 869. *Erysimo similis hirsuta alba*. C. B. Prodr. 42.

3. *Turritis*; vulgaris; ramosa. T. 244. *Bursa Pastoria, sive Pilosella siliquosa*. J. B. 870.

4. *Turritis*; folio *Leucii* *Tourn. Inst. 224. Boerb. Ind. A. 215. Camelina*. Offic. Ger. 213. Emac. 273. *Camelina sive Myagrum alterum amarum*. Park. Theat. 868. *Myagrum siliqua longa*. C. B. P. 109. *Myagro affinis planta siliquis longis*. J. B. 2. 894. Raii Synop. 3. 298. *Erysimum Galeno & Theophrasto*. Raii Hist. 1. 811. **TREACLE WORMSEED.**

This is sometimes found in purrid Places, and flowers in June and July. The Herb itself is used, which kills and dislodges Worms, corroborates the Stomach, expels Poison, is beneficial to paralytic and epileptic Patients, and cures Ulcers of the Mouth. *Dale*.

Besides the foregoing Species of *Turritis*, *Dale* mentions the following Sort; which is,

- TURRITIS.** Offic. Ger. 212. Emac. 272. Raii Hist. 1. 799. Synop. 3. 293. *Tourn. Inst. 223. Turritis vulgarior*, J. B. 2. 836. Park. Theat. 852. *Lobelia Brassica sylvestris hispida, non ramosa*. C. B. P. 112. *Leucoium flore albo, siliquis uno versu dispositis, & reflexis*. Ejsd. 243. **TOWER MUSTARD.**

This is found in sandy Hills, and flowers in June. The only Part of it used, is the Herb itself, the Juice of which is, by some, recommended for curing Ulcers of the Mouth, and killing Worms. *Dale*.

TURSIO. The Porpoise.

TURTAS, *turtas*. A sort of Tart, made of Dates, Meal, and Water, and baked under the Embers. *Erosian*.

TURTUR. Offic. Schrod. 5. 324. Mer. Pin. 175. Bellon. des Oyle. 310. Aldrov. Ornith. 2. 505. Gefn. de Avib. 277. Schw. A. 362. Charlt. Exer. 85. Jonf. de Avib. 64. Raii Ornith. 183. Ejsd. Synop. 61. Will. Ornith. 134. **THE TUR-TLE-DOVE.**

This Bird, and its Fat, are used. In Virtues it agrees with the Pigeon, especially in stopping Dysenteries, and immoderate Discharges of the Menfes. The Fat, collected when the Animal is roasting, is, according to *Schroder*, properly used as an Ointment in Disorders of the Kidneys, Abdomen, Breast, and Groins. *Dale*.

TURUNDÆ. Tents.

Tents are sometimes used in dressing Wounds, and are made of scraped Lint artfully rolled up, with a broad Head like a Nail. Their Length and Thickness are different, according to the different Sizes of the Wound for which they are designed. See *Tab. XXIII. Lit. K, L, M, and N*. This sort of Tents are principally used in deep Wounds and Ulcers; for by their Assistance, 1. Remedies may not only be conveyed to the innermost Recesses and Cavities of the Wound; but, 2. they prevent the external Parts of the Wound from coalescing, before the Bottom appears to be healed. 3. By their Means, also, Wounds may be conveniently cleansed from Blood, and other Sordes. But they must not only be fitted to the Wound, but, also, made extremely soft, that they may not increase the Pain of the Wound. That they may not obstruct the Healing of the Wound, if it appears to be sufficiently deterged, and that the Cavities are gradually uniting, the Tents should be lessened in Size, and, as soon as possible, entirely laid aside. And it is not improbable, that the Neglect of this Caution induced some Surgeons, both ancient and modern, of no mean Reputation, to forbid entirely the Use of Tents: Among these are *Magatus* and *Belloste*.

Some Tents are, also, made of Linen Rags, not scraped, but entire, twisted together in a conical Form, with a Thread fastened at its Basis; but the small End should be a little scraped, to render it softer, that it may not increase the Pain. The Thread is fastened to the Basis, that the Tent may be easily extracted, if it should accidentally drop into the Cavity of the Abdomen or Thorax. See *Tab. XXIII. Fig. O*. This Kind of Tent is principally used in Wounds which penetrate into the Cavity of the Abdomen and Thorax, lest they should heal, before the Blood, and other purulent Matters, be evacuated.

A third Kind of Tent is made for dilating the Orifice of a Wound, lest it should be too narrow, that the Blood, Sanies, or any extraneous Substance lodged within the Wound, may be more easily extracted, or that Remedies may be more conveniently admitted. These Tents are generally made of a Piece of Sponge prepared in a peculiar Manner; or of the dried Roots of *Gentian*, *Turnep*, *Calamus aromaticus*, or *Comfrey*; which

which are of such a Nature as to imbibe the Matter that flows to them; and, being by these means swelled, they dilate the Orifice of the Wound. Not unlike Tents are those Tubes or Pipes of Lead or Silver, which are sometimes used for discharging Blood or Pus out of narrow Wounds or Ulcers; and sometimes for evacuating dropical Waters, and Urine. Their Size and Figure vary according as the Nature of the Wound may require. See *Tab. XXIII. Lit. P, Q, R, S, T, V, X.* Tents are rejected by *Magatus* and *Bellofse* in *Fistulas*. See *FISTULA*.

Garengeot's Objections to Tents in Wounds of the Abdomen are considered under the Article *ABDOMEN*.

For the Use of Tents in the Cure of Inguinal Ruptures, see *BUBONOCLE*.

The Reasons against the Use of Tents in Lithotomy are taken Notice of under the Article *LITHOTOMIA*.

TURUNDULA. A small Tent.

TUS. The same as *THUS*.

TUSAI. A Name for several Species of *Corona Imperialis*.

TUSSEDO. A Cough.

TUSSICULARIA. Medicines which excite a Cough. *Cal. Arelianus*.

TUSSILAGO.

The Characters are;

The Root is very creeping; the Flower consists of very numerous Barbulæ, stands on a single Stalk, and is included in a Calyx, which has a multifid Base.

Boerhaave mentions two Sorts of *Tussilago*; which are,

1. *Tussilago*; vulgaris. *C. B. P.* 197. *Tourn. Inst.* 487. *Boerb. Ind. A.* 101. *Tussilago*, *Farfara*. *Offic. Tussilago*. *J. B.* 3. 563. *Ger.* 666. *Emac.* 811. *Park.* 1220. *Raii Hist.* 1. 259. *Synop.* 78. *COLTS-FOOT*.

The Roots of *Colts-foot* are thick at the Head, from which run several Strings. The Flowers spring up about the latter End of *February*, or the Beginning of *March*, on Stalks about two or three Inches long, beset with sharp-pointed scaly Leaves; they are yellow, radiated, and in Shape like *Dandelion*, which turn into Down like them: The Leaves spring up, after these are gone, somewhat roundish, but angular, and indented about the Edges, hollowed-in next the Stalk, in Shape like *Butterbur*, but much less, whitish underneath, having the upper Part green, but covered with a cottony Skin, that is easily wiped off. It grows in moist watery Places, and flowers early in the Spring. The Leaves and Flowers are used.

They are pectoral, and accounted good for Diseases of the Lungs and Breast, as Coughs Consumptions, and Shortness of Breath; and are frequently put into pectoral Apozems: The dry Herb, cut small, is smoked among Tobacco for Coughs, and other Affections of the Lungs. *Miller's Bot. Off.*

Colts-foot-leaves are bitter, glutinous, and a little styptic; they have the Taste of an *Artichoke*, and give but a very faint Tincture of Red to the blue Paper. There seems to be in this Plant a Salt resembling that of *Coral*, involved in Sulphur, and a great deal of viscous Phlegm. The Leaves and Flowers are very sweetening, moderately aperitive, and dedicated (if I may so say) to the Diseases of the Breast, which are occasioned by acrid and saltish Serosities. The Leaves are prescribed to asthmatic Persons, to smoke after the manner of Tobacco. *Mr. Boyle* advises to mix with those of *Colts-foot*, Flower of Sulphur, and some powdered Amber: He affirms, that this Medicine has cured several of the Phthisick. In the Time of *Dioscorides*, they made those that were afflicted with these Distempers, receive the Smoak of the Leaves of this Plant at their Mouths. The Flowers and Leaves are used in the pectoral Decoctions, and Lohochs to make one spit; there is a Syrup and a Conserve made of these Flowers. The following Pilsan is very good for a dry Cough.

Pour four Quarts of boiling Water upon four Handfuls of the Leaves of *Colts-foot*, and three Pugils of the Flowers; two Pugils of the Tops of *Hyssop*, one Ounce of *Raisins*, and three Spoonfuls of *Narbonne Honey*; boil it a little; take the Pot from the Fire; cover it, and strain the Pilsan when it is cold. *Martyn's Tournefort*.

Hillierius informs us, that he restored many Children labouring under an Atrophy, only by the Leaves of *Colts-foot*, which he ordered to be cut down like other Pot-herbs, made up with a farinaceous Puls, fried in Butter like Sage, and used for a long Time, as we are informed by *D. Same ex Observat. Hieron. Reusneri. Raii Hist. Plant.*

2. *Tussilago*; Alpina; rotundifolia; glabra. *C. B. P.* 197. *M. H.* 3. 130. *Boerb. Ind. alt. Plant. Vol. 1.*

This Plant, in all Probability, is called *Tussilago*, from the Word *Tussis*; because it is good for a Cough. It receives the Name *Bechion* from the Greek Word βήχης, which corresponds to the Latin *Tussis*. It is called *Ungula Caballina*, or *Calceum Equinum*, because its Leaf, in Shape, resembles an Horse's Foot. It receives the Name of *Farfara*, or *Farfarella*, because its Leaves resemble those of the white Poplar, or appear to have

Meal sprinkled on them. It is, also, called *Filius ante Patrem*, because in the Months of *February* and *March*, when its Leaves have not appeared, it suddenly sends forth its Flowers, which hardly continue above two Days.

The Flowers, Roots, Stalks, Leaves and Fruit, are used in Medicine. They are of a penetrating, heating, and lenitive Quality; for which Reason they incide thick and pituitous Humours contained in the Lungs; and are good in Coughs, Consumptions, and Pleurifies. The recent Leaves bruised in a Mortar, and boiled with double the Quantity of Sugar, are excellent in a Phthisis, an Exulceration of the Kidneys, a long-continued ulcerous Gonorrhœa, and Disorders of the Stomach arising from Phlegm. *Colts-foot* is accounted alexipharmic, because it excites Sweat. The recent Leaves, applied externally, are beneficial for the Cure of Ulcers and Inflammations. Its Juice drank for some Days, is said to cure quartan Agues. *Hist. Plant. adscript. Boerhaav.*

TUSSIS. A Cough.

A Cough and an Asthma are so nearly related, and so frequently complicated, that the one can hardly be without the other: A Cough, then, is a violent Expulsion of a foreign Matter from the Bronchia of the Lungs, by means of their increased contracted, or convulsive Force, accompanied with a violent Expiration.

As I intend to give the History and Pathology of this Disorder, I shall begin with a Description of those Parts, which most immediately concur to the Production of a Cough, that thus we may discover the true Essence of this convulsive Motion, and be able to understand its several Differences. The primary Seat, then, of a Cough is, that large Canal, by means of which we breathe, and which is divided into two Parts, the *Aspera Arteria*, and the *Bronchia*: The latter of these are distributed through the Substance of the Lungs, whilst the former reaches from the Lungs to the Fauces. The Origin of the *Aspera Arteria*, which is called the *Larynx*, is a Canal, beginning at the Fauces, and form'd of five Cartilages, connected by three Membranes, the exterior of which is nervous; that in the Middle fleshy, and the internal glandular: The superior Aperture of this Canal is call'd the Glottis, which is covered with a cartilaginous Covering, called the *Epiglottis*: The *Larynx* is succeeded by a cartilaginous and membranous Tube, call'd the *Aspera Arteria*, which, being wider at the Beginning, and gradually becoming narrower, in its Progress to the Lungs, is, near them, divided into two Ramifications, call'd the *Bronchia*. These Ramifications are divided into numberless other, which are distributed through the Substance of the Lungs, and which consist of cartilaginous Segments, and contractile Membranes; then they terminate in small Vesicles, like Clusters, which adhere to these small bronchial Ramifications, and constitute the most considerable Part of the Lungs.

All these pneumatic Canals, from Beginning to End, are surrounded with a Membrane, consisting of longitudinal and annular Fibres, and furnish'd with many excretory Ducts and Glands; the Number, Situation and Figure of which is exquisitely delineated by *Morgagni advers. Tab. XI. Fig. 1.* These Glands pour into these Canals, subservient to Breathing, a thin, roscid, mild, and lymphatic Humour, which, also, in all Probability, drops from those Glands, which externally adhere to the *Epiglottis*, the *arytenoide Cartilages*, and the Extremities of the *Bronchia*. These Glands are represented by *Heister* in *A. N. C. Cent. 7 & 8. Ob. 63.* Provident Nature has bestowed on these Ducts, Vessels of various Sorts, especially of the arterial Kind, distributed from the bronchial Artery: This bronchial Artery takes its Beginning from the Trunk of the *Arteria Magna descendens*, above the Arch of the superior inter-costal Arteries; and is divided into three Ramifications, one of which runs externally upon the *Aspera Arteria*, whilst the other two distribute many Ramifications through the whole Substance of the Membranes of the Trachea, and of the pulmonary *Bronchia*. These Ducts, also, receive venous Vessels from the bronchial Vein; the Ramifications of which, being propagated in the same manner with the Arteries, at last, by a large Ramification, terminate in the Trunk of the *Vena cava descendens*, and the *Azygos*: Both these Species of Vessels were discovered and are accurately described by *Mr. Ruysch*, in *Epist. 4.* And lastly, the Ducts, subservient to Respiration, receive Nerves from the *Par vagum*, and the inter-costal Nerve.

The primary Use and Function of these Canals is, to afford a commodious Ingress of the Air to the Lungs, and a free Return of it thence, in order to facilitate the Circulation of the Blood, so necessary to Life and Health: For this Purpose, these Ducts are furnish'd, first, with a large Number of Glands, not for secreting an excrementitious Liquor, for this Part is by no means naturally destin'd for the Excretion of the Sords, but the Design of those Glands is, to discharge a thin Lymph, which, by a mild and continual Lubrication, cherishes the Membranes of the Trachea and *Bronchia*, lest they should become dry by the continual Action of the Air in Inspiration; and, when this Lymph has perform'd its Office, it is resolv'd into Exhalations, and carried off with the expired Air, after the manner of cutaneous Perspiration. For the same Purpose, these Ducts, subservient to

Respiration

Respiration, are furnish'd, secondly, not only with nervous Coats, exquisitely sensible, but, also, with muscular Coats, possess'd of longitudinal and annular Fibres, by means of which they are capable, not only of constrictory, but, also, of a dilatatory Motion, which provident Nature has bestow'd on all the nervous and membranous Ducts of the Body, as we find in the Ureters, the biliary Ducts, the Stomach, and Intestines: Nor is this Motion without its peculiar Advantages; for it greatly contributes, not only to promote the Ingress and Egress of the Air, but, also, to the Secretion of the Lymph from the above-mentioned Glands, and to the Circulation of the Blood, through the bronchial Vessels. But, thirdly, tho' these membranous Ducts are not of themselves sufficient for the Business of Respiration, yet they are so necessarily connected with the other Parts, subservient to the same Purpose, such as the Lungs, the Pleura, and the Diaphragm, together with the intercostal and abdominal Muscles, that 'tis almost impossible, that when one Part acts, all the others should not, also, begin to act.

When these Parts are in their due and proper Condition, Respiration is carried on in a natural Manner: But when any one of them recedes from its natural State, Respiration is forthwith injured and perverted. Without considering other Disorders of Respiration, we only now treat of a Cough, which always arises from a preternatural State of some of the above mentioned pneumonic Canals. I don't hesitate to affirm, that what in the Stomach produces a Vomiting, in the Bronchia gives rise to the Cough; that is, an Inversion of their tonic Motion; for I am of Opinion, that under a Cough, the bronchial Ducts, being constricted from their inferior to their superior Parts, force their contain'd Air quickly and impetuously upwards, as if they were to expel something foreign: But since, when these are disorder'd, 'tis necessary the other Parts of the Breast destin'd to Respiration, and intimately connected with these, should, in consequence of the strict Consent between them, become Partakers of their inordinate Motions, it is sufficiently obvious, why the more violent a Cough, which is a preternatural Expiration, is, the more violently the Breast, the Abdomen, and the whole Body should be convulsed. In consequence of this Consent, it also frequently happens, that when the Stomach, the Diaphragm, the Oesophagus, the præcordial Nerves, and those distributed from them, or the pituitary Membrane of the Nostrils, are, by any Cause, vellicated, the Ducts, subservient to Respiration, being by that means affected, a Cough is excited.

If, therefore, a spasmodic, and convulsive Disorder of these Ducts, is the remote Cause of a Cough, their Vellication must necessarily be the immediate Cause of such a convulsive Disorder, and consequently of the Cough. Every Cough, therefore, has its Seat in the Breast, tho' its productive Causes are not always lodg'd there. And this Diversity of remote Causes, which concur to the Production of a Cough, produces a great many different Species thereof.

Nor do we intend to consider that Species of Cough, which, as a terrible Symptom, accompanies various Disorders: Of this Kind is a Phibiscical Cough, which arises from a Colligation of the Vesicles, and bronchial Vessels, produced by an Ulcer of the Lungs; and, consequently, has, for its Foundation, a Solution of Continuity. In this Species of Cough, an ulcerous and foreign Matter is not conveyed through the pulmonary Glands, but thro' the corroded, lacerated, and gaping Cavities of the Bronchia; and, by vellicating the nervous Membranes, produces the Cough. To the Class of symptomatic Coughs, also, belong those which happen in Astmas, Peripneumonies, Pleurifies, a Scirrhus, and Impostumation of the Lungs, or an Inflammation of the Diaphragm and Liver. Of the symptomatic Kind, are, also, those Coughs, which arise from a Wound inflicted in a Nerve or Tendon about the Neck; as, also, those which succeed Convulsions, Epilepsies, and hysterical Disorders: For these Species of Coughs are, for the most part, produced by a Vellication of the Bronchia, only induced by Consent, since the Cause of the Disorder is lodg'd in a Place more or less distant from the Præcordia.

Nor shall we, at great Length, consider that Species of Cough, which arises from a Falling of any foreign solid or fluid Body into the Aspera Arteria, thro' the Aperture of the Glottis: These Accidents are very terrible, and often fatal, by inducing a sudden Suffocation, memorable Instances of which are found in *Marcelli Donati Hist. Med. Mirab. Lib. 3. cap. 7.* To this Species of Coughs, belong those produced by Tumors, Stones, and other preternatural Things, adhering to the Aspera Arteria and Bronchia. Hence Authors, of undoubted Veracity, assure us, that Stones, and other small Bodies, like Hail, have been thrown up in Coughing. See *Alexander Trallian, in Lib. 5. Paulus Aegineta, Lib. 3. Cap. 28 and 31. and Pet. Borelli, in Obs. Cent. 1. Obs. 67.*

Nor are we to consider those Coughs, which are produced by the Fumes of Lead, Metals, and, especially of acid Minerals long inspired with the Air; to which the Diggers and Refiners of Metals, Porters, who use much Litharge, Masons, and those who deal much in Quick-lime, are principally subject, since these Coughs are easily accounted for; because, when the me-

tallic, and almost corrosive Particles, enter the Ducts subservient to Respiration, and possess'd of an exquisite Sensibility, they insinuate themselves intimately into them, and constrict them violently, which proves the Cause of a dry Cough, complicated with an Asthma.

Nor does that slight and short Cough, which, in Persons otherwise sound, is produced by a Suppression of Transpiration, come under our Consideration. Coughs of this Kind are produced, when Persons, especially of pituitous Habits, suddenly expose their Heads or Breasts, when warm, and under a gentle Perspiration, to Cold; in consequence of which the acrid Serum, repelled from the Skin, falls upon the Aspera Arteria and Bronchia. Coughs of this Kind are, also, produced, in old Persons, when they sleep in cold Places, especially in the Night-time; or freely expose themselves to a cold and Winter Air: This Species of Cough is, also, a Concomitant of a Coryza; and is soon cured, either by keeping warm, or, perhaps, more expeditiously, by the Exhibition of proper Diaphoretics. To this Species of Disorders, also, belongs the Falling of the Mucus from the Nostrils to the Fauces and Larynx: But this Mucus is, however, easily expectorated in the Morning.

But we shall treat, at greater Length, of that Cough which is a primary Disorder, violently affects the whole Body, and racks the Patient, not only by its Vehemence, but, also, by its long Continuance: This we call a rheumatic Cough; for it has for its Cause an inverted Motion of the Humours, from the Circumference of the Body to the Lungs, and a Congestion of them therein. Nor is it ever free from Horripilations, and febrile Commotions, principally observable towards the Evening. This Species of Cough is either dry or moist, according to the Habit of the Patient. The moist Species is incident to sanguineous and phlegmatic Persons; to Persons whose nervous, fibrous, and muscular Parts, are soft; to those who abound with serous and pituitous Juices, such as Women rather than Men; and Infants, Children, and old Persons, rather than young and adult Persons: But the dry Cough is more incident to hypochondriac, scorbutic, and cachectic Persons; to such as are of a rigid Habit of Body; to those who have a weak nervous System, disposed to spasmodic Motions; and to such as abound with an acrid Serum.

The highest Degree of a rheumatic Cough is called a convulsive or Chin-cough. This rages with such unbounded Fury, and agitates the Patient with such Concussions, that he frequently seems to be in Danger of a Suffocation. Sometimes, especially in the Beginning, it is dry; and none, or at most a very small Quantity of thin Serum, more or less acrid, is expectorated: At other times it is moist; and then, after violent Efforts, a sublivid, and often an highly tenacious Mucus is expectorated. Under this Species of Cough the Patient's Extremities become cold; he is costive, discharges thin Urine, and his vital Juices, being too copiously and impetuously conveyed to his superior Parts, fill his Head and Breast: Hence, under the Paroxysm, his Face is red, his Veins tumid, and his Pulse strong and quick; his Eyes are prominent, and discharge Tears; his Eye-lids swell, and sometimes, when he sneezes, the Blood bursts from his Nostrils. Sometimes, also, the small Vessels of the Lungs are ruptured, and a Spitting of Blood succeeds. This Species of Cough is frequently accompanied with an Hiccup, and troublesome Vomiting; some Patients involuntarily discharge their Fæces and Urine; and others, especially Children, in coughing, contract Hernias; or, according to *Hippocrates in Aph. 46. Sect. 6.* become gibbous. In *M. N. C. Cent. 1. Obs. 1.* we have a memorable Instance of one of the Bodies of the Vertebrae of the Back, broken through the Middle, by the Vehemence of a Cough of this Kind. It is, also, to be observed, that an Apoplexy may be produced by the excessive Vehemence of a Cough. And *Boyle* observes, that by such a Cough a sudden Loss of Memory, as, also, a Palsy of the Hands, and other Limbs, were produced.

The material Cause of a convulsive, or Chin-cough, resides in the thin, acrid, and almost caustic Humour deposited on the highly sensible Coats of the Ducts destin'd for Respiration. This Humour is either lodged only in the Larynx, and Aspera Arteria, in which Case it produces a continual and ungrateful Titillation of the Fauces; or it is more deeply seated in the pulmonary Bronchia; and then it excites the most atrocious Efforts of Coughing. This Humour is generated by the acrid and impure Sordes, either not sufficiently expelled to the Surface of the Body, or repelled by any Cause, especially Cold, and consequently congested in the Lungs. Hence we learn, that a Suppression of the Itch, Tinea, and Achors of the Head, the Gutta Rosacea, as, also, a too hasty Consolidation of Ulcers, or the Repelling of the Gout, are succeeded by a Chin-cough: And there is no other Reason, why the Measles are preceded, accompanied, and succeeded with long continued Coughs of this Kind, than that the acrid morbillaceous Matter is retired to the Ducts subservient to Respiration, and violently vellicates them. See *A. N. C. Dec. 3. Obs. 11.*

A rheumatic and convulsive Cough, arising from a common Cause, some Fault of the Air, for Instance, frequently rages epidemically in various Countries. It seizes principally in the Au-

sum and Winter, especially if the Winter, after a South Wind, and a moderate Warmth, suddenly becomes intensely cold, and nipping North Winds begin to blow. But this Cause only excites a rheumatic Cough in impure Habits; whilst in others it only, for the most part, produces one of the catarrhus Kind: Hence we generally observe, that the Cause of these epidemic Coughs is an Air replete with pernicious ferid Clouds, or impregnated with other acrid and often poisonous Particles, the Causes, also, of exanthematous Fevers; which Particles, when drawn in with the Air, not only produce a violent Cough, but also Aphthæ, which render it more intolerable, than it would have otherwise been. Besides, in the Spring these several Coughs sometimes rage epidemically, and are accompanied with an Hoarseness; and at this Season they derive their Origin from the saline and acrid Exhalations contained in the Air, by the Heat of the Sun raised from the Earth after Winter, and insinuating themselves through the Glands of the Ducts subservient to Respiration. See *Hippocr. Epidem. Lib. 6. Sect. 8. Sennertus de Febribus, Lib. 4. Cap. 17. Sydenhami Opera.*

Let this suffice, with respect to the highest Degree of a rheumatic Cough, the Causes of which are generally external. But there are other Coughs, which are more properly called rheumatic, which proceed from an internal Cause, and which are not only long protracted, but, also, very uneasy to the Patient, since they are complicated with rheumatic Pains of the Breast and Head, Hemicranias, Tooth-achs, Punctures of the Sides resembling a Pleurisy, and Defluxions of an acrid Matter from the Head to the Fauces. Coughs of this Kind are principally incident to cachectic and scorbutic Constitutions, in consequence of a Suppression of oedematous Swellings of the Feet, or any other Tumors: And this preposterous Practice brings on so violent a Cough, and Difficulty of Breathing, that the miserable Patient seems to be in Danger of being suffocated. Coughs of this Kind are very common in old Persons, who abound with impure Juices; and in such Patients it is produced by external Cold, admitted principally to that Region of the Back, where the first Vertebra of the Loins, and greater Mesenteric Plexus of Nerves, are found; nor is it owing to any other Cause than a Conveyance of the acrid Serum from the external Parts of the Body to the Lungs. This Species of Cough, in pituitous and old Patients, who live delicately, use a sedentary Life, and have neglected usual Venesection, is frequently of the moist Kind, and produces a critical Effect; since by its means the whole Mass of Blood and Humours, though not without considerable Uneasiness, is excellently purged from the Redundance of impure Serum; so that when the Cough is removed, the natural Strength returns, and the Sleep, Appetite, and perfect Health, are restored.

To the Class of rheumatic Coughs, also, belong those of the stomachic and hypocondriac Kinds: The Cause of the former of which is lodged in the Stomach; and that of the latter, deeper in the Hypochondria and Intestines: And both these Species of Coughs are produced, partly by a Consent of the Nerves, and partly by a rheumatic Defluxion of Serum on the Lungs. The stomachic Cough discovers itself by peculiar Signs, which are a Nausea, a Cardialgia, a Loss of Appetite, a defective Digestion, a Sense of Weight in the Stomach: And the first Stimulus to Coughing is perceived about the Pit of the Stomach. The hypocondriac Cough, on the contrary, is accompanied with Flatulences, Spasms of the Intestines, and the other hypocondriac Symptoms. The stomachic Cough is produced by a bilious, acrid, and acid Sordes, which is lodged in the Stomach, especially in its superior Orifice, and in the Oesophagus, and which vellicates the nervous Coats of these Parts, which are closely connected with the Ducts subservient to Respiration. Hence this Species of Cough is accompanied with frequent Vomiting. It is most troublesome, when the Stomach is empty; and is familiar to those labouring under a Tertian, especially of the continual Kind, as we are informed by *Hippocrates in Epidem. Lib. 2.* The hypocondriac Cough is produced by thick, impure, and serous Humours, by the Force of Spasms, and abdominal Flatulences, conveyed to the Breast and Lungs; and it is the more violent, if an excessive Cold, or the Influence of exorbitant Passions, have preceded, as the occasional Causes. But it is to be observed in general, that every periodic Cough derives its Origin from Sordes lodged in the Stomach, or rather in the Duodenum.

We must, also, consider an habitual Cough, which may be justly called one of the catarrhus and rheumatic Kind. This Species principally depends on a Relaxation of the Glands situated in the Fauces, Palate, and Larynx, and is protracted for many Years with a continual Expectoration. It is accompanied with a defective Digestion, and a successive Consumption of the whole Body. It is incident to serous Patients, to those who lead a sedentary Life, and to such as are addicted to Lucubrations, and drinking of Wines.

As for the Prognostics of Coughs, a dry Cough generally passes into one of the moist Kind, which, when of long standing, becomes habitual, spoils the Digestion, and induces a cachectic State, and a slow Fever. A moist Cough, passing into

one of the dry Kind, and leaving a Sense of Weight in the Breast, subjects the Patient to the Danger of a putrid or an hectic Fever, according to *Lommius, in Observ. Medicin. Lib. 2.* Convulsive and Chin-coughs are dangerous in Infants, because they easily induce a Suffocation, especially in difficult Dentition, and the Measles. In Children they produce Distortions of the Back, and Hernias; in pregnant Women, Abortion; and in Adults, a Spitting of Blood, and a Phthisis. That Coughs of this Kind are, also, sometimes productive of a sudden Suffocation, we are inform'd by *Willis, in Pharm. ration. p. 2. Sect. 1. Cap. 6.* and *Hildanus, Cent. 2. Obs. 68.* Coughs succeeding a Scirrhus of the Lungs, or any other of the Viscera, are generally incurable by any Remedies whatever. And those Coughs which are produced by a Repulsion of exanthematous Eruptions, cease when these Eruptions are again recalled. *Lommius*, in the Part above quoted, informs us, "That all Coughs, which deprive the Patient of Sleep, are bad; and that such as are long-continued, frequent, violent, and accompanied with a Defluxion, that is, habitual, rheumatic Coughs, are productive of bad Effects." Coughs happening to dropical Patients, are bad Signs, according to *Hippocrates in Sect. 6. Aphor. 35.* On the contrary, a moderate Heat in the Night, an equable Sweat or Moisture over all the Body, a copious Discharge of Urine, a due Solubility of Body, tranquil Sleep, and an easy Expectoration, are sure Signs, that the Cough is in a fair Way of being removed.

The CURE.

In the Cure of a rheumatic Cough, four Intentions are to be pursued: For, in the first Place, we are to correct the peccant Matter, dispose it for Elimination, and, if necessary, promote Expectoration. Secondly, we are to derive the Afflux of the Serum from the Præcordia, and invite it to other more proper Emmunctories. Thirdly, we are to check the exorbitant Commotions of the Body. And, fourthly, we are to restore Strength to the weakened Parts.

If, therefore, the Bronchia are obstructed by a tenacious, coagulated Mucus, this Mucus is to be incided, resolved, and softened. This Intention is excellently answered by the resolvent Roots; the best of which are, the Root of Florentine Orris; the Root or Fæcula of Arum; and, what is very powerful in fusing tough and tenacious Humours, and procuring Expectoration, five of six Grains of Squill-root, exhibited with a little Nitre, as also Oxy-mel of Squills, Essence of Gum Ammoniac, anisated Spirit of Sal Ammoniac, Milk and Flowers of Sulphur, and Sperma Ceti.

An highly thin, acrid and saline Humour is disposed for Elimination, by incrassating Medicines, and such as correct the Acrimony of the Lymph. These Intentions are excellently answer'd by Decoctions prepared of Barley, Shavings of Hartshorn, Roots of Vipers-grass, and Liquorice; by Cremor of Barley and Water Gruel, prepared with sweet Almonds, and Currants; by a Decoction of Turneps, prepared with Sugar; by Jellies of the Horns of Deer, and other Animals; by Broths prepared of Fleashes and Milk; by Lohochs of the Lungs of Foxes; by the Syrups of Poppies, Colts-foot, and Mountain Diacodium; by Sperma Ceti exhibited with Milk; and, above all, by Oil of sweet Almonds recently expressed without Fire, and exhibited either alone, or with Syrup of Maiden-hair, or Julap of Roses. Thus,

Take of the Oil of sweet Almonds, and of the Syrup of Maiden-hair, each one Ounce; of Sperma Ceti, three Drams; and of Saffron, fifteen Grains: Mix all together; and exhibit.

The same Intention is, also, excellently answered by Infusions of Paul's Betony and Hyssop; the Flowers of Mallows, Elder, red Poppies, Sage and Daisies; the Roots of Liquorice; the Seeds of Fennel; and the Bark of Sassafras. When a catarrhus Cough is become habitual, and accompanied with Loss of Appetite, and a Consumption, the Cure is to be attempted by Asses Milk, or Whey, or the *Selteran* Waters, mixed with an equal Quantity of Milk.

When there is too great a Congestion, Afflux, and Defluxion of Serum in the Breast, as happens in a very moist, pituitous and long-protracted Cough, it is expedient to derive this Serum from the Præcordia and pulmonary Vessels, partly by the Anus, the proper Emmunctory of mucus Sordes, and partly by the Skin, the proper Outlet of the thinner and more subtle Humours. As in all Coughs, so more especially in those of the convulsive and rheumatic Kind, a due Solubility of Body is of great Advantage, for procuring which, correcting the Acrimony, and mildly, though copiously, and, without any Trouble or Loss of Strength, evacuating the serous Sordes, I have found none of all the Laxatives more effectual than Magma, two Ounces of which may be exhibited in some proper Infusion or Decoction, and the Dose repeated as the Situation of the Patient requires. I generally dissolve two Ounces of it in eight Ounces of the Water of Paul's Betony, or the Flowers of the Egyptian Thorn, with a gentle Heat, adding afterwards one Dram of the *Terra foliata*

foliata Tartari, and a few Drops of the Oils of Cedar, Anise, or Mace. *Gabelboverus*, also, in *Cent. 4. Obs. 7.* recommends several Ounces of Manna to be exhibited for the successful Cure of Coughs. The same Laxative may, also, be exhibited in an Infusion of Paul's Betony, or in Milk. This Intention is, also, answered by solutive Syrup of Roses, recently extracted Cassia, the laxative Decoctions, and Raisins impregnated with Rhabarb. And if the Stomach cannot bear these Laxatives, the redundant Serum and Mucus are, by Clysters, to be evacuated through their proper Emunctory, which is principally in the large Intestines.

By restoring the equal Circulation of the Blood through the whole Body, and especially by inviting the Serum to the subcutaneous Glands, its Afflux to the Præcordia is prevented. This Intention is answered by warm pectoral Infusions of the Flowers of Mallows and Violets, the Leaves of Hyssop and Sage, the Seeds of Fennel and Anise, and Cinnamon. These Infusions are to be drank in the Morning in Bed, observing a proper Regimen, and keeping the Body always in an equal Heat. The same Intention is, also, answered by the diaphoretic and bezoardic Powders prepared of Crabs-eyes, the Pulvis-Marchionis, prepared Amber, diaphoretic Antimony, or, in its stead, *Poterius's* Antihætic, uncalcin'd Hartshorn, and Cinnabar, with the Addition of a few Grains of the express'd Oil of Nutmegs, or of the Oil of Saffron. To these Powders we may, also, add Flowers of Sulphur, if the Cough is produced by a Retropulsion of Achors, or an Itch.

The third Intention is to check the exorbitant Commotions of the Body; which is to be attempted in the very Beginning, for fear of greater Danger. Among the Remedies answering this End, the best is Saffron, which is highly friendly to the Breast, and its Extract with the bezoardic Powders. Some, also, order Oak-moss to be added both to the Powders, and to the Decoctions. The same Intention is, also, answered by the *Pilule de Syrace* mix'd with the *Pilule Aloephanginae*, and exhibited in the Evening, ordering at the same Time Expectorants; such as Oil of sweet Almonds, and Sperma Ceti. This End is, also, answered by the anodyne mineral Liquor, or the Liquid Laudanum of *Sydenham*, united with Spirit of Hartshorn, so much extol'd by *Boyle*. If the Disorder does not yield to these, we are to have recourse to more powerful Anodynes; such as the *Pilule de Syrace*, the *Pilule Starckeyanzæ*, the *Pilule Wildergansii*, and Preparations of the Theriaca.

Nor for allaying the Vehemency of a Cough are we to condemn Topics; since, in a Cough of the phthisical Kind, great Relief is afforded by applying the Emplastrum Diasulphuris Rulandi to the Breast. In a convulsive, or Chin-cough, excellent Effects are produced by anointing the Præcordia with the Unguentum potabile rubrum, mixed with Spirit of Wine. The anointing the Sides of the Thorax with the pectoral Ointment in the Pharmacopœia Augustana, is of great Efficacy in allaying Coughs, mitigating Pains of the Breast, and promoting Expectoration. In all rheumatic Coughs I have, from long Experience, found the following Plaister very beneficial.

Take of the best Myrrh, Bdellium, and Amber, each half an Ounce; of Sperma Ceti, human Fat, Wax, and red Lead, each two Ounces; of Venice Soap, three Drams; of Saffron, one Dram; and of Camphire, half a Dram: Mix for a Plaister to be applied to the Breast, Neck, and Spine of Back.

In the Decline of the Disease, the fourth Intention is to be pursued, and the weakened Parts corroborated, because Coughs easily recur. For this Purpose I recommend the Essence of Amber, and the Spirit of Hartshorn mixed with Tincture of Tartar, or the anodyne Liquor; with the Addition of a few Drops of the Oil of Sassafras-wood; as, also, the Essence of Cascarella. I have often observed happy Effects produced by a few Drops of the Balsam of Life, exhibited with Extract or Tincture of Saffron. In the End of the Disorder, in order to corroborate the Stomach, I generally prescribe the following Electuary:

Take of the Conserve of red Roses, two Ounces; of the Conserve of Rosemary, one Ounce; of prepared Amber and Nutmegs, each three Drams; and of the Syrup of Citron or Orange-peel, a sufficient Quantity.

Crato, in *Lib. 37. Consil.* extols Amber with a Decoction of Raisins, and very justly, since that Medicine is possessed of a corroborative, and, at the same time, of a laxative Virtue. But the genuine Essence of Amber is far preferable to Amber itself. The Stomach is, also, excellently corroborated by old and generous *Falernian Wine*, which the Antients, and especially *Pliny*, greatly extolled. *Hippocrates*, in *Lib. de Vita Acutorum*, greatly recommends the Use of sweet Wine for old Persons. Water of Paul's Betony, and of Hyssop distilled with Wine, and edulcorated, adding a little Saffron, is very proper

for the same Purpose. In order to strengthen the Glands of the Fauces and Bronchia, from which the Humour continually falls down to the Larynx, and Aspera Arteria, I have always, with great Success, sprinkled upon the Head a Powder prepared of Amber, Benjamin, Mastich, Flowers of Roman Chamomile, and Clove-gilly-flowers. The Mouth is, also, to be frequently gargarised either with *French Brandy*, or with a Decoction of Sage, Hyssop, and Red-rose-flowers, in Wine.

In preventing and curing Coughs of all Kinds, a proper Regimen is of the last Importance. The Air, then, ought to be neither too cold, nor too hot; but in such a State as to preserve the Body in a perpetual breathing Sweat. The Night Air is particularly hurtful; and bad Effects are produced by cold, cloudy, and rainy Weather; as, also, by excessive Heat; but, most of all, by Northerly Winds. Those who are frequently subject to Coughs and Catarrhs, ought to abstain from such Aliments as are high-salted, indurated in the Smoak, too strongly seasoned with Aromatics, as, also, such as are acid and austere; because these render the Blood, and its Serum, acrimonious and impure. They are, also, to have a due Regard to what they drink; for no Malt Liquor is proper, and much less acid Wine. For Drink, such Persons ought rather to use Barley-water, or Puffin, or a Decoction prepared of the *China Root*, Raisins, and the Roots of Vipers-grass, or Hydromel, which *Gabelboverus* orders in the following Manner:

Take of despumated Honey, four Ounces; of Spring Water, three Quarts; of Liquorice, five Drams; six Figs; of the Seeds of Fennel, and Roots of Burnet, each two Drams; of the Flowers of Mallows, one Handful; of the Flowers of Sage, and Violets, each one Pugal; and of Cinnamon, two Scruples: Mix, and boil to the Consumption of half a Quart.

Scorbutic Patients, afflicted with a Cough, may, for Drink, use pure Spring-water, not too cold, either alone, or corrected with sweet Almonds, or fine Wheaten Bread. The common People, with great Success, in violent epidemical Coughs, pour boiling Water upon the Bran of Wheat, and drink the Infusion when cold.

The Prevention of Coughs, in a great measure, depends upon a proper Use of the Non-naturals. Those Persons who, when recovering from a Cough, drink Wine, expose themselves to the Cold, or indulge themselves in exorbitant Passions, are forthwith seized with a more violent Cough, than that which they before laboured under. Old Persons ought to guard against Cold of the Feet, and especially of the Back; and because in the Winter rheumatic Disorders are easily contracted, the Head, the Neck, and the Regions of the Præcordia and Loins, as, also, the Feet, in old Persons, who are subject to a Cough, are to be carefully fortified against the Cold with warm Linen and Cotton, in order to preserve a moderate and equal Perspiration; for when any one of these nervous Parts is affected and penetrated by the Cold, especially by Northerly Winds, all the rest, in consequence of their mutual Consent, are preternaturally affected. It is, also, necessary to keep the Body sufficiently soluble, and the Perspiration free; for which Purpose moderate, but frequent Exercise is healthy during fine Weather. Those who are pietiboric, ought at stated Times, and especially about the Equinoxes, to use Venesection, or Scarification. When the Cough is epidemical, we ought to guard against its Tyranny by a proper Regimen of light Aliments, and preserving the Excretions free and uninterrupted.

In all Coughs we are to deal cautiously with Expectorants, sweet Substances, and incrassating Decoctions; lest, as is customary among the common People, by exhibiting these alone, and in too large Quantities, we should still farther relax the Lungs, and excite a greater Afflux of Humours to them. And in stomachic and hypochondriac Coughs, we ought totally to abstain from such Medicines, because they spoil the Digestion, and by that means pave the Way for a Cachexy and Dropsy.

A Chin-cough, arising from a Retropulsion of exanthematous Eruptions, indicates the recalling of the peccant Matter to the Surface of the Body. For this Purpose nothing is more effectual than *Æthiops Mineral*, or Flowers of Sulphur internally exhibited with diaphoretic Antimony, or the bezoardic Powder, especially at Night: Nor, besides Frictions, and Bathing of the Feet, is there a more effectual Remedy for drawing the Serum from the Breast, than Vescicatories; provided the Delicacy of the Age would but permit their Use. In the Chin-coughs of Children it is of considerable Service to anoint the Soles of the Feet with Hogs-lard.

In Coughs arising from a Repression of cedematous Tumours of the Feet, besides Clysters, inciding and diaphoretic Medicines, and such as derive the Motion of the Humours from the Breast, gentle Diuretics are of singular Service; such as the Tincture of Tartar, the tartarised Tincture of Amber, and the visceral Elixir mixed with the pectoral Elixir. But acrid saline Substances, and drastic Diuretics, are not to be used, because they

they carry off the sweet Serum; whereas the others carry off the acrid Serum through the urinary Passages.

I have frequently seen a long-continued Cough, arising from a scorbutic State of the Blood and Humours, cured by an internal Exhibition of Whey and Powders prepared of Crabs-eyes, the Pulvis Marchionis, prepared Amber, diaphoretic Animony, Extract of Saffron, and the aqueous Extract of Calcarilla, interposing a Laxative of Rhubarb, and ordering for common Drink cold Water, corrected with sweet Almonds; or the *Selleriean* Waters, mixed with *Moselle* Wine; or a Decoction with Water of such temperate Species as have a Tendency to depurate and sweeten the Blood. I have, also, towards the Evening, exhibited the Pilulæ Aloephanginæ, mixed with the Pilulæ de Stryace, and ordered the Application of the above-described Plaster to the Breast.

If the Cough is excited by the acid and bilious Sordes in the Stomach, nothing is more efficacious than Absorbents; such as Crabs-eyes, and prepared Amber mixed with the Arcanum duplicatum, with the Addition of a few Drops of the Oil of Mace: To these we are, also, to join mild Laxatives prepared of Manna and Rhubarb. The stomachic Cough of Children is removed by a gentle Emetic, if nothing contraindicates that Practice.

In a Cough arising from an Obstruction of the Viscera of the Abdomen, which is called an hypochondriac Cough, those Medicines are most proper, which recal the suppress'd Excretions of Blood. Happy Effects are, also, produced by Antispasmodics, and bathing the Feet: But nothing is so effectual as tepid mineral Waters, mixed with Goats, or rather Asses, Milk, and drank with a proper Regimen.

A long-continued Cough, tending to a Consumption, is most effectually cured by Asses Milk, provided the Body is duly prepared for drinking it: And this Method of Cure succeeds best, if long Journeys, Changes of Air, and Corroboratives, are joined with it: Nor, if the Cough is very moist, has any thing a more happy Influence, than a proper Abstinence from Aliments, especially from Flesh.

It is always expedient to mix Anodynes, such as the Pilulæ de Cynoglossio, and the Pilulæ de Stryace, with equal Quantities of Laxatives, such as the Pilulæ Aloephanginæ, or the Pilulæ Cratonis de Succino, and to exhibit them in Conjunction at Bed-time; for when Anodynes are exhibited alone, I have observed, that the Cough is suppress'd, and an Asthma produced by a too great Congestion of Humours, and a Weight about the Breast.

As an intense Cold, so also an excessive Heat, is prejudicial to Persons afflicted with a Cough. Hence Infusions, if excessively hot, exasperate the Cough; for which Reason all the Liquors the Patient drinks ought to be only tepid.

Venefections are beneficial to plethoric Persons, whose Veins are tumid and prominent, like Cords; or who have their Excretions suppressed: They are, also, an excellent Preservative even in old Persons past the seventieth Year of their Age; nor can we be without Venesection, when the convulsive Cough is so intolerably violent, that in Children, and young Persons, a Rupture of some of the Vessels is to be dreaded from it. *Sydenham* affirms, that he cured a Cough of the convulsive epidemic Kind, only by Venesection, repeated Purging, and Vescicatories.

Celsus, in *Lib. 4. Cap. 4.* when treating of the Cure of a Cough, gives the following Directions: "The Patient is to drink a Decoction of Hyssop every other Day, and read with a loud Voice, which is first hindered by the Cough, but the Reading afterwards overcomes the Cough; then the Patient must walk, use Exercise, and long-continued Frictions of his Breast; then he is to eat fat Figs. In a moist Cough, strong Frictions, especially of the Head, with hot Substances, are beneficial: A poach'd Egg may, also, be exhibited, with the Addition of a little Sulphur; and for Drink he is to use tepid Water." And I must own, I am of Opinion, that it is best to follow the Advice of *Galen* in curing a Cough, who tells us, that we are to prescribe Things light, simple, and most familiar to Nature, rather than compound active Medicines, prepared in the Shop. Thus I remember, among the common People, to have seen an obstinate chronic Cough, not only alleviated, but, also, totally removed, by a Decoction of dried Turneps; or of the Stalks of red Colewort; or of the Bran of Wheat, mixed with Sugar. If the Matter of the Fluxion is thin, copious, and acrid, which is known from the Redness of the Eyes, the Titillation and Sense of Biting in the Throat, and the saltish Taste in the Mouth, the Juice of *Spanish* Liquorice, despumated Honey, an inspissated Mass consisting of Jelly of Hartshorn, and Decoction of Liquorice, and Oil of sweet Almonds, mixed with Syrup of Poppies, and gradually swallowed, afford immediate Relief. No less common and excellent a Remedy, is the Yolk of a new-laid Egg, mixed with Sugar-candy and Saffron, drinking after it a Dish or two of Bohea Tea; as, also, fresh Butter, with Sugar and Milk, with an Infusion of Paul's Betony, and the Flowers of red Poppies.

When the Epiglottis, the first and primary Instrument of the Voice, is so relaxed, and deprived of its Tone, that the Voice becomes hoarse, it is expedient frequently to gargarize the Mouth

with a Gargarism prepared of nervous Ingredients; such as the Flowers of Rosemary, Lavender, and common Chamomile, the Tops of Thyme and Origanum, Sage and Myrrh, boiled in Wine: Externally I use, with great Success, to apply to the Larynx a Bag consisting of the above-mentioned Ingredients, with an Addition of Amber and Stryax Calamita. *Hippocrates*, in *Lib. de Visu Acutorum*, would not have hoarse Persons purged; but rather chose to cure the Coldness and Moisture of their Constitutions, by drying their Heads, and the other Parts affected, by the Use of Topics. *Hoffman*.

In 1675, the Season having continued unusually warm, like Summer, till towards the End of October, and being suddenly succeeded by cold and moist Weather, a Cough became more frequent, than I remember to have known it at any other Time; for it scarce suffered any one to escape, of whatever Age or Constitution he were, and seized whole Families at once; nor was it remarkable only for the Numbers it attacked, (for every Winter abundance of Persons are afflicted with a Cough) but, also, on account of the Danger that attended it. For as the Constitution both now, and during the preceeding Autumn, eminently tended to produce the epidemic Fever, and as there was now no other Epidemic existing, which by its Opposition might, in some measure, lessen its Violence, the Cough made Way for, and readily changed into, the Fever. In the mean while, as the Cough assisted the Constitution in producing the Fever, so the Fever on this Account attacked the Lungs and Pleura, just as it had affected the Head even the Week preceding this Cough; which sudden Alteration of the Symptoms occasioned some, for want of sufficient Attention, to esteem this Fever an essential Pleurisy or Peripneumony, though it remained the same as it had been during this Constitution.

For it began now, as it always did, with a Pain in the Head, Back, and some of the Limbs; which were the Symptoms of every Fever of this Constitution, except only that the febrile Matter, when it was copiously deposited in the Lungs and Pleura, through the Violence of the Cough, occasion'd such Symptoms as belong to those Parts. But nevertheless, as far as I could observe, the Fever was precisely the same with that which prevailed to the Day when these Coughs first appeared; and this, also, the Remedies, to which it readily yielded plainly, shewed. And tho' the pungent Pain of the Side, the Difficulty of breathing, the Colour of the Blood that was taken away, and the rest of the Symptoms that are usual in a Pleurisy, seemed to intimate, that it was an essential Pleurisy; yet this Disease required no other Method of Cure, than that which agreed with the Fever of this Constitution, and did no ways admit of that which was proper in the true Pleurisy. Add to this, that when the Pleurisy is the original Disease, it usually arises betwixt Spring and Summer; whereas the Distemper we now treat of, began at a very different Time, and is only to be reckoned a Symptom of the Fever which was peculiar to the present Year, and the Effect of an accidental Cough.

Now, in order to proceed in a proper manner to the particular Method of Cure, which Experience shews to be requisite both in this Cough, and in those which happen in other Years, provided they proceed from the same Causes, it is to be observed, that the Effluvia, which used to be expelled the Mass of Blood by insensible Perspiration, are struck in, and thrown upon the Lungs, from the Stoppage of the Pores by Cold; and, by irritating the Lungs, immediately raise a Cough. And the hot and excrementitious Exhalations being by this means detained in the Habit, a Fever is easily raised in the Mass of Blood, when either the Vapours are so copious, that the Lungs are unable to expel them, or the Inflammation is increased by the adventitious Heat arising from the Use of over-heating Remedies, or too hot a Regimen, so as suddenly to cause a Fever in a Person who was already too much disposed to this Disease. But of whatever Kind the Stationary Fever be which prevails the same Year, and at that particular Time, this new Fever soon assumes its Nature, and becomes of the same Kind, and is every-where subservient thereto; tho' it may still retain some Symptoms belonging to the Cough, whence it arose. In every Cough, therefore, proceeding from this Cause, 'tis sufficiently apparent, that Regard must not only be had to the Cough, but, also, to the Fever that so readily accompanies it.

Relying on this Foundation, I endeavoured to relieve such as required my Assistance by the following Method: If the Cough had not yet occasioned a Fever, and other Symptoms, which, as we said, usually accompany it, I judged it sufficient to forbid the Use of Flesh-meats, and all Kinds of spirituous Liquors; and advised moderate Exercise, and the Benefit of the open Air, with a Draught of a cooling Pectoral Pisan, to be taken between whiles. These few Things sufficed to relieve the Cough, and prevent the Fever, and other Symptoms, usually attending it. For by the Abstinence from Flesh, and spirituous Liquors, along with the Use of cooling Medicines, the Blood was so cooled, as not easily to admit of a febrile Impression; and by means of Exercise those hot Effluvia of the Blood, which strike in, and occasion a Cough, as often as the Pores are stop'd by sudden Cold, are commodiously

modicly exhaled in the natural and true Way, with Advantage to the Patient. *Sydenham.*

TUTENAG. Speitre, or Zink.

TUTIA. Turry. See CADMIA.

TYLLI GRANA. The Seeds of the lesser *Ricinus*. *Castellus*, from *Gregor. Hymman.*

TYLOMA, *τύλωμα*. A Callus.

TYMPANIAS. *τυμπανίας*. The same as TYMPANITIS.

TYMPANITES. A Tympany.

In no Part of the human Body are so great Disorders produced by Flatulences, which are nothing but Vapours and Exhalations, possessed of an expansive and elastic Quality, than in the Cavities of the Stomach and Intestines; where being, as it were, pent up in a Prison, they violently distend these Canals which are possessed of Sensation and Motion, destroy their Tone, produce great Pain and Anxiety, and by these means greatly injure all the several Functions of the Body.

If the Stomach is preternaturally distended by Flatulences, very violent Symptoms are produced, such as intolerable Uneasiness about the Præcordia, accompanied with a Difficulty of Breathing, an Oppression of the Breast, Inquietude, a Coldness of the Extremities, and an uncommon Loss of Strength. In this State the Patient's Countenance becomes contracted and livid, and sometimes the Fauces are so contracted, as to render Deglutition difficult; and Palpitations of the Heart, Flushings, Dimness of Sight, Vertigos, and other Symptoms of the like Nature, are brought on. Flatulences of this Kind, are known by a Tumour about the Pit of the Stomach, towards the Right Side, which is often discovered by the Touch; as, also, by a frequent and violent Eructation, by which the Symptoms are considerably mitigated.

The Causes of the terrible Symptoms produced by a violent Inflation of the Stomach, are these: 'Tis certain from Anatomy, that the Stomach is an highly nervous Part, and that the Ramifications of the eighth and intercostal Pairs of Nerves, are copiously distributed thro' its nervous Coat; and as these Ramifications run off to all the nervous Parts of the Body, and such as are subservient to Sensation and Motion, 'tis not to be wondered at, if, in consequence of this close Communication, violent Disorders should, also, be produced in all the other sensible Parts of the Body. And these Symptoms are accompanied with an Expansion of the Stomach, by which the expansive and constrictory Motion of the Diaphragm, on which Respiration depends, is hindered. And since by these means the Cavity of the Thorax is lessened, the Lungs cannot duly expand themselves. Hence the free Passage of the Blood from one Ventricle of the Heart to the other is obstructed.

The Intestines, which are furnished with the same Kind of Coats and Ramifications of Nerves and Blood-vessels, with the Stomach, are, also, subject to similar flatulent Distensions; and, if the Whole of the large and small Intestines are violently distended by Flatulences, there is not only a Tumour of the whole Abdomen, but, also, a considerable Pain, especially about the Navel, where the small Intestines are situated, accompanied with an obstinate Costiveness, Inquietude, Anxiety, Refrigeration of the Extremities, and Loss of Strength; in which Case the Disorder is called a flatulent Colic. When this Flatulence is not transitory, but protracted for some Months or Years, an hard Tumour of the Abdomen is produced, which, when struck, sounds like a Drum, and is for that Reason called Tympanites; a Disorder hardly curable by any Medicines, especially when accompanied with an *Ascites*, and an Extenuation of the superior Parts.

The proximate Cause of these Flatulences is twofold; the one, which is material, consists in the easy and copious Generation of these Flatulences, and is owing to Aliments, especially of a tenacious mucid Kind, and such as are fit for inducing Flatulences, such as Pot-herbs, the several Species of Radish, Pease, Beans, dry'd Sea Fishes, Summer Fruits, all fermentable and sweet Aliments, Preparations of Honey, Ale prepared of Wheat, farinaceous and wheaten Aliments; Paps, especially prepared of Miller; and the Fat of Mutton, especially if cold Liquors are drank after them. But it is to be observed, that these Aliments, whether moist or dry, are injurious in proportion to the Quantity taken.

The other, which is the formal Cause of these Flatulences, consists in a considerable Weakness of the peristaltic Motion of the Intestines, which depends upon an obstructed Influx of the nervous Fluid, and arterial Blood, into the Intestines; for as this peristaltic Motion, when in its natural State, not only resists the Vapours generated in the Intestines, in consequence of their Moisture, but, also, without any Trouble, propels and eliminates them, so, on the contrary, this Motion, when the Tone and Strength of the Viscera are weakened, and their Membranes rendered flaccid, becomes incapable of any longer performing its proper Office. Besides, the Aliments, before they are convey'd to the Intestines, remain for a considerable Time in the Stomach, and are resolv'd into Vapours. Hence, in the adjacent *Duodenum* and *Jejunum*, on account of the Acrimony,

there is a particular Spasm produced, which constricts the Right Orifice of the Stomach or *Pylorus*, and by Constrict the Left; so that the Vapours cannot be discharg'd, but violently exercise their elastic Force on the nervous Coats of the Stomach; and when this Distension is removed by a greater Influx of the nervous Fluid, and the Tone of the Stomach is for a time restored, the Flatulences are with great Impetuosity discharged upwards.

As it is so, we may easily conceive, that whatever depraves the peristaltic Motion, also contributes to the Generation of Flatulences. Hence the Reason is obvious, why Men of lax, spongy, and phlegmatic Habits of Body, Women, old Persons and Infants, are highly subject to Flatulences. And because, under an inordinate constrictory and dilatatory Motion of the Intestines, the Vapours continually generated in the Intestines, cannot be freely transpir'd, but produce a great deal of Mischief, we may easily understand why, by exposing the Abdomen and Limbs to the Cold, by walking upon cold Floors, immersing the Hands in cold Water, or drinking cold Liquors when the Body is over-heated in the Summer-time, flatulent Colics, and Gripes of the lower Abdomen, are so frequently produced; for all these Things have a remarkable Tendency to weaken the Tone of the Intestines.

But other more powerful Causes, by destroying the Tone of the Intestines, concur to the Production of Flatulences; for 'tis certain from Experience, that dangerous Inflations of the Abdomen are principally incident to those whose Strength is impaired, and their Blood and nervous Fluid impoverished by a previous Disease; such as a Dysentery, an acute, a variolous, or a chronical intermittent Fever; excessive Hemorrhages, Wounds, the hæmorrhoidal Discharge, Abortion, difficult Labours, or an immoderate Evacuation of the Menes or Lochia, especially if the Patients, without paying a due Regard, to their Strength, eat too copiously. Hence we may learn, what Judgment is to be form'd, when, as it often happens in acute and dangerous Disorders, about the critical Times, uneasy Distentions of the Præcordia, accompanied with Rumblings, and a Fluctuation of Flatulences in the lower Abdomen, are perceiv'd; for they are generally a Sign of Death, not only because they indicate an extreme Loss of Strength, but especially because they in a great measure obstruct Respiration. These Inflations of the Abdomen, proceeding from a total Destruction of Strength, are by the Liquors and Medicines taken by the Patient, whilst alive, generally so increased, that the Abdomen is, by proper Means, to be compress'd, for fear it should break.

'Tis, also, certain from Experience, that violent and long-contin'd Spasms of the *Prima Viæ* are succeeded by a want of Tone and a Flaccidity of the Intestines, a Weakness of their peristaltic Motion, and violent Inflations. Hence a spasmodic Colic is frequently succeeded by one of the flatulent Kind; which, when not rightly treated, and when anodyne Portions are exhibited in order to mitigate the Pain, frequently and easily degenerate into a Palsy. For the illustration of this, *Wesper's* Experiments in *Tr. de Cicuta aquatica*, in order to demonstrate the Effects of Poison, are of singular Service; for by exhibiting Arsenic to Dogs, he first observed violent Vomings, and spasmodic Contractions of the Stomach. Then the Stomach, becoming flaccid, was afterwards incredibly distended by Flatulences. This is, also, evinced by dissecting those who are taken off by any acrid Poison, which operates by producing violent Spasms; for, upon making an Incision in their Abdomen, their whole Intestines, by means of the Flatulences, burst forth in such a manner, that there is hardly a Possibility of replacing them. From a due Consideration of what has been said, we may clearly understand, why acrid Purgatives, and Emetics, Dysenteries, and spasmodic and hæmorrhoidal Colics generally leave a remarkable Weakness of the *Prima Viæ*, which greatly tends to produce Inflations of the Abdomen.

It frequently happens, that both Spasms and Flatulences afflict the Intestines; and whilst the Spasms contract their Coats, the Flatulences contained in their Cavities, attempt a violent contrary Expansion. This principally happens, when the flatulent Matter is possessed of a certain bilious Acrimony, as is observable in sucking Children, who are violently rack'd by Gripes and Rumblings, which discover themselves externally by their vehement ExploSIONS, whilst the Fæces of the Patient are green by the Admixture of an acid corroding Substance, which, like *Aqua Fortis*, consumes fine Linen Cloths. The same is, also, observed, when tenacious mucous Fæces mixed with Bile, and resembling the Yolk of an Egg, are discharged: The thick and mucous Humours, which are in Infants raised in a moist and mucilaginous Cough, and which, by being swallowed, obstruct the Stomach and Intestines, are, also, frequently the Cause of copious Flatulences, accompanied with Gripes.

Having already considered those Flatulences which equally distend the whole Intestines, we now come to treat of those particular Inflations and Spasms, which, in the Course of our Practice, we have observed only to afflict certain Parts of the Intestines. It is, the more, to be observed, that Disorders of this Kind are principally

principally incident to hypochondriac Patients, and hysteric Women; when, for Instance, the Stomach is inflated without any Expansion of the Intestines. This principally happens, when the Spasm possesses the *Duodenum*, or Beginning of the *Jejunum*. The *Ileum*, also, without any Inflation of the Stomach, and large Intestines, is, in Children afflicted with Worms and *Hernias*, frequently found greatly expanded, and painful towards the Navel. And in hypochondriac Patients, and those labouring under the *Hæmorrhoids*, when the *Intestinum Rectum*, and inferior Part of the *Colon*, in consequence of the Stagnation of the Blood, and its obstructed Discharge thro' the hæmorrhoidal Veins, are violently constricted, and rendered narrow by the Spasms, the superior Part of the *Colon*, and especially its Flexure in the Left Side, and about the lumbar Region, is greatly expanded. Hence arises a pressory Pain, which is commonly, tho' falsely, ascribed to some Disorder of the Spleen. It sometimes, also, happens, that the Flexure of the *Colon* in the Right Hypochondrium, about the Liver, and Region of the Stomach, is greatly elevated, and produces troublesome Symptoms; the Cause of which is, in my Opinion, lodg'd in the Beginning of the *Colon*, which is situated in the Confiner of the *Os Ileum*, the Valves of the *Colon*, and the *Intestinum cæcum*, since this Part of the *Colon* is deprived of its due Tone, and systaltic Motion; in consequence of which the Excrements are forced upwards, a Circumstance which greatly contributes to the Generation of Flatulences; and not only a spasmodic Stricture, and subsequent transitory Inflation seize a certain Portion of the Intestines, and are the Causes of the most violent Symptoms, but, also, a certain Narrowness, Hardness, or Callusity, arising from various Causes, affect particular Parts of the Intestines, and, by perverting their whole peristaltic Motion, give Rise to the most violent Symptoms. But Causes of this Kind can be only discovered by dissecting the Patients after their Death. See *Walsberi Dissert. de Angustia Intestinarum*.

We now come to consider that Species of Flatulence, in which there is not a transitory, but a permanent and continual Inflation of the Abdomen, and which is called a Tympanites; which *Celsus*, in *Lib. 3. Cap. 12.* defines, "A Tumor and vehement Distention of the Abdomen, accompanied with frequent Rumbings, produced by the Motion of the Flatulences." This Disorder discovers itself by the following Signs: For the most part, after a Pain and Tension about the Left lumbar Region, and an obstinate Costiveness, the Abdomen is violently distended. Flatulences and Eructations are now and then violently discharged upwards: The Pulse is unequal, the Appetite languid, and the Thirst increased; and, about the *Præcordia* and Navel, a sensitive, corroding, and punctory Pain, accompanied with a certain Heat, is perceived. The Patient can lie on neither of his Sides, nor does the Tumor ever subside, when he lies on his Back.

The Cause of this continual uneasy and dangerous Inflation of the Stomach and Intestines, is by *Willis*, *Bagliivi*, and others of the Moderns, justly ascribed to be a spasmodic Stricture of the intestinal Coat, by the long Continuance of which, the Pores and Passages of the Intestines, through which the Vapours transpire, are straitened and obstructed; so that the retained Vapours, by their elastic Force, in consequence of an Admixture of the Air, afterwards produce a violent Distention of the Intestines. And that the genuine Cause of this Disorder consists in such a Stricture, seems to be pretty plainly indicated by *Hippocrates*, in *Aphor. 11. Sect. 4.* where we are told, "That those who have Gripes in the Abdomen, and violent Pains about the Navel and Loins, which can neither be removed by Medicines, nor any other Means, fall into a Tympanites, or dry Dropsy."

This Disorder is both by the Antients and Moderns, accounted a Species of Dropsy, because, especially as a Symptom, it is often complicated with an Ascites; whereas, nevertheless, it is absolutely a distinct Disease, and accompanied with no Extravasation of Water in the Abdomen. Thus *Dolæus*, in *Encyclopæd. Lib. 3. Cap. 9.* informs us, That in a Girl of nine Years of Age, who died of a Tympanites, he found not one Drop either of Serum or Water in the Abdomen. And in *M. N. C. Decur. 1. Annot. Obs. 85.* we have an Account of a Boy who died of a Tympanites; and, upon dissecting his Body, his Stomach was found preternaturally distended with Flatulences, and contained a small Quantity of a viscid Humour: But his whole Intestines were pellucid, and in many Places, when prick'd, collaps'd; without the least Appearance of a single Drop of Water. *Valesius* also, in *Comment. in Lib. 4. Hippocrat. de Victus Rat. in acut. and Collatus in Adversar. Lib. 2. cap. 40.* observes, That, upon the Aperture of a similar Carcase, a very inconsiderable Quantity of Water was discharged; but a gross Flatulence being evacuated, the whole Abdomen suddenly subsided. *Platerus*, also, in *Obs. 53.* informs us, that in a Boy who died of a Tympanites, the Intestines were so distended, as in some Places to be as large as a Person's Thigh, and that, being broken by Compression, they discharged the Fæces with a considerable Impetuosity. But in other Parts they were so contorted and wreathed up, that neither the Flatu-

lences, nor the Excrements, could find any Passage downwards. A large Number of oblong Worms were, also, found in his Intestines.

A Tympanites without a Dropsy, is most incident to Women, especially after Labour; when the Lochia are either too scantily discharged, or by Cold, or the Influence of Passion, totally suppressed. The same happens when after Labour, the Abdomen not being duly compressed and swathed, any Error in Regimen is committed; or, when in the Beginning of their Lying-in, the *Præmia Viæ* are not sufficiently purged from their Sordes: For, in these Cases, Women have generally for a long time, an hard and inflated Abdomen, accompanied with considerable Uneasiness, Difficulty of Breathing, Anxiety, and obstinate Costiveness. I have often observed the same Symptoms produced by a difficult Labour, if the Secundines have not been totally removed; or if, in extracting them, the Uterus has been wounded. Imprudent Treatment after Abortion, also, lays a frequent Foundation for a Tympanites; the Cause of which is, in my Opinion, a perverse and disturbed Motion of the Blood, through the Vessels of the Uterus and Intestines: For if, in consequence of any Disorder of the Uterus, the natural Motion of the Blood, or its critical Excretion, are not duly carried on, by reason of the subsequent Stagnation, the free Circulation of the Blood will be, by Consent of the Parts, hindered thro' the abdominal Viscera, especially through the Intestines, where a Portion of the Blood or Serum remaining, distorts and constricts their tender and sensible Fibres, and renders them harder and more tense; so that the Perspiration of the Intestines cannot afterwards be freely and duly carried on. When this happens, the Flatulences are generally rather the Effect than the Cause of the Tympanitis.

These Inflations of the Abdomen are frequently observed in Infants and Children, especially if they are afflicted with Worms; as, also, after the Measles and Small Pox: And unless Misfortunes of this Kind are seasonably encountered with proper Remedies, the superior Parts become extenuated, and an hectic Heat supervening, the Patients die. By the Voracity, also, of Infants and Children, when the Stomach and its Tone are weak, Tumours of this Kind are often produced, and various Causes may concur to their Production; for as the Measles, Small Pox, or a continual Fever, in consequence of the Loss of Strength, and the Exhaustion of the spirituous Fluid, are succeeded by a considerable Weakness of the peristaltic Motion; and since, by reason of the Dyscrasy of the Blood and Humours contracted by the Disease, the Coats of the Intestines and Peritonæum, are spasmodically constricted by an acrid Serum, which hinders the Discharge of the Flatulences, it easily happens that a Tympanites is produced. Sometimes, also, there is an infarction of the mesenteric Glands, and lacteal Vessels, which not transmitting the chylous Juice, accumulates Sordes in the *Præmia Viæ*; and these Sordes are resolved into Flatulences, and partly carried off by Stool.

But not only hysteric Women and Infants, and Children labouring under Worms, or spent by previous Disorders, are subject to a Tympanites; but, also, those who are inclined to that Species of Dropsy called an Ascites: The principal Cause of which seems to be, that in such Patients, where the abdominal Viscera, especially the Liver, do not duly perform their proper Offices, the Bile becomes peccant both in Quantity and Quality, and is therefore deprived of its Qualities necessary for Digestion; for the Bile is a genuine and natural preservative Medicine: For by its alkaline, sulphureous, and saponaceous Principle, it not only promotes the intimate Solution and Digestion of the Aliments; but, also, by its moderately sulphureous and balsamic Bitterness, it gently stimulates and corroborates the Coats of the Intestines; by which means it preserves the peristaltic Motion entire; for when this Motion is perverted or disturbed, the whole Oeconomy of the vital Motions, together with the salutary Excretions, is, also, disturbed and perverted, as we generally observe in hypochondriac Patients.

For the Illustration and Confirmation of this Doctrine, let us consider a very singular Case, related in the Philosophical Transactions of the Royal Society of London in the Year 1730. N^o 414. A Soldier received a Wound; of which, after the Appearance of various Symptoms, he died on the seventh Day: Upon laying open his Body, no internal Part was found hurt, except his Gall-bladder; which being gently perforated, in the Bottom, was collaps'd and flaccid, in consequence of a total Effusion of the Bile: Though no Signs of the slightest Inflammation appeared in any of his Viscera, yet his Intestines were highly inflated, distended, and tinged of a yellow Colour by the discharged Bile, which was effus'd all over the Abdomen. The external Wound was dry, and free from Tumor; nor, during the Patient's Life, was it accompanied with any Sign of Inflammation; so that it is surprising that a Wound apparently so slight, unaccompany'd with a Fever, or any other violent Symptoms, should so soon prove mortal.

Among the memorable Symptoms afflicting this Patient, we ought first of all to consider the Inflation of his Abdomen, which

which immediately succeeded the Wound, and remained without any considerable Increase or Decrease, and even appeared after Death; so that the Patient appeared to have been affected with an Ascites, or a Tympanites. Yet during this Distention of his Intestines, which was the Cause of the Inflation of his Abdomen, he could discharge no Eructations nor Flatulences either upwards or downwards; and though he eat and drank sufficiently, yet he had not one Stool through the whole Course of the Disorder, nor could his Body be rendered soluble by the strongest Purgatives and Clysters: His Urine was in small Quantity, yellow, as it were tinged with Saffron, and without any Sediment. But nothing of a febrile Heat was observable in all his Body; for his Pulse was not quick, but rather equal and strong, till a little before his Death, when it became unequal: Nor was his Tongue black, hard, and rough, as it generally is in Fevers, especially of the inflammatory Kind; but it was dry, for want of a due Quantity of Saliva. And though, during his Disorder, he slept but about half an Hour at very distant Intervals, and could not be disposed to sleep by the Use of Opium, yet the smallest Signs of a Delirium did not appear; and thus he died without any more violent Symptoms, except an Hiccup and a gentle Effort to vomit, which, seized him the Day before he died.

From this Description of the Case, and its concomitant Symptoms, we shall draw something for the Establishment of our Doctrine. Hence, then, we learn, how much a laudable Secretion of the Bile contributes to the Preservation of Health, and how much its Defect or Peccancy tend to induce the most violent Disorders, especially a Tympanites; for in this Patient's Case, no other Cause than the Effusion or total Defect of the Bile, produced the Inflation of the Intestines; by which, being distended beyond their proper Sphere of Elasticity, they totally lost their peristaltic Motion; and when this Motion was destroy'd, not only the natural Motion of the Chyle through the lacteal Vessels was hindered, but, also, the Secretions in the other Viscera weaken'd, and at last destroy'd. Hence Death must of Necessity soon ensue.

As for the Prognostics of a Tympanites, it is justly reckoned a dangerous Disorder, since the Patients are oftener observed to die than recover. Hence *Puerarius in Additam. ad Burnettii Thesaur. med. Tom. 2. Lib. 8.* ingenuously confesses, that he never knew a Patient afflicted with a Tympanites recover; because this Disorder indicates an obstinate Constriction of the Pores, an hardly dissoluble Incarceration of the Flatulences, and a violent Distention of the Parts, accompanied with a Privation of their Tone. When a Tympanites is accompanied with, or supervenes a Dropsy, it hardly admits of a Cure, because the violent Distention of the abdominal Muscles and Intestines, by compressing the Veins, renders the Circulation of the Blood very languid and weak, produces a costive State, and suppresses Perspiration. A simple Tympanites, when inveterate, and not quickly cured, in Women and Infants, passes into an obstinate chronic Disorder, which proves mortal.

On the contrary, that Distention of the Abdomen, which is called a flatulent Colic, is not naturally very dangerous, and is easily cured; when, by proper internal and external Remedies, the lost Tone of the Intestines is restored. But if Spasms concur to produce the Flatulences, as it generally happens in Women whose Menes are not duly discharged, or in those who labour under a Stone in the Ureters, or biliary Ducts; or, if spasmodic Symptoms supervene Efforts to the hæmorrhoidal Discharge, then the Cure is somewhat more difficult, because the Force and Operation of the Medicines ought partly to allay the Spasms, and partly to restore the Tone of the Intestines; which Intentions, however, seem inconsistent with each other.

In curing Flatulences of the Stomach and Intestines, the Physician's principal Intention is, to promote a Discharge of the Vapours by the Anus, and to attenuate, and gently carry off by Stool the tough and viscid Matter which contributes to the Generation of the Flatulences. For this Purpose, we are, first of all, to use derivative, discutient, and evacuating Clysters; such as those prepared of Hyssop, Clary, Flowers of common and Roman Chamomile, Tops of Yarrow, Juniper-berries, and the larger carminative Seeds, with Veal-broth, adding a sufficient Quantity of Sal-gemma, Sal-ammoniac, or Epsom Salt, and the Oil of Chamomile. But it is to be observed, that one or two Clysters are not sufficient for removing the Disorder; but they are to be frequently repeated.

With these we are to interpose Laxatives, possessed of a carminative, and at the same time of a somewhat anodyne Quality; such as the balsamic Pills, prepared in my Method, or that of *Becher and Stahl*. Or if the Patient is strong, and the Inflation a real Tympanites, I generally exhibit two Parts of the *Extractum Panchymagogum Cralli*, with one Part of the *Pilule Willegansii*, or of the *Pilule Starckii*, or *Pilule de Styrate*, in some not very spirituous carminative Water.

After these, we are to use Medicines possessed of a moderately balsamic Principle, and a volatile, oleous, and aromatic

Salt, commonly called Carminatives: But the Operation of these Medicines is not to be so explained, as if, by their subtle, volatile Salt, they attenuated the Matter of the Flatulences, and rendered it thinner; but rather, because, by invigorating the Tone and Systole of the intestinal Coats, they hinder the Stagnation of the Flatulences, move them from their Seat, and render them more capable of being easily eliminated, or prevent the Generation of new Flatulences: For as the destroy'd peristaltic Motion of the Stomach and Intestines is the principal Cause of Flatulences, so all Medicines, which have a remarkable Virtue in strengthening these Parts, are most proper for the Removal of this Disorder. The best and most approved of this Kind, are Powders prepared of the Roots of Wake-Robin, Zedoary, and white Burnet; the digestive Salt of *Sylvius*, or vitriolated Tartar; Cumin-seeds; the Tops of the lesser Centaury, and dried Orange-peel, each one Dram; and six Drops of the genuine Oil of Chamomile, or of the Oil of Cedar, or of the Oil of Orange-peel; to which, if there is a Suspicion of an Acid lodged in the *Prime Viæ*, we may commodiously add Crab-eyes.

To this Class of Medicines we may refer the following in a liquid Form.

Take of the Essence of Orange-peel, and of the carminative Essence of Zedoary of *Wedelius*, each half an Ounce; of the Spiritus Nitri dulcis, or of any anodyne Liqueur, and of the Spiritus de Tribus, each two Drams: Mix, and exhibit forty Drops for a Dose:

Take of the carminative Water of *Dorncrellius*, of the Waters of common Chamomile and Zedoary prepared with Wine, each one Ounce; of the Spiritus Nitri dulcis, of the pure Oil of Caraway, eight Drops, mixed with two Drams of Sugar.

Nor are we to neglect external Remedies, such as Liniments apply'd by way of Ointment to the whole epigastric Region: The principal Ingredients of these Liniments ought to be, boil'd Oils of Chamomile and Rue, Oil of Nutmeg, and Peruvian Balsam; with which we may mix, the Oils of Juniper, Caraway, Anise, or Cumin: But, instead of all others, we may use the Liquid Balsam of Life, which, when mixed with three Parts of Hungary Water, and applied by way of Ointment to the Abdomen, or laid on with a warm Linen Cloth, is found of great Efficacy.

If a flatulent Distention of the Abdomen proceeds partly from a long-continued spasmodic Stricture of the intestinal Coats, and partly from their preternatural Tension and Hardness, and if these are supported by the Stagnation and bilious Acrimony of the Humours, we are to deal very cautiously with hot, aromatic, volatile, and sulphureous Carminatives, such as the distill'd ethereal Oils of Juniper and Caraway; since these, by increasing the Elasticity of the Flatulences, and the Turgescence of the Humours, render the Inflation more obstinate, and the Symptoms more dangerous; for they excite a preternatural Heat, accompanied with an insatiable Thirst, an Anxiety, and great Difficulty of Breathing. Hence *Fienus*, in *Lib. de Flatibus, Cap. 12.* mentions a Girl miserably afflicted with a Tympanites, who, by the Use of an hot Electuary prescribed by the Physician for the Distension of the Flatulences, fell into a new, and at the same time so large an Inflation, that the whole Breast was surprisingly distended, and the miserable Patient soon after died. To this Purpose, also, *Helmot.* in *Lib. de Flatibus*, tells us, "That if Flatulences are Vapours and Exhalations, Pain and Flatulences must be more excited, and a Distention of the Parts produced, by the Exhibition of hot Substances; because, by this means, the Vapours must be increased, and the Pains and Distentions multiplied."

All Purgatives, even Preparations of Sena and Aloes not excepted, are carefully to be avoided, because they dry the Intestines, and render their Fibres tense, constricted, and hard. But they are still more injurious and dangerous, if, by repeated Doses of them, any one attempts the Evacuation of the Flatulences. We rather recommend Preparations of Manna, with Cream of Tartar dissolv'd in Whey, or the *Sedlitz* Waters; nor omitting, at the same time, emollient, and gently discutient Clysters.

When Spasms copiously generate Flatulences, which frequently happens in a plethoric hæmorrhoidal State, to young Persons and Adults, Preparations of Nitre, join'd with detergent and refrigerating Salts, are most safe. Good Effects are, also, produced by the mineral Liqueur; Citron-juice, with Salt of Wormwood; Oil of sweet Almonds; Emulsions of the Four cold Seeds; the *Pilule Sybii*, and the *Pilule Starckii*: Venesection is, also, sometimes beneficial. Hence *Carolus de la Font*, Professor in the Academy of Avignon, in *Dissert. de Hydrope Tympanite*, gives us an Instance of a Person by him cured of a Tympanites, by Tincture of Roses, impregnated with a few Drops of the Spirit of Vitriol, and a Julap, prepared of the Waters of Purslane Succory,

Succory, and Water-Lilies, together with the Syrups of Water-Lilies and Poppies, Sal Prunellæ, and Spirit of Sulphur; interposing now-and-then a temperate Emulsion, or a Decoction of Barley, with Syrup of Lemons, and Sal Prunellæ; and an Opiate composed of mineral Crystal, Crabs-eyes, Vitriol of Mars, and Conserve of Roses.

When these violent and obstinate abdominal Distentions happen after difficult Labours, Lying-in, Abortion, or an irregular Discharge of the Menstrues, the Pills made in Imitation of those of *Becher*, of bitter Extracts and temperate resinous Gums, with a small Portion of Aloes, exhibited in a proper Order, and in due Doses, are of singular Efficacy. The same happy Effects are, also, produced by temperate balsamic Elixirs, prepared of the same Ingredients; for these, by their mild, sulphureous, and balsamic Virtue, restore the lost Tone and Strength of the Stomach and Intestines, and produce happy Effects, especially when the Bile is defective, or too strong, provided they are not exhibited in too large Doses: But if the Patient is too long habituated to them, they, in Process of Time, by drying the intestinal Coats, produce preternatural Straitness in particular Parts, and often bring on fatal Symptoms.

Clysters are of great Efficacy, not only to prevent Flatulences, but, also, remove them, both in their Beginning and State. But if the Spasms exert their Tyranny in the small Intestines, Clysters are not sufficient; but we are to prescribe Preparations of Manna; Cassia; Epsom Salt; Sedlitz Salt; and Goats Whey, prepared with Cream of Tartar, or vitriolated Tartar. The proper Use of hot and cold medicinal Waters is, also, of great Use in hypochondriac Patients afflicted with Flatulences.

Among the external Remedies for violent Inflammations of the Abdomen, the Antients most esteemed dry Fomentations; and, especially Sand dried by the Fire, or the Heat of the Sun. Hence they recommend this Remedy in various Parts of their Works. See *Celsus*, Lib. 3. Cap. 21. And *Pliny*, in *Histor. natural.* Lib. 21. Cap. 6. informs us, "That Sea-sand, especially when small, and rendered hot by the Sun, is of singular Service in drying the Bodies of dropical Patients." *Celsus Aurelianus*, in Lib. 3. *Tard. Pass.* Cap. 8. is, also, of Opinion, That warm Fomentations of Sand ought to be used in dropical Cases. But, as other Things successfully used by the Antients, are by us neglected, so, also, this Practice is discarded, though it seems to have a pretty effectual Tendency to answer its Intention: For the warm Sand, not only by the Compression occasioned by its Bulk, checks and confines the Inflation, but, also, by its dry Heat attenuates the peccant and stagnant Humours, so as to restore a free Circulation of the Juices: By this means, also, the Pores of the Skin are opened, and Perspiration assisted. It is a common Practice at present to apply dry and hot Oats, included in a Bag, to the Regions of the Stomach and Navel; because Oats are possessed of a dissolving and discutient Virtue. Besides these Measures, I have, also, known the Soap-plaster well impregnated with Camphire, and soften'd with Oil of Henbane, afford considerable Relief when applied to the Abdomen. The Galbanum-plaster is, also, little inferior to it in Efficacy. *Frederic Hoffman*.

TYMPANUM. The Drum of the Ear. It, also, imports a Part of a surgical Machine, in *Oribasius*, de *Machamentis*, Cap. 4.

TYPHA.

The Characters are;

It has the Appearance of the Arundo; the Flower is male, consisting only of naked and very dusty Stamina, which are closely compacted into a slender Spike. The Ovaries, which are collected into a very close Spike, are closely lodged under the former Spike, and are of a thin Contexture, and furnished with a Multitude of Filaments: Both Spikes are extended in one continued Length in the Figure of a Club.

Boerhaave mentions three Sorts of *Typha*; which are,

1. *Typha*; palustris; major. C. B. P. 20. *Theat.* 337. *J. B.* 2. 539. *Tourn. Inst.* 540. *Boerb. Ind. a.* 2. 167. *Typha*. *Offic.* Ger. 42. *Emac.* 46. *Raii Hist.* 2. 1312. *Synop.* 3. 436. *Typha palustris maxima*. *Park. Theat.* 1204. **CATS-TAIL, or REED-MACE.**

This Plant is found in Marshes, and on the Brinks of Rivulets. The only Part of it used is its Flower, which, when mixed with well-washed Hogs-lard, cures Burns. *Dale*.

2. *Typha*; palustris; clavâ gracili. C. B. P. 20. *Theat.* 340.
3. *Typha*; palustris minor. C. B. P. 20. *Theat.* 341.

Boerb. Ind. alt. Plant.

TYPHA AROMATICA. See *ACORUS VERUS*.

TYPHLINIDIA. τυφλινίδια. A Sort of pickled Fish mentioned by *Oribasius*, *Collect. Medicinal.* L. 2. C. 58.

TYPHODES, τυφώδης πυρετός. The same as **TYPHOS**.

TYPHOMANIA, τυφωμανία, from τυφός, and μανία, in *Galen's Exegetis*, is expounded by μικρὸν ἐκ φρενιτικῆς καὶ λιθάρης πάθημα, "a Disorder complicated of a Phrensy and a Lethargy." But in some Copies of *Galen* it is written τυφλομανία, as well as in 4 *Epid.* where they read ἀλλὰ τυφλομανία, to which Place *Galen* seems to have an Eye in his *Exegetis*; though it be there read in the Nominative Case. We, however, read τυφωμανία, in both Places, and understand it of an Affection compounded

of a Phrensy and a Lethargy; in which the Patients are delirious, and labour under a sleepy Coma, from a Mixture of Bile and Phlegm, according to *Galen*, *Com. 1. in Proorrh.* where he says, ἐνὸς μὲν ἐν ὅτῳ ἀρχὴ τέλει ἵπτε παρρησίου καὶ τὸ κῶμα διατείνεται μικρὸν, &c. "When a Delirium and Coma continue to the End, I call it a Disorder complicated of a Phrensy and a Lethargy, which by some is called τυφωμανία, as in *Hippocrates*, de *Morbis*." From hence arises a Suspicion, that the Books de *Morbis*, as now extant, are not entire; and that *Galen*, in his *Exegetis*, had a Regard to some Passage therein which is now wanting; for we find no mention of *Typhomania* in these Books, nor in the Book de *Morbis internis*. This Affection, thus complicated of a Phrensy and a Lethargy, may be called a lethargic Madness or Delirium, or a mad and delirious Lethargy, according to the Author of the *Definitiones medicæ*; though for τυφωμανία we there read corruptly τυφωρία (*Typhoria*), which corrupt Reading is followed by the Translator. *Galen*, *Lib. de Comate*, Cap. 4. and *Com. 1. in Proorrh.* tells us, that this Disorder is called *Typhomania*; but in his *Isag. Pulf.* and *Lib. 4. de Caus. Pulf.* he tells us, that it is a Disease which wants a Name, and therefore he defines it by some proper Characters; which is a Custom he himself, however, *Lib. de Comate*, Cap. 4. ascribes to ignorant Physicians. This Variety of Opinions about the Name, and the Disorder signify'd by it, might, perhaps, give Occasion to *Hippocrates*, 4 *Epid.* to call it, as it were, to prevent Mistakes, ἀλλὰ τυφωμανία, "a true Typhomania."

TYPHONIA. The same as **TYPHOMANIA**.

TYPHOS, τυφός. Of this Disorder, according to *Hippocrates*, there are five Species: The first is a legitimate continual Fever, which impairs the Strength, is accompanied with Pains of the Belly, and a preternatural Heat of the Eyes; hinders the Patient from looking steadily on any Object whatever; and renders him unable, in consequence of the violent Pain, to answer any Question that is asked him; though he begins to speak, and fix his Eyes attentively on Objects, when he is at the Point of Death.

The second Species of Typhus begins with a Tertian or Quartan Fever, which are succeeded by a Pain of the Head. In this Disorder the Patient discharges a large Quantity of Saliva and Worms from his Mouth: His Eyes are painful, his Countenance pale, and his Feet, and sometimes his whole Body, seiz'd with soft Swellings: His Breast and Back are now-and-then painful, his Belly rumbles, his Eyes are fierce, he spits a great deal, and his Saliva adheres to his Throat, which renders his Voice tremulous and faint.

The third Species of Typhus is known by intense Pains in the Joints, and sometimes over all the Body: The Blood, contaminated by the Bile, becomes hot, and stagnates in the Limbs; whilst that Portion of the Bile which is retained in the Joints, becoming indurated, like Gravel-stone, the Patient grows lame.

The fourth Species of Typhus is known by a violent Tension, Elevation, and Heat of the Abdomen, succeeded by a Diarrhoea, which sometimes terminates in a Dropsy, and is sometimes accompanied with a Fever.

The fifth Species of Typhus is known by a Paleness, and kind of Transparence of the whole Body, as if it was a Bladder full of Water, though without any Inflation. On the contrary, the Body is extenuated, dry, and weak, especially about the Clavicles and Countenance: The Eyes are very hollow, and the Body sometimes black. The Patient rarely winks with his Eyes, and feels the Bed-clothes with his Hands, as if he wanted to catch Knaps of Wool, or Straws. He is more uneasy after eating, than when he was in a State of Health. He loves the Smell of an extinguished Lamp, and is often troubled with Pollutions, both when asleep and awake.

TYPOS, τύπος. The Form, or Type of a Disease; importing the particular Manner of its Remission, and Exacerbation.

TYRANNIS, τυραννίς. The Name of an Antidote in *Galen*. *L. 2. de Antidot.* C. 10.

TYRBE, τυρβή, is a Perturbation, or Confusion. Thus, *Lib. de Fract.* πᾶσαν γὰρ αὐτὴν τυρβὴν παράγει τῇσιν ἐπιστάσεσιν, "should cause a Disorder in the whole Disposition of the Bandage." Here τυρβή is by *Erosian* expounded τυραχὴ, a Perturbation, or Confusion. The same is the Sense of the Word in *Lucian*, *Polybius*, and *Aristophanes in Vespis*.

TYRIA. The same as **OPHIASIS** in the Arabic Authors. See **ALOPECIA**.

TYR-ASIS, τυρίασις. The **ELEPHANTIASIS**, or Leprosy.

TYRIUM EMPLASTRUM. The Name of a Plaster describ'd by *Aetius*, *Tetrabib.* 4. *Serm.* 3. C. 12.

TYROS, τυρός. Cheese.

TYROSIS. A Disorder of the Stomach proceeding from Milk coagulated therein.

TYRRHENICUM EMPLASTRUM. The Name of a Plaster mentioned by *Aetius*, *Tetrabib.* 4. *Serm.* 3. C. 14.

TYRUS. A barbarous Word, importing a Serpent, or Viper.

V.

VACCA. The Cow. See Bos.

VACCARIA. A Name for the *Lychnis*; *segetum*; *rubra*; *foliis Perfoliata*.

VACCINIA. See *Vitis Idæa*.

VACCINIA NIGRA. A Name for the *Vitis Idæa*; *foliis oblongis*; *crenatis*; *fructu nigricante*.

VAGINA. The Passage from the external *Pudenda* to the Mouth of the *Uterus*. See *UTERUS*. The Name is, also, applied to other Parts of the Body, as to the *Capsula Glissonii*, which is called *Vagina Portæ*.

DISORDERS INCIDENT TO THE VAGINA.

The Method of dividing preternatural Cohesions in the Genitals of Women.

Some Girls are born with the Orifices of the *Pudenda* so conglutinated, that they are unable to discharge their Urine, whence they continue, for the first Days after their Birth, perpetually crying, without any Evacuation of Urine. In this Case, the Child must inevitably perish, if not speedily relieved by Incision. Some have the *Urethra* open, for the free Discharge of the Urine; and others, but a small Perforation, by which the Urine is made with the greatest Difficulty, and only by Drops; and, in both these Cases, the *Vagina* may be preternaturally closed, by the *Hymen*, or some other Membrane; by which means, as they begin to ripen, and arrive at the Age of Puberty, when the menstrual Flux begins to flow, it has no Passage left for its Discharge, nor can they admit of Coition: And thus, from the menstrual Blood being collected in the *Vagina*, are produced violent Pains, Tumors of the *Abdomen*, Faintings, *Deliria*, and other most malignant Symptoms. This Disorder has been observed by many Physicians, who have denominated Girls, in this Condition, *Atreta*, which denotes *imperfecta*. It appears, that *Aristotle* was acquainted with this Disorder, when he says, "That in some Girls the Mouth of the Womb continued closed, or conglutinated, from their Birth to the first Appearance of the menstrual Discharge; which endeavouring to force its Way, violent Pain is excited, and the Part either bursts spontaneously, or must be separated by the Surgeon. Sometimes the Death of the Patient has ensued, when the Passage has been opened violently, or could not be divided at all." Other Girls have the Mouth of the *Vagina* closed with a Membrane, which, however, is furnished with one or more Perforations proper for discharging the menstrual Flux, but will not admit of connubial Embraces; and therefore the Disorder is seldom discovered, before they are married. Various Cases of these Kinds are described by *Roonhuysen*, *Lib. 2. de Clausura Uteri*, *Obs. 1. Benevenius de abdit. Morb. Caus. Cap. 28. Cabrolus Obs. Anatom. 23. Fabricius ab Aquapendente, in Oper. Chir. de Hymene imperforato. Hildanus, Cent. 3. Obs. 60. Schenck, Lib. 4. de Part. Genital. Solingen, in Obs. 5. Meckren, Obs. Chirurg. 55. Mauriceau, in his Obs. sur la Maladies des Femmes grosses; Ruysch, in his Obs. Chir. 32. and by Saviard, in his Obs. Chirurg. 4.*

This Disorder differs, in different Patients: In some there appears the Mark of a Perforation, or Passage, whereby the Urine may be easily discharged, and which, at the same time, leads to the *Vagina* and *Uterus*: In others, no such Perforation can be observed, because of the Thickness and Density of the obstructing Membrane, or the firm Coalition of the *Vagina*, which renders the Cure either impracticable, or extremely difficult. Sometimes, in new-born Infants, a copious Collection of Urine, perhaps, in the *Vagina*, or in Adults, who have the urinary Passage open, the menstrual Blood, so distend the *Labia Pudendi*, as to shew the natural Passage of the *Vagina*, and, also, of the *Urethra*, according to the Observations of many of the above-mentioned Authors. Sometimes these Cohesions are not only formed in the Fœtus before the Birth, as *Aristotle* and *Celsus* have observed; but they, also, happen in Adults, after an Exulceration of the Orifice of the *Vagina*, especially after a difficult Birth, when the Parts are so violently lacerated, inflamed, and exulcerated, that its Sides either entirely coalesce, or only a small Perforation remain, for the Discharge of the menstrual Blood, but not sufficient to admit of Copulation. In new-born Infants, therefore, it prevents the Discharge of Urine; but, in Adults, it obstructs the, 1. Menstrual Flux. 2. Coition. 3. Conception. And, 4. The Birth. Its Cure, therefore, is extremely necessary.

These Disorders are discovered, in new-born Children, when they retain their Urine for the first Days after their Birth, and by seeing and feeling the Part; but in Adults, when the *Vagina* is obstructed by a Membrane, it appears from a Defect of the menstrual Discharge, intense Pains about the Pubes, Loins, and Belly, a Paleness of the Face, and Swelling of the Abdomen; and, most certainly, by feeling and inspecting the Parts: But in those who have a small Perforation in the *Hymen*, sufficient to permit the menstrual Discharge, when Copulation is found to be obstructed, difficult, and imperfect. With regard to the Prognostic, if the obstructing Membrane be thin, it is generally broken in the first Act of Coition; or, if this Remedy should not be sufficient, it may be easily removed, by the Knife. But if the Cohesion of the Parts is strong, and lies deep, or if the Obstruction be made by a thick fleshy Substance, the Cure is difficult; not only because the Bladder, or neighbouring Intestine, are in danger of being wounded, as *Roonhuysen* acknowledges once to have happened to himself; but the Cure often does not succeed, because of the great Difficulty of preserving a sufficient Wideness of the Passage.

In order to the Cure, it is, in the first Place, necessary, to consider, carefully, the Nature and State of the Disorder: If there appears any Mark of the *Urethra*, and the *Vagina*, so that they are only obstructed by a Membrane, this Membrane must be opened in both these Passages, if both are closed, by a rectilinear Incision, from the superior to the inferior Part; or, as *Celsus* advises, by a crucial Incision, according to the natural Aperture of the Part; but if a small Opening be left in the upper or lower Part of the Orifices of these Passages, the Membrane may be divided with a Pair of Scissars, or with a Director, and falciform Knife, taking care not to injure the urinary Passage, much less the Bladder: Then, if it appear necessary, the whole Membrane may be extirpated; afterwards, a proper Tent, anointed with Basilicon, or some digestive Ointment, must be introduced into the Wound for a few Days; and, to prevent its falling out, secured by a Bandage; then a Tent, spread with a drying Ointment, as that of Cerufs, or *Diapompholyx*, must be applied, as before, and continued till no Danger appears of a new Cohesion of the Parts: But if the Membrane be thick, or if the Obstruction be formed by a fleshy Substance, so that no Appearance remains of the natural Passage of the *Vagina*, a careful Inquiry must be made, whether the Cavity may not be perceived by the Finger; if it can thus be discovered, with great Caution make a rectilinear Incision, sufficiently large, in the proper Place, as before directed; then laying hold of it by the Extremity, with a Forceps, or Hook, let it be extirpated, that the Passage may be sufficiently opened: Proceed, in the rest of the Cure, as before directed, excepting that, towards the Conclusion, when the Wound begins to heal, a leaden Pipe, of a sufficient Size, spread with a cicatrizing Medicine, must be introduced; and this Medicine must be continued, till a Cicatrix be induced.

Sometimes new-married Women, and even those who have lived Years in the matrimonial State, have the Orifice of the *Vagina* so contracted, either by an Exulceration, or some other Cause, that they cannot admit of conjugal Embraces, although the menstrual Blood may be freely discharged. In this Case, it may be adviseable, as I have happily tried the Experiment, to enlarge the Aperture, by making Incisions, of a sufficient Depth, in its Sides, and lower Parts, and by Abscission of the superfluous Parts of the Lips; and then a large Tent, with dry Lint, twisted, must be introduced: Afterwards, in the subsequent Dressings, which must be repeated twice every Day, excepting the Day of Operation, lest the retained Matter, and *Sordes*, should occasion a troublesome fetid Smell, apply to the Sides of the Wound a vulnerary Balm, and then a proper Pessary, made of prepared Sponge, or the swelling Roots, for the more convenient dilating of the Part, and let this Treatment be continued, till it begins to heal: And, lastly, a leaden Pipe, spread with some deficcative Medicine, must be introduced every Day, till the Part is healed, and no more Danger of Cohesion remains. When the Constriction of the Orifice of the *Vagina* has not been from the Birth, but produced by some external Causes, I have successfully experienced the Method of Cure here laid down. *Saviard* relates a like Case, in his *Obs. Chirurg. 32.*

Cabrolus relates a remarkable Case of a Patient about eighteen or twenty Years of Age, whose urinary Passage was entirely obstructed by a thick Membrane; and her Urine, being, probably,

dably, conveyed by the *Urachus*, was constantly discharged by the Navel, which hung down about the Length of four Inches, like the Comb or Beak of a Turkey-cock; and exciting almost an intolerable fetid Smell, as of putrid Urine. To remedy this most troublesome Disorder, *Cabrolus* first made an Incision into the Membrane which obstructed the Urethra; and, in order to preserve a free Passage for the Urine, he introduced a leaden Pipe as far as the Bladder. Next Day he made a Ligature with a strong waxed Thread, as is commonly done in cutting Ruptures, upon the protruded Part at the Navel, by which the Urine had been hitherto evacuated, and extirpated it below the Ligature: He then applied to it the actual Cautery, and, after the Eschar was removed, he deterged the Ulcer, and induced a Cicatrix with desiccative Medicines, as in other Ulcers: Thus he completed the Cure in twelve Days. The same Method may be followed in like Cases, only omitting the actual Cautery, which is not here very necessary, and greatly intimidates the Patient, and all who are present.

THE METHOD OF OPENING THE VAGINA, WHEN THE OBSTRUCTION IS DEEPLY SEATED.

Besides these Disorders already explained, Women are sometimes subject to have the Vagina preternaturally obstructed, by a Membrane deeply seated; or by an entire Cohesion of its Sides; and thus the Discharge of the menstrual Flux being prevented, most acute Pains of the Belly and Hips, Swellings of the Abdomen, with *Nausea*, Extenuation, Watchings, and the other Symptoms above-recited, and sometimes even Madness, are induced. Sometimes the Disorder is born with the Patient; but frequently it arises from an external Cause, especially a difficult Birth, when, after a violent Laceration and Inflammation, the Vagina becomes exulcerated. Instances of this Kind are given by *Roonhuysen*. *Benevinius* relates a Case of this Nature that proceeded from a Venereal Cause: And *Becker*, one from the Small-pox. Frequently the obstructing Membrane is situated near the Orifice of the Vagina; sometimes about the Middle; at other times near the Uterus. Sometimes the whole Vagina, or great Part of it, is concremented, or, at least, filled up with a thick fleshy Substance; and if this Concretion reaches deep, difficult and dangerous is the Cure; because the Bladder, and *Intestinum Rectum*, as we before observed, are very subject to be injured. Sometimes the Membrane does not entirely obstruct the Vagina: And sometimes the Cohesion of its Sides is not total, but a Perforation is left for the Discharge of the Menstrues. Women, however, in this Condition, are capable of but an imperfect Coition; and hence new-married People, especially if they are prone to Superstition, frequently imagine themselves bewitched; or the Husband may think his Wife incapable of Conception; and therefore, meditate a Divorce, though sometimes such Women have become pregnant. *Becker* relates a particular Story of a wanton Girl, who had been born with an obstructed Vagina: She being convinced by repeated Trials, that she was incapable of being deflowered, enticed many vigorous young Fellows to lie with her; and when she had disappointed their Hopes of Enjoyment, and deprived them of their Money, she ridiculed them as insignificant Bedfellows for a Woman. But at length she committed herself to the Care of a Surgeon, to have this Impediment removed; and he soon so completely remedied his Patient, that she, both as a Fee, and a Testimony of the happy Cure, in a proper Time presented him with Twins, he himself being the Father.

With regard to the Cure of this Disorder, it may be easily effected in young Girls, when the preternatural Membrane is thin, and not very remote from the Orifice of the Vagina, and if, as was above observed, the Incision be cautiously performed. But, in Women this Operation cannot be so conveniently performed, unless the Membrane be distended by the menstrual Blood, as it has been performed by the above-mentioned, and others. *Amyand*, in the *Philosophical Transactions*, No 422. gives the Case of a Woman whose Vagina, after Delivery, was so obstructed with concremented Caruncles, that the Efflux of the menstrual Blood was not only prevented, but, by its collecting in the Vagina, the Urethra was compressed, and a Suppression of Urine ensued. All these Authors relate, that immediately after the Incision, not only a surprising and copious Discharge is made of inspissated Blood, and a fetid Liquor, but the Patient is relieved from all the Miseries she before suffered, and even from imminent Death: And, lastly, the Wound has been brought to a Cicatrix, almost without the Use of any other Remedies than proper Tents, Pessaries of Wax, and leaden Pipes. But, if the Membrane be thicker, and deeply seated in the Vagina, whether it be furnished with a Perforation or not, the Operation must be performed in the same manner: But greater Caution is required, as the *Intestinum Rectum*, and Bladder, are more exposed to Injuries; the rest of the Cure may be continued, as before directed: But greater Care is, also,

necessary, in preserving a sufficient Wideness in the Passage. Nor will it be improper to use here a *Speculum Uteri*, for the more accurate Inspection of the Parts, and the more wary Performance of the Incision.

If Women in their Pregnancy, or in Labour, be afflicted in this manner, a timely Remedy must be applied; lest the Difficulty of the Birth should induce the most violent Disorders. If a pregnant Woman be thus affected, the Membrane should be extirpated long before the time of Travail; for then the Fœtus, lying behind the Membrane, may be easily wounded with the Knife. But if the Cure, by Ignorance or Negligence, be delayed to the time of Labour, the Operation must, even then, be performed, but with the utmost Caution, to prevent any Injury happening to the Child. A small Wound must, therefore, be first made in the preternatural Membrane, with a Knife armed with a Button, see *Tab. XXVI. Fig. 4-5.* or a Director may be used; or a proper Forceps; or the common surgical Knife, which must be applied with extreme Care. *Mauriceau* advises, that the Midwife should forcibly divide this Membrane with her Fingers; but, as the Consequences attending Laceration may be extremely dangerous, I think Incision preferable.

It remains to be observed, that if the Vagina be not obstructed by a Membrane, but by a thick fleshy Substance, deeply seated; or if the Sides of the Vagina are concremented, the Operation must be both difficult and dangerous; from which, therefore, we ought rather to refrain, as *Benevinius* formerly did. But when the Operation is performed, in Cases less dangerous, unless the Part be long kept distended with Spongetents, proper Pipes, or Pessaries, it will, soon after the Cure, easily contract again, so as not to admit conjugal Embraces. And upon this account I have not only been obliged to repeat the Operation, but *Roonhuysen* has done the same, who advises Surgeons particularly to attend to these Circumstances. But when there is an Adhesion of the Sides of the Vagina, deeply situated, as I once observed in a Butcher's Wife, in whom the Disorder proceeded from a difficult Labour, the Incision is extremely dangerous; from which I therefore abstained, in this Case, contrary to the earnest Intreaties of both her and her Husband, who were desirous of having Children. But if the Vagina be obstructed by a thick fleshy Substance, though the Incision should be made, yet the Flesh becomes so luxuriant, or indurated and callous, that not only part of the Lips must be extirpated, where it can be done with Safety, for which Purpose the Affair must be duly considered, by Inspection, Feeling, and a *Speculum Uteri*; but the fungous Flesh must be consumed by corrosive and desiccative Medicines, and repressed by proper Tents, and leaden Pipes, till the Passage be sufficiently enlarged, and the Sides perfectly healed; otherwise the Vagina will easily reunite, and render all this troublesome Procedure ineffectual. In Cases of this Kind, *Roonhuysen* and *Becker* may be consulted, who illustrate this Affair with various Observations and Examples. *Roonhuysen*, also, delivers a Method of opening the internal Orifice of the Womb, when obstructed: But as almost all Access is denied to this Part, this Operation appears scarcely practicable, and extremely dangerous; nor does it seem possible to preserve the Opening. *Heister-Chirurg*.

THE METHOD OF REMOVING TUBERCLES, CARUNCLES, AND OTHER EXCRESCENCES OF THE VAGINA.

Sometimes Excrecences of different Kinds, Sizes, and Figures, grow not only on the external Parts of the Vagina, but, also, internally, both in the anterior and posterior or superior Parts. Some of these Excrecences resemble a Mushroom; others, a Fig; others, a Pear; and some, the Clapper of a Bell: And sometimes they increase to such a surprising Degree, that those of the last-mentioned Figure will reach to the Knees; which are not only great Obstructions to Copulation, and the Birth; but occasion intense Pain, and even threaten a Gangrene or Cancer, if not timely removed: When they are very large, they are, by some, called *Sarcomas of the Womb*. *Celsus* and *Tulpius* call them simply *Fungi*; but *Solingen* terms them *Fici*; adding, though improperly, the Epithet *cancerous*, because they admit of an easy Cure. The nearer they are situated to the Orifice of the Vagina, the more easily are they removed; but the Task is very difficult when they lie deep; so that *Tulpius* calls it a very uncommon Operation. Some have taken Excrecences of this kind for a Falling-down of the Womb, but without Foundation.

The same Method of Cure must be followed here, that is generally observed in removing Tubercles and *Sarcomas*, or fleshy Excrecences, by the Ligature; by the Knife, or both; or by corrosive Medicines. But particular Care must be taken, not to mistake a *Prolapsus Uteri* for an Excrecence of this kind.

But, because these Disorders of the Vagina are not only nearly related to a Polypus of the Nostrils; but are sometimes so deeply situated, near to the Uterus, and sometimes proceed from the Uterus itself, that they cannot be extirpated by the Methods above proposed, *Fabricius ab Aquapendente*, and *Dionis*, thought it necessary to use the Forceps recommended in extracting Polypuses of the Nose, (see *Tab. XL. Fig. 9. 10. 11.*) with which Instrument the Excrescence may be twisted off. But, before this Method be attempted, particular Circumspection must be used, to see whether the Patient is not exposed to greater Injuries by the Operation. *Voelters*, a German Surgeon, informs us, that he has removed many of these Excrescences, of various kinds, with a red-hot Knife; but I am so far from recommending his Example to others, that I rather think it ought to be abhorred, as cruel and dangerous. *Solingen* relates, that he happily extirpated a cancerous Excrescence in the Vagina of a Woman, who recovered in a short time. *Obs. 29.* But he gives no Account how he performed the Operation; nor any Reason why he called the Disorder *cancerous*. *Heist. Chir.*

THE METHOD OF TREATING A PROLAPSUS UTERI, OR FALLING-DOWN OF THE WOMB.

That a *Prolapsus Uteri* is an Impossibility in Nature, was not only alleged, but obstinately maintained, by some Physicians of the last Century: Among these were *Mechren*, *Roombuyssen*, *Van Horne*, *Barbette*, *Vander Beche*, *Kerkringius*, *Verduc*, and others. But that the Uterus is sometimes protruded from the Abdomen, through the external Orifice of the Vagina, is manifest from the Observations of the most experienced Physicians, both ancient and modern: Of this Number are, *Aetius*, *Aegineta*, *Rosset*, *Fabricius ab Aquapendente*, *Berengarius*, *Paré*, *Hildanus*, *Solingen*, *Mauriceau*, and many others. The celebrated *Ruyseh*, in his *Obs. 1. 7. 9. and 10.* has clearly explained this Affair, and illustrated it with elegant and distinct Figures; two of which we have represented in *Tab. LV. Fig. 2. and 3.* Next to him is *Saviard*, a Surgeon of *Paris*, who gives ten Cases observed by himself; then *Jo. Mau. Hoffman*, a Physician of *Altorf*; *Schacherus*, a celebrated Physician of *Leipsic*; *Slevogtius*, *Vaterus*, and *Buggravius*, who all certified the Truth of this Disorder, and described it from Cases of which they were Eye-witnesses. And I myself have seen Instances of this kind. When the Womb only bears down upon the Vagina, it is called a *Descensus Uteri*; but when it is protruded without the Vagina, it is denominated a *Prolapsus*, or *Procidencia Uteri*. Of the *Prolapsus Uteri* there are two Kinds; one happens without an Inversion of the Womb, when the internal Orifice of the Uterus appears at the Extremity of the prolapsed Part, as in *Fig. 2. Lit. C*; the other with an Inversion of the Womb, when the internal Orifice of the Uterus does not appear (see *Fig. 3.*), as has been testified by the above-quoted Authors.

An inverted and non-inverted Uterus may be distinguished, as we just now observed, by the Orifice of the Womb, which appears when the Uterus is not inverted, as in *Tab. LV. Fig. 2. C*; and by this Sign, also, it may be known from a Bearing-down, or from fungous Excrescences of the Vagina. But it is not unworthy of Observation, that *Widemannus* not only described, but beautifully and clearly delineated, a singular *Prolapsus* of the whole internal wrinkled Coat of the Vagina, with an Orifice so nearly resembling that of the Uterus, that none could have doubted it, before the Body was opened; when the Uterus was found in its proper Place, and only the wrinkled Coat of the Vagina prolapsed. And that Physicians may more prudently distinguish these Disorders, and not rashly mistake a *Prolapsus Vaginae* for a *Procidencia Uteri*, I thought it not improper to represent the Figure given us by *Widemannus*, in *Ephem. Nat. Cur. Cent. VIII. Obs. 98.* though not so large as the Life. See *Tab. LV. Fig. 4.* The Appearance, therefore, of an Orifice in such a *Prolapsus* (see *Lit. F*) is not an infallible Sign of a *Prolapsus Uteri*, as has been generally represented; but the prolapsed Part must be carefully considered, till it can be certainly known, whether it be the *Vagina* or *Uterus*. *Widemannus*, indeed, produces no pathognomic Sign, by which the Vagina, in this Case, may be assuredly distinguished from the Uterus; but he says, that when he introduced his Probe into the Perforation *F*, which so nearly resembled the Orifice of the Uterus, that it penetrated much deeper than the Cavity of the Womb, almost the Length of half a Foot: But whether this Sign always appears, remains to be proved by future Experiments. This Observation of *Widemannus* ought to be frequently read, and carefully considered.

A *Prolapsus* of the Uterus, and one of the Vagina, are difficult to be certainly known, as well as to be distinguished from one another. We have a remarkable Instance of this kind in the Physicians and Surgeons of *Tholouse*, and many of those at *Paris*, who imagined a Girl about thirty, who,

from her Childhood, had been troubled with a *Prolapsus Uteri*; to be an Hermaphrodite; and publicly declared, that in this Hermaphrodite the Male Sex was predominant. Upon this Declaration, the Parliament of *Tholouse* ordained the reputed Hermaphrodite to lay aside female Apparel, and assume a masculine Dress, under a severe Penalty, if she refused. But when *Saviard* had narrowly examined her at *Paris*, he found her to be really a Girl, and, by restoring the Uterus to its natural Situation, metamorphosed her into her proper Sex; and, by the King's Command, she was ordered to dress accordingly. The inconsiderate Judgment of the *Tholousians* more plainly appears from this diverting Relation, of *Saviard*, in *Obs. 15.* who assures us, that she had no Resemblance either of a *Penis* or *Testicles*, Appendages which, in my Opinion, are absolutely necessary to the Formation of a Man; besides her Breasts were large, and her Face was entirely female, without a Beard.

This Disorder proceeds from a Relaxation and Weakness of the Ligaments of the Uterus and Vagina; whence it is observed frequently to follow a difficult Birth, or other violent Efforts; though Virgins and Girls are sometimes affected with it. Another Species of *Prolapsus* is, when the prolapsed Uterus is inverted like a Bag, with its interior Side turned outwards, and then the Orifice of the Womb does not appear, but is concealed in the Vagina. See *Fig. 3. B.* Of this Kind of *Prolapsus* we have, among others, a remarkable Instance, described by *Genselius*. In this Case, the prolapsed Uterus resembles a Mole, or a bloody and unseemly fleshy Excrescence; and, therefore, it is not surprising, that some unskilful Surgeons and Midwives have mistaken the Disorder, and by rude Treatment, endeavouring to extract the Womb by Force, bring the Patient's Life into extreme Danger. This miserable Disorder seldom happens, except when the Uterus is extracted with the Secundines; or immediately after a difficult Delivery, when the internal Orifice of the Womb is so dilated, that the Body of the Uterus is easily transmitted through it; or, lastly, when the Patient is so strained by the Labour-pains, or by the Continuance of the Throes after Delivery, that, by a vehement Effort the Uterus slips through its internal Orifice, and is forced without the *Labia Pudenda*. But from whatever Cause the Disorder proceeds, unless it be quickly restored to its natural Situation, as the above-mentioned Authors have observed, a sudden Death is generally the Consequence; and, therefore, any Delay must be extremely dangerous.

In this Species of a prolapsed Uterus, the Surgeon or Midwife must, in the first Place, take care that the Patient evacuate her Urine, lest the Repletion of the Bladder should obstruct the Reduction of the Uterus: Then the Patient being laid on her Back, with her Hips elevated, and Thighs distended, the Secundines, if they still adhere, must be cautiously removed by the Fingers, and the Uterus, with all possible Expedition, gently restored, by the Hand, to its former Situation. This Operation may be most conveniently performed, by tenderly returning into the Vagina the lower Part of the prolapsed Uterus, at *Fig. 3. C.* with the three first Fingers, and, then, with the whole Hand, into its natural Place in the Cavity of the Abdomen; then, contracting the Hand into the Form of a Fist, it must be retained there, till the Uterus is reduced to its usual Figure, and, then, gently contracted: These Particulars are more easily executed immediately after the Delivery, while the Orifice of the Womb, and the Vagina, are preternaturally dilated. The Uterus being thus replaced, and reduced to its former Figure, the Patient should be laid on her Back, in Bed, and earnestly exhorted to keep her Legs close, and to dispose herself for Rest; for by procuring Rest, and keeping this Posture, the Cure may often be completed, without any other Assistance. Nor will it be improper to close up the Orifice of the Vagina with Compresses, and a proper Bandage, lest, by Strefs of Pains consequent to the Birth, by Coughing, or by Sneezing, the Uterus should be again prolapsed: Thus will the Orifice of the Uterus be gradually contracted, so as to afford no Passage for the Uterus, and, consequently, the Disorder be removed. If the Uterus be not quickly returned, according to *Hildanus*, *Stalpart*, *Ruyseh*, *Saviard*, and other Authors above-quoted, sudden Death must be the Consequence: For the Orifice of the Womb is, by Degrees, so constricted by the superior Part of the Uterus, that an Inflammation is induced; and the Reduction of the Womb becomes impracticable; and a Sphacelus is occasioned by the stagnated and corrupt Blood, and the Patient suffers a miserable Death. But if the Case be not desperate, when the Surgeon is called, Care must be taken to free the Uterus from its Inflammation, and to restore it to its proper Place with all possible Expedition: For this Purpose it is, in the first place, necessary to bleed her copiously; and then she should discharge her Urine, that no Obstruction may be occasioned by the Distention of the Bladder: Then let the Patient be laid in the same Posture as is above directed; and then let the Uterus be carefully fomented with warm Milk and Water, and

and anointed with Butter, or warm Oil; or let digestive and emollient Fomentations, or Cataplasms, be so long applied, till the Part becomes soft and slippery, and capable of being replaced by the Method already directed. For unless this Reduction can be seasonably accomplished, the Preservation of the Patient becomes impracticable; nor will the Extirpation of the Uterus, by Ligature or Abcision, as some have imagined, ought avail. *Ruyssch* relates a Case, in which a Surgeon removed by Ligature a prolapsed Uterus, but without Success; for the Patient soon died.

But here I think it may be worthy of Consideration, whether Scarification may not be advantageously attempted in such desperate Cases, when the Uterus is swelled and inflamed, as in other violent Inflammations of a cancerous Disposition, which to me seems not improbable.

That Species of Prolapsus in which the Uterus is not inverted, but its internal Orifice appears, which is not always the Consequence of a difficult Birth, but is often produced by a Weakness of the Ligaments, is not attended with such unhappy Consequences. By the Appearance of the internal Orifice of the Womb, this *Prolapsus Uteri* may, also, be distinguished from fungous Excrescences, or Tubercles of the Vagina, as was already observed. In this Case the Danger of an Inflammation, or Sphacelus, is not so much to be apprehended, as in the former Kind. This Species of *Prolapsus Uteri* is not only incident to Women after a difficult Labour, but, also, to others, to the chaste Virgins, and even young Girls, according to the Observations of *Mauriceau*, *Saviard*, and others. But if this Disorder be for some time neglected, not only great Uneasiness is occasioned, but a Difficulty of Urine, violent Pains of the Hips, Exulcerations of the prolapsed Uterus, and an Inflammation followed with a Sphacelus, Scirrhus, or Cancer. And the longer the Use of proper Remedies is delayed, the more difficult is the Reduction of the Uterus, because it becomes swelled and enlarged, and cannot be retained in its natural Situation, without proper Instruments. For a Relapse can scarcely be prevented, either in Walking, or in some Commotion of the Body; or in Sneezing and Coughing, especially if not sustained by a proper Bandage or Instrument. But if the prolapsed Uterus be affected with a Cancer, or Gangrene, the Reduction ought not to be attempted: For *Ruyssch* informs us, in *Obs.* 9. that, after it is replaced, more intense Pains, and other malignant Symptoms, are induced.

If, therefore, there be no Appearance of a Gangrene, or Sphacelus, two Intentions are necessary to be answered in the Cure: 1. That the Uterus be restored to its proper Place. 2. That a Relapse be prevented. With regard to the first Intention, if the prolapsed Uterus has not been of long Duration, or greatly increased in Bulk, it may be easily replaced by the Method already directed: Let the Head be laid low; the Buttocks elevated; the Legs spread wide; and the Womb gently replaced with the Fingers, or a strong Wax-candle. It has been often observed, that Women troubled with this Disorder can replace the Uterus themselves, without any Difficulty. But if the Disorder be inveterate, and the Uterus enlarged, so that it cannot be without Difficulty reduced, dige-
rent Fomentations must be applied, and the Bladder and Intestines emptied, that it may be the more easily restored to its natural Situation. But as the Uterus can scarcely be sustained by the Coats of the Vagina, and its own relaxed, debilitated Ligaments, great Care, as well as proper Bandages and Instruments are required to prevent a Relapse. For this Purpose it will be expedient to rest some Days in Bed, and to convey the Steams of strengthening Suffumigations through the Vagina, with a proper Funnel and Pipe (see *Tab.* LV. *Fig.* 14.): Aromatic and astringent Fomentations, prepared with Spirit of Wine should, also, be injected with a Syringe. Then putting a Compress on the external Orifice of the Vagina, carefully apply the T Bandage. When the Uterus is greatly swelled, it ought to be fomented with Digestives, till its Bulk be diminished, and then it may be replaced. If the Uterus be exulcerated, as frequently happens, the Reduction of it ought not to be delayed upon that Account: For *Saviard* observes, that these Ulcers are much easier healed when the Part is restored to its proper Situation, than when it is preternaturally prolapsed. This Author, also, relates an Instance of a *Prolapsus Uteri* in a Virgin, who had, at the same time, a Stone in her Bladder: In this Case he first replaced the Uterus, and then extracted the Stone, and relieved her from both Disorders, only using a Pessary. See his *Obs.* 15.

If the Disorder is already become so inveterate and obstinate, that the Uterus cannot be retained by the Methods already proposed, there remains but one Resource, to which Recourse is commonly had; and that is, to repress the Vagina, by introducing a Pessary. The best Sort of Pessaries are made of Box, Ash, or other hard Woods, or of Cork, and covered with Wax, having a Perforation in the Middle. (See *Tab.* LV.

Fig. 6. 7. 8. 9.). Without the Wax they would swell, rot, and produce many Inconveniences, so as not to be, without Difficulty, extracted, and, perhaps, by Pieces. Those who can afford the Expence, may have them made of Ivory, or of Silver or Gold excavated: Thus a Pessary of a proper Size and Shape, must be carefully pressed by the Fingers, deep into the Vagina, even to the Orifice of the Uterus, that it may not easily fall out; having a String fastened to it, (see *Tab.* LV. *Fig.* 6. and 10.) by which it may be extracted and cleaned. The String should, also, be tied to any Belt about the Waist, lest, by happening to fall out, when the Patient walks, it should indecently drop upon the Ground. A Pessary is judged to be of a proper Size, when it is not easily admitted at first, that it may more firmly remain, and better repress the Uterus; but, in some Cases, Pessaries twice as large as these are required. The Perforations in Pessaries are designed for a Passage for the menstrual Blood, and other Sordes, discharged from the Womb; and, therefore, those Pessaries which are of an oval or pyramidal Form, are not so convenient; such as those of a prodigious Size, recommended by *Paré*, *Hildanus*, *Scultetus*, *Roonhuysen*, and others: Besides, these perforated Pessaries will admit the Semen for Procreation, and, also, the strengthening Suffumigations and Injections, so necessary in these Cases. When these Pessaries are rightly made, they are so far from being troublesome, that when once Women have been accustomed to them, they retain them without the least Uneasiness. It is proper to observe, that some Women, who have been affected with this Disorder, have been freed from it upon their becoming pregnant, by reason of the Dilatation of the Womb. See *Pechlinus*, *Obs.* 20. and *Saviard*, *Obs.* 12. But *Mauriceau*, *Schellhammer*, *Hunerwolf*, *Saviard*, and others, prove that this is not always the Case; but the Orifice of the Womb, with the Head of the Fœtus, may be felt without the Vagina.

Saviard prefers a kind of elastic Steel Pessary before all others; but as he gives no Description of it, Nobody can know what he means. But *Goelcke*, in a Dissertation published at Halle, in 1710. describes a new Method of curing a *Prolapsus Uteri*, in which he recommends an elastic Pessary, made of Iron-wire, and wreathed into a conical Form: He, also, gives a small Representation of it; but does not explain its proper Length or Thickness. But in *Tab.* LV. *Fig.* 11, these Faults are corrected, where it is represented of a convenient Size: He directs the Inside to be covered with Lint, and the Outside with thin soft Leather; and orders a String to be fastened on each Side of the Basis of the Cone, that it may be easily extracted. When it is to be introduced, it ought to be a little compressed; so that, after it is placed, it expands itself, by its elastic Force, and is thus firmly retained, without any Danger of falling out: He owns indeed, that he never experienced the Effects of this Pessary, but, as it has all the Qualities necessary for the Formation of a good Pessary, he does not doubt of its Excellency. But as I am afraid, that, in so moist a Place, such a Pessary should soon be corroded by Rust, to which Iron is particularly subject, I have, therefore, always used the wooden Pessaries, represented in *Fig.* 6. 7. and 8. which I have found to answer the End. *Heister Chir.*

THE METHOD OF TREATING A BEARING-DOWN OF THE VAGINA.

A Bearing-down of the Vagina has not only been confounded with a Bearing-down of the Uterus, by ignorant Midwives, but, also, by Physicians and Surgeons of Learning and Experience; and these different Disorders have, likewise, been confounded with the same Denomination: But they may be distinguished from one another; partly by considering the anatomical Structure of the Parts; and partly, by attending to the diagnostic Signs above observed. The Vagina is said to be prolapsed, when the Whole, (as in *Tab.* LV. *Fig.* 4.) or only Part of it, being relaxed, by whatever Causes, hangs without the Pudenda. Sometimes the whole Vagina is prolapsed, and appears like crude bloody Flesh, resembling a thick fleshy Ring, more or less swelled, according to the different Causes of the Disorder, and other Circumstances. If the prolapsed Vagina swells violently, and is attended with Inflammation, as I have sometimes observed, after a difficult Labour, there is immediate Danger of a Sphacelus: If the prolapsed Part be affected with little or no Swelling; or if the Tumor be unaccompanied with Inflammation, the Disorder may long be born, without Trouble, and without Danger. Sometimes a Part of the Vagina is preternaturally prolapsed out of the Pudenda, and may be produced by lifting too great Weights; or by an Effort in a difficult Birth; or by a Congestion of peccant Matter, resembling a large Fungus, or a *Prolapsus Uteri*. Many plain Instances of this Disorder have been observed: And *Meekren* has related, and illustrated with Figures, a very remarkable Case in *Cap.* 54. of his Observations. This kind of Disorder may not only be taken for a *Prolapsus Uteri*; but
rather

rather for a Tumor, as a *Fungus*, *Ficus*, *Sarcoma*, or fleshy Excrescence; and, therefore, it may be thought necessary to remove it by a Ligature, or by Abscission. But to distinguish this Disorder from a *Prolapsus Uteri*, or a Tubercle of the Vagina, it is necessary to observe, that an inverted *Prolapsus Uteri* never happens, unless immediately after Delivery; but Tubercles of the Vagina, or any Part of it, may be produced at any Time besides that of Delivery, and increase gradually, and, as it were, imperceptibly. Though I observed in the Year 1720, in a Lady of Quality, suffering under a difficult Labour, that whilst the Foetus was yet in the Womb, Part of the Vagina was suddenly prolapsed, and within twenty-four Hours a Fungus or Tubercle appeared, equal to the Size of two Fists, which soon became sphacelous; and, though the Child was safely brought forth, the unhappy Mother died within eight Days. Hence, then, it is not surprising, that some Physicians, not having sufficiently considered the Signs by which a *Prolapsus Uteri* may be distinguished from a *Prolapsus Vaginae*, have, therefore, asserted, that a prolapsed Uterus may sometimes not only be extirpated without endangering Life; but that those very Women, though deprived of the Womb, may afterwards conceive and bring forth Children. That, after the Extirpation of a Tubercle of the Vagina, as in Fig. 5. or where the whole internal corrugated Coat of the Vagina falls down, like a *Prolapsus Uteri*, those Women may afterwards conceive, and bring Children, was never denied: But it is absolutely impossible, that, after the Uterus is extirpated, a Woman should conceive; and, therefore, these Relations may justly be accounted fabulous.

How Tubercles resembling a *Prolapsus Vaginae* may be removed, we have already explained: But when the Vagina appears prolapsed, like a large bloody Ring, hard and inflamed, unless it be seasonably restored to its proper Place, there is great Danger of the prolapsed Part being affected with a Gangrene, or Sphacelus: But the Danger is less, if the prolapsed Part be flaccid, and not inflamed. If no Inflammation appears, the Vagina should be restored to its natural Situation with the Fingers, or a thick Wax-candle, and then fomented with strengthening and digerent Medicines: Then the Patient should be ordered to rest in Bed for some Days, keeping her Legs close, or crossed. Mean while the Part should be fomented with Decoctions of strengthening, digerent, aromatic, and astringent Herbs, with Red-wine; or with Lime-water, mixed with Spirit of Wine: Suffumigations, also, of Mastich, Olibanum, Myrrh, Amber, and the like, should, also, be conveyed into the Vagina with a proper Pipe (see Tab. LV. Fig. 14.) and Funnel; then let the Part be carefully bound with the T Bandage. Thus may the prolapsed Vagina be restored to its natural Vigour, especially if the Disorder be recent, and, if proper internal Medicines be exhibited: For this Purpose, the medicated Waters, hot Baths, and chalybeate Waters, are excellent. But if the Disorder be so inveterate as not to yield to the Remedies here proposed; it must, therefore, be palliated, and the Patient be ordered to wear the T Bandage constantly; by which means the Danger of a Scirrhus, or Gangrene, may be averted.

But if the prolapsed Part be seized with an Inflammation, the Inflammation must be removed, not only by the Application of discutient Fomentations and Cataplasms externally, but, also, by the Exhibition of proper internal Medicines, not omitting Venesection, before the prolapsed Vagina can be restored to its natural Position, otherwise a Gangrene might be induced, which would soon be followed by the Death of the Patient. But if the Inflammation be mild, the prolapsed Part may be reduced without Danger, as the natural Heat of the Body will greatly contribute to discuss the Tumor. But if a Sphacelus, or Fungus, already appears upon the prolapsed Vagina, which may be known from its Blackness and fetid Smell, the morbid Part must be scarified; digestive Fomentations and Cataplasms applied; and whatever else is necessary in the Cure of a Sphacelus. *Heister. Chirurg.*

VAGINALIS TUNICA. A Coat of the Testes; another of the Oesophagus, and another of the Spinal Marrow, are called by this Name.

VAGITUS. The Bellowings or Moanings of Children, when out of Order.

VALENTIA SCABIOSÆ. Powers of Scabious.

Take of the Juice of green Scabious, pressed out, and strained through a Cloth, and of Hogs-lard, cleared of its Membranes, each as much as you please: Let the Lard be beat in a Stone Mortar, and the Juice poured in by little at a time, for the Conveniency of Mixture, and giving its Tincture: Then put them together into a proper Vessel, to be exposted to the Sun, and so that the Juice may cover the Lard: After nine Days, put them again into the Mortar as before, and throw away that thin and discoloured

Humidity, which separates upon beating, without rubbing them together; and again, put it into its Vessel for five Days: Afterwards beat it again, and by a little at a time, mix with it fresh Juice of Scabious; and after a fresh Infusion of fifteen Days, in its proper Vessel, in the Sun, let it be cleared before of its watry Humidity. Let it then stand again in the same manner, for fifteen Days longer, with fresh Juice; and, after a little Beating, let it be kept for Use, in a glass or earthen Vessel.

This, we are told by the first Compilers of the College Dispensatory, was the Contrivance of *John Arden*, an experienced Surgeon at *Newark*, in *Nottinghamshire*, who lived in the Reign of *Edward the Third*. After Insertion of this, which they had from an antient Manuscript, they particularly direct to repeat the Processes with fresh Juice, till the Lard looks of a deep Green; and that is made the Measure of the Repetitions necessary.

VALERIANA.

The Characters are;

The Leaves are conjugated: The Stalk is floriferous, and divided as in umbelliferous Plants: Under the Umbellæ, both large and small, are two long small Leaves: The End of the Pedicle shoots forth two small similar Leaves, which supply the Place of a Calyx: From the Centre of the Area of the Pedicle, within these Leaves, proceeds an oblong Ovary, on whose fimbriated Apex grows a monopetalous, Funnel-shaped, naked Flower, furnished with three Stamina, proceeding from the internal Sides of the Flower: The Tube of the Flower, from its lower Part, where it adheres to the Ovary, frequently shoots forth a blind Spur at the Side: The Seed is oblong, depressed, running out narrow, almost flat and downy: From the Centre of the Apex of the Ovary shoots forth a long Tube.

Boerhaave mentions thirteen Species of *Valeriana*; which are,

1. *Valeriana*; major; hortensis. *Boerb. Ind. alt.* 74. *Phu majus, sive Valeriana major.* Offic. Park. 119. *Valeriana hortensis.* Ger. 917. Emac. 1075. *Valeriana hortensis; Phu Olu-satri folio Dioscoridis.* C. B. P. 164. Tourn. Inst. 132. *Valeriana major odorata radice.* J. B. 3. 209. Raii Hist. 1. 388.

GARDEN VALERIAN.

The Root of the Garden Valerian is about a Finger thick, of a brown Colour, growing not deep in the Earth, but spreading itself across, with many large white Strings on each Side, which makes the Root appear, like a large Scolopendra, or Caterpillar with many long Feet, of a very strong Smell, especially when dry: It shoots out several hollow channel'd Stalks, two or three Feet high, having the lower Leaves long and round-pointed; some whole, and others cut in, resembling those of Scabious, but that they are smooth: The Leaves, which grow on the Stalks, are, also, much more cut in: The Stalks are divided towards the Top into several Branches, having, at each Divarication, a long narrow Leaf; and at the Ends grow the Flowers, in a kind of Umbels, each Flower being a small, long, narrow Tub, divided at the Top into five Segments, with as many Apices of a white Colour; they stand on the Rudiments of the Seed, which, when they are fallen, grow larger, being longish, striated with a downy Top. It is usually planted in Gardens, though it grows wild in the *Alpine* Countries. The Roots are principally used.

They are alexipharmic, sudorific, and cephalic; and are accounted useful in malignant Fevers, and pestilential Distempers: They help the Head and Nerves, provoke Urine, and bring down the Menfes.

They are one of the Ingredients of the *Theriaca* and *Mithridate*. *Miller's Bot. Off.*

The Root and Herb are alexipharmic, sudorific, and diuretic: Their principal Use is in Weakness of the Sight, Pestilence, Asthma, inveterate Cough, being boiled with Liquorice, Raisins, and Anise, in the Pleurisy, Obstructions of the Liver and Spleen, Jaundice, Stoppage of the Ureters, Hernia, and the like. Outwardly they strengthen the Sight, absterge Specks, and Films, being boiled in Wine or Water, and instilled by Drops: They ease the Head-ach, provoke the Menfes and Sweating, being used in Baths: In Suffumigations they dry up Rheums, and correct the Malignity of Buboës and Carbuncles, extract Bullets or Arrows, and cleanse inveterate Ulcers. Thus far *Schroder*: And indeed he has said enough, if not too much, in its Praise. It is certainly, however, a potent Diuretic.

The Powder of the Root, which grows spontaneously, before it produces a Stalk, taken once or twice, to the Quantity of half a Spoonful, in Wine, Water, Milk, or any other proper Juice, cures the Epilepsy; for it purges upwards and downwards. *Sylvius* thinks, that more is to be ascribed to this Plant, than to Peony, on account of its abounding with a volatile Salt. It is usual with us in *England*, to apply the bruised Leaves to

Wounds, when but flight; whence it is called by some *Cut-singer*. *Raii Hist. Plant.*

2. *Valeriana*; *sylvestris*; major. *Ger.* 917. *Emac.* 1075. *Park.* 122. *C. B. P.* 164. *Raii Hist.* 1. 388. *Synop.* 3. 200. *Tourn. Inst. Boerh. Ind. A.* 74. *Valeriana sylvestris*. *Offic.* *Valeriana sylvestris magna aquatica*. *J. B.* 3. 209. *Phu Dioscoridis verior*. *Col. Ecph.* 1. 210. **GREAT WILD VALERIAN.**

We have two Species of this great wild Valerian; the first has a Root divided into several white thick Strings, growing more downward, and less spreading than the other; of no great Scent, when just taken out of the Ground, but smelling very strong when dry. The Stalks arise to be about a Yard high, hollow and channelled, having several long winged Leaves, whose Pinnæ are long, sharp-pointed, and serrated about the Edges, high-veined, and somewhat hairy; the Leaves, which grow higher on the Stalks, are narrower, and less serrated. The Flowers are, in Shape, like those of the Garden Valerian, of a pale-purple Colour, and having the like Seed. This grows in Woods, and dryer Places than the other, which is larger, taller, the Root more spread out; the Leaves are larger, smoother, of a deeper shining Green, with broader Pinnæ; the Stalks grow taller; the Flowers are much alike. This grows in watery Places, and near Ditches, both flowering in May. The Root of this has as strong a Smell as the other; they are both used promiscuously, though the former seems to come nearest *Columna's* Figure and Description in his *Phytopinax*.

They are come much into Use of late, in Diseases of the Head, and all nervous Affections. *Miller's Bot. Off.*

The Leaves of this Plant have no Smell, but an herby, saltish, bitter Taste, and give a pretty deep Tincture of Red to the blue Paper; the Roots stain it a little; they are bitter and styptic, of an aromatic penetrating Smell, and something disagreeable. This Plant has a volatile aromatic oily Salt, loaded with a Part of the Acid of the Sal Ammoniac; whereas the artificial volatile oily Salt of this Acid, is detained by the Salt of Tartar.

Thus the wild Valerian is anti-epileptic, sudorific, hysteric, and emmenagogic: It gives great Relief to those troubled with the Asthma, or Vapours: *Camerarius* commends it very much for the Jaundice; and *Fabius Columna* for the Epilepsy; who acknowledges himself to have been cured of the Epilepsy by this Root; and that he had seen several other Persons cured by it: He advises to pull it up before it pushes forth its Stalks, to reduce it to Powder, and swallow half a Spoonful of it in Wine, Water, Milk, or any other Liquor: It may be given to Children, and all Persons that have convulsive Fits. I have seen it have great Efficacy in the hysteric Passion, and most violent Paroxysms of the Asthma. Pour a Pint of boiling Water upon an Ounce of the Roots of this Plant; remove the Pot from the Fire; cover the Infusion well; and give it to drink by Glassfuls. The Extract of these Roots is good for the same Diseases: They give a Scruple of it with a Grain of Laudanum, or else mix the Laudanum with half a Scruple of the Powder of these Roots. *Martyn's Tournesfort.*

It is effectual in Convulsions, Ruptures, and Bruises by Falls, as, also, for Inflammations, and Exulcerations of the Mouth and Gums, and the Aphthæ, *H. Ox.* and cures a Tertian Fever. *Schw. Dale.*

A Dram of the Powder of the dry'd Roots, taken in Wine, purges upwards and downwards. *Dr. Mead*, in his Book *de Imperio Solis & Luna*, highly commends the Root of this Plant against the Epilepsy.

3. *Valeriana*; major; *sylvestris*; montana. *C. B. P.* 164.
4. *Valeriana*; foliis Calcitrapæ. *C. B. P.* 164.
5. *Valeriana*; foliis Calcitrapæ, magis dissectis.
6. *Valeriana*; palustris minor. *C. B. P.* 164. *Tourn. Inst.* 132. *Boerh. Ind. A.* 74. *Phu minus & Valeriana minor*. *Offic.* *Valeriana minor*. *Ger.* 916. *Emac.* 1075. *Raii Hist.* 1. 388. *Valeriana sylvestris minor*. *Park.* 122. *Raii Synop.* 3. 206. *Valeriana minor pratensis vel aquatica*. *J. B.* 3. 211. **SMALL VALERIAN.**

The Roots of this Valerian are long, slender, and creeping, sending out a few small white Fibres. The Leaves which spring from them, before the Stalks run up to Flower, are almost round, but somewhat pointed. The Leaves which grow on the Stalks, are like those of the Garden-kind, but less. We have two Species of this Valerian, one whereof rises higher than the other, having usually three Pair of Leaves set opposite; the Umbels of Flowers grow closer, and the Flowers are a great deal smaller, than the other, which arises not so high, and has usually but two Pair of Leaves on the Stalks. The Flowers are much larger, and like the Garden Valerian, but of a pale-purple Colour, as are, also, the former. They grow both promiscuously in marshy Grounds, and moist Meadows, as in *Battersea Field*, near the *Thames*, in great Plenty, flowering in May.

I know no particular Virtue this Species of Valerian is en-

dowed with, Authors having said but little about it; neither is it ever used in the Shops that I know of. *Miller's Bot. Off.*

The Parts in Use are the Root and Leaves, which as they resemble those of the *Great Wild Valerian* in outward Appearance, so are they supposed to agree with them in Virtues, tho' in an inferior, or milder Degree. *Dale.*

7. *Valeriana*; *sylvestris*; vel palustris; altera; flore minore densius stipata. *Raii Synop.* 98.

8. *Valeriana*; tuberosa. *J. B.* 3. 2. 207.

9. *Valeriana*; rubra. *C. B. P.* 165.

10. *Valeriana*; marina; latifolia; major; alba. *M. U.* 50.

11. *Valeriana*; rubra; angustifolia. *C. B. P.* 65.

12. *Valeriana*; maxima; Pyrenaica; Cascaliz folio. *Fagon. T.* 131.

13. *Valeriana*; Lusitanica; latifolia; annua; lacinizata. *T.* 132. *Boerh. Ind. alt. Plant.*

The first is the true *Phu* of *Dioscorides*, and the Antients; and takes that Name either from the Greek Word *φύω*, (*phyo*) to grow, or spring from, or from *Phy*, a Pontic Word, denoting the penetrating Smell of its Root. But it is erroneously affirmed to be the *Herba Saracenica*, for healing of Wounds; for the Taste shews the contrary; for it is aromatic, penetrating, and somewhat ungrateful Taste, as it is said of the *Nardus* of the Antients; whence it appears to be of an aperitive Quality, and is reckoned among *Aristolochies*, *Emmenagogues*, and *Antiscorbutics*; it, also, exhilarates the Heart, and the Brain; and is effectual in all Disorders proceeding from cold, viscid, and aqueous Humours. A great Author, has talked much of its Virtues against Sorceries and Witchcraft, induced, I suppose, from its extraordinary Efficacy in spasmodic, hysteric, epileptic, and melancholic Cases. These Disorders are called *Lunatic*, and are attended with surprising Symptoms; for which Reason the Antients called them *Morbos Sacros*, Diseases of the Gods. But the Antients made but little Distinction between their Gods and Demons, which might lay a Foundation for this Opinion of the before-mentioned Author. *Hippocrates* says very well of these *Morbi Sacri*, that there are some Diseases very surprising, and therefore called *Sacred*, or *Divine*, not because they came from the Gods, for then all would be *sacred*, but from their surprising Effects; whence this Plant has been esteemed an Antidemoniac, though Rue, also, cures the same Diseases. There are Authors who advise the Root as an Amulet against a Quotidian Fever, and hang it about the Neck for that Purpose. *Fabius Columna*, a Man of the first Rank, and concerned in public Affairs, fell into an epileptic Disorder. Finding no Relief from Physicians, and being fatigued with the long Continuance of the Disease, he betook himself wholly to the Reading of the Antients, in order to examine, whether he could find out by Name a Plant which would cure the Epilepsy; and at length he happened upon this Plant, the second, by the Root of which he was cured. From that time he became an extraordinary Botanist, and assures us, that he knew many epileptic Patients cured by this Plant. He advises to pull up the Root before it begins to sprout, and exhibit the same in Powder to the Patient, for six Days together, in the Morning fasting, in Water, Wine, or Milk: This Medicine provokes Sweat, and frequently gives the Patient a Stool or two, which is a very good Sign. The Roots are very odoriferous, acrimonious, and penetrating; and have a balsamic, and somewhat oily Taste: Whence the *Valeriana* has the same Virtues which we observe in umbelliferous Plants. It is a proper Ingredient in pectoral, stomachic, and uterine Diseases, and is very effectual in a Stoppage of the Menfes, an Ounce or two of the bruised Root being made into an Infusion after the manner of Tea, and sweetened with Honey. It is an excellent Remedy against Worms, and epileptic Fits, in Infants. *Camerarius* highly commends it against the Jaundice, and a violent Asthma, the Infusion of the Root in Water, or the Powder thereof with a Grain of Laudanum, being exhibited. This Plant is effectual, also, against all Sorts of Contusions, the Leaves being bruised in Wine, and applied to the Place affected; the same discuss scirrhus Tumors without Suppuration, and speedily cicatrize Wounds; for which Reason the Peasants in the Country apply the Leaves of this Plant to all sordid Ulcers. The Root is received into all Antidotes; but the first Species is most celebrated, and I can recommend it from an hundred Experiments which I have made of its Virtues. The eighth, ninth, tenth, and following Species, are cultivated in Gardens, being beautiful Plants, and continuing a long time in Flower. *Hist. Plant. adscript. Boerhaav.*

VALERIANA is, also, a Name for several Sorts of VALERIANELLA; which see.

VALERIANA GRÆCA. A Name for several Sorts of POLEMONIUM; which see.

VALERIANÆ RUBRÆ SIMILIS. A Name for the *Limonium*; *maritimum*; *majus*.

VALERIANA URTICÆ FOLIO. A Name for the *Eupatorium*; *Urticæ foliis*; *Canadense*; *flore albo*.

VALERIANELLA.

The Characters are;

The Root is annual and fibrous; the Leaves are conjugated; the Stalk and Branches are divided in two, and appear at Top like an Umbella. The Calyx is monophyllous, small, quinquefid, and closed. The Flower is monopetalous, of various Shapes in different Plants, and furnished with two, three, or four Stamina, growing out of the internal Sides of the Flower, which grows on the Apex of the Ovary. The Ovary grows on the Centre of the Calyx, shoots forth a Tube, and becomes a Fruit of various Forms, inclosing a single Seed.

Boerhaave mentions six Sorts of *Valerianella*; which are,

1. *Valerianella*; *arvensis*; *præcox*; *humilior*; *femine depresso*. *Raii Synop.* 3. 201. *Tourn. Inst.* 132. *Boerb. Ind. A.* 75. *Lactuca agnina*. *Offic. Ger.* 242. *Emac.* 310. *Park.* 812. *Valeriana campestris inodora major*. *C. B. P.* 165. *Raii Hist.* 1. 302. *Locusta Herba prior*. *J. B.* 3. 323. *Locusta Herba, Pes Locustæ*. *Chab.* 437. **LAMBS-LETTUCE, or CORN-SALLAD.**

VALERIANELLA is cooling, and somewhat moistening, being in Temperament and Virtues not unlike Lettuce, and supplies its Room in Winter, and the Beginning of Spring, being pleasantly eaten with Vinegar, Salt, and Oil, like other Salads, among which it is reckoned one of the best. Lambs are mightily delighted and improved, and fattened, by eating this Plant; whence, they say, it takes the Name of *Lambs-lettuce*. *Raii Hist. Plant.*

It grows in Gardens, and among Corn, and flowers in the Spring. *Dale.*

2. *Valerianella*; *arvensis*; *præcox*; *humilis*; *foliis ferratis*. *T.* 132. *Pseudo-valeriana, erecta, serotina, semine umbilicato, hirsuto, pyramidalis*. *M. H.* 3. 104. *Locusta, altera, foliis ferratis*. *J. B.* 324.

3. *Valerianella*; *femine stellato*. *C. B. P.* 165. *Pseudo-valeriana, annua, semine coronato, major, Lustanica*. *M. H.* 3. 104.

4. *Valerianella*; *Cretica*; *fructu veficario*. *T. Cor.* 6.

5. *Valerianella*; *cornucopoides*; *rubra*; *vel Indica*. *M. U.* 53. *Pseudo-valeriana, cornucopoides; annua, purpurea, semine solido*. *M. H.* 3. 104. *Valeriana, peregrina, purpurea*. *C. B. P.* 164.

6. *Valerianella*; *Africana*; *foliis angustis*; *flore macula rubente notato*. *H. A.* 2. 217. *Boerb. Ind. alt. Plant.*

The Plant is called *Valerianella*, that is, *small Valeriana*, from its Resemblance to the *Valeriana*. It grows in warm Places. The first and second Species are called *Lambs-lettuce*, because they contain a very mild Juice in all their Parts, with which Lambs are highly delighted and improved. The Name *Locusta* is given to this Plant from the Resemblance of its Branches to the Legs of a Grasshopper, when going to leap.

The first and second Species are very soft, succulent, mild, pleasant, and nourishing Herbs; whence they are good, mild, light, and nutritive Food for weak Stomachs. *Valerianella* is proper in Cases which require Lenients, Relaxants, or Lubricants; whence it is of Use in the Pleurisy and Nephritis, and, also, to procure Sleep. The crude Juice, or the Leaves, boiled in mild Flesh-broth, are very mild and wholesome Remedies in a Phthisis, where the softest and most lenient things are required. This Plant is, moreover, an extraordinary Demulcent; whence it is of Service in the Strangury, Pissing, and Spitting of Blood, Asperities of the Lungs, Cough, and Pains in the Kidneys, and is a celebrated Remedy for mitigating the Gout. It has the same Effect, whether boiled in Whey, or the expressed Juice thereof taken in good Quantity. It gives extraordinary Relief in hypochondriac Disorders. The Seed is highly aperient, and of excellent Use in the Scurvy, and all Diseases where the Root of the *Bulbocastanum* is of Service; it is, also, commended in a Gonorrhoea and Dysentery. *Hist. Plant. adscript. Boerhaav.*

VALERIANELLA ZEYLANICA. A Name for the *Hydrocotyle*; *Zeylanica*; *Asari folio*.

VALERIANELLOIDES.

The Characters are;

The Root is fibrous and perennial, and is produced from sowing the Seed, which is ash-coloured, oblong, sharp, and small, like the Seed of the Lesser Cumin. The Stalk is ramous, cineritious, covered with a slight Down, and frutescent. The Leaves are conjugated, roundish, scabrous, serrated, upon a long, sulcated Pedicle. From the Wings of the Leaves proceed other conjugated Leaves, similar, and four in Number. The Tops of the Stalk and Branches run into a very long and slender Spike, to which grow on every Side, as it were, engraved, long, monophyllous Calyces, deeply quinquefid, slender, tubulous, and very closely adhering to the Sides of the Spike. These Calyces contain a monopetalous, Funnel-shaped, quinquefid,

expanded Flower, of a pale-bluish Colour. From the Inside of the Tube of this Flower proceed two Stamina. The Ovary is in the Centre of the Calyx, and consists of one long, cylindrical Seed, which has a long Tube with an hemispherical Apex. This Plant grows in *America*. *Boerb. Ind. alt. Plant.*

VALERIANTHEMUM. A Name for the *Rapunculus*; *Valerianoides*; *cæruleus*; *umbellatus*.

VALGUS. Bow-leg'd.

THE METHOD OF REMEDYING BANDY-LEGS IN CHILDREN.
